RHSC and DCN EDINBURGH
COMMON MECHANICAL CLAUSES

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

This specification shall be read in conjunction with all other Mechanical and Public Health Specifications for the RHSC and DCN building and contains clauses common to all aspects of the mechanical and public health installation.

Fans & Pumps

All fan assemblies shall incorporate fan impeller and motors selected to provide the most energy efficient solution conforming to Section 6 regulations. All fans and pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

Y10 PIPELINES

GENERAL

Project Co. shall supply all pipelines as new, undamaged, free from corrosion, not sub-standard and conform to the requirements of the specification.

Assist the manufacturer of any preformed or prefabricated pipework in the completion of their works.

Provide adequate and safe storage for all material in respect of their own works.

This shall include:

Purpose made racks for the storage of pipes and similar materials to prevent bending or distortion.

Purpose made cap ends to prevent dirt and rodent infestation.

Protect against frost, building works, or the operation of others.

Keeping clean, tidy, and free from waste and superfluous material all of their areas. For water services, pipe runs should not be excessively long and dead legs should be kept to an absolute minimum to avoid stagnation.

Where pipework joints are welded the procedure shall be carried out in accordance with Code of Practice TR/5.

Project Co. shall cut out the joints as selected and these will be examined for fault or excessive jointing material

110A STEEL PIPELINES FOR CHILLED WATER SYSTEMS and FOR LOW TEMPERATURE HOT WATER HEATING SYSTEMS FOR PIPE SIZES GREATER THAN 50mm and FOR PERMANENTLY CONCEALED SERVICES

- Thickness series for tubes to BS EN 10255: Heavy.
- Quality for tubes to BS EN 10216-1 or BS EN 10217-1: TR2.
- Finish: Varnish.
- Jointing method:
  - Permanently concealed: Welded class 1.
  - Accessible: Mechanical grooved joints 50-300 mm.

110B STEEL PIPELINES FOR NATURAL GAS SUPPLY SYSTEMS

- Thickness series for tubes to BS EN 10255: Above ground pipework to be heavy Duty welded throughout its length and painted yellow ochre.
- Quality for tubes to BS EN 10216-1 or BS EN 10217-1: Gas Pipework to be installed to BS EN 1775 & BS EN 15001.
- Finish: Varnish.
- Jointing method:
  - Permanently concealed: Welded class 1.
  - Accessible: welded.

110C STEEL PIPELINES FOR FUEL OIL SUPPLY SYSTEMS

- Thickness series for tubes to BS EN 10255: Medium . Quality for tubes to BS EN 10216-1 or BS EN 10217-1: TR1.
- Finish: Varnish.
- Jointing method:
  - Permanently concealed: Welded class 1.
  - Accessible: Screwed up to and including 50 mm or Welded and flanged 65 mm and Over.

110F STEEL PIPELINES FOR CHILLED WATER SYSTEMS and FOR LOW TEMPERATURE
HOT WATER HEATING SYSTEMS FOR PIPE SIZES LESS THAN 50mm

- Mapress carbon steel - unalloyed steel E 195 Quality for tubes.: Not applicable.
- Finish: Zinc plated.
- Jointing method:
  - Accessible: Mapress press fitting installed in accordance with manufacturer's instructions.

120B COPPER PIPELINES FOR REFRIGERENT PIPEWORK

- Standard: To BS EN 1057
  - Grade: R250 or Suitable for refrigerant gas used.
  Finish: Plain.
- Jointing method:
  - Permanently concealed: Brazed.
  - Accessible: Brazed.

130 PLASTICS WATER PIPELINES FOR UNDERGROUND POTABLE MAINS COLD WATER SUPPLY

- Manufacturer: Submit proposals.
  - Product reference: A water meter will be incorporated with direct reading and a BMS interface onto the incoming domestic mains supply at the entry to the site. A leak detection system will be linked to the BMS and difference in flows recorded to identify potential leaks. The site's domestic main water meter will be fitted with isolation valves and double check valves in accordance with the water byelaws.

- Pipe and fittings: PE 100 SDR 11. Site water mains will be installed in accordance with NJUG requirements. Where contaminated land is known use WRAS approved barrier pipe and backfill to be from a clean source.
  - Classification to BS 7291-1: Suitable for Mains water.
  - Classification to BS EN ISO 15874-1, BS EN ISO 15875-1, BS EN ISO 15876-1 or BS EN ISO 15877-1: BS EN 12201.
  - Classification to BS ISO 4427-1: Not applicable.
  - Colour: Blue.
- Jointing method: Electrofusion in accordance with manufacturer's instructions.

138 PLASTICS TREATED WATER PIPELINES FOR DEIONISED WATER

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Pipe and fittings: PVC-U. Cast iron must NOT be used in the construction of any pipes, fittings, valves, pumps or part thereof which may come into contact with the water.
  - Classification to BS 7291-1: Not applicable.
  - Classification to BS EN ISO 15874-1, BS EN ISO 15875-1, or BS EN ISO 15877-1: Not applicable.
  - Classification to BS ISO 4427-1: Not applicable.
  - Colour: Project Co. choice
- Jointing method: To suit tube.

140 STAINLESS STEEL PIPELINES FOR DOMESTIC HOT AND COLD WATER SERVICES

- Manufacturer: Submit proposals.
  - Product reference: Stainless Steel pipework shall be 316 S16 and comply with BS EN 10312, BS EN 10088-2, BS 3605 BS 864 part 2, DIN 2463, BS 4127, DIN 1988. Note that all these domestic supplies can only connect to outlets and equipment that are suitable for potable quality water supplies, i.e. Type A air gap protection. Cast iron may only be used in the construction of any pipes, fittings, valves, pumps or part thereof which may come into contact with the water if there is no other suitable alternative material available. The installation shall comply with HS (G) 70.
- Finish: Bright annealed
- Jointing method: Crimp in accordance with manufacturer's instructions.

140A STAINLESS STEEL PIPELINES FOR FILTERED WATER

- Manufacturer: Submit proposals.
  - Product reference: Stainless Steel pipework shall be 316 S16 and comply with BS EN 10312, BS EN 10088-2, BS 3605 BS 864 part 2, DIN 2463, BS 4127, DIN 1988. The installation shall comply with HS (G) 70. Cast iron must NOT be used in the construction of any pipes, fittings, valves, pumps or part thereof which may come into contact with the water.
- Finish: Bright annealed
- Jointing method: Board's proposals.

PRODUCTS

310 STEEL TUBES

- < 150 mm: To BS EN 10255.
- 150 mm and above: To BS EN 10216-1 and BS EN 10217-1.

320 JOINTING MATERIALS FOR STEEL TUBES

- Jointing compound: To BS 6956-5.
- PTFE tape: To BS EN 751-3.
- Flange jointing rings: To BS EN 1514-4.
- Elastomeric gaskets: To BS EN 681-1.
- Welding rods:
  - Gas welding: To BS EN 12536.
  - Arc welding: To BS EN ISO 636.

330 FITTINGS FOR STEEL TUBES

- Malleable: To BS 143 and BS 1256.
- Flanged: To BS EN 1092-1.
- Welded: To BS EN 10253-1 and BS EN 10253-2.
- Mechanical couplings: Manufacturer's standard.

340 COPPER TUBES

- Standard: To BS EN 1057.
  - Buried R220.
  - Above ground R250.

350 JOINTING MATERIALS FOR COPPER TUBES

- Solder for capillary fittings: To BS EN ISO 9453.
- Lead free solder for capillary fittings: To BS EN ISO 9453.
- Brazing filling: To BS EN 1044.
- Flange jointing rings: To BS EN 1514-4.

360 FITTINGS FOR COPPER TUBES

- Capillary: To BS EN 1254-1.
- Compression: To BS EN 1254-2.
- Flanges: To BS EN 1092-3.
- Press fittings: To manufacturer's standard.

373 POLYETHYLENE (PE) TUBES

- Standards:
  - Pipe:
    For gaseous fuels (PE): To BS EN 1555-2.
    For buried gaseous fuels (PE): To BS ISO 4437.
    For water supply (PE): BS EN 12201-2.
  - Fittings:
    For gaseous fuels: To BS EN 1555-3.
    For buried gaseous fuels (PE): To BS ISO 4437.
    For water supply: BS EN 12201-3.

385 JOINTING MATERIALS FOR PLASTICS TUBES

- Standards:
  - Compression: To BS EN 1254-3.
  - Electrofusion: To BS EN 12201-3.
  - Socket and spigot: To BS EN 12201-3.
  - Solvent cement: To BS EN 1452-3.
  - Elastomeric ring seal: To BS EN 1452-3.

390 STAINLESS STEEL TUBES

- Standards: To BS 4825-1 and BS EN 10312.

400 FITTINGS FOR STAINLESS STEEL TUBES

- Capillary: To BS 4825-2.
- Clamp type couplings: To BS 4825-3.
- Threaded (IDF type) couplings: To BS 4825-4.
- Recessed ring joint type (RJT) couplings: To BS 4825-5.
- Press fittings: To manufacturer's standard.

EXECUTION

Project Co. shall install services to building programme in a workman like manor and as specification. Due to the size of the water systems being installed all pressure testing and commissioning equipment shall be cleaned and chlorinated before each use. This is to prevent the systems from being contaminated with pseudomonas.

605 PIPELINES INSTALLATION GENERALLY

- Installation: In accordance with the latest edition of HVCA TR/20.
- Appearance: Install exposed pipe runs parallel with other pipe or service runs and building structure, taking account of gradients for draining or venting. Set vertical pipes plumb, or follow building line.
- Gradients: Install with gradients to allow drainage and air release.
- Air venting: Provide vents at high points.
- Draining: Provide drains at low points.
- Pipeline expansion and contraction: Arrange supports and fixings to accommodate pipeline movement caused by the thermal changes. Allow for movement at branch connections.
- Pipeline support: Arrange supports and accessories for equipment, appliances and ancillary fitments in pipelines, so that no undue strain is imposed upon pipes.
- Dirt, insects and rodents: Prevent ingress.

610 SPACING OF PIPELINES

- Minimum clearance between insulated pipelines and:
  - Wall finish: 25 mm.
  - Ceiling finish or soffit: 100 mm.
  - Floor finish: 150 mm.
  - Electrical services: 150 mm.
  - Adjacent services: 100 mm.
  - Uninsulated pipeline: 75 mm.
  - Another insulated pipeline: 25 mm.
- Minimum clearance between uninsulated pipelines and:
  - Wall finish: 25 mm.
  - Ceiling finish or soffit: 100 mm.
  - Floor finish: 150 mm.
  - Electrical services: 150 mm.
  - Adjacent services: 150 mm.
  - Another uninsulated pipeline: 25 mm.

620 PIPELINE SUPPORTS LTHW,CHW

- Type: Overstrap, washer and nuts.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Steel.

620A PIPELINE SUPPORTS COPPER PIPELINES

- Type: Pipe clip, sling rod, washer and nuts.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Brass.

620B PIPELINE SUPPORTS PVC PIPES

- Type: Pipe clip, sling rod, washer and nuts.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Brass or PVC

620C PIPELINE SUPPORTS ABOVE GROUND PRE-INSULATED PIPES

- Type: Overstrap, washer and nuts by manufacturer.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Steel.

620D PIPELINE SUPPORTS STAINLESS STEEL PIPEWORK

- Type: Pipe clip, sling rod, washer and nuts.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Stainless steel.

620E PIPELINE SUPPORTS NATURAL GAS AND FUEL OIL

- Type: Pipe clip, sling rod, washer and nuts.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
  - Material: Steel.

621 PIPELINE SUPPORT BRACKETS

- Type: Unistrut support for 50mm and below, submit proposals for pipe sizes above 50mm.
- Finish: Match pipeline supports.

625 PIPELINE FITTINGS

- Reductions and enlargements:
  - On horizontal pipeline runs: Eccentric.
  - On vertical pipeline runs: Concentric.
- Bushes: Use only at radiators.
- Square tees: Provide at vent and drain points.
- Square elbows: Do not use.
- Fabricated junctions and fittings: Same material as the main pipeline.
- Demountable joints: Regularly spaced along pipeline runs and at items of equipment.

630A PIPELINE SLEEVES

- Sleeves: Fit to pipes passing through building fabric.
- Material: Match pipeline.
- Size: One or two sizes larger than pipe to allow clearance. Continue insulation and vapour barrier through sleeve on chilled water services and agree fire break continuing detail with Building Control Officer.
- Finish: Install sleeves flush with building finish. In areas where floors are washed down, install protruding 100 mm above floor finish.
- Sealing: seal between building fabric and sleeve to maintain same fire or acoustic integrity as wall/floor shall be by Project Co.
- Masking plates: Fit at visible penetrations, including through false ceilings of occupied rooms.

635 DISSIMILAR METALS

- Electrolytic corrosion: Prevent.

640A ANCHORS GENERALLY

- Design: To resist axial stress transmitted by flexure of horizontal and vertical pipe runs, and loading on vertical pipes.
- Fixings: Provide associated backing plates, nuts, washers and bolts for attachment to, or building into building structure.
- Building structure: Suitable for transmitted stress. Board's Proposals to be submitted.

645A ANCHORS FOR STEEL PIPES

- Anchor: Two slip on flanges welded to pipes, bolted together through a mild steel channel section.
- Fixing: Bolted to building structure.
- Pipe restraints: Mild steel overstraps or heavy U-bolts welded to pipes.
- Board's Proposals to be submitted.

650 ANCHORS FOR COPPER PIPES

- Anchor: Two flanges fixed to copper female adaptors.
- Anchor fixing: Bolted to building structure.
- Pipe restraints: Saddle clamps.

660 SLIDE GUIDES

- Expansion and contraction: Direct movement from pipe anchor points towards loops, bellows or flexible inserts.
- Thrust: Linear relative to the axis of pipe.
- Friction: Apply a friction reducing material between metal faces subjected to movement.

665A WELDING STEEL PIPEWORK GENERALLY

- Standard: In accordance with HVCA TR/5.
- Welder identification: Mark each weld to identify operative.
- Non-destructive testing method: Ultrasonic examination and/or Board's proposals.
- Completed welds: Wire brush and protect from corrosion.

670 FLANGED JOINTS IN STEEL PIPES

- Preparation:
  - Flange mating faces: Parallel.
  - Flange peripheries: Flush with each other.
  - Bolt holes: Align correctly.
- Welded flanges: Weld neck and bore of 'slip on' flanges. Butt weld neck of welding neck flanges.
- Screwed flanges: Apply jointing materials. Screw on flange. Expand tube into flange.
- Making and sealing: Insert jointing between flange mating faces. Tighten joint equally all round.

675 SCREWED JOINTS IN STEEL PIPES

- Preparation of plain ends: Cut square. Ream out bore. Screw, taper thread.

- Making and sealing: Coat male pipe threads with jointing compound and hemp, or PTFE tape on small sizes. Immediately after connect with female end of socket or fitting, and tighten. Remove coating intruding into pipe. Leave joint clean.

680 MECHANICAL JOINTS IN GROOVED STEEL AND STAINLESS STEEL PIPES

- Preparation: Cut ends square, free of bumps, dents and score marks within manufacturer's tolerances. Form groove and assemble.
- Making and sealing: Thoroughly lubricate gasket, externally and internally. Stretch over pipe end and bring pipe ends together. Slide gasket into central position over both pipe ends. Position joint half housings over gasket and insert bolts, nuts and electrical continuity clip if required. Tighten bolts. Check alignment of joint and pipework.

680A MECHANICAL JOINTS IN MAPRESS CARBON STEEL AND STAINLESS STEEL PIPES

- Preparation: Cut ends square, free of bumps, dents and score marks within manufacturer's tolerances.
- Making and sealing: Use manufacturer's specialist tools to form joint. Check alignment of joint and pipework. Identify joint as being complete, e.g. spray paint.

700 CAPILLARY JOINTS IN COPPER PIPES

- Standard: To BS EN 1254-1.
- Preparation: Cut square and deburr. Clean plain ends using fine steel wool.
- Making and sealing: Do not use excess flux. Make joint. Clean off traces of flux when completed.

710 COMPRESSION JOINTS IN COPPER PIPES

- Standard: To BS EN 1254-2.
- Preparation: Cut square and deburr.
- Making and sealing:
  - Type A: Compress ring onto the wall of the tube.
  - Type B: Compress the formed portion of the tube against the formed end of the fitting.

730 COMPRESSION JOINTS IN STAINLESS STEEL PIPES

- Standard: To BS EN 1254-2.
- Preparation: Cut square and deburr.
- Making and sealing:
  - Type A: Compress ring onto the wall of the tube.
  - Type B: Compress the formed portion of the tube against the formed end of the fitting.

745 JOINTS IN PVC PIPES

- Type: Solvent welded generally, and ring seal at expansion joints.
- Preparation: Cut plain ends square and deburr. Clean plain ends using solvent cleaner.

750 FUSION JOINTS IN POLYETHYLENE PIPES

- Preparation: Cut plain ends square. Form pipe ends for socket type joints.

755 MECHANICAL FITTINGS FOR POLYETHYLENE PIPES

- Preparation: Cut plain ends square. Check wall thickness and pressure rating of fitting.

COMPLETION

910 GENERAL INSPECTION AND TESTING

- Inspection of joints: Cut out, cut open and inspect.
- Number of joints: Testing of gas pipework in accordance with BS EN 1775 & BS EN 15001. Testing of other pipework to be in accordance with TR/20. See also section Y50 mechanical commissioning.
- Safety precautions: In accordance with HSE GS4.

Y11 PIPELINE ANCILLARIES

GENERAL

Project Co. shall supply all pipeline ancillaries as new, undamaged, free from corrosion, not sub-standard and conform to the requirements of the specification. Provide adequate and safe storage for all material in respect of their own works.

This shall include:

Purpose made storage of pipeline ancillaries and similar materials to prevent damage. Protect against frost, building works, or the operation of others. Keeping clean, tidy, and free from waste and superfluous material all of their areas

110 PIPELINE ANCILLARIES FOR INCOMING MAINS WATER SUPPLY

- Water supply: PE 80 - Draw off taps and stop valves TO ISO 14885 electrofusion or compression. Suitable for pipe to BS EN 12201.
- Accessories: Backflow prevention devices.

120 PIPELINE ANCILLARIES FOR HOT AND COLD WATER SUPPLY

- Float valves: Fully variable delayed action.
- Isolating valves: Ball valves, stainless steel to BS ISO 7121I, complete with integral flow regulators/restrictors.
- Check valves: Stainless steel.
- Regulating valves: Stainless steel.
- Mixing valves: Thermostatic mixing valves for use in care establishments to SHTN 6.
- Draining devices: DOC at end of run stainless steel.
- Expansion devices: Expansion loops, stainless steel.
- Vibration isolation: Not required.
- Gauges: Temperature.
- Accessories: Not required.

120A PIPELINE ANCILLARIES FOR FILTERED WATER SYSTEMS

- Float valves: Piston type stainless steel.
- Isolating valves: Ball valves, stainless steel to BS ISO 7121I.
- Check valves: Stainless steel.
- Regulating valves: Not required.
- Mixing valves: Thermostatic mixing valves for use in care establishments to SHTN 6.
- Draining devices: DOC at end of run stainless steel.
- Expansion devices: Expansion loops, stainless steel.
- Vibration isolation: Not required.
- Gauges: Temperature.
- Accessories: Not required.

130 PIPELINE ANCILLARIES FOR HEATING SYSTEMS

- Isolating valves: Ball valves, cast iron or steel butterfly and gate valves, copper alloy to BS EN 7121, BS EN 12288, BS EN 13709.
- Check valves: Lift type to BS EN 12334, BS EN 12288, BS EN 13709.
- Regulating valves: Variable orifice valve (used for measuring, regulating and isolating). Brass double regulating to BS 7350. PICV control valves.
- Radiator valves: Radiator valves to BS 2767, fixed orifice valve (used for isolating only).
- Draining and venting devices: Brass automatic air vents and draining taps to BS EN 1982.
- Expansion devices: Expansion loops, steel to BS EN 898-1, BS EN 10255.
- Vibration isolation: Rubber bellows.
- De-aerators: As indicated on drawings.
- Separators: Combined air and dirt separators.
- Gauges: Pressure and altitude and Temperature to BS EN 837.
- Accessories: Pipeline strainers and Test points.

140 PIPELINE ANCILLARIES FOR CHILLED WATER AND CONDENSER WATER SYSTEMS

- Isolating valves: Ball valves, cast iron or steel butterfly and gate valves, copper alloy to BS EN 7121, BS EN 12288, BS EN 13709.
- Check valves: Lift type to BS EN 12334, BS EN 12288, BS EN 13709.
- Regulating valves: Variable orifice valve (used for measuring, regulating and isolating).Brass Double regulating to BS 7350. PICV control valves.
- Draining and venting devices: Brass automatic air vents and draining taps to BS EN 1982.
- Expansion devices: Not required.
- Vibration isolation: Rubber bellows.
- De-aerators: Pressure differential de-aerators.
- Separators: Dirt separators.
- Gauges: Pressure and altitude and Temperature to BS EN 837.
- Accessories: Pipeline strainers and test points.

PRODUCTS

302 CONNECTIONS FOR ANCILLARIES

- Capillary: To BS EN 1254-1.
- Compression for copper tubes: To BS EN 1254-2.
- Compression for plastics pipes: To BS EN 1254-3.
- Flanged for cast iron: To BS EN 1092-2.
- Flanged for copper alloy: To BS EN 1092-3.
- Threaded:
  - Where pressure-tight joints are made on the threads: To BS 21 or BS EN 10226-1.
  - Where pressure-tight joints are not made on the threads: To BS EN ISO 228-1

309 WATER SUPPLY - STOP VALVES FOR POTABLE WATER TO BE STAINLESS STEEL

- Standard: To BS EN 1213.
- Type: Straight.
- Manufacturer: submit proposals
  - Product reference: Project Co. choice
- Material: Copper alloy.
- Connections: Compression.

311 WATER SUPPLY - STOP VALVES, UNDERGROUND GENERAL

- Standard: To BS 5433.
- Type: To suit Pipe work.
- Manufacturer: To suit pipework.
  - Product reference: To suit pipework.
- Material: Bronze.
- Connections: Union ends.

321 FLOAT OPERATED VALVES, PISTON TYPE

- Valve to suit Stainless Steel pipework.
- Standard: To BS 1212-1.
- Type: Non-equilibrium.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Seat bore and body pattern designation: Submit proposals.
- Connections: To suit connection.

323 FLOATS FOR BALL VALVES GENERAL

- Standards:
  - Plastics: To BS 2456.
- Type: Spherical.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Diameter: To suit system.
- Grade: To suit system.

331 ISOLATING VALVES - BALL VALVES, CAST IRON OR STEEL GENERAL

- Standard: To BS ISO 7121.
- Type: Full bore.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Carbon steel.
- Connections: Threaded.
- Options: Wrench.

333 ISOLATING VALVES - BALL VALVES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Not brass copper alloy.
- Connections: Threaded.
- Finish: Natural.

335 ISOLATING VALVES - BUTTERFLY VALVES GENERAL

- Standard: To BS EN 593.
- Type: Single flange wafer body.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Materials:
  - Body: Carbon steel.
  - Shaft: Nickel-copper alloy.
  - Disk: Aluminium bronze.
  - Seat: Ethylene propylene diene monomer (EPDM) .
- Operation: Gear.

353 CHECK VALVES, CAST IRON GENERAL

- Standard: To BS EN 12334.
- Type: Lift.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Body type: Flanged.
- Mounting: To suit system.
- Iron type: Grey.
- Connections: Flanged.

355 CHECK VALVES, LIFT TYPE GENERAL

- Standard: To BS 5154 or BS EN 12288.
- Type: Straight.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Series: A.
- Material: Not copper alloy.
- Connections: To suit pipework and standard.

365 REGULATING VALVES - DOUBLE GENERAL

- Standard: To BS 7350.
- Type: Globe.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Not copper alloy.
- Connections: Threaded.

367 REGULATING VALVES - FLOW MEASURING DEVICES GENERAL

- Standard: To BS 7350.
- Type: 4.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Copper alloy.
- Connections: Threaded.

367A DIFFERENTIAL PRESSURE CONTROL VALVES (DPCV)

- Standard: To BS 7350.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: self actuating
- Operating pressure range: 20 to 100kPa

- Operating temperature range: 6 to 120 deg C
- Material:
  - body Copper alloy or cast iron
  - Seat: stainless steel
  - plug: <50mm brass: >50mm stainless steel
- Connections: Threaded or flanged.

377 THERMOSTATIC MIXING VALVES FOR USE IN CARE ESTABLISHMENTS FOR DOMESTIC HOT WATER SERVICES

- Standard: To BS 7942.
- Type: To comply with SHTN 6.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: Flow rate regulators and Integral backflow devices.

385 RADIATOR VALVES GENERAL

- Standard: To BS 2767.
- Type: Angle pattern.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Bronze with chrome finish.
- Connections: Threaded.
- Finish: Chrome plated.
- Options: To suit system.

387 THERMOSTATIC RADIATOR VALVES

TRV's shall have the facility to allow the removal and replacement of the internal valve component while still under pressure from the main system in full operation. shall provide two no. specialist valve removal kits for use during the occupational period of the hospital. Project Co. shall ensure that the combination of thermostatic radiator valves and associated isolation/regulation valves do not have a greater pressure drop than 15kPa under maximum design flow rates.

- Standards: To BS 7478 and BS EN 215.
- Type: Integral sensor with multi position locking. Valves to be either occupant adjustable or remote sensor which are non adjustable.
- Pattern: To suite installation.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Connections: Internal pipe thread and cone seated union.

401 DRAINING AND VENTING DEVICES - AUTOMATIC AIR VENTS GENERAL

- Type: Vertical inlet with integral lockshield isolating valve (Valves to be Stainless Steel when used with H&CWS) non-corrodible needle valve and seats. Discharge pipe to be terminated in a conspicuous position.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Gunmetal.
- Connections: Threaded.

403 DRAINING AND VENTING DEVICES - DRAINING TAPS (Valves to be Stainless Steel when used with H&CWS)

- Standard: To BS 2879.
- Type: 1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Bronze.
- Connections: Threaded.

415 EXPANSION DEVICES - EXPANSION COMPENSATORS, LATERAL GENERAL

- Standards: In accordance with BS 6129-1 and to BS ISO 15348.
- Type: Two tie bars.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material:
  - Bellows: Stainless steel 1.4571 (316 Ti), to BS EN 10088-1
  - Inner sleeve: Stainless steel 1.4541 (321), to BS EN 10088-1
  - Tie bars: Gr 8.8, to BS EN ISO 898-1, zinc plated
- Connections: Flanged

421 VIBRATION ISOLATION - FLEXIBLE HOSES General - SHALL NOT BE USED ON DOMESTIC WATER SERVICES

- Type: Rubber cored.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Ethylene propylene diene monomer (EPDM) rubber hose with stainless steel braid.
- Connections:
  - Rubber cored: To suit system.
  - Stainless steel: To suit system.

423 VIBRATION ISOLATION - RUBBER BELLOWS

Flexible connections shall be fitted to all pump suction and discharged connections, chillers and other centrifugal reciprocating or vibrating equipment and where anti-vibration mounts or inertia bases are fitted. Spacer pieces shall be installed during the construction phase with the flexible connection not being put in place until the system is complete. Flexible connections shall be suitable for the system type in which they are installed. Bellows shall be installed as close to the vibration source as possible. Rubber bellows shall be of reinforced EDPM rubber with wire-reinforced cuffs. Flanges shall be able to swivel and be removable. Tie bars with top hat washers shall be used where working pressure exceeds 1.5 bar. Where united bellows are used the manufactures recommendations for anchors and guides shall be followed. All flexible connections used on heating circuits shall have a design life of 120 months at the given conditions and after this time have a minimum burst pressure of 30 bar. For working temperatures between 70 and 100°C the bellows carcase shall be steel wire mesh reinforced throughout. For temperatures above 100°C bellows shall be of thick wall spirally wound multi -ply construction. For potable cold and hot water services the bellows liner shall be of a food grade butyl rubber.

- Type: Tied.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

- Material:
  - Liner: To suit system.
  - Reinforcement: Corrosion resistant steel wire.
  - Cover: Ethylene propylene diene monomer (EPDM) rubber.
- Connections: Flanged.

431 DE-AERATORS, PRESSURE: DIFFERENTIAL CHILLED WATER

- Type: Self circulating unit.
- Manufacturer: As schedule.
  - Product reference: As schedule.
- Material: Carbon steel.
- Connections: As schedule.

439 COMBINED AIR AND DIRT SEPARATORS: LTHW HEATING

The combined dirt and air separator shall be fitted to the main flow header of the primary heating water system.

The deaerator shall be capable of conditioning the water to make it highly absorptive at all points in the system by removing not only free but also dissolved gases released in the form of micro bubbles and also providing sludge removal.

The deaerator shall be at least line size and flanged to PN16 for sizes 50mm and above. The automatic air release system shall be installed complete with isolating valve to allow removal of automatic air vent and tamper proof air release valve. The valve shall be self closing and guaranteed against leakage.

The deaerator shall be mounted in a horizontal pipe at the hottest part of the system. The separator shall remove all dirt particles heavier than water down to 10 micron whilst keeping a constant pressure drop.

Velocity through the deaerator shall be no more than 1.5m/s.

- Type: Vertical housing with internal large surface area mechanism to remove microbubbles via coalescence effect.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Carbon steel.
- Connections: Flanged.

441 DIRT SEPARATORS: CHILLED WATER

- Type: Vertical mild steel housing with internal reservoir, sludge pipe, perforation plate and automatic air release mechanism.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Carbon steel.
- Connections: Flanged.

451 GAUGES, PRESSURE AND ALTITUDE GENERAL

- Standard:
  - Bourdon: To BS EN 837-1.
  - Diaphragm: To BS EN 837-3.
- Diameter: 100 mm.

- Manufacturer: Calibrated, to twice the working pressure complete with lever handle gauge cock and adjustable red dial pointer. White faced with black scale.
  - Product reference:.
- Case: To suit pipework and standard.
- Connections: To suit pipework.

453 GAUGES, TEMPERATURE GENERAL

- Standard: To BS EN 13190.
- Type: Bi-metallic.
- Manufacturer: Submit proposals.
  - Product reference: For LTHW 0 120 with divisions of 1 deg C all to be calibrated.
- Diameter: 100.
- Case: Brass.
- Connections: To suit pipework.
- Integral accessories: 100 mm immersion length pocket.

465 ACCESSORIES - BACKFLOW PREVENTION DEVICES GENERAL

- Standards:
  - Anti-pollution check valves: To BS EN 13959.
  - Check valves: To BS 6282-1.
  - Combined check and anti-vacuum valves: To BS 6282-4.
  - Hose union: To BS EN 14454.
  - In-line anti-vacuum valves: To BS EN 14451.
  - Terminal anti-vacuum valves: To BS 6282-2.
- Type: Submit proposals.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Copper alloy.

467 ACCESSORIES - PIPELINE STRAINERS

Strainers shall be install in location to ensure commissioning can be completed as per this specification.

- Type: Simplex basket.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: To suit pipework and standard.
- Connections: To suit pipework.
- Integral accessories: Plugged connections for drain, air vent and differential pressure monitoring.

469 ACCESSORIES - SAFETY VALVES GENERAL

- Standard: To BS EN ISO 4126-1.
- Type: Double.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: To suit pipework and standard.
- Connections: To terminate 150mm from floor level adjacent to gulley position.

471 ACCESSORIES - TEST POINTS GENERAL

- Type: Self sealing.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: To suit pipework and standard.
- Connections: To suit pipework.

FABRICATION

Project Co. shall assist the manufacturer of any preformed or prefabricated pipework in the completion of their works to ensure a correct and timely installation.

510 FABRICATED ANCILLARIES

- Proposals: Submit.
- Content: Include the following:
  - Overall dimensions.
  - Shop fabrication drawings.

520 EXPANSION LOOPS, STAINLESS STEEL for HWS

- Standard: To BS EN 1057.
- Type: Formed bends from single pipe length.

530 EXPANSION LOOPS, STEEL FOR LTHW SYSTEMS

- Standard: To BS EN 10255.
- Type: Jointed welded fittings.

540 AIR BOTTLES GENERAL.

- Construction: A vertical extension from pipe.
  - Size: Bore of pipe.
  - Length: Submit proposals.
- Extension pipe: Copper with a manual vent cock located in an easily accessible position.

EXECUTION

Project Co. shall install services to building programme in a workman like manner and as specification.

610 INSTALLATION OF VALVES GENERALLY

- Installation: In accordance with BS 6683.
- Location: As drawings, specification and standards.
- Isolation and regulation valves: Provide at equipment and on sub circuits.
- Access: Locate valves so they can be readily operated and maintained. Locate next to equipment which is to be isolated.
- Connection to pipework: Fit with joints that suit the pipe material.

620 INSTALLATION OF DOUBLE REGULATING VALVES

- Locations: Provide 10 diameters of straight pipe upstream of valve and 5 diameters downstream.

640 INSTALLATION OF FLOW MEASUREMENT DEVICES

- Locations: Provide straight length of pipe upstream and downstream.

655 INSTALLATION OF THERMOSTATIC RADIATOR VALVES

- Locations: In areas which represent the space temperature, e.g. not behind curtains or enclosed in heating or radiator panels.

660 INSTALLATION OF VENT COCKS

- Discharge pipes: Provide at outlets of vent cocks.

665 INSTALLATION OF DISCHARGE CONNECTIONS

- Safety and relief valves: Terminate at a safe discharge point.
- Vent cocks: Terminate 150 mm above floor level.
- Air bottles: Terminate with air cock or needle valve in a convenient position.
- Automatic air vents: Terminate over a suitable gully or drain line in a visible location.

685 INSTALLATION OF COMBINED AIR AND DIRT SEPARATORS

- Locations: Fit with dirt drain at lowest point for removing dirt that sinks.

690 INSTALLATION OF EXPANSION LOOPS

- Location: As drawings and specification.
- Stress: Minimize.

695 INSTALLATION OF CONTROL COMPONENTS

- Locations: Project Co. shall liaise with the controls specialist to ensure all controls are supplied and installed as specification and drawings. This shall include all controls that have been free issued to equipment manufactures. Control valve selection shall show figures for the valve authority.
- Insulation: Submit details of proposed insulation method where control components are on insulated pipelines.
- Supports: Do not strain components.
- Access: Adequate for operation and maintenance.

COMPLETION

910 VALVE TESTS

- Standard: To BS EN 12266-1.

920 KEYS

- Tee handled short shank keys: Supply for valve spindle shanks.
  - Number: 10.
- Lever pattern keys: Supply for drain cocks.
  - Number: 10.

930 HOSE UNIONS

- Spares: Supply for drain cocks.
  - Number: 10.

Y12 MECHANICAL CLEANING AND CHEMICAL TREATMENT

EXECUTION

Project Co. shall provide a Method statement for cleaning and chemical treatment.

610 GENERALLY

- Water analysis: Analyse water samples before treatment.
- Preliminary checks: Before cleaning or chemical treatment, complete pressure tests.
- Disposal of waste: Neutralize waste products and dispose to drain.

620A FLUSHING OF HOT AND COLD WATER SYSTEMS

Standard: To BS 8558 and SHTN 2.
Installation checks: Thoroughly inspect pipework.
Drainage: Provide adequate drainage, preferably direct to manhole.

The use of stainless steel, PVC-U, PVC-C, PB or PE-X piping requires a leachate flushing regime to reduce the level of contaminants leaching from the piping material into the water. Details of this regime are given in SHTN 2. All parts in contact with the water must be non-dezincifiable. It is recommended that a specialist firms are engaged for the disinfecting and water sampling process. NOTE chlorine should NOT be used for the disinfection of stainless steel piping or membrane filters manufactured from polypropylene. Disinfection and subsequent flushing should be carried out as a continuous and consecutive operation without any intermediate delays.

630 FLUSHING OF HEATING AND CHILLED WATER SYSTEMS

- Flushing: In accordance with BSRIA AG 1/2001.1.
- Installation checks: Thoroughly inspect pipework.
- Drainage: Provide adequate drainage, preferably direct to manhole.

640 PURGING GAS PIPEWORK

- Standards: To IGE/UP/1 and IGE/UP/1A.

650 WATER TREATMENT FOR HOT AND COLD WATER SYSTEMS

- Standard: To BS 8558.
- Samples for analysis: Provide after flushing.

660 WATER TREATMENT FOR HEATING SYSTEMS

- Treatment: In accordance with BSRIA AG 2/93.
- Chemicals:
  - Corrosion inhibitors: Project Co. shall ensure all chemicals used in the cleaning and flushing of systems do not damage the pipe work or associated valves.
  - pH control: Submit proposals.
  - Scale inhibitors: Submit proposals.

670 WATER TREATMENT FOR CHILLED WATER SYSTEMS

- Treatment: In accordance with BSRIA AG 2/93.
- Chemicals:
  - Corrosion inhibitors: Project Co. shall ensure all chemicals used in the cleaning and flushing of systems do not damage the pipe work or associated valves.
  - pH control: Submit proposals.
  - Scale inhibitors: Submit proposals.

COMPLETION

910 WATER QUALITY TESTS

- Standard: To BS 8558.
- Samples: Submit samples for bacteriological analysis.
- Water temperature: Record the temperature of the water at each sampling point, at the time of taking the sample.
- Test results: Submit.

Y20 PUMPS
PRODUCTS

310A PUMP SELECTION

- General: Select pump at or near the most efficient part of the performance curve for required duty. Project Co. shall ensure that all pumps are installed in the correct orientation. Complete with isolation and non-return valves.

320 PUMPS GENERALLY

General safety standard: To BS EN 809.

- Electrical safety: To BS EN 60335-2-51.
- Dynamic balance: To BS ISO 2953.
- Test standards: To BS EN ISO 9906 and in accordance with BS EN ISO 5198.
- Belts and pulleys: To BS 3790.
- Rotodynamic pumps: To BS EN 1151-1 and -2.
- Connections:
  - Flanged, copper alloy and composite: To BS EN 1092-3.
  - Flanged, cast iron: To BS EN 1092-2.
  - Threaded: To BS 21 or BS EN 10226-1.

340 CLOSE COUPLED END SUCTION PUMPS GENERAL

- Standard: To BS EN 22858.
- Arrangement: As pump schedule.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Flow rate: As pump schedule.
- System resistance: As pump schedule.
- Motor and impeller speed (maximum): Submit proposals.
- Motor efficiency: IE2
- Electrical supply: As pump schedule.
- Speed control: Variable.
- Discharge branch: As pump schedule.
- Casing material: Submit proposals.
- Accessories: Pumps to be fitted with isolation and non-return valves and strainer.
- Connections: Flanged, cast iron, pumps to be mounted with anti-vibration mounts.

360 CLOSE COUPLED IN LINE PUMPS FOR HEATING and CHILLED WATER SYSTEM

- Arrangement: As pump schedule.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Flow rate: As pump schedule.
- System resistance: As pump schedule.
- Motor and impeller speed (maximum): Submit proposals.
- Motor efficiency: IE2
- Electrical supply: As Pump schedule.
- Speed control: Variable.
- Casing material: Grey cast iron to BS EN 1561.

- Accessories: Pumps to be fitted with isolation and non-return valves and strainer. Pump and fittings to be made from Non- dezincifiable material.
- Connections: Flanged. Pumps to be mounted with anti-vibration mounts .

360A CLOSE COUPLED IN LINE PUMPS FOR HOT WATER SERVICE

- Arrangement: As pump schedule.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Flow rate: As pump schedule.
- System resistance: As pump schedule.
- Motor and impeller speed (maximum): Submit proposals.
- Motor efficiency: IE2
- Electrical supply: As Pump schedule.
- Speed control: None
- Casing material: Bronze.
- Impeller: Stainless steel.
- Accessories: Pumps to be fitted with isolation and non-return valves and strainer.
- Connections: Flanged, cast iron, Pumps to be mounted with anti-vibration mounts

370 SUBMERSIBLE PUMPS

- Manufacturer: As pump schedule.
  - Product reference: As pump schedule.
- Material: Plastic.
- Flow rate: As pump schedule.
- System resistance: As pump schedule.
- Motor and impeller speed (maximum): As pump schedule.
- Electrical supply: As pump schedule.
- Accessories: Pumps to be fitted with isolation and non-return valves and filter.
- Connections: Threaded.

380 FUEL OIL TRANSFER PUMPS

- Application: Duty and/ or standby.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Flow rate: As pump schedule, pump to be suitable for type of fuel being used.
- System resistance: As pump schedule.
- Motor efficiency: IE2
- Electrical supply: As pump schedule.
- Accessories: Pumps to be fitted with isolation and non-return valves and filters. Pumps to have auto-changeover.
- Connections: Threaded, pumps to be mounted with anti-vibration mounts and fusible link lever type fire valve.

410A PRESSURISATION UNITS FOR LTHW SYSTEMS

- Standards:
  - Generally: To BS EN 13831.
  - Low temperature hot water heating: In accordance with BS 7074-2.
- General: Fully automatic pre-wired packaged unit on common base plate.

- Arrangement: The units shall be of the fully automatic type, pre-piped and pre-wired, and mounted on a common base frame. The units shall include a fully automatic make-up, mounted on anti-vibration mounting. Expansion vessels shall be of the number and size to suit the requirements of installation, and shall incorporate replaceable diaphragms. Units shall have an electrical control system, complete with integrated alarm, which is fail safe and linked to the heat source.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Static head: As schedule.
- Plant rating: As schedule.
- System water content: As schedule.
- Operating temperatures: As schedule.
- Operating pressure: As schedule.
- Electrical supply type: As schedule.
- Components: Microprocessor control with digital display and volt free contacts and audible Alarm. Pumps to BS 1452 and suitable for system, expansion vessel shall be welded steel stamped and tested with a heavy duty duty/EDPM diaphragm. Mains water break tank to water byelaws having an air gap. The integrated control panel shall have a indicating lights for each pump condition or status, run, hand, off, auto and tripped/fault. Pumps shall have auto changeover. Unit must be suitable for system temperatures.
- Accessories: Pressurisation units to be fitted with isolation and non-return valves.

410B PRESSURISATION UNITS FOR CHILLED WATER SYSTEMS

- Standards:
  - Generally: To BS EN 13831.
  - Chilled water and condenser water: In accordance with BS 7074-3.
- General: Fully automatic pre-wired packaged unit on common base plate.
- Arrangement: As Scheduled.
- Manufacturer: As schedule.
  - Product reference: As schedule.
- Static head: As schedule.
- Plant rating: As schedule.
- System water content: As schedule.
- Operating temperatures:
  - As schedule.
- Operating pressure: As schedule.
- Electrical supply type: As schedule.
- Components: Microprocessor control with digital display and volt free contacts and audible Alarm. Pumps to BS 1452 and suitable for system, expansion vessel shall be welded steel stamped and tested with a heavy duty duty/EDPM diaphragm. Mains water break tank to water byelaws having an air gap. The integrated control panel shall have a indicating lights for each pump condition or status, run, hand, off, auto and tripped/fault. Pumps shall have auto-changeover unit must be suitable for system Temperatures.
- Accessories: Pressurisation units to be fitted with isolation and non-return valves.

420 PRESSURE BOOSTER SETS WHOLESOME WATER

- Manufacturer: Project Co. choice
  - Product reference: As schedule. The booster set must be suitable for the system type. All connections to be 316 stainless steel. Pump sets shall incorporate a minimum of three pumps for domestic water supply all mounted on a single bed plate with necessary flanged suction and delivery manifold arrangements, anti-vibration mountings and remote/control panel showing pump status.
- Flow rate: As schedule.
- Maximum draw: As schedule.
- Working head: As schedule.
- Electrical supply type: As schedule.
- Operation: As schedule. The set point adjusted via the control panel. The control shall take care of adjustments to maintain constant pressure and optimum efficiency.
- Pumps:
  - Type: As schedule. The pumps shall be of the in-line vertical multi-stage design mounted on a common base frame provided with all the necessary fittings. Pumps shall be selected for silent operation with Integrated variable frequency drive motors. All parts of the pumps and valves that are in contact with the water must be of stainless steel.
  - Number: As schedule. Motor efficiency: IE2
- Control panel mounting: As schedule. The base shall be cast iron (class 30). The control of the booster set shall build on the master and slave principal where one pump is the master pump and where the other pumps act as slaves.
- Accessories: Pressure booster sets to be fitted with isolation, non-return and be skid mounted.

420A PRESSURE BOOSTER SETS: CWS

- Manufacturer: As schedule.
  - Product reference: As schedule. The booster set must be suitable for the system type. All connection to be 316 stainless steel. Pump sets shall incorporate a minimum of three pumps for domestic water supply all mounted on a single bed plate with necessary flanged suction and delivery manifold arrangements, anti-vibration mountings and remote/control panel showing pump status.
- Flow rate: As schedule.
- Maximum draw: As schedule.
- Working head: As schedule.
- Electrical supply type: As schedule.
- Operation: As schedule The set point adjusted via the control panel. The control shall take care of adjustments to maintain constant pressure and optimum efficiency.
- Pumps:
  - Type: As schedule. The pumps shall be of the in-line vertical multi-stage design mounted on a common base frame provided with all the necessary fittings. Pumps shall be selected for silent operation. All parts of the pumps and valves that are in contact with the water must be of stainless steel.
    Motor efficiency: IE2
    Control panel mounting: As schedule. The control of the booster set shall build on the master and slave principal where one pump is the master pump and where the other pumps act as slaves.

- Accessories: Pressure booster sets to be fitted with isolation, non-return and be skid mounted.

EXECUTION

610 INSTALLATION OF PUMPS GENERALLY

- Pipeline connections: Arrange to prevent transmission of pipeline forces to pump casing.
- Pressure gauge tappings: Provide in flow and return pipeline connections and in common suction and delivery pipeline.
- Brackets: Support pipeline mounted pumps on purpose made brackets lined with vibration absorbent material.
- Alignment: Align and balance to minimize vibration.
- Belt tension: Correctly tension drive belts.
- Access: Provide adequate space for service and maintenance.
- Identification plate: Engrave showing
  - manufacturer's name and address;
  - serial number;
  - duty and maximum head;
  - speed; and
  - electrical loading.

620 VIBRATION ISOLATION

- Flexible connections: As section Y11.
- Anti-vibration mountings: Submit proposals.

630 INSTALLING PRESSURISATION UNITS

- Location of expansion vessel: In the system return pipeline close to the heat source or chilled water unit.

COMPLETION

Project Co. shall provide a method statement for cleaning and chemical treatment. System pumps are not to be used for flushing. Also see section Y50

920 COMMISSIONING

- In-line pumps: Change impeller & motor if necessary.
- Test certificates and performance curves: Submit.

Y21 TANKS AND CISTERNS

PRODUCTS

Sectional tanks shall be installed and tested by the manufacturer
Each cistern shall be divided into two separate compartments; a full height partition shall be constructed from standard panels. Each compartment shall be treated as a separate cistern and shall be capable of working normally with one compartment empty. Ball valve boxes shall be provided on each cistern compartment and shall incorporate access panels in the top of each.

320 GLASS FIBRE REINFORCED TANKS AND CISTERNS: DOMESTIC COLD WATER

Bulk wholesome quality sectional water storage tanks and break tanks will be located within the basement of the hospital building. The tanks will store 100% of the total main hospital water storage. The tanks will be insulated and complete with raised ball valve housings, middle partitions, self-draining bases, flushing drain, overflows and all necessary connections to comply with Water Authority requirements. Separate connections will be made from the break tank header to the filtration plants. Separate connections will be made from the cold water storage tank header to the booster sets.

- Standard: To BS EN 13280.
  - Type: For wholesome water, To Scottish Water Byelaws, SHTM 2040 and BS 6700.
  - Class: To comply with current Scottish Water Byelaws, Byelaw 30 and BS 6700.
- Application: Cold water storage for domestic.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Capacity:
  - Maximum: As tanks and cisterns schedule.
  - Minimum: As tanks and cisterns schedule.
- Future requirement: As tanks and cisterns schedule.
- Maximum rate of filling and emptying: Refer to specification.
- Head fluctuations: Refer to specification.
- Cycles per day: Refer to specification.
- Water:
  - Quality: Potable.
  - Temperature: Refer to specification.
- Type and weight of float operated valve: As tanks and cisterns schedule.
- Manholes: 600 x 600 mm.
- Division plates: As tanks and cisterns scheduled.
- Baffle plates: As tanks and cisterns schedule.
- Weir plates: As tanks and cisterns scheduled.
- Limiting conditions: As tanks and cisterns schedule.
- Connections: As tanks and cisterns schedule.
- Support: As tanks and cisterns schedule.
- Inspection at factory: Not required.
- On site erection: By manufacturer.

- Accessories:
  - External access ladder;
  - Internal access ladder;
  - Level switches; and
  - Temperature probes. Hi/ Lo level and temperature Sensors to be BMS addressable.

360 TANK CONTENTS GAUGES: General

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Sight glass.
- Float level indicator: Hydrostatic dial type.

380 VENT PIPES

- Materials: Stainless Steel.
- Jointing: Compression or capillary.

EXECUTION

610 INSTALLING TANKS AND CISTERNS

- Moulded plastics: To BS 4213.
- Glass reinforced plastics: To BS EN 13280.
- Access: Allow for internal and external inspection and cleaning.

COMPLETION

910 CLEANING

- General: Clean out tanks and cisterns before site testing and commissioning.

Y24 TRACE HEATING TAPES

PRODUCTS

330 TRACE HEATING TAPE FOR PIPELINES ABOVE GROUND MAINS AND DOMESTIC WATER EXTERNAL TO BUILDING

- Manufacturer: Project Co. choice
  - Product reference: The heat tape shall automatically adjusts heat output in response to increasing or decreasing pipe temperature, controllers shall have a thermostat and a terminal block within a polycarbonate enclosure environmentally protected to IP66 and be suitable for wall or pipe mounting and have volt-free contacts for use with Building Management Systems.
- Application: Frost protection.
- Pipe material: Stainless steel/polyethylene.
- Tape: Self regulating.
- Electrical voltage: As schedule.
- Accessories: As schedule.

EXECUTION

Generally the trace heating tape shall be installed in such a way to prevent damage to the trace heating system or the services.

620 INSTALLING ELECTRIC SURFACE HEATING ON METAL SURFACES

- Installation: In accordance with BS 6351-3.

Y30 MECHANICAL THERMAL INSULATION
GENERAL

Project Co. shall ensure that the insulation does not interfere with fire sleeves and stopping. Project Co. shall co-ordinate the lagging with the trace heating installation to ensure correct operation of both.

110B INSULATION TO CONTROL HEAT LOSS FOR HOT WATER PIPELINES INTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: Phenolic foam, thermal conductivity 0.024 W/mK.
- Insulation thickness to BS 5422 (minimum): Copper and stainless steel pipelines, high emissivity, table 18 and increase thickness by one additional size.
  - Temperature of contents: 65°C.
- Protection: Not required.
- Accessories to be insulated: Insulation for valves and flanges.

110C INSULATION TO CONTROL HEAT LOSS FOR HOT WATER PIPELINES IN PLANTROOMS

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre pipe section, thermal conductivity 0.040 W/m·K.
- Insulation thickness to BS 5422 (minimum): Copper and Stainless steel pipelines, high emissivity, table 18.
  - Temperature of contents: 65°C.
- Protection: Sheet aluminium casing. The sheet aluminium casing shall be supplied and installed on pipework upto 2m above FFL in the plantroom.
- Accessories to be insulated: Insulation for valves and flanges.

120A INSULATION TO CONTROL CONDENSATION FOR COLD WATER PIPELINES EXTERNAL

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): Stainless Steel pipelines, high emissivity, table 6.
  - Temperature of contents: 10°C.
- Vapour barrier: Required.
- Protection: Polyisobutylene.
- Accessories to be insulated: Insulation for valves and flanges. See drawings for trace heating Requirements.

120B INSULATION TO CONTROL CONDENSATION FOR COLD WATER PIPELINES INTERNAL

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K. Insulation thickness to BS 5422 (minimum): Stainless Steel pipelines, high emissivity, table 6.
  - Temperature of contents: 10°C.
- Vapour barrier: Required.
- Protection: Not required.
- Accessories to be insulated: Insulation for valves and flanges.

120C INSULATION TO CONTROL CONDENSATION FOR COLD WATER PIPELINES IN PLANTROOMS

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): Stainless Steel pipelines, high emissivity, table 6.
  - Temperature of contents: 10°C.
- Vapour barrier: Required.
- Protection: Sheet aluminium casing.
- Accessories to be insulated: Insulation for valves and flanges.

130A INSULATION TO CONTROL HEAT LOSS FOR LOW TEMPERATURE HOT WATER HEATING PIPELINES EXTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre pipe section, thermal conductivity 0.040 W/m·K.
- Insulation thickness to BS 5422 (minimum): Copper and steel pipes, high emissivity, table 16 and increase thickness by one additional size.
  - Temperature of contents: 80°C.
- Protection: Polyisobutylene.
- Accessories to be insulated: Insulation for valves and flanges.

130B INSULATION TO CONTROL HEAT LOSS FOR LOW TEMPERATURE HOT WATER HEATING PIPELINES INTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: Phenolic foam, thermal conductivity 0.025 W/m·K.
- Insulation thickness to BS 5422 (minimum): Copper and steel pipes, high emissivity, table 16 and increase thickness by one additional size.
  - Temperature of contents: 80°C.
- Protection: Not required.
- Accessories to be insulated: Insulation for valves and flanges.

130C INSULATION TO CONTROL HEAT LOSS FOR LOW TEMPERATURE HOT WATER HEATING PIPELINES IN PLANTROOMS

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre pipe section, thermal conductivity 0.040 W/m·K.
- Insulation thickness to BS 5422 (minimum): Copper and steel pipes, high emissivity, table 16 and increase thickness by one additional size.
  - Temperature of contents: 80°C.
- Protection: Sheet aluminium casing. The sheet aluminium casing shall be supplied and installed on pipework upto 2m above FFL in the plantroom.
- Accessories to be insulated: Insulation for valves and flanges.

140A INSULATION TO CONTROL CONDENSATION FOR RAIN WATER PIPELINES ENERGY CENTRE & PLANTROOMS

- Standard: To BS 5422, section 7.
- Insulation materials: Mineral fibre pipe sections, thermal conductivity 0.033 W/m K.
- Insulation thickness to BS 5422 (minimum): Steel pipelines, high emissivity, table 6.
  - Temperature of contents: 5°C.
- Vapour barrier: Required.

- Protection: Sheet aluminium casing. The sheet aluminium casing shall be supplied and installed on pipework upto 2m above FFL in the plantroom.
- Accessories to be insulated: Insulation for valves and flanges. All surfaces to maintain vapour seal.

140B INSULATION TO CONTROL CONDENSATION FOR RAIN WATER PIPELINES INTERNAL

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): Steel pipelines, high emissivity, table 6.
  - Temperature of contents: 5°C.
- Vapour barrier: Required.
- Protection: Not required.
- Accessories to be insulated: Insulation for valves and flanges, All surfaces to maintain vapour seal.

145A INSULATION TO CONTROL HEAT GAIN FOR CHILLED WATER PIPELINES EXTERNAL

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): High emissivity, table 11.
  - Temperature of contents: 6°C.
- Vapour barrier: Required.
- Protection: Polyisobutylene.
- Accessories to be insulated: Insulation for valves and flanges.

145B INSULATION TO CONTROL HEAT GAIN FOR CHILLED WATER PIPELINES INTERNAL

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): High emissivity, table 11.
  - Temperature of contents: 6°C.
- Vapour barrier: Required.
- Protection: Not required.
- Accessories to be insulated: Insulation for valves and flanges.

145C INSULATION TO CONTROL HEAT GAIN FOR CHILLED WATER PIPELINES IN PLANTROOMS

- Standard: To BS 5422, section 7.
- Insulation materials: Phenolic foam, thermal conductivity 0.018 W/m·K.
- Insulation thickness to BS 5422 (minimum): High emissivity, table 11.
  - Temperature of contents: 6°C.
- Vapour barrier: Required.
- Protection: Sheet aluminium casing. The sheet aluminium casing shall be supplied and installed on pipework upto 2m above FFL in the plantroom.
- Accessories to be insulated: Insulation for valves and flanges.

150 INSULATION TO PROTECT AGAINST FREEZING FOR PIPELINES FOR EXPOSED PIPEWORK

- Standard: To BS 5422, section 11. Insulation materials: Mineral fibre pipe sections, thermal conductivity 0.033 W/m K.
- Insulation thickness to BS 5422 (minimum): Selected commercial and institutional conditions, table 29.
  - Specified conditions: See Y24 for trace heating requirements.
- Protection: Sheet aluminium casing.
- Accessories to be insulated: Insulation for valves and flanges.

160 INSULATION FOR CONDENSATION CONTROL ON DUCTWORK CARRYING CHILLED AIR IN PLANT ROOMS & RISERS

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre slabs, thermal conductivity 0.032 W/m·K at 0°C.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 14 for 13°C AHU's.
  - Minimum air temperature inside duct: 10°C.
  - Emissivity: Low.
- Vapour barrier: Required.
- Protection: Sheet aluminium casing for low level ductwork.
- Accessories to be insulated: All surfaces to maintain vapour seal.

160A INSULATION FOR CONDENSATION CONTROL ON DUCTWORK CARRYING CHILLED AIR EXTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre slabs, thermal conductivity 0.032 W/m·K at 0°C.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 14 for 13°C AHU's.
  - Minimum air temperature inside duct: 10°C.
  - Emissivity: Low.
- Vapour barrier: Required.
- Protection: Polyisobutylene.
- Accessories to be insulated: All surfaces to maintain vapour seal.

160B INSULATION FOR CONDENSATION CONTROL ON DUCTWORK CARRYING CHILLED AIR INTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: 13°C AHU's Phenolic foam, thermal conductivity 0.018 W/m·K and 18°C AHU's Mineral fibre slabs, thermal conductivity 0.035 W/m·K.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 13 for 13°C AHU's.
  - Minimum air temperature inside duct: 10°C.
  - Emissivity: Low.
- Vapour barrier: Required.
- Protection: Not required.
- Accessories to be insulated: All surfaces to maintain vapour seal.

170 INSULATION TO CONTROL HEAT LOSS FOR DUCTWORK CARRYING WARM AIR PLANTROOMS & RISERS

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre slabs, thermal conductivity 0.035 W/m·K.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 13 for 13°C AHU's.
  - Emissivity: Low.
- Protection: Sheet aluminium casing for Low level ductwork.
- Accessories to be insulated: Control and Fire dampers.

170A INSULATION TO CONTROL HEAT LOSS FOR DUCTWORK CARRYING WARM AIR EXTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: Mineral fibre slabs, thermal conductivity 0.035 W/m·K.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 13 for 13°C AHU's.
  - Emissivity: Low.
- Protection: Polyisobutylene.
- Accessories to be insulated: Control and Fire dampers.

170B INSULATION TO CONTROL HEAT LOSS FOR DUCTWORK CARRYING WARM AIR INTERNAL

- Standard: To BS 5422, section 8.
- Insulation materials: 13°C AHU's Phenolic foam, thermal conductivity 0.020 W/m·K and 18°C AHU's Mineral fibre slabs, thermal conductivity 0.035 W/m·K.
- Insulation thickness to BS 5422 (minimum): Table 12 for 18°C & Table 13 for 13°C AHU's.
  - Emissivity: Low.
- Protection: Not required.
- Accessories to be insulated: Control and Fire dampers.

180 INSULATION TO CONTROL HEAT LOSS FOR LOW TEMPERATURE HOT WATER HEAT EXCHANGERS, CYLINDERS AND BUFFER VESSELS FOR NON - PRE LAGGED

- Standard: To BS 5422, clause 8.
- Insulation materials: Mineral fibre slabs, thermal conductivity 0.040 W/m·K.
- Insulation thickness to BS 5422 (min): Copper & steel vessels, low emissivity, table 15.
  - Temperature of contents: 80°C
- Protection: Sheet aluminium casing.
- Accessories to be insulated: Cover plates and Removable access covers.

190A INSULATION FOR FLUES BOILERS, GENERATORS & CHP UNITS

- Insulation materials: Boiler flues to be twin walled complete with insulation by the manufacturer.
- Protection: See boiler and flue specification for further information.
- Accessories to be insulated: See boiler and flue specification for further information.

PRODUCTS

330 MINERAL FIBRE PIPE SECTION INSULATION GENERALLY
- Standard: To BS 3958-4.
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Recycled content: 50 % (minimum) to BS EN ISO 14021.
- Finish: Aluminium foil faced.

340 MINERAL FIBRE SLABS INSULATION GENERALLY
- Standard: To BS 3958-5.
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Form: Rigid slabs.
- Recycled content: Submit proposals.
- Finish: Aluminium foil faced.

360 PHENOLIC FOAM INSULATION GENERALLY
- Standard: To BS EN 13166.
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Form: Duct slab & pipe sections with zero ODP
- Finish: Aluminium.

380 VAPOUR BARRIER PERMEANCE
- Standard: To BS 5422, clause 5.6.

405 POLYISOBUTYLENE PROTECTION GENERALLY
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Colour: Submit proposals.

425 SHEET ALUMINIUM CASING PROTECTION GENERALLY
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Finish: Manufacturer's standard.

480 INSULATION FOR VALVES AND FLANGES GENERALLY
- Insulation materials: To match pipelines insulation.
  - Finish: To match pipelines finish.
  - Form: Removable and reusable preformed rigid covers.

495 INSULATION AT LOADBEARING PIPELINE SUPPORTS
- Hot pipelines up to 120°C: 300 mm length of high density phenolic foam.
- Hot pipelines above120°C: 300 mm length of calcium silicate.
- Cold pipelines: 300 mm length of high density phenolic foam.

EXECUTION

610 INSTALLATION GENERALLY

- Standard: In accordance with BS 5790.
- Timing: Insulate after installed system has been fully tested and joints proved sound.
- Insulation: Do not enclose adjacent units together.
- Clearance: Maintain between pipes.
- Finish: Neatly finish joints, corners, edges and overlaps.

625 INSTALLATION OF FOIL FACED MINERAL FIBRE INSULATION ON PIPELINES

- Joints: Close butt, seal with 50 mm wide class O tape on both longitudinal and circumferential joints.
- At fittings: Mitre. Secure with tape.
- Vapour seal: Tape exposed insulation membrane. Seal vapour barrier at pipe support with class O tape.

640 INSTALLATION OF PHENOLIC FOAM INSULATION ON PIPELINES

- Joints: Close butt, seal with 50 mm wide class '0' tape on both longitudinal and circumferential joints.
- At fittings: Mitre. Secure with tape.
- Vapour seal: Tape exposed insulation membrane. Seal vapour barrier at pipe support with class '0' tape.

660 INSTALLATION OF FOIL FACED MINERAL FIBRE INSULATION ON DUCTWORK

- Fixing to underside of ducting: Self adhesive stick pins. Further support with 0.7-1.0 x 50 mm mesh galvanized wire netting.
- Joints, pin penetrations, cut outs for test holes and supports: Seal with 100 mm wide class '0' foil tape.

690 INSTALLATION OF PHENOLIC FOAM INSULATION ON VESSELS

- Application: Install pre-formed segments or pre-slotted foil faced insulation around the diameter of the vessel. Lay with staggered joints.
- Joints: Seal joints and gaps around protrusions with jointing compound.
- Finish: Secure with aluminium banding.
- Access: Allow for removal of access covers.

710 INSTALLATION OF POLYISOBUTYLENE (PIB) PROTECTION

- Thickness (minimum): 0.8 mm.
- Application: Wrap sheeting with 50 mm overlap. Solvent weld joints.
- Finish: Secure with aluminium banding.

720 INSTALLATION OF SHEET ALUMINIUM PROTECTION

- Application: Form sheet to fit circumference of insulation with 50 mm longitudinal and circumferential overlaps. Secure overlaps with self tapping screws or rivets. Seal joints with grey sealant.
- Expansion: Make provision.

740 INSTALLATION AT VALVES AND FLANGES

- Application: Do not obstruct removal of nuts and bolts, or operation of valves.

750 INSTALLATION AT LOADBEARING PIPELINES SUPPORTS

- Application: Close butt to insulation.
- Joints: Seal with 100 mm wide class 'O' foil tape.
- Sleeve: Provide sheet metal protection sleeve.

755 INSTALLATION AT NON-LOADBEARING PIPELINES SUPPORTS

- Insulation: Carry through pipe support.

760 INSULATION NOT CARRIED THROUGH PIPELINES SUPPORTS

- Insulation at supports: Provide aluminium end caps.

770 INSULATION CARRIED THROUGH DUCTWORK SUPPORTS

- High density phenolic foam: Close butt to insulation.
- Sleeve: Provide sheet metal protective sleeve.

800 INSTALLING VAPOUR BARRIERS

- Integrity: Maintain throughout.

Y31 VIBRATION ISOLATING MOUNTINGS PRODUCTS

Project Co. shall ensure that building services plant and equipment are suitably isolated from the building structure in order to prevent the transmission of vibration. Reference shall be made to the specification and reports produced by the project Acoustic Consultant reports and specifications.

Project Co. shall comply with the guidance on the satisfactory magnitude of building vibration with respect to human response given in BS 6472. Project Co. shall comply with the following vibration limits detailed below:

a) Plant rooms on occupied floors 0.015 m/s2;
b) Plant rooms above and below occupied floor levels 0.050 m/s2; and
c) Remote plant rooms 0.100 m/s2

310 MOUNTINGS GENERALLY

- Criteria: Ensure that vibration generated by the engineering services is not transmitted to pipework, ductwork, the building and supporting structure.
- Overload capacity (minimum): 50%.
- Colour code: Identify for load and deflection rating.
- Marking: Label with load capacity.

320 SPRING ISOLATORS GENERALLY

- Type: Caged.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Colour code: Submit proposals.
- Load: Submit proposals.
- Deflection: Submit proposals.

330 COMPRESSION ISOLATORS GENERALLY

- Type: Spring.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Colour code: Submit proposals.
- Load: Submit proposals.
- Deflection: Submit proposals.

340 ISOLATION HANGERS GENERALLY

- Type: Spring and neoprene rubber.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice
- Colour code: Submit proposals.
- Load: Submit proposals.
- Deflection: Submit proposals.
- Drop rod misalignment capability: 20%.

350 INERTIA BASES GENERALLY

- Type: External isolator mounting brackets.
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Material: Welded steel channel perimeter frame.
- Reinforcing steelwork and mesh: Required.
- Thickness: To suit Equipment.

360 FLEXIBLE HOSES GENERALLY - NOT TO BE USED ON DOMESTIC WATER SERVICES

- Type: Generally flexible hoses shall not be used.
- Manufacturer: may submit an application for the use of flexible hoses in special circumstances.
  - Product reference: Submit proposals.
- Connections:
  - Rubber cored: Not required.
  - Stainless steel: Not required.

370 RUBBER BELLOWS GENERALLY

- Type: Tied.
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Material:
  - Liner: To suit service.
  - Reinforcement: Synthetic fibre.
  - Cover: Ethylene propylene diene monomer (EPDM) rubber.
- Connections: To suit service.

EXECUTION

610 CAST IN SITU BASES

- Supported equipment: Arrange equipment on base to distribute load evenly.

COMPLETION

910 DOCUMENTATION

- Operation and maintenance instructions: Submit.

Y32 MECHANICAL PLANT AND EQUIPMENT IDENTIFICATION

PRODUCTS

310 PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for pumps, booster sets and pressurization units.
- Manufacturer: Submit proposals
  - Product reference: Plates shall show
    Manufactures Name and address
    Serial Number and allocated Plant number on the schedule
    duty and Maximum head
    Speed
    Electrical Load.
- Information: Purpose and reference number.

310A PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for boilers & heat exchangers.
- Manufacturer: Project Co. choice
  - Product reference: Plates shall show
    Manufactures Name and address
    Serial Number and allocated plant number on the schedule
    Maximum Output
    Design Pressure.
- Information: Purpose and reference number.

310B PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for AHU's.
- Manufacturer: Submit proposals
  - Product reference: Plates shall show
    Manufactures Name and address
    Serial Number and allocated Plant number on the schedule
    Fan duty and speed
    Output for Heating and cooling coil
    Filter type and dirty pressure drop.
- Information: Purpose and reference number.

310C PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for Fans.
- Manufacturer: Submit proposals
  - Product reference: Plates shall show
    Manufactures name and address
    Fan model, serial number and allocated plant number on the schedule
    Design duty
    Fan speed
    Electrical details
    Direction of rotation.
- Information: Purpose and reference number.

310D PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for calorifiers and plate heat exchangers.
- Manufacturer: Submit proposals
  - Product reference: Plates shall show Manufactures name and address
  - Serial Number and allocated plant number on the schedule
  - Duty Operating Temperature & Pressure.
- Information: Purpose and reference number.

310E PLANT AND EQUIPMENT IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Metal plates for terminal heaters/coolers and fan coil units.
- Manufacturer: Submit proposals
  - Product reference: Plates shall show
    Manufactures Name and address
    Serial number and allocated plant number on the schedule
    Duty
    Operating temperature & pressure.
- Information: Purpose and reference number.

320 VALVE IDENTIFICATION LABELS

- Standard: To BS 1710.
- Type: Laminated plastics plates
- Manufacturer: Submit proposals
  - Product reference: Project Co. choice
- Information: Purpose and reference number.
- Colours: Basic and safety colour identification of associated system.

330 VALVE CHARTS AND SCHEMATICS

- Type: Plastic encapsulated.

EXECUTION

610 IDENTIFYING PIPEWORK

- Standards: To BS 1710.
- Identification type: Adhesive colour bands.
- Application of basic identification colour: To BS 1710 Or painted for gas and fuel lines.
- Safety colour identification: On or next to the colour bands.
- Information: Abbreviation of name and Colour bands as BS 1710 Appendix D.
- Direction of flow: Indication arrow and the word FLOW or the letter F and Indication arrow and the word RETURN or the letter R.

620 IDENTIFYING DUCTWORK

- Standard: To HVCA DW/144 Appendix B.
- Identification type: Self-adhesive plastics or transfers.
- Direction of flow: Equilateral triangle, 150 mm length of side, with one apex pointing in the direction of flow.
- Information: Space served by the duct and associated plant reference required.

630 INSTALLING PLANT AND EQUIPMENT IDENTIFICATION

- Fixing: Fix with adhesive to equipment.
- Location: On equipment.

640 INSTALLING VALVE IDENTIFICATION

- Fixing: Secure with tie wrap.

650 INSTALLING VALVE CHARTS AND SCHEMATICS

- Fixing: Plug and screw to wall.
- Location: Boiler house and plant rooms or Energy Centre as appropriate.

Y35 FLUES AND CHIMNEYS

PRODUCTS

310A METAL FLUES AND CHIMNEYS TWIN WALL STAINLESS STEEL FOR BOILERS, GENERATORS AND CHP UNITS.

- Standard: To BS 4076 or BS EN 1856-1.
- Manufacturer: Flue and chimneys to be erected by chimney/flue specialist. Adjoining sections shall be of a tight fit by means of a socket/bayonet type construction. All sections and joints shall have a fire rated seal throughout its construction including any sealant used. The flues, which will exit the Energy Centre and terminate at the appropriate height above ground level to comply with the requirements of the Clean Air Act. The flues will be supported by pre-fabricated steel structures which will incorporate all access platforms and ladders, etc, together with aircraft warning lights and lightning protection.
  - Product reference: Project Co. choice
- Construction: Twin wall flue with an outer band of stainless steel shall be provided at the joint of each section to aid the fire seal, structural integrity and continuous external appearance. All fastenings shall be stainless steel. The height of the flues shall comprise of the minimum amount of practical sections. Project Co's. flue specialist shall advise if draught stabilisers are required. Base connections to each flue shall be by easy swept bend into a tee piece. The tee piece shall be fitted with a removable end cap for cleaning and access to the flue. The flue shall be fitted with a drain point. The top of the flue shall have a tapered section to provide sufficient efflux velocity. A bird mesh guard shall also be fitted to each terminal. All supports/ structure for the flues shall be by the chimney specialist together with all necessary access platforms & ladders to install and maintain the flues. Submit calculations and details for the Structural Engineer's approval. The support structure shall be capable of being clad in accordance with the Architect's requirements.
- Insulation: Twin walled flues to be insulated with suitable grade of insulation material. Thickness to be calculated by the manufacture to give maximum flue performance.
- Material and finish: As Schedule. Stainless steel used in the construct of the flue shall be of a suitable grade to resist acid corrosion of the inner skin and provide suitable resistance to staining and weathering of the outer skin.
  - Colour: Stainless steel.
- Fittings: Suitable for Flue Specified. All flues shall be designed to provide lightning protection facilities in accordance with BS EN 62305. Lug connectors shall be provided on each flue for connection and to the requirements of the lightning specialist. .

EXECUTION

610 INSTALLING FLUES AND CHIMNEYS

- Joints and bends: Minimize number.
- Slope (maximum): 30° from the vertical.
- Joints: Install with sockets uppermost, fully supported and fixed securely with brackets supplied for the purpose. Do not locate joints within the depth of floors.
- Seals: Seal joints to provide a gas-tight installation.
- Expansion and contraction: Accommodate thermal movement.

- Fire safety: Locate a safe distance from combustible materials.
- Roof junction: Weatherproof. Fit terminal and flashings, collars, and the like.

COMPLETION

Flues shall have access doors, drain points and lightning protection.
The height of the flues shall be sufficient to avoid any interference with the hospital and not cause over cooling of the flue gases. Where flues are sited in close proximity to one another great care must be taken to avoid interference from other flue gases or back draught. Flues to be protected from damage during and following installation.

910 TESTING FLUES AND CHIMNEYS

- Standard: To BS EN 1859.
- Results: Submit.

920 ANALYSIS OF FLUE GASES

- Results: Submit.

Y50 MECHANICAL COMMISSIONING

EXECUTION

- Project Co. shall employ an independent commissioning engineer. The commissioning engineer shall be responsible for fully managing the commissioning process for the electrical and mechanical, public health, medical gases, life safety and communications Installations and shall carry out all necessary liaison with other Boards and specialist installers and compile the operation and maintenance manuals. Project Co. shall Pressure test all systems to this specification, TR/20 and the Institute of Hospital Engineers Guidance to Engineering Commissioning. The system shall not be insulated until pressure testing of the pipework is complete.

  Project Co. shall not use the system pumps for flushing any of the pipework systems. Project Co. shall ensure that the system has adequate connections to enable the correct flushing of the systems. Project Co. shall ensure the system is in a suitable condition for flushing to commence. e.g. removal of control valves. Strainers and stool pieces to be in place. The building services systems shall be commissioned by the commissioning engineer to meet the project objectives.

  Commissioning shall be completed in accordance with CIBSE commissioning Codes, and BSRIA guide 2/89.3. Remedial and defect work to the systems shall be completed and all polarity testing, phase sequence testing, loop impedance testing shall have been carried out before commissioning commences.

  The gas service shall be tested and commissioned to Scottish Gas Regulations and Institution of Gas Engineers publications. All work shall be carried out by a suitable qualified gas engineer. Copies of the engineer's registration certificate shall be attached to the test certificates. Project Co. shall issue a commissioning programme to all parties for review four weeks before the planed commencement of commissioning. this shall include a method statement. Progressive static testing will be witnessed by site engineer(s).

  Sufficient notice of testing shall be afforded to the site engineer to enable them to be present. Evidence will be required from the commissioning engineer that all services have been commissioned and are operating correctly.

  Room cooling capacities shall be tested on a department by department basis by introduction of temporary heat loads to prove the system design capabilities. This shall be carried out as part of the contract works. shall also carry out seasonal commissioning as detailed in BREEAM. Guidance, to ensure full system performance i.e. main cooling plant operation in the summer and heating plant in the winter. All checks and measurements of commissioning records shall be recorded in writing by the commissioning engineer as commissioning proceeds, together with appropriate comments.

610 COMMISSIONING PROGRAMME

- Generally: Submit before commissioning commences.
  - Notice (minimum): To be agreed with the Board.
- Commissioning manager: Submit details.

615 PERFORMANCE TESTING PROGRAMME

- Generally: Submit before performance testing commences.
  - Notice (minimum): 1 week.
- Performance testing manager: Submit details.

COMPLETION

O& M documentation shall be issued at least three months before completion of any part of the contract. The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.
Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

910 COMMISSIONING OF HOT AND COLD WATER SUPPLY SYSTEMS

- Commissioning: In accordance with BS 8558, BSRIA AG 2/89 and CIBSE Commissioning code W.
- Notice (minimum): 1 week.
- Equipment: Check and adjust operation of equipment, controls and safety devices.
- Outlets: Check operation of outlets for satisfactory rate of flow and temperature.

930 COMMISSIONING OF WATER HEATING SYSTEMS

- Commissioning: In accordance with BSRIA AG 2/89 and CIBSE Commissioning code W.
- Variable flow systems: In accordance with CIBSE Knowledge Services Commissioning variable flow pipework systems.
- Notice (minimum): 1 week.

940 COMMISSIONING OF BOILER PLANT

- Commissioning: In accordance with CIBSE Commissioning code B.
- Notice (minimum): 1 week.

950 COMMISSIONING OF CHILLED WATER SYSTEMS

- Commissioning: In accordance with BSRIA AG 2/89 and CIBSE Commissioning code W.
- Variable flow systems: In accordance with CIBSE Knowledge Services Commissioning variable flow pipework systems.
- Notice (minimum): 1 week.

960 COMMISSIONING OF REFRIGERATING SYSTEMS

- Commissioning: In accordance with CIBSE Commissioning code R.
- Notice (minimum): 1 week.

970 COMMISSIONING OF AIR DISTRIBUTION SYSTEMS

- Commissioning: in accordance with BSRIA AG 3/89 and CIBSE Commissioning code A
- Notice (minimum): 1 week.

980 COMMISSIONING OF CENTRAL CONTROLS AND BUILDING MANAGEMENT SYSTEMS

- Commissioning: In accordance with CIBSE Commissioning code C.
- Notice (minimum): 1 week.

985A PERFORMANCE TESTING

- General: Demonstrate the performance of the installations.
  - Guaranteed efficiency: Tolerances defined in this specification and schedules.
- Environmental tests: Carry out environmental testing. If necessary, use artificial loads to simulate operating conditions.
- Recorders: Supply and maintain portable seven day space temperature and relative humidity recorders, complete with charts and/or Board's proposals.
  - Number of recorders: To be agreed with the Board.

Reports: Submit.

990 INSPECTION AND TEST RECORDS

- Records for water systems: In accordance with BSRIA AG 2/89.
- Records for air systems: In accordance with BSRIA AG 3/89.
- Record sheets: Submit.
  - Number of copies: 3

995 DEMONSTRATIONS

- Running of plant: Run, maintain and supervise the installations under normal working conditions.
  - Duration: 4 weeks.
- Instruction: Instruct and demonstrate the purpose, function and operation of the installations.

996 SEASONAL COMMISSIONING

Seasonal commissioning of plant and systems shall be undertaken over the first 24 month period in accordance with the requirements of the BREEAM Assessment. Measurement and recording of criteria for thermal comfort (temperature and humidity where applicable), ventilation rates and effectiveness, lighting levels and controls, etc shall be carried out at three monthly intervals. A representative from the Hospital shall also give subjective feedback for consideration in the monitoring process.

997 OPERATING THEATRES

In standard operating theatres provide validation report in accordance with the relevant NHS documentation including demonstration of air velocities at the operation table position.

In UCV operating theatres provide validation reports and terminal challenge test in accordance with the relevant NHS documentation of air velocities access the room in accordance with SHTM 03-01 figure 6.

RHSC and DCN EDINBURGH
VENTILATION SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as “Project Co”.

To carry out the development of the design, The Specialist shall obtain the necessary supporting documentation.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

This specification relates to the Ventilation System serving the RHSC/DCN and associated Energy Centre.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include the following:-

- Ventilation System, including:-
    1. Kitchen extract equipment
    2. Fan coil units
    3. Local air conditioning systems
    4. Air ductwork and ancillaries
    5. Air handling units
    6. Fans
    7. Air filtration
    8. Heating and cooling coils

9. Heat recovery
10. Air treatment
11. Silencers and acoustic treatment
12. Air terminal devices

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- BMS and automatic control systems
- Insulation
- Louvres in external façade
- Kitchen canopies/hoods

4.0 INTERFACES AND DEMARCATIONS

The Ventilation Systems shall be provided as a complete working system serving the RHSC-DCH building.

Project Co. shall provide information to other parties for power supplies, controls and fire alarm system interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Ventilation System shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform to all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

6.0 DESIGN CRITERIA

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

External Design Conditions	
Winter	-6oC sat
Summer	26oC db 19oC wb
Sizing for refrigeration plant	30oC
LTHW Flow Temperature	80°C

LTHW Return Temperature	60°C
Primary Chilled Water Flow Temp	6°C
Secondary Chilled Water Return Temperature	12°C

For ventilation/air change rates used in the design, Project Co. shall refer to the ADB sheets.

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Specialist Installers. Project Co. shall liaise with other specialist parties as necessary to ensure that all interfaces and co-ordination between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist
- Other disciplines for co-ordination
- Fire Protect Systems specialist
- Kitchen Specialist

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of the Ventilation System.

8.0 SYSTEM DESCRIPTION

The mechanical ventilation and air conditioning systems shall comply with HVAC DW144, 154, 172, TR19, BS 5726 (updated) SHTM 03-01, and descriptions and requirements set out below.

8.1 Background to Ventilation and Air Conditioning Installations

The building is largely sealed with limited openable windows in order to control the internal environment within the spaces.

The building ventilation is based on a mixed mode solution where it permits, utilising openable windows together with mechanical vent and a peak lop cooling solution.

The Hospital shall be mechanically ventilated:-

- Throughout all internal rooms that have no access to natural ventilation
- Perimeter areas where mechanical ventilation is required for clinical reasons
- Perimeter areas where mechanical ventilation is required for operational and environmental control reasons
- Deep plan perimeter areas where necessary to assist the natural ventilation
- Ward areas throughout

The various departments to match their function shall be served by a number of ventilation air handling systems.

In general, each air handling system shall be served by packaged air-handling units containing all components necessary (e.g. fans, coils, filters, etc.) to provide the correct environmental control of those spaces/rooms served.

Fan coil units shall also be provided for comfort cooling in areas where there is a need for separation or where high heat gains make these a more appropriate choice of systems.

Various types of room are included within this project and are described elsewhere. These are:-

- Wards
- Isolation rooms
- Outpatient type departments
- Operating theatres
- Critical care departments
- Comfort cooled areas (e.g. diagnostic imaging)
- Catering facilities
- Safety cabinet extracts
- Computer rooms and data hub rooms

Fan Motors

All fan assemblies shall incorporate fan impeller and motors selected to provide the most energy efficient solution conforming to Section 6 regulations and shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

System Resistance

The carbon target of 80kg/m^2 per annum requires that, for example, system pressure loss is limited to reduce fan power.

The detailed design calculations for fan resistance have been based on assumed pressure drops through in-line components which are stated in the specification or equipment data sheets. ’s selection of components shall ensure that the pressure drop of a component does not exceed that assumed in the calculations. shall also take care in finally detailed the ductwork routes to avoid potential causes of high pressure drop that may have a detrimental effect on ultimate fan performance. Upon completion of ’s installation drawings shall recalculate the whole system pressure drop, including all components to verify that the design calculated pressure drop has not been exceeded. For the purposes of calculating the system resistances the following allowances have been made in the figures in the equipment schedules:

System performance

Project Co. shall supply and install services and equipment to perform as per specification.

Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Grille	25 Pa
Dampers	20 Pa
Heater Battery	20 Pa
Louvre	25 Pa
Plant Room Attenuator	50 Pa
Cross Talk Attenuator	25 Pa
Cowl	50 Pa
HEPA Filter	450 Pa

All rectangular radiused bends: r/w = 0.5
All circular radiused bends: r/d = 1

Where a particular manufacturer is specified, Project Co. shall include for that manufacturer.

Where considered appropriate, equivalent standard alternatives shall be offered for consideration.

This shall be done in a timely manner and Project Co. shall provide all details including but not limited to:

- Detailed description
- Cost comparison
- Technical comparison
- Thermal comfort comparison
- Carbon emission and energy usage comparison
- References to standards
- References to SHTM/HTMs

Completion

Project Co. shall protect the system from damage or interference during the works.

Project Co. shall test, and clean the system as per TR/19.

Project Co. shall submit O&M and record information via Zutec.

Project Co. defects and liability period shall be as the contract prelims.

940 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
  - Quantity: 2 sets.

U10 VENTILATION SYSTEMS

ALL AIR SYSTEMS

These shall be low velocity systems with air being distributed throughout the building in galvanised sheet steel ductwork via ceiling voids and riser duct spaces terminating in ceiling or wall diffusers as appropriate.

On full fresh air systems, heat recovery devices shall be provided, to exchange heat between exhausted extract air and incoming fresh air wherever significant energy savings can be achieved.

Generally, temperature control shall be by means of room or duct-mounted sensors which shall operate, via the automatic control system software the control valves on the hot water and chilled water to the heating and cooling coils respectively.

Areas shall be controlled in zones or as individual rooms as necessary to achieve the conditions required by the ADB Sheets.

Supply plants shall incorporate panel type coarse pre-filters followed by high efficiency bag filters. Absolute HEPA (high efficiency particulate air) terminal filters shall be provided only for 'ultra clean' areas such as UCV Theatres for Orthopaedic and Neurosurgical and isolation rooms. Some isolation rooms shall incorporate HEPA filters on the extract system.

Within relevant air handling units, blank sections shall be included for future provision of full humidity control, including humidification and dehumidification in critical care clinical areas, such operating theatres, recovery, radiology and MRI Scanner or wherever close control of humidity is required for the successful operation of sensitive equipment, e.g. computers, as advised by the ADB Sheets.

Air pressure regimes for theatre suites shall be designed in accordance with the guidance provided in SHTM 03-1 employing wall mounted pressure stabilisers.

Air volumes have been established by consideration of heat gains or losses and also the air change rate necessary for comfort and safety as appropriate for the activity carried out in each area. Relative air pressures between rooms shall be maintained to suit the activity concerned, by design of the supply and extract air volumes, and use of pressure relief equipment where necessary to prevent cross infection or transfer of unpleasant odours between areas, as required by the ADB sheets.

Heat recovery shall be provided between the supply and extract systems. The hospital ventilation systems shall be in accordance with SHTM 03-01 Ventilation in health care premises, DW 144 and DW 143.

The ventilation system including all AHU's, fan's, diffusers, dampers and grilles shall meet the design noise and vibration criteria.

The ventilation and cooling system shall be zoned with each air handling system being served by packaged air-handling units containing all components necessary (e.g. fans, coils, filters, etc.) to provide the correct environmental control of those spaces/rooms served.

The philosophy of the system is to provide energy efficient operation with areas of the hospital operating on a similar time and clinical nature being served from the same system, and to maintain a sensible level of availability, such that in the event of plant breakdown or maintenance, limited areas of ventilation are lost. Air handling plants shall have availability reinforced by the provision of duplicate motors or fans, which shall automatically changeover to maintain the ventilation requirements.

Project Co. shall take care in finally co-ordinating the ductwork routes to avoid potential causes of high pressure drop that will have a detrimental effect on ultimate fan performance.

All ventilation controls shall be capable of being fully interrogated by the building management system through the independent network protocol.

WARDS

The ventilation systems serving ward areas shall provide treated air to internal spaces, clinical spaces and make-up air for sanitary accommodation.

Make up air for en suite WC accommodation shall be introduced directly into the associated bedroom at suitable temperature to maintain the required space temperatures.

Air shall be extracted from spaces by either the clean or dirty extract systems as appropriate. Heat recovery shall be provided between the supply and extract systems. The type of recovery system employed shall depend on the area being served. Refer to system drawings and schedules for details.

The ventilation plant shall use different facades of the plantroom for intake and exhaust air via vertical wall louvres. This strategy will avoid short circuiting or contamination of the supply air and also meet the BREEAM requirement for separation. Project Co. shall exercise caution when locating any other extracts or gas scavenging exhaust to ensure the supply intakes are not contaminated.

ISOLATION ROOMS

Each lobbied isolation room shall be provided with its own dedicated ventilation system in line with SHBN 04.

Each system ventilation plant shall filter, heat and cool the air and supply it to the room lobby at the required temperature, as dictated by a sensor in the bedroom.

Air shall be transferred to the room via a wall mounted pressure stabiliser and then extracted from the suite via the bedroom and en suite WC, and ducted by fire-clad ductwork to a dedicated extract fan in the plantroom.

Each extract fan unit shall comprise of an isolation damper and a centrifugal cased extract fan, with the motor located out of the air stream, and the exhaust duct shall discharge 3.0 metres above roof level. Were it is not possible to achieve a safe discharge height of 3.0 metres above roof level. The extract air shall be HEPA filtered through 'safe change' filter units in the plantroom before being discharged to atmosphere with all other ventilation exhausts.

Due to the small size of the plants, heat recovery is not considered viable and shall therefore not be provided.

Isolations rooms supply air terminals shall be capable of having terminal HEPA filters fitted at some future date. The air handling unit fan shall be capable of overcoming the additional resistance imposed by the HEPA filter by a simple speed change on the motor inverter.

OUTPATIENT TYPE DEPARTMENTS

The ventilation systems serving outpatient areas shall provide heated air to internal spaces, clinical spaces and make-up air for sanitary accommodation.

Radiant panels shall generally be installed to individual spaces to provide independent control of heating and comfort cooled fresh air for cooling requirements.

Air shall be extracted by clean and dirty extract systems.

Heat recovery shall be provided between the supply and extract systems.

OPERATING THEATRES

Each operating theatre shall be provided with a dedicated ventilation system.

Each system ventilation plant shall filter, heat and cool the air and supply it to the suite of rooms, and be arranged to allow individual temperature set point adjustment with this indicated on the associated surgeon's theatre panel.

The pressure regimes between the spaces in each theatre suite shall be maintained by a combination of supply and extract rates to each space, and pressure stabilisers located in the walls.

Heat recovery shall be provided between the supply and extract systems. Out of hours setback shall be provided by reducing the air volumes and temperature set points.

In theatres with a requirement for Ultra Clean Ventilation (UCV), a specialist shall be employed to undertake the provision of the UCV canopy in accordance with SHTM 03-01.

Ancillary areas associated with the Operating Theatre department shall be served from a dedicated plant.

CRITICAL CARE DEPARTMENTS

Critical care departments such as ITU/HDU shall be provided with dedicated ventilation systems.

The supply air ventilation plant shall heat and cool the air as required by the control system to provide the correct condition in the various rooms/zones.

Final temperature control to the spaces shall be achieved by terminal reheaters controlled from user adjustable sensors within each space. Heater batteries shall be located wherever possible in plant areas, but where heaters can only be provided in the ceiling void of the occupied space they shall be located away from patient occupied spaces, i.e. bed spaces.

Heat recovery shall be provided between the supply and extract systems.

COMFORT COOLED AREAS

Departments where space temperature control is required, such as the Emergency Centre, Diagnostic Imaging, etc. cooling shall be provided by treated air to clinical spaces and spaces with high equipment gains.

The department shall be arranged in a number of zones to suit the control requirements, varying heat gains and use of the spaces.

Particular areas that have high-density heat gains shall be provided with terminal cooling in the form of fan coil units to achieve the required space conditions.

The supply air ventilation plant shall heat or cool the air as required by the control system to provide the correct condition in the various rooms/zones.

All AHU's and fans shall be suitable for hospital application.

SAFETY CABINET EXTRACT SYSTEMS

The Laboratories shall be served by separate extract systems serving the general areas whilst extracts from safety cabinets shall be handled by individual contaminated extract systems.

The design of the general extract system shall be co-ordinated with the associated supply system and contaminated extracts to maintain suitable pressure levels.

QUENCH PIPES

The Quench pipes serving the MRI machines shall be installed by in accordance with a design and specification produced by the MRI supplier/installer. The route of the pipes shall be as shown on the drawings and they shall be insulated and terminate in accordance with the recommendations given by the MRI supplier/installer. The Quench pipes are required to be continuous and therefore the pipe structure and insulation shall maintain the required 2 hour fire integrity.

130 MECHANICAL SUPPLY VENTILATION SYSTEM

Supply air from central air handling plant shall be delivered through the ductwork systems to the areas served, and discharged via ceiling mounted diffusers.

Supply and extract air handling plants shall be of a packaged construction with a double skin casing complete with thermal/acoustic insulation material between the two skins. Units shall house filters, coils, fans and motorised inlet dampers, etc. Heat recovery devices and humidifiers shall also be incorporated where required. External fan motors shall be provided to all units with some units types having twin motors.

All AHU's and fans shall be suitable for hospital application.

- Location of plant: Various locations throughout the building.
- Type of system: Multizone, constant volume.
- External air intake terminals: Architectural louvres.
- Air filters: In air handling units, as section U81.
- Accessories: As schedule.
- Heat recovery: In air handling units, as section U81/U85.
- Air handling units: As section U81and schedules.
  - Fabrication: Construction, as section U81.
- Supply fans: As schedule.
- Acoustic treatment: Rectangular silencer, as section U87.
- Air ductwork and ancillaries: Ductwork, Fire rated and smoke extract ductwork and fittings as section U80.
  - Accessories: Dampers, fire and smoke, metal ductwork, as section U80.
- Thermal insulation on supply air ductwork: As section Y30.
- Vibration isolation mountings: Spring isolators, as section Y31.
- Reheat batteries: As schedules and drawings.
- Room supply air terminal devices: Grilles and diffusers as specified.
- Controls: All ventilation controls must be capable of being fully interrogated by the building management system through the independent network protocol.
- Completion:

  - Identification of ductwork and equipment: As section Y32.
  - Testing and commissioning:
  - Ductwork pressure testing, as section U80;
  - Air distribution system commissioning, as section Y50; and
  - Performance testing, as section Y50.

140 MECHANICAL EXTRACT VENTILATION SYSTEM

Extract air from the area concerned shall be drawn through a ductwork system to extract fans in the roof plantrooms for discharge to atmosphere, or returned to the air handling plant for recirculation.

- Room extract air terminal devices: As drawings.
- Air ductwork and ancillaries: Fire rated and smoke extract ductwork and fittings, as section U80 and Smoke extract ductwork, as section U80:
  - Accessories: Dampers, fire and smoke, metal ductwork, as section U80 and Flexible ductwork, as section U80.
- Thermal insulation on extract air ductwork: As specified.
- Vibration isolation mountings: Spring isolators, as section Y31.
- Heat recovery: Plate recuperator, as section U85 or thermal wheel, as section U85 depending on AHU type.
- Acoustic treatment: Rectangular silencer, as section U87.
- Extract fans: The extract fan shall have twin motors depending of fan type.
- External exhaust air terminals: Architectural louvres
- Controls: All ventilation controls must be capable of being fully interrogated by the building management system through the independent network protocol.
- Completion:

  - Identification of ductwork and equipment: As section Y32.
  - Testing and commissioning:
  - Ductwork pressure testing, as section U80;
  - Air distribution system commissioning, as section Y50; and
  - Performance testing, as section Y50.

150 TOILET EXTRACT VENTILATION SYSTEM

Potentially contaminated dirty air extract systems shall be discharged at, or above, roof level.

Dirty extract shall be provided to extract air from toilets, bathrooms, cleaners' rooms and dirty utility areas. Extract plants shall be separate extract fan units.

Air shall be extracted via grilles in the individual rooms and ducted by galvanised sheet steel ductwork similar to that provided for the general supply and extract systems to extract fans in the plantrooms. Make up air shall be via the main ventilation system.

Separate dirty extract units shall be manufactured heavy gauge aluzinc corrosion resistant steel. The general construction is to Class A leakage.

The fan unit shall be supplied complete with all manufacture control accessories to be fully integrated into the BMS.

The fan unit shall be provided with an integrated commissioning/speed control to accurately commission the system. The commissioning set up facility directly controls the integrated speed control/frequency inverter.

Heat recovery shall be used for the larger dirty extract systems.

Where toilets or bathrooms are in isolated positions, not convenient to central ducted systems, small units operated by light switch control shall be used

- Room extract air terminal devices: Air transfer grilles and diffusers, as specification.

- Air ductwork and ancillaries: Sheet metal ductwork and fittings, circular, as section U80 and Sheet metal ductwork and fittings, rectangular, as section U80:
  - Accessories: Dampers, fire and smoke, metal ductwork, as section U80 and Flexible ductwork, as section U80.
- Thermal insulation on extract air ductwork: Not required
- Vibration isolation mountings: Spring isolators, as section Y31.
- Acoustic treatment: Circular silencer, as section U87 and Rectangular silencer, as section U87.
- Extract fans: Twin Toilet extract fans run and standby, as section U82.
- External exhaust air terminals: Architectural louvres.
- Controls: All ventilation controls must be capable of being fully interrogated by the building management system through the independent network protocol.
- Completion:

  - Identification of ductwork and equipment: As section Y32.
  - Testing and commissioning:
  - Ductwork pressure testing, *as section U80;*
  - Air distribution system commissioning, as section Y50; and
  - Performance testing, as section Y50.

160 KITCHEN EXTRACT VENTILATION SYSTEM

Ventilation to the central catering areas shall be provided to deal with the requirements on the cooking equipment to reduce odours and limit temperatures within the space.
Contaminated air extract systems shall be discharged at, or above, the roof level at high velocity as appropriate.

Ventilation make-up air shall be provided to balance the extracted air.

There shall no recovery from kitchen hood extract due to the difficulties with grease laden air.

The kitchen canopies shall be supplied and installed by the kitchen specialist and do not form part of these works. Project Co. shall liaise with the kitchen specialist, so as to agree requirements. All the main kitchen extract hoods to be the capture/entrainment type. This type of canopy entrains the contaminant air by supplying fresh air over the kitchen island. This shall reduce extract air flow rates and hence save energy. The hoods and supply air shall also have a set back position when the kitchen is not in use. This shall reduce air flows when the kitchen is not in use and reduce energy consumption

- Air ductwork and ancillaries: Fire rated and smoke extract ductwork and fittings, as section U80. All kitchen extract systems to DW172:
  - Accessories: All kitchen hood extract ductwork to be fire rated.
- Thermal insulation on extract air ductwork: Not required.
- Vibration isolation mountings: Spring isolators, as section Y31.
- Acoustic treatment: Specialist to examine.

- Extract fans: Centrifugal belt driven, as section U82.
- Completion:

  - Identification of ductwork and equipment: As section Y32.
  - Testing and commissioning:
  - Ductwork pressure testing, as section U80;
  - Air distribution system commissioning, as section Y50; and
  - Performance testing, as section Y50.

EXECUTION

Project Co. shall ensure all works shall be done in a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

All supply and extract ventilation systems shall be clearly labelled. The label shall identify both the AHU and the area that it serves. The lettering shall be at least 50 mm high and be mounted in an easily visible place near the fan of the unit. Any sub-systems and the principal branch ducts shall be similarly labelled. The direction of air flow shall be clearly marked on all main and branch ducts.

630 INSTALLING DUCTWORK ON AIR HANDLING UNITS

- Air discharge: Connect ductwork to allow air to straighten as it leaves the air handling unit.

U41 FAN COIL UNITS

310 FAN COIL UNITS

Fan coil units shall be complete with dedicated controls enabling temperatures to be varied within each treated space. The units shall, where applicable, include heating. The controls shall comprise local room mounted temperature sensor/controller operating 2-port electrically operated valves in response to user inputs to raise or lower the room temperatures.

All Fan coil unit motors shall be fitted with built in Thermal overload protection.

- Performance: To BS 4856.
- Manufacturer: choice
  - Product reference: Project Co. to provide technical proposals.
- Project Co. shall examine all layout drawings, schematics and schedules, in order to ascertain duties and required temperatures.
- Fan speed: Low.
- Fan motors: EC type with a Specific Fan Power less than 0.8 watts per litre/second
- Noise levels: As fan coil schedule.
- Electrical supply type: As fan coil schedule.
- Casings: As manufacturer's standard for application.
- Mounting: As manufacturer's standard for application.
- Finish: As manufacturer's standard for application.
- Ductwork connections: Installer to provide proposals.
- Access: Provide access to filter, fan and motor, valves and controls.
- Drip tray:
  - Position: Under coil, and under control valve where fitted.
  - Material: Corrosion resistant.
  - Condensation: Insulate external faces to prevent.
- Controls: All ventilation controls must be capable of being fully interrogated by the building management system through the independent network protocol.
- Accessories: As Fan coil schedule.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

610 FAN COIL UNIT DRAIN LINE

- Drain connections: Connect drain line flush with bottom of drip tray.
- Drain line: To discharge via a suitable dry type trap.

U60 LOCAL AND ROOM AIR CONDITIONING SYSTEMS

GENERAL

Generally ventilation and comfort cooling shall be from central systems. Where this is not possible because of the remoteness of the area from the main plant, the particular use of the space, or high cooling loads, local systems shall be used. Project Co. shall ensure that these systems are installed to the same high standard as the main system.

PRODUCTS

All elements of the work shall be in accordance with the requirements of current legislation, regulations and industry standards. The installation shall also comply with relevant British Standards. Project Co. shall provide working drawings for the installation and issue them for comment before work commences.

340 COMPUTER ROOM AIR CONDITIONING UNITS (CRAC)

The main core server room air-conditioning systems shall be feed from the main chilled water system. Computer rooms shall each be provided with independent system via dedicated secondary chilled water circuits having their own plate heat exchangers and circulating pumps.

CRACs shall be floor standing 'downflow' type and must be capable of being fully interrogated by the building management system through the independent network protocol.

To comply with these directives appropriate national & harmonised standards have been applied. These are listed on the Declaration of Conformity, supplied with each product.

Unit cabinets shall be manufactured from galvanised sheet steel coated with epoxy baked powder paint to provide a durable finish. Internal strength and rigidity shall be provided by a welded space frame constructed of channel profile folded steel. Cabinets shall be lined internally with fire resistant 20mm foam (UL94 V0) for thermal and acoustic insulation. Cabinets shall meet the Hospital acoustic and vibration requirements. The cabinet doors are full height, hinged and key lock secured. Door arrangement shall allow flexible door opening/removal for improved access. Doors shall have rubberised door seals reduce sound breakout and eradicate leakage.

The units shall have large surface area coil(s) to optimise airflow and heat transfer, manufactured from refrigeration quality copper tubes with mechanically bonded aluminium fins.

Fins shall be coated with a non-stick acrylic film to provide additional corrosion protection and efficient surface water removal for improved performance.

Coil headers shall be circuited to ensure low water pressure drops. The cooling coils shall be mounted over a full width stainless steel condensate tray. Chilled water flow shall be via a factory fitted 3 port modulating control valve.

All coils shall be Factory pressure tested to 20Bar.

Fans shall be backward curved impellers, direct drive centrifugal fan assemblies with integral rotor mounted motor which is statically and dynamically balanced for quiet operation. Designed for high corrosion resistance, the impellers are laser welded aluminium with galvanised rotor and die cast aluminium EC power module. An inbuilt EC fan control module shall allow the fan to modulate from 15-100%.

Filters shall be 97mm pleated disposable panel filters in a rigid frame. Conform to BS EN 779-G4.

Access and removal from unit front. An adjustable diaphragm pressure switch fitted across the filter assembly shall monitor pressure drop which shall initiate a filter dirty alarm.

The control panel shall have fan motor contactors and overloads, transformer, sub circuit protection, volt free contacts, mains and inter-connecting terminals. The panel shall be fitted within the cabinet and be hinged for easy access to other components within the unit. The electrical control panels shall be wired to the latest European standards and codes of practice.

To ensure complete unit isolation of the electrical panel during adjustment and maintenance a door interlocking isolator is provided as standard.

Units shall be fitted with the microprocessor controller which shall have a real time clock and a communication port plus networking and Bac Net BMS connections. A backlit LCD door mounted display keypad assembly shall be fitted to view the unit status and allow operator adjustment.

The condensate pump shall have a reservoir with a capacity of 5 l/m at a head of 10.8m.
Leak detection tape suitable for sensing water droplets shall be supplied loose for remote mounting on site.

- to provide technical proposals.
- Arrangement: Vertical.
- Casing: Steel frame with acoustically lined steel panels.
- Finish: Manufacturer's standard.
  - Colour: Manufacturer's standard.
- Controls: All controls must be capable of being fully interrogated by the building management system through the independent network protocol.

Each server room shall be provided with the following:

• Room sensible cooling capacity	32 kW
• Number of units (N+I)	3- No.
• Sensible cooling capacity per unit	16 kW
• Sensible Heat Ratio	1.0
• Chilled water temperatures at unit	Flow 6°C Return 12°C
• Chilled water flow rate per unit	0.635 litres/second

- Maximum coil/valve pressure drop 60 kPa
- Inlet air design conditions 22°C 50% RH
- Nominal air flow per unit 3.75 m³/s

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

U80 AIR DUCTWORK AND ANCILLARIES

During installation the ductwork shall be installed to a PDI (Protection, Delivery & Installation) as defined in the HVCA (2005) TR/19 – Guide to good practice: internal cleanliness of ventilation systems'.

A Specialist Cleaning Operation shall be performed on all ductwork systems installed serving Clinical Areas, in accordance with the guidelines of Section 9 – Verification of Cleanliness, HVCA TR/19.

The cleanliness of the ductwork installation shall be confirmed and documented by means of the post clean verification test procedure outlined in Section 9.5 of HVCA (2005 TR/19).

300 CLASSIFICATION

Ductwork shall be classified as described in Table 1 of DW/144, as follows:-

- Plantroom and main riser ductwork: Class B
- Distribution ductwork at each floor Class: A

The ductwork installer shall clearly indicate on the manufacturing and installation drawings the classification of the ductwork proposed.

All ductwork shall meet the leakage criteria given in the Building Regulations Section 6 which requires it to meet the requirements of HVCA DW/143.

10%, chosen at random, of Class B ductwork shall be selected by the Board for testing.

Ductwork branch connections shall be shoe type as fig 106 in DW144, spigot type branches shall not be acceptable.

Project Co. shall ensure that sufficient dampers are provided to regulate and balance the system. Dampers on grilles or diffusers shall be used only for balancing of external air distribution devices in a common branch. All dampers shall be sufficiently rigid to prevent vibration within the systems, when absorbing the additional available pressure of the system.

PRODUCTS

A specialist ductwork manufacturer/ installer shall be employed by to fabricate install and test a range of ductwork that shall be used for general ventilation, air conditioning or comfort cooling.

305 DAMPERS, FIRE AND SMOKE, METAL DUCTWORK

The ductwork system shall be provided with fire dampers in locations corresponding to the appropriate fire separation barriers. Actuation of the dampers shall be in accordance with SHTM81 Fire Code, and the Fire Consultants Strategy Report, subject to the separation performance of the barrier.

Where actuation of the damper is via the fire alarm system the damper shall be motorised to facilitate re-opening after testing of the fire alarm system. Dampers utilising fusible link operation only shall be provided with local mechanical indicator on the side of the fire damper. Dampers with motorised operation shall be monitored via a separate electronic remote monitoring system.

Fire dampers shall be fitted with the correct installation frame and supports.

Fire rated ductwork shall be utilised where the use of fire dampers is inappropriate.

The smoke damper control panel must be capable of being fully interrogated by the building management system through the independent network protocol.

Smoke control dampers shall be provided in the positions as indicated on the drawings and shall be suitable for mounting in the horizontal or vertical plane. They shall be certified by the manufacturer to have been tested to the temperature time curve of BS ISO 10294, for a period of 4 hours with a classification of ES 240 in the fully closed position with power off.

Smoke control dampers shall have factory fitted installation frames to HVCA 10.1.83 specification and shall allow for all additional framing, supports and bracing securing the damper to the structures, to the satisfaction of the Building Control Officer.

All smoke control dampers shall be supplied with a factory fitted actuator, complete with integral micro switches and controlled mechanical fail safe operation of not more than 20 seconds.

The totally enclosed precise movement with British Standard 5588: Part 9999: 1999 should be held in the open position by means of a thermally actuated device set to operate at approximately 74 °C. Automatic smoke and fire control dampers are fire rated dampers as they are held in the reset (Open) position by a thermally actuated device.

The totally enclosed precise movement opposed blade drive shall be positioned out of airstream for protection against damage, be hard wearing and free running.

The control mode/damper connection shall be by means of the drive interface mechanism, which shall be totally independent of the ductwork.

Automatic smoke release dampers with their appropriate control modes shall have spring fail-safe open operation.

Project Co. shall be responsible for allocating a unique reference number to each damper per system and produce a schedule for the purposes of carrying out the inspection and testing of all installed smoke/fire dampers. Upon completion of the tests, the certificates, with the schedule must be issued confirming that all dampers have been inspected and function correctly in accordance with the manufacturer's data sheets. The ductwork installer shall allow for subsequent demonstration of all fire/smoke dampers to a witnessing party. Access door requirements as DW144 Appendix M require unique numbers to be identified on the fire damper and also on installation / record drawings, damper control graphics and within a schedule to be included in the O& M instructions.

Project Co. shall be responsible for ensuring the mechanical inspection and testing of all smoke/fire dampers installed on the contract is carried out with the smoke damper control specialist testing and in attendance same time. Upon completion of the tests, the certificates must be issued for confirming that all the dampers have been inspected and that they function correctly in accordance with the manufacturer's data sheets.

The dampers shall comply to Class A and B of Eurovent Document 2/2 and Test Procedures for Classes A, B and C of HVCA Ductwork Specification DW144.

305A DAMPERS, FIRE AND SMOKE, METAL DUCTWORK

The slam shut curtain fire dampers shall have a stainless steel folding curtain having unbroken movable joints, stainless steel constant tension closure springs for positive closure and stainless steel peripheral gasketing.

The self resettable, latching removable release mechanism cassette, shall ensure the closure of the stainless steel curtain under full fire conditions. The housing shall be galvanised steel fully welded spigotted type casing suitable for square, rectangular, circular or flat oval connections.

The spigotted casing with continuously welded corners and spigot connections makes these dampers suitable for inclusion into air distribution systems to the test methods of
Eurovent Class A, B & C and HVCA Ductwork specification DW144.

- Standard: To BS EN 1366-2.
- Type: Multi-blade.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Material: Stainless steel.
- Accessories: External visual indication of fire damper blade position.
- Fusible links fusing temperature: 72°C.

310 DAMPERS, NON-RETURN

Non return dampers shall be installed as shown on the drawings. They shall automatically shut of individual sections of an air conditioning system.

The damper shall be selected for the type of system (constant or variable volume).

- Standard: To BS EN 1751.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Leakage through closed blades: Class 0.
- Casing leakage: Project Co. to submit proposals.
- Pressure: Project Co. to submit proposals.
- Material: Galvanized sheet steel frame and aluminium blades.

330 DAMPERS, SHUT OFF

Shut of dampers shall be suitable for air conditioning and ventilation systems requiring air control and low closed blade leakage characteristics. For standard low/medium pressure and velocity systems.

Air control and system balancing shut-off dampers shall comprising of stainless steel aerodynamic blades with synthetic trailing edge blade seals, synthetic blade end bearings and stainless steel top and side spring tempered flexible gasketing. Dampers to have a maximum closed blade leakage of 27 l/s at 1000 Pa when measured on a 1000mm wide x 1000mm high damper. Housed in a galvanised mild steel frame having integral peripheral flanges.

- Standard: To BS EN 1751.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Leakage through closed blades: to submit proposals.
- Casing leakage: to submit proposals.
- Pressure: to submit proposals.
- Setting: to submit proposals.
- Material: Galvanized sheet steel.
- Control method: Electric and electronic.

340 FLEXIBLE DUCTWORK

Flexible ductwork shall not be used in runs that are more than 1.0m. Fixed ductwork shall terminate not less than 450mm from terminal equipment. Actual lengths of flexible ductwork when fully extended shall not exceed 125% of the connection distance.

Where the flexible ductwork is to be insulated, this shall be factory applied of a type approved for the application and to the thermal conductivity equivalent to the adjacent thermal insulation, and shall be Class O fire rated.

- Standard: To HVCA DW/144.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Material: As specification U10.

370 PRESSURE STABILISERS

Pressure control flaps/pressure stabilisers are to be installed as shown on drawings. The flap/stabiliser shall accurately control the differential air pressure between adjacent rooms, and the blades close fully as soon as the pressure differential drops below the required level. This diverts the airflow to pass through an open door forcing back airborne contamination.

The damper shall come with a Standard Finish: RAL9010 powder coated white with antimicrobial protection as standard.

Bearings shall be stainless steel ball roller type sealed for life ball bearings. Pressure Control Range shall be 3 - 50 Pa with a setting accuracy of +/- 1 Pa. Where required the flap/pressure stabilisers shall come complete with fire/fire smoke damper.

The fire/smoke damper shall be standard smoke/fire damper integrity tested to BS EN 1366 for 245 minutes - ES classification (ES245).The fire/smoke damper shall be enclose in a case with the flap/stabiliser as one unit and the entire case shall be powder coated white with antimicrobial protection as standard. The fire damper must be compatible and be capable of being controlled by the fire damper control panel/system.

- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Material: Stainless steel flap and adjustable balance weight assembly.
- Wall mounting casings material: to submit proposals.
- Control pressure of balance weight: to submit proposals.

380 ACCESS DOORS

An access panel shall be provided adjacent to all items of in-line equipment that require either regular servicing or intermittent access.

Access doors shall not generally be less than 450 mm long by the full width of the duct on sizes up to 450 mm wide. For ductwork sizes up to 600 mm wide, access door shall not be less than 450 mm x 450mm clear opening. Ductwork sizes for 600 mm-900 mm shall have not less than 600 mm x 450 mm access doors. For ducts with longest dimensions below 300 mm Level 2 access doors DW/144 Table 25 shall apply. For ductwork with sides longer than 900mm access door sizes shall be agreed with . Where man access into ductwork is possible then the supports and fixing shall be suitable to support the weight of an occupant and tools. Access doors shall be installed adjacent to all coils and batteries for inspection and cleaning.

Access and inspection opening locations shall be in accordance with Part 7 of DW/144 and suitable to comply with the requirements of TR/19 with the exception of above and the following.

All doors shall be fitted with rust-resistant quick release fasteners and those in the riser shafts shall be supplied with an approved retaining device fixed to door and frame. Access doors shall be capable of withstanding the respective system test pressures referred to in Table 1 of DW/144.

All access doors are to be pre-insulated and shall be constructed and installed in such a manner that the internal face of the duct and door is maintained when fixed. On insulated services all access doors shall be fitted with raised stools which shall be equal to the depth of the insulation. For tender purposes assume insulation thickness of 38 mm. All insulation finishes shall be extended to the neck size of the access door with the access doorframe returns exposed on the surface of the insulation finish.

Ductwork test holes shall be required to be drilled in the locations recommended in SHTM 2025/03-01 (Commissioning) and identified by the commissioning engineer. Test holes shall be drilled and located in accordance with the requirements of BSRIA Application Guide 3/89 Section C3.2 at the positions confirmed by in situ marking or marked up ductwork drawings. Each test hole to be sealed with a top hat grommet. Locations shall not be limited to those described.

Access doors, panels and covers other than those regarded as standard practice (see DW/144) shall be marked on the manufacturers drawings issued for comment or noted below or in other sections of this specification, including type to be used.

Details of large access openings shall be agreed and shall be:-

Fitted in readily accessible locations and suitable for the purpose.

Provided to the sizes, requirements and positions recommended in DW/144 and this specification and on the drawings, utilising suitable proprietary products, which meet the relevant pressure classifications. Provided adjacent to duct mounted filters, cooling coils, fans, heating coils, humidifiers, and all dampers including hand fire and smoke dampers to facilitate easy cleaning and maintenance.

For air-conditioning (A.C) systems access doors provided for Level 3 access and for other ventilation systems Level 2 access is provided all as indicated on DW/144 Table 25.

Access doors shall be sealed, to ensure an airtight seal with a soft EDPM full-face gasket secured to the ductwork with an approved adhesive. Fire rated to match the standard of ductwork in which they are installed. Insulated in all thermally insulated ductwork to match the insulation value of the associated lagging and maintain the vapour barrier.

FABRICATION

Ductwork used for general ventilation system (including air-conditioning and comfort cooling) shall be manufactured from sheet steel and may be rectangular, circular or flat oval as indicated on the scheme design drawings. Ductwork constructed from an alternative material shall be agreed with and clearly indicated on the scheme drawings. Ductwork, shall generally be constructed from zinc coated Steel as described in DW/144.

The specialist ductwork manufacturer/installer shall be responsible for:-

Reviewing associated Architects and Structural Engineers drawings to confirm routes, availability of supports etc. Site measuring built structures to confirm suitability of routes, co-ordination (with the structure).

Provision of manufacturing/installation and builderswork drawings associated with the ductwork system.

Provision of support details and proposed locations. This shall be via manufacturing drawings and mark-ups on Architectural/Structural engineers' scheme drawings.
Co-ordination and installation of all ductwork components not directly supplied by the ductwork manufacturer/ installer.

Manufacture and supply of all ductwork, and associated components. Installation, air leakage testing, and component operation testing of the ductwork systems and their associated equipment. Preparation of as-fitted ductwork drawings - issued as electronic copy and hard copy at a scale of 1:50 or 1:25.

All the forgoing responsibilities shall be co-ordinated and integrated within the agreed programme of installation.

520 FIRE RATED AND SMOKE EXTRACT DUCTWORK AND FITTINGS

Where indicated on the scheme drawings or where passing through fire rated rooms/enclosures, ductwork shall be of fire rated construction equal to the room/enclosure through which it passes, in accordance with the Fire Consultant's Strategy Report and NHS Fire Code SHTM 81. Project Co. shall review the fire strategy and architects drawings.

The location of the fire enclosing structures and their value (in hours) are indicated on the Architects drawings.

The ductwork shall be constructed as a complete system to provide the rated protection for stability, integrity and insulation when tested in accordance with SHTM 81 and BS. Any components within the system shall maintain the overall integrity in accordance with the test procedures.

Where ductwork services penetrate fire rated walls and cavity barriers, the penetrations shall be sealed after installation by using a proprietary fire sleeve/sealant as manufactured by specialists.

The ductwork systems shall be fire stopped where appropriate. Where plastic ductwork is specified the ductwork manufacturer/installer shall supply and fit to ductwork intumescent sleeves for to finish too.

The ductwork shall be constructed as a complete system to provide the rated protection for stability, integrity and insulation when tested in accordance with BS476 Part 24. Any components within the system shall maintain the overall integrity in accordance with the test procedures.

All fire rated ductwork shall be constructed and installed by a specialist supplier who shall certificate the complete system to the approval of the Local Authority Building Control Officer.

The standard of fire stopping shall give greater or equal fire resistance as the construction through which the service penetrates. Where sheet steel or rolled steel section sealing flanges are required the ductwork manufacturer/installater shall provide them.
Cleanliness and leak tests shall be as main ductwork section.

- Standard: To HVCA DW/144.
- Fire resistance to BS 476-24: As this specification.
  - Stability: To meet room requirements.
  - Integrity: To meet room requirements.
  - Insulation: To meet room requirements.
- Accessories:
  - Materials: Compatible with ductwork.
  - Finish: Match ductwork.

530 PLASTICS DUCTWORK AND FITTINGS, CIRCULAR (No plastic ductwork shall be used without prior written agreement of)

- Standard: To HVCA DW/154.
- Environmental conditions for plastics ductwork: As drawings.
- Material: As drawings.
- Regulating dampers: As drawings.
- Flexible joint connections: Fit on fan inlets and outlets and at building expansion joints.
- Hangers and supports
  - Strength requirements: To BS EN 12236.
- Access openings: As required.

550 SHEET METAL DUCTWORK AND FITTINGS, CIRCULAR

Standard components shall be used wherever practical. Circular ductwork supports shall be as Figures 65 (drop rod studding only) or 66(DW/144).

- Standards: To HVCA DW/144, BS EN 1506 and BS EN 12237.
- Air leakage testing: As classification requirement.
- Special installations: Not applicable.
- Material: Suitable for system and as drawings.
- Construction: Spirally wound.
- Regulating dampers:
  - Balancing type: Suitable for system and as drawings.
  - Operation: Suitable for system.
  - Material: Suitable for system.
- Flexible joint connections: Fit on fan inlets and outlets and at building expansion joints.
- Hangers and supports
  - Strength requirements: To BS EN 12236.
- Access openings:
  - Function:
  - Inspection;
  - Cleaning; and
  - Maintenance.
  - Sizes: As DW 144 and Part U10.

560 SHEET METAL DUCTWORK AND FITTINGS, RECTANGULAR

Any duct with an aspect ratio greater than 4:1 shall be supplied with a central splitter. For all slide-on flange systems ventilation with bolted corners, joints on all systems to be further secured with intermediary fastenings to the Manufacturer's recommendations. Only full girth stiffeners shall be used. Dimpling, self-tapping screws and piercing screws shall not be used as fasteners on ductwork. Turning vanes shall be double skinned as (DW/144) and attached to ductwork using guide rails as indicated in DW/144. Access doors are required in accordance with HVCA guide TR/19 Tables 2 and 3.

The ductwork manufacturer/installer may use radius bends as Figure 29 (DW/144) as an alternative, enabling turning vanes to be omitted.

- Standards: To HVCA DW/144 and BS EN 1505.
- Air leakage testing: As classification requirement.
- Special installations: Not applicable.
- Material: Suitable for system and as drawing.
- Regulating dampers:
  - Balancing type: Suitable for system and as drawing.
  - Operation: Suitable for system.
  - Material: Suitable for system.
- Flexible joint connections: Fit on fan inlets and outlets and at building expansion joints.
- Hangers and supports
  - Strength requirements: To BS EN 12236.
- Access openings:
  - Function:
  - Inspection;
  - Cleaning; and
  - Maintenance.
  - Sizes: As DW 144 and Part U10.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

610 GENERAL

- Cut edges on ductwork, flanges and supports: Smooth and burr free.

630 INSTALLATION OF PLASTICS DUCTWORK

- Standard: To HVCA DW/154.
  - Other requirements: Generally no plastic ductwork shall be used.
- Installing flexible joint connections: Minimize pressure drop.

640 INSTALLATION OF SHEET METAL DUCTWORK

- Standard: To HVCA DW/144.
  - Other requirements: Hangers and supports shall be generally as Table 15 of DW/144 or with manufacturer's proprietary devices with the following qualifications.
- Installing flexible joint connections: Minimize pressure drop.

650 SUPPORT OF AIR TERMINALS UNITS IN CEILING GRIDS

- Standard: To HVCA DW/144.
- Special supports: Supply and extract grille/ diffuser supports shall be as manufacturers detail.
- Position: is responsible for the co-ordination of the reflected ceiling
- layout.

670 DUCTWORK SUPPORT FOR VAPOUR SEAL CONTINUITY

- Method of support:

The horizontal bearers shall be steel profiled section such as Uni-strut or equal and approved proprietary support system. The horizontal bearers shall have a galvanised finish, and plastic end-caps. A medium density Class O rubber or EDPM gasket shall be provided between the ductwork and the support bearer horizontal surface. The gasket shall not fully deform under load. The ductwork shall calculate the support system selected. Horizontal supports shall not be used as secondary supports for additional services without prior approval. Calculations shall include the additional loads imposed by the agreed additional services. Multi-tier ductwork runs shall all be supported on individual horizontal bearers with single length common support rods sized for the combined load of all ducts being supported. Multiple section drop rods shall not be accepted. Insulated ducts with vapour sealing shall be provided with a timber or composite material isolating member between ductwork and the support bearer, either horizontally (rectangular ductwork) or circumferential (circular/flat oval ductwork).

The isolating member shall be the full depth of the insulation and shall have the insulation finish/vapour seal and where applicable encasement extended without a break at least 1 duct width or diameter either side of the support channel. The isolation rubber gasket shall also be included. The ductwork Project Co. shall include an allowance for insulation on all faces of ductwork when setting out in horizontal and vertical planes. Supports or bearers, that interrupt or penetrate the insulation or vapour seal, shall not be accepted.

The ductwork manufacturer/installer shall provide a standard sheet of support details cross referenced with the manufacturing and installation drawings. Where cantilever brackets or other special forms of support are indicated, they shall be structurally strong enough to take the load and to transfer the imposed load to the building structure. The Board may require design and supporting calculations for comment prior to manufacture.

690 DRAINAGE OF DUCTWORK

- Ductwork: Install to drain entrained moisture
- Joints: Lap to minimize moisture leakage.

700 TEST HOLES

- Location: In accordance with CIBSE Commissioning Code Series A and HVCA DW/144.

710 CONTROLS AND SENSING EQUIPMENT

- Install sensors and test points to suit specialist control and sensing equipment.

720 WEATHERPROOFING

- All duct work penetrations to the external shall be weathered by

740 INSTALLING CONTROL EQUIPMENT

- General: Fit sensors, damper motors and other control equipment.

760 ACCESS TO DAMPERS FOR RESETTING AND MAINTENANCE

- Location: Provide access to damper mechanisms on fire dampers; smoke dampers; combined smoke and fire dampers; and volume control dampers through access doors, false ceilings etc. Where more than one fire damper is installed in a frame provide access to all fire dampers.
- Fire links: Provide access so that they can be replaced.

790 DUCTWORK CLEANLINESS & VERIFICATION

Refer to section U80 above.

915 CLEANING OF KITCHEN EXTRACT SYSTEMS

- Cleaning: In accordance with HVCA TR/19.
- Method of test: Deposit thickness test.
- Method of cleaning: As section 7 TR/19.
- Post clean verification of cleanliness report: Submit.

940 AIR LEAKAGE TESTING OF MEDIUM PRESSURE DUCTWORK

- Standard: To HVCA DW/144.
- Procedure: Carry out tests. Submit report.
- Extent: Random testing of 10% maximum of the ductwork system.
- Test pressure: To HVCA DW/144.
- Documentation: Submit calculations used to arrive at the allowable loss for the section to be tested.

950 AIR LEAKAGE TESTING OF PLANT ITEMS

- Standard: To HVCA DW/144.
- Procedure: Include in-line plant with certificate of conformity for pressure class and air leakage classification for system under test.

960 FIRE DAMPER SPARES

- Fusible links: Supply spares.
  - Quantity: 4 no full set of spares.

U81 AIR HANDLING UNITS

PRODUCTS

Packaged supply and extract air handling plants shall be provided as defined in the schedules of equipment and as indicated on the drawings, or as defined further in this specification.

The air handling unit and fan supplier shall select the internal components of the plants, such that the overall system resistance does not result in system fan power being excessive.

Project Co. shall obtain from his proposed supplier calculations to demonstrate that the Building Regulation requirements for Specific Fan Power, etc are being met along with his technical submission.

All items of the AHU plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol.

310 AIR HANDLING UNITS

The supply and extract air handling plant shall in all respects comply and align with the requirements and recommendation detailed within the Health Technical Memoranda, in particular SHTM03-01 and 08-01, except where specifically noted within this specification.

The AHU shall be arranged so that the majority of items are under positive pressure. Any item of plant requiring a drain shall be on the positive pressure side of the fan.

AHU Plants shall be of a rigid, air tight, assembly and constructed in unitary form or consist of standard modular components, assembled to ensure even airflow throughout plant with no by-passing of active components. Sealing strips shall be provided between all component parts. Factory joints shall be fully tightened and all necessary sealing strips, nuts, bolts and washers etc. being provided for site made joints. The units shall be suitable for operating against closed dampers, i.e.no flow conditions during normal and fire operation. Panels penetrated by service pipes, electrical cables etc. shall be sealed together with all joints having an air leakage integrity at design pressure which is not less than the integrity of the associated ductwork systems.

The units shall incorporate gradual change section pieces between sections to minimise pressure drops, with spacing of components to manufacturer's recommendations to ensure satisfactory operation at each stage and allow access for inspection, cleaning and maintenance. The inside surfaces shall have smooth and easy clean finishes free from structural projection. The location of fan motor, fan belts, filters etc. shall be as detailed in the schedules and on the drawings.

All modular constructed plants shall be provided with purpose made base frames. Bases shall be of sufficient height to accommodate drainage traps from dehumidifiers, humidifiers etc. All plants shall be provided with sufficient access panels/doors and viewing windows to allow maintenance and repairs to be carried out. Coils used in air-handling units shall be rated in accordance with EN 1216. On larger plants, split/multiple coils shall be used.

Construction shall be such as to withstand maximum fan static pressure without deformation and with panel deflection of not more than 1/120 of maximum panel dimension under operating conditions.

Energy recovery shall be via a plate heat exchanger or thermal wheel (fitted with a purge sector), depending on the type of unit. Cleaning access shall be required to both sides of any energy-recovery device.

Where units incorporate recuperators or cooling coils, the internal surfaces of the units liable to be affected by any free water produced shall be protected by anti-corrosion paint (white). Such units shall have adequate drain trays to collect water; the drain trays shall be extended, or other means of collection shall be provided to ensure the removal of any water deposited or condensed in adjacent sections.

Trays collecting cooled water shall be insulated to prevent condensation on the outer surface. All the surfaces/features shall be suitable to withstand regular cleaning with a water solution containing 5ppm chlorine, such as 316 stainless steel. Internal sloping surfaces for humidifier and cooling coil sections to fall to drain. All drains shall be provided with glass U-traps suitable to withstand twice the negative/positive pressure produced by the fan and have a screwed access for cleaning and filling as indicated in TM13 (Minimising the risk of Legionnaire's disease) and as further defined in Department of Health Guidance Notes. Certified type test performance certificates shall be issued on completion of plant testing for fans, coils, filters and electric motors etc. Fire rating type test certificates shall be provided for filters. Individual pressure testing certificates shall be provided for coils. Specific fan performance curves shall be provided and these are to relate to the unit ESP with clean filters.

All wiring from fans is to be taken through the unit casing and a 2 metre tail left for connecting to inverters supplied by the controls specialist

Viewing ports and internal illumination shall be fitted to facilitate routine inspection of the AHU. Viewing ports should be at a convenient height so that temporary ladders are not required. Internal illumination should be provided by fittings to at least IP55 rating. Fittings shall be positioned so that they provide both illumination for inspection and task lighting. All of the lights in a unit shall be operated by a single switch.

320 AIR CONTROL DAMPERS

Motorised low leakage shut off dampers shall be located immediately behind the intake and discharge of each supply and extract system respectively. They shall be of the opposed blade type, opening through a full 90^{o} and must close automatically in the event of power failure or plant shutdown to prevent any reversal of the system airflow.
A manually operated isolating damper should be installed between the main AHU and its distribution system to enable the unit to be isolated when cleaning is in progress.

- Function: Shut off.
  - Damper position: Dampers are to be rigid, with square connections fitted with end and edge seals of a flexible material and with minimal play in linkages. The leakage on shut-off should be less than 2%.
- Damper control: Motorized.
- Type: Multi-blade damper, opposed blade.
- Material: Manufacturer's standard.
- Ancillaries Locking device and Position indicator.

330 FILTERS

Filters shall be securely housed and sealed in well-fitting frames that minimise air by pass.

Mounting frames shall be designed so that the air flow pushes the filter into its housing to help minimise air bypass. Mounting frames shall be capable of being withdrawn so that the filter can be changed without having to reach into the unit.

Neither the filter media, nor any material used in the construction of the filters, shall be capable of sustaining combustion

All filters sections shall be provided with direct reading dial type gauges marked with clean and dirty sectors to visually show filter status.

A complete spare set of filters shall be provided at handover. Filter grades to be as schedule.

Refer to section U83.

340 HEAT RECOVERY

Heat recovery shall be provided to air handling units and be of the type as indicated on the schedules.
Refer to section U85.

350 HUMIDIFIERS

Space for future installation of packaged steam humidifiers shall be provided to air handling units as indicated on the schedules.

Space shall be included within Operating Theatre air handling units for the provision of humidification in the future.

Refer to section U86.

360 PREHEATERS

Duties as schedule.

Frost coils shall be plain tube without fins, where practical. Where this is not practical coils with fins at 6mm spacing shall be used.

Refer to section U84.

370 COOLING COILS

Duties as schedule.

Refer to section U84.

380 REHEATER

Duties as schedule.

Refer to Section U84.

390 FANS

Fans shall be selected to limit the total system (supply and extract fans) specific fan power, as described in the 'Non-Domestic Heating, Cooling and Ventilation Compliance Guide – Section 10. External system resistances for air handling units and fans are given in the schedule.

Fans shall be centrifugal fans with backward curved aerofoil blades, and give an efficiency of not less than 78%.

Fans shall be positioned to 'blow through' the central plant so that the cooling coil and humidifier drains shall be under positive pressure.

Where a centrifugal fan is located with an open intake, the clear distance between the suction opening and the nearest wall should be not less than half the diameter of the inlet. If two fans with free inlets are positioned within the same chamber, their adjacent suction openings should be at least 1 diameter apart.

Fan/s and drive/s shall be provided with mounting frames and isolation mountings.

Motors shall be located externally. On externally driven fans, drive connection or belts shall be provided with airtight seals to prevent leakage. Externally driven fans shall have suitable anti-vibration mountings and frame with flexible connections to the fan sections of the unit. Fan-drive trains, whether supply or extract, should be easily visible without the need to remove access covers.

Fan drives shall be protected by a mesh guard.

All fans shall be controlled by inverter speed control drives supplied by the controls specialist.

Fans shall be capable of being direct start with fixed speed and manual operation in the event of a computer control system failure or software fault.

Particularly attention shall be given to critical care systems serving operating suites, high dependency care units of any type, isolation facilities, laboratories and pharmaceutical production suites in this regard.

- Performance: In accordance with BS 6583.
- Type of fan: Centrifugal.
- Motor mounting: The fan motor shall be external to the air stream.
- Blow through units: Arrange section to allow uniform velocity profile downstream.

Refer to Section U82.

405 ATTENUATOR

Where attenuators are located within the air handling unit they shall be the same cross sectional area as the AHU and have diffusion plenums as necessary.

Cleaning access should be provided at both ends of any attenuator unit.

Attenuators shall meet SHTM03-01 and this specification.

The splitters shall be fitted with 0.8mm mild steel galvanised bull nosed entries and exits to reduce pressure drop.

Normally the attenuators shall be installed with the splitters in the vertical plane. However in some circumstances, i.e. close to a vertical bend it may be necessary to install with splitters horizontally. In those circumstances the splitters shall be suitably stiffened to prevent flexing and restriction of the airway.

Refer to section U87.

FABRICATION

Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme

Project Co. shall protect the AHU's from damage or interference during the works.

The AHU's shall be blanked off when delivered to site to prevent dust entering the AHU.

Project Co. shall include for the services of the manufacturer's skilled services engineers to start up, test and check all the AHU's and controls. This shall include all tests to prove that all the AHU equipment is working with and responding to the clients BMS network and head end. The units when commissioned shall be "Set Up" to give maximum efficiency. The AHU's shall be witnessed by the Board before the plant shall be accepted from . Project Co. shall allow for instruction of the clients representative on the working of the equipment.

510 AIR HANDLING UNIT CASING CONSTRUCTION

Supply air handling plants shall be of a packaged construction with a double skin casing, complete with thermal/acoustic insulation material between the two skins. Units shall house filters, coils, fans and motorised inlet dampers, etc. Heat recovery devices shall also be incorporated as detailed in the AHU schedule.

Vibration isolation shall be provided in the form of spring anti-vibration mountings located under fan and motor bases with flexible connections from the fan discharge and the adjoining ductwork.

- Standard: To BS EN 1886.
- Details: is to submit shop drawings and details of dimensions and weight for review.
- Thermal performance of casing, to form part of the technical submission.
- Acoustic insulation of casing: To form part of the technical submission.
- Fire protection: To form part of the technical submission.
- Material: To form part of the technical submission.
  - Finish: To form part of the technical submission.
- Air handling unit feet: Base to suit AHU and depth of drain and pipe fall.
- is to allow space to integrate the BMS controls into each air handling unit, to serve that respective AHU, and liase with the BMS Specialist to integrate this.

520 AIR HANDLING UNIT ACCESS

- General: Provide access openings and covers complete, including opening devices.
- Seal: To prevent excessive air leakage.
- Seal durability: For normal maintenance operations over at least 10 years.
- Access type: Access doors/hatches as appropriate and where indicated on the drawings or called for in SHTMs, shall be provided complete with handles, locks, keys and latches to the same standards of construction and finish of unit.

Where the unit is large enough for a maintenance engineer to enter the unit, facilities for local maintenance isolation of equipment and opening the doors from the inside shall be provided.

The doors should be large enough e.g. 500mm minimum to allow easy access. Items requiring infrequent access such as attenuators may be via bolted on, lift off panels All doors/panels shall be provided with seals to prevent air leakage.

Access shall be provided as a minimum to fan chamber, dampers, filters, humidifiers and both sides of heating and cooling coils.

Internal lights and double glazed viewing windows shall be provided into fan chambers,
either sides of coils, humidifier sections and where indicated on the drawings. Fittings within the unit shall be to IP55 standard and be operated from a single switch. Additionally, the cladding shall be capable of being easily removed as is necessary to obtain access for necessary inspection and maintenance and also for removal of large items of equipment.

All necessary items shall be assembled by means of nuts, bolts, anti-vibration lock washers equal and approved quick release fastenings. Access doors on isolation suite extract shall have biohazard label affixed.

EXECUTION

610 COMPONENT ASSEMBLY

- Sealing: Provide gaskets between air handling unit sections to prevent air leakage from casing.
- Site drilling of air handling unit: Not permitted.

620A ACCESS

- Access space: Position air handling units to allow space for maintenance and access.

Access for servicing shall be as manufacture recommendations and drawings.

As a minimum Project Co. shall allow the width of the AHU for withdrawing the coils.

630 COIL INSTALLATION GENERALLY

- Venting and draining: Set out pipeline to and from the coils to allow venting and draining of the coils and piping.
- Support: Do not support pipeline and valves on coil connections.
- Access: Allow space to inspect and maintain the coils on both sides.

640 HOT WATER COILS INSTALLATION

- Expansion: Connect pipeline to allow free expansion of headers and tubes.

650A DRAIN LINES INSTALLATION

- All items of plant that could produce moisture must be provided with a drainage system.

The system shall comprise a drip tray, glass trap, air break and associated drainage pipework. All parts of the drainage system must comply with SHTM 03-01.

The drip-tray should be constructed of stainless steel, and be so arranged that it shall completely drain. To prevent 'pooling', it is essential that the drain connection should not have an up-stand; and that a slope of 1 in 20 in all directions should be incorporated to the drain outlet position. The tray must be completely accessible or, for smaller units, easily removable for inspection and cleaning.

Where traps are fitted to plant located outside or in unheated plant rooms trace heating shall be required. The trace heating must not raise the temperature of the water in the trap above 5^{o}C.

660 SERVICES CONNECTIONS

- Entry points: Seal around electrical cable and pipeline entry points to prevent air leakage.
- Flexible cables: Provide between fan motor and local isolator.

670 ISOLATION OF AIR HANDLING UNITS

- Electrical connections: Provide means of isolating air handling units electrically.
- Pipe connections: Provide means of isolating pipelines to air handling units.
- Steam: Provide means of isolating steam to humidifier when access door is opened.

680 SUPPORT FOR AIR HANDLING UNITS

- Method: Purpose made raised frame, with sufficient clearance for drains and traps.

COMPLETION

During the flushing of the pipework system the AHU coil must be by passed or disconnected.

Under no circumstances shall flush though the coils

The units shall be supplied initially with one complete set of spare filters and a further set is to be offered for handover to the client at the end of the contract. This set should be carefully packed and labelled for each plant and filter type.

Alongside each filter gauge a permanent label is required with the following information:-

- Type (pre, bag, final etc.)
- Grade
- Size
- Clean PD (at full speed)
- Dirty PD (at full speed)

910 PRE-COMMISSIONING OF COILS

- Preparation:
  - Remove protective covering.
  - Check frost protection and drain if heat is not available in freezing conditions.
  - Straighten fins.
- Cleaning and chemical treatment: Use chemicals compatible with the materials in the coils.

920 AIR LEAKAGE TESTING

- Testing: In accordance with HEVAC Guide to air handling unit leakage testing.

930 TESTING

- Test location: On site before incorporation in works. (Selected factory testing/inspection may be carried out)
- Test results: Submit.

U82 FANS

PRODUCTS

All fans shall be type tested to BS.848 and a type test certificate shall be provided for each type of fan supplied. All fan duties shall be at an air density of 1.2 kg/m³ at 1.01325 bar and 15°C. Fan outlet velocities shall not exceed 10.00 m/s. Each fan shall be provided with dedicated fan performance curves, with the duty selection, absorbed power requirements, motor selection and sound power levels clearly indicated.

All fans shall be selected for low noise.

All fans shall be low energy type.

All fan's and system controls must be capable of being fully interrogated by the building
management system through the independent network protocol.

All fans shall be inverter driven.

310 AXIAL FLOW FANS

Axial flow fans shall be of the long case pattern with a heavy gauge mild steel casing
galvanised after fabrication, flanged and drilled at each end.

The impeller shall be of multi-blade aerofoil section constructed from die cast aluminium or heavy-duty steel. The hub design shall allow for manual adjustment of the blade pitch angle. Multi-stage axial fans shall be arranged with contra-rotating stages.

The impellers shall be directly driven through a totally enclosed motor with ball or roller bearing to suit the application. The fan motor shall be sized so that a blade pitch angle adjustment of the impeller of up to 2° shall be possible without a change of motor. During assembly of each fan the fan impeller shall be statically balanced to a level of 4.5 mm/s RMS at the fan feet. All bearing lubrication shall be extended to the outside of the casing. Axial fans shall be complete with anti-vibration mounts, flexible connections and matching flanges for duct connection and bellmouths and guards where fans are in free air. Motor terminal boxes shall be external to the casing and provide protection to IP55 as defined in BSEN.60529.

- Performance: To BS 848-1.
- to provide technical proposals for review.
- Mechanical safety: To BS 848-5.
- Electrical safety: To BS EN 60335-2-80.
- Dimensions: To BS 848-4.
- Operating conditions:
  - Environment: Existing hospital and residential housing
  - Air density: 1.20 kg/m3.
- Operation: As schedule and drawings.

- Inspection doors: Fit airtight inspection doors giving access to drive motors and other components requiring regular servicing and maintenance.
- Motor and drive: Match fan.
- Material:
  - Casing: Manufacturer's standard. to submit proposals.
  - Impeller: Manufacturer's standard.
- Anti-vibration mountings: Manufacturer's standard. to submit proposals.
- Flexible duct connections: Manufacturer's standard. to submit proposals.
- Accessories: As schedule and drawings.

320 CENTRIFUGAL FANS

Fan units shall be installed as detailed on drawings and fan schedules. External fans shall be weatherproofed and suitable for conditions.

The assembly is dynamically balanced to DIN ISO 1940. Motors shall be constructed from aluminium and be suitable for speed control.

Fans shall be suitable for horizontal through to vertical shaft operation. Supplied IP55, with removable drain plugs.

Sealed for life bearings lubricated with wide temperature range grease. Motors shall be fitted with thermostat overheat protection as standard. Three phase motors shall be suitable for inverter speed control down to 20% of full speed where specified.

Fans shall be fully cased, complete with an externally mounted pre-wired electrical terminal box. Casings shall be from sheet steel with integral pre-drilled inlet flanges.

Casings shall have a galvanised finish to provide a high corrosion resistance

- Performance: To BS 848-1.
- to provide technical proposals for review.
- Mechanical safety: To BS 848-5.
- Electrical safety: To BS EN 60335-2-80.
- Dimensions: To BS 848-4.
- Operating conditions:
  - Environment: Existing hospital and residential housing.
  - Air density: 1.20 kg/m3.
- Operation: As Fan schedule.
- Motor and drive: Match fan.
- Casing: Manufacturer's standard. to submit proposals.
- Inspection doors: Fit airtight doors in scroll and cover.
- Mounting: As Fan schedule and drawings.
- Material Galvanized sheet steel.
- Anti-vibration mountings: Manufacturer's standard. to submit proposals.
- Flexible duct connections: Manufacturer's standard. to submit proposals.
- Accessories: As Fan schedule.

350 ROOF MOUNTED FANS

The roof mounted extract/supply fans shall be located in the positions indicated on the drawings and in accordance with the relevant fan schedule. They shall have a low profile cowl manufactured in flame retardant GRP.

The roof fan shall suit the roof profile.

The fan shall be supplied complete with backdraught shutters, bird guard, purlin box curb, hand guard, specific details of the curb and purlin shall be confirmed by

Project Co. shall make due allowance for supporting the fan via the provision of purpose made trimmers between purlins. The trimmers shall be sized to adequately support the weight of the fans.

The fan shall be supplied with all the control interfaces to integrate with the clients BMS system.

- Performance: To BS 848-1.
  - Inlet and outlet arrangement: to provide technical proposals for review.
- to provide technical proposals for review.
- Mechanical safety: To BS 848-5.
- Electrical safety: To BS EN 60335-2-80.
- Dimensions: To BS 848-4.
- Operating conditions:
  - Environment: Normal
  - Air density: 1.20 kg/m3.
- Operation: As Fan schedule and drawings.
- Motor and drive: Match fan.
- Anti-vibration mountings: Manufacturer's standard. to submit proposals.
- Flexible duct connections: Required.
- Flexible electrical connection: Fans electrical power shall be rated for outdoor use.
- Accessories: As Fan schedule.

355 SMOKE EXTRACT FANS.

Fans shall be the bifurcated type as indicated or required, the motor shall be outside the airstream. Motors may be placed between the two halves of the casing using ambient air for motor cooling. Where hot gases, vapours or corrosive fumes are being handled, the motor bearings shall be suitable for operation at the temperatures resulting for the processes involved.

Fans shall be specially constructed for the temperature and the running duration specified during Fire/smoke condition.

- Standard: To BS EN 12101-3.
- to provide technical proposals for review.
- Electrical safety: To BS EN 60335-2-80.

- Accessories:
  - Flexible connections: Required.
  - Vibration isolators: Manufacturer's standard. to submit proposals.
- Control: As schedule.
- Starting device: As schedule.

360 TOILET EXTRACT FANS

Dirty extract systems shall be provided with dedicated extract fans. The fans shall be arranged for duplicate operation in a run and stand-by configuration.

The fans shall be of the centrifugal type with forward curved blades. The impellers shall be belt driven.

Each fan shall have its own dedicated motor and drive assembly mounted on a common base frame with spring anti-vibration mounts between the frame and the unit case/framework.

The fans shall be arranged for auto changeover achieved via the BMS. On failure of the duty fan the stand-by shall start and run. The changeover shall also include the automatic activation of backdraught dampers. The fan enclosure shall be configured to allow continuous operation of the stand-by fan while the failed unit is removed for repair or replacement. The fan and motor shall be removed as a common assembly.

The fans shall be housed in a common heavy gauge aluminium casing arranged for ducted inlet and outlets.

The units shall be provided with airflow and failure monitors suitable for interfacing with the BMS. Auto changeover shall be undertaken by the BMS.

- Performance: To BS 848-1.
  - Inlet and outlet arrangement: As drawings.
- Manufacturer: to provide technical proposals.
  - Product reference: to provide technical proposals.
- to provide technical proposals for review.
- Electrical safety: To BS EN 60335-2-80.
- Operation: As schedule
- Electrical supply type: As schedule.
- Accessories:
  - Access panel: Removable panel
  - Controls: Speed controller to match fan, refer to BMS for further details.
  - Silencer.
  - Backdraught damper.
  - Anti-vibration mount.
  - Guards.

370 CONSTRUCTION AND HANDLING

- Casings: Rigid, so there is no drumming under operating conditions.
- Lifting: Provide lifting eyebolts facilities on fans or sections heavier than 20 kg.

EXECUTION

610 INSTALLATION

- Fixing: Use fixing points provided. Do not strain the fan structure when bolts are tightened.
- Orientation: Mount impeller shaft horizontally.
- Alignment: Install fan to allow optimum air flow path.

U83 AIR FILTRATION

PRODUCTS

Filters shall be provided in a separate plant section of the air handling unit or, if specified, as part of a common section. Filter banks shall be provided with mounting frames to suit standard commercially available filter cells, arranged for side or front withdrawal as per schedules.

Air filters shall be constructed not to be capable of supporting combustion.

Gauges shall be provided across each filter. Tees and branch tubing should be fitted to allow the controls specialist to fit a separate dirty filter warning pressure switch. All filters shall include a filter dirty alarm to the BMS.

Alongside each filter gauge a permanent label is required with the following information:-

- Type (pre, bag, final etc.)
- Grade
- Size
- Clean PD (at full speed)
- Dirty PD (at full speed)

One complete spare set of filter media for each plant shall be provided at handover, being carefully packed for storage and labelled for respective plant and filter types.

Project Co. shall supply and install services and equipment to perform as per specification. Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Where a particular manufacture is specified, Project Co. shall include for that manufacturer.

Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration.

This must be done in a timely manner and Project Co. shall provide all details including but not limited to.

- Detailed description
- Cost comparison
- Technical comparison
- References to standards

310 PRIMARY FILTERS

Filter media shall be manufactured from 100% recycled materials. Filter media shall be a cotton and synthetic blend, lofted to a uniform depth, and formed into a uniform radial pleats.

A welded wire grid, treated for corrosion resistance, shall be bonded to the downstream side of the media to maintain the radial pleat and prevent media oscillation.

An enclosing frame, of biodegradable board shall provide a rigid and durable enclosure.

The frame shall be bonded to the media to prevent air bypass.

The manufacturer shall provide evidence of facility certification to ISO standard.

- Performance: To BS EN 779.
- Filter type: to submit proposals.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Duty:
  - Air flow rate: to submit proposals.
  - Air velocity: to submit proposals.
  - Initial filter pressure drop: to submit proposals.
  - Final filter pressure drop: 150 Pa.
  - Filter class: As schedules.
  - Filter height, width and limiting depth: As schedule and drawings.
  - Conditions: Sewerage works nearby.
- Flammability: Non-flammable for duration of recommended working life.
- Casing: Manufacturer's standard.
- Access: As specification.
- Filter mounting frames: Purpose made, rigid, with building-in ties where filter is mounted in walls or partitions.

320 SECONDARY FILTERS

Bag or extended surface type filters shall be provided to the required grade or better as specified, in the Equipment Schedules with maximum air velocity at face not exceeding 2.5 m/s. Filter media shall be manufactured from 100% recycled media.

Filters shall be fully self-supporting without external ties or stiffening frames. Filters shall inflate fully, shall not sag or flutter, nor have effective medium area reduced by obstruction due to contact with other filter faces or housing surfaces when operating between 60% and 110% of design air volume for constant volume systems or between the specified minimum and maximum air volume rates for multi-speed systems. Bag shall be short or normal length as noted in the Schedule of design criteria.

- Performance: To BS EN 779.
- Filter type: Bag.

- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Duty:
  - Air flow rate: to submit proposals.
  - Air velocity: to submit proposals.
  - Initial filter pressure drop: to submit proposals.
  - Final filter pressure drop: 250 Pa.
  - Filter class: to submit proposals.
  - Filter height, width and limiting depth: to submit proposals.
- Flammability: Non-flammable for duration of recommended working life.
- Casing: Rigid.
- Access: to submit proposals.
- Filter mounting frames: Purpose made, rigid, with building-in ties where filter is mounted in walls or partitions.
  - Material: to submit proposals.

330 HIGH EFFICIENCY PARTICLE ARRESTOR (HEPA) FILTERS

High efficiency particulate air filters (HEPA/absolute) shall remove virtually all particles from air.

HEPA filters shall be H14 (EU 14) (unless otherwise Specified) with an efficiency of 99.995% @ MPPS.

HEPA filters shall be of the replaceable panel type with leak proof seals. They shall be installed in a manner that permits on site validation of the filter and its housing. This shall involve the release of a Dispersed Oil Particle (DOP) challenge smoke through an injection point upstream of the filter and a measurement of the DOP penetration across the downstream face.

A photometer shall be used to detect leaks.

The Method of testing/Validation with DOP shall be as set out in SHTM 03-01.

Filter housing and seal (generally Housing shall be Electro zinced steel painted white RAL 9010, seal shall be Silicone or Polyurethane gel) shall be suitable for application.

- Standard: To BS EN 1822.
- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Use of conditioned space: to submit proposals.
- Duty:
  - Maximum air flow rate: to submit proposals.
  - Air velocity: to submit proposals.
  - Filter height, width and limiting depth: to submit proposals.
- Filter media: HEPA filter media - Group H.
- Filter class: H14.
- Filter casing: Provide with gasket fitted to casing.
- Filter material: As above.
- Flammability: Non-flammable for duration of recommended working life.
- Access: Access shall be provided for filter change and DOP test.
- Filter frame material: To suit application, as schedule.

370 EDGE SEALS

- Function: Prevent air by-passing filters. Seals must remain effective after removal and replacement of cells.

380 PRESSURE GAUGES

Each filter shall have a filter dirty alarm filter status and filter dirty alarm. This shall be compatible with the client BMS system:

- Type: Dial.
- Manufacturer: to provide technical proposals.
  - Product reference: to provide technical proposals.
- Gauge markings: Positions equivalent to 'Filter Dirty' and 'Filter Clean' conditions.
- Pressure differential switch: Provide for visual or audio warning of 'Filter Blocked Condition'.

390 TERMINAL FILTER HOUSINGS

- Terminal filter housing shall be easy to maintain, clean housing, able to accept a range of standard diffusers and grilles. The diffuser and colour shall match the other supply and extract diffusers. Before any HEPA filters are installed the ductwork system shall be suitably clean.
  The terminal housings shall have:
  Polyester power coat finish
  Limited travel filter clamps
  DOP/Pd sample port
  Installation hanging brackets
  Fully welded flange
  Top or side circular inlet
  Damaged filters must not be installed in the system.

- Filters housed: HEPA and ULPA.
- Housing seals: Gaskets between holding frames on banks of filters. Seal filters into steel casing.

395 FILTER SAFE-CHANGE UNITS

Where indicated on the drawings supply and install safe change housings complete with all pre and main filters. All housings to be manufactured from seam welded carbon steel with 2 pack epoxy coat finish.

Each filter assembly shall have the following features:-

- Inlet and outlet ductwork connections and support feet.
- Inlet and outlet tight shut off dampers.

Tight shut off dampers shall have seals to KTA 3601 or DIN 25414 (maximum leakage 0.01m³/hr x m² with a pressure differential of 2000Pa). The dampers shall be pressure tight to 5000Pa. The damper mechanism shall be designed such that after closure no energy is required to keep the damper in a closed position. The case and blades of the unit shall be constructed of sheet stainless steel to BS 1449 – Grade 304 – S11 Finish 2B. Bearing assemblies shall be stainless steel or brass. Damper blade sealed shall be neoprene foam rubber material, temperature resistant up to 80°C.

- Manometer points across each filter housing with manometer fitted across the hepa filter. Tappings to be configured to allow for BEMS monitoring of hepa filter condition. Manometer to be mounted on the assembly framework.
- 2 No. stainless steel cam bars for filter location.
- Aerosol sampling point in bottom spigot.
- All necessary safe change bag and retaining ring sets.
- All filter assemblies shall be factory pressure tested to a pressure of 2500Pa for minimum 1 hour and a test certificate provided.
- Leak test devices to DIN 1946 shall also be provided to allow maintenance staff to ensure replacement filters are properly seated prior to operation.
- Each unit shall have:
- Minipleat high capacity absolute filters, 610 x 610 x 292mm deep with MDF case, efficiency to BS EN 1822 grade H14, 99.995%. All filters throughout the development shall be a common grade.
- Hardened case pre-filters 610 x 610 x 60mm to BN 779 grade G7.
- Upon completion of installation, a site validation test shall be carried out to achieve a maximum of 0.005% penetration and certificate provided.

EXECUTION

610 INSTALLING FILTER FRAMES

- Fixing: Securely fasten frames to ductwork walls.
- Gaps around the frames: Seal with mastic sealant.

620 INSTALLING FILTERS

- Mounting: Clamp securely against sealing gasket to prevent leaks.

630 INSTALLING PRESSURE GAUGES

- General: Fix external to unit to allow easy observation, within 3 m of filter.

U84 HEATING AND COOLING COILS
PRODUCTS

To facilitate maintenance access, auxiliary wet batteries should be located above corridors or other non-critical areas and not above patient occupied spaces. Access doors shall met the requirements in section U80.

310 LOW TEMPERATURE HOT WATER HEATING COILS

Hot water coils shall be installed as shown on drawings.

Tubes are arranged in a staggered pattern with respect to adjacent rows to provide maximum heat transfer efficiency.

Return bends are the full thickness and diameter of the coil tubes to provide unrestricted flow and undiminished strength Access for cleaning shall be provided to both sides of all coils and batteries.

All water batteries shall be designed to ensure equal flow through all circuits. The water flow and return connections together with the airflow direction shall be permanently marked on the casing. All coils shall be supplied complete with vents and drains. Provision shall be made for expansion of the tubes and for effective venting of the coils.

Coils shall be arranged so as to facilitate removal of the coils without draining local pipework

On large coils, multiple or split coils shall be used to ease installation, repair and maintenance operations.

Heat exchanger finned surfaces shall extend the full width of the coil casing. Coils shall be suitably protected against corrosion with due regard to the geographical location of the coil and local atmospheric conditions. Sealing devices shall be provided around the casing to prevent air by-pass

Casings shall be galvanised sheet steel with angle framing at each end drilled ready to receive the counter flanges on the connecting ductwork. Coils shall be supported so that their weight is not transmitted to ductwork and so they can be removed without disturbing adjacent ductwork. Inspection doors shall be provided on both the upstream and the downstream sides of the coils.

All coils shall be tested at the manufacturer's works or an approved testing laboratory and rated for thermal performance to BS EN 13053 and certificates provided. These tests shall also include confirmation of water pressure drops at the design flow rates. These pressure drops shall be from pipework pressure tapping on the flow and return connections external to the unit.

The maximum water system pressure drop shall be *25* kPa. The maximum air pressure drop across the coil shall be *20* Pa. Any site tests that show either pressure drops above this level shall require the replacement of the coil.

Where auxiliary/re - heater-batteries are located in false ceilings, they should be fitted with a catch tray and leak detection alarm. The catch tray shall be installed under both the battery and the control valve assembly to protect the ceiling from leaks. The moisture sensor and alarm shall be fitted in the tray and shall alarm the clients BMS in the event of a leak.

- Performance: To BS 5141-2 and BS EN 1216.
- Project Co. shall submit proposals for review.
- Materials: Solid drawn copper tubes with copper fins.
- Tube wall thickness: At least 0.7 mm.
- Fin thickness (minimum):
  - Aluminium: 0.4 mm.
  - Copper: 0.3 mm.
- Fin spacing (maximum): As schedule.
- Thermal expansion: Allow for movement.
- Casing finish: Galvanized mild steel.
- Access doors: Hinged, airtight and watertight for maintenance.
- Draining and venting: As specification.
- Water test pressure: Up to 2.1 MPa or 1.5 times the working pressure, whichever is greater.
- Packaging: Fit protection for fins before despatch.
- Protection: Fit blank flanges or caps to pipe connections after manufacture.
- Accessories: As schedule.

320 CHILLED WATER COOLING COILS

Access for cleaning must be provided to both sides of all cooling coils. The coil shall have electro tinned fins.

Coils frames and casings shall be manufactured from stainless steel.

Pipe Connections shall be screwed up to 50mm, flanged above. Maximum velocity over the coils shall be 2m/s.

The coil shall have an eliminator.

All cooling coils shall be fitted with their own independent drainage system. The system shall comprise of a stainless steel drip-tray, glass trap, air break and associated drainage pipework.

The drip tray shall be arranged to drain completely and prevent pooling.

The drain connection shall not have an up-stand. A slope of 1 in 20 in all directions shall be incorporated to the drain outlet position.

Where coils are greater than one metre high intermediate drain trays shall be provided.

The AHU base shall be high enough to accommodate the trap and pipe work fall.

The tray shall be completely accessible or for inspection and cleaning.

Each drip-tray shall be provided with its own drain trap. The drain trap shall be of the clear (borosilicate) glass type.

The trap shall have a means for filling and shall incorporate couplings to facilitate removal for cleaning. It shall be located in an easily visible position where it shall not be subject to casual knocks. The pipework connecting it to the drainage tray should have a continuous fall of not less than 1 in 20.

Water from each trap shall discharge via a clear air gap of at least 15 mm above the unrestricted spill-over level of either an open tundish connected to a drainage stack via a second trap, or a floor gully. A support shall be provided to ensure that the air gap cannot be reduced. Drainage pipework shall be copper.

A baffle device shall be provided in the drip-tray to prevent air bypassing the coil, and the tray shall be large enough to capture the moisture from the eliminator, bends and headers.

The cooling-coil control valve shall close upon selection of low speed, system shut-down, low airflow or fan failure.

The maximum water pressure drops across the coils shall be *30* kPa. The maximum air pressure drops across the coils shall be 80 Pa. Any site tests that show pressures above either of these levels shall require the replacement of the coil.

- Performance: To BS 5141-1 and BS EN 1216.
- Duty: Refer to drawings and schedules.
- Materials: Solid drawn copper tubes with copper fins, all electro-tinned.
- Tube wall thickness: At least 0.7 mm.
- Fin thickness (minimum):
  - Aluminium: 0.4 mm.
  - Copper: 0.3 mm.
- Casing:
  - Finish: Stainless steel
  - Return bends: Provide removable covers. Lag and vapour seal the bends.
- Eliminator plates: Install downstream of all coils.
- Draining and venting: As specification.
- Access doors: Hinged, airtight and watertight for maintenance.
- Water test pressure: Up to 2.1 MPa or 1.5 times the working pressure, whichever is greater.
- Packaging: Fit protection for fins before despatch.
- Protection: Fit blank flanges or caps to pipe connections after manufacture.
- Accessories As schedule.

- Airflow: Evenly distributed over face area of coil (to be verified at commissioning)
- Air velocity: Ensure it is below level at which moisture carryover occurs.

340 ELECTRIC HEATER BATTERIES

Generally electric heating batteries are to be avoided. Their use should be restricted to low power use (for example trimming control).

Where used, electric heaters shall be provided with high temperature cut out protection with automatic reset.

is to provide technical submissions for review.

- Casing material: Aluminium.
  - Casing finish: Natural.
- Access doors: Hinged, airtight and watertight for maintenance.
- Heating elements: Mount on removable terminal plate.
  - Type: As schedule.
- Terminal boxes: Welded steel.
- Safety cut-out switch: Automatic reset, wired in series or via contactor with heating elements.
- Controls:
  - Fan interlock to prevent heater operating without fan running.
  - Run-on timer to allow airflow to cool heater before switching off fan.
- Air flow detector switch: Wired in series with other safety devices.
  - Type: Differential pressure.
- Accessories: Heater batteries to be thyrister controlled.

610 INSTALLATION

- Equipment, controls and instruments positioned next to heating coils: Protect from thermal radiation.
- Fixings: Support coils independently of ductwork.

620 ELIMINATOR PLATES INSTALLATION

- General: Fit to allow removal from coil casing.

U85 HEAT RECOVERY

Thermal wheel heat exchangers shall be incorporated within extract air plants handling uncontaminated air (non hygro-scopic type). These plants shall also include main dirty air extract plants. The heat exchangers shall transfer heat energy within the extract air to a pumped circulation water heat recovery system. Heat exchangers within the fresh air plants shall utilise the recovered heat to pre-heat incoming fresh air.

Where the use of thermal wheel heat recovery units have been found to be inappropriate plate recuperator systems shall be employed.

The heat recovery systems shall be configured to operate at all times when useful energy can be recovered and used by the various air plants.

PRODUCTS

310 PLATE RECUPERATORS

- is to submit proposals for review based upon details shown on drawings, schematics and schedules.
- Efficiency: minimum 55%.
- Heat transfer plates: Manufacturer's standard for application. to provide technical submission.
- Coating: Manufacturer's standard for application.
- Access doors: Hinged, airtight and watertight for maintenance.
- Accessories:
  - Face and bypass dampers;

330 THERMAL WHEELS

- is to submit proposals for review based upon details shown on drawings, schematics and schedules.
- Efficiency: minimum 65%.
- Rotor: Non-hygroscopic.
- Access doors: Hinged, airtight and watertight for maintenance.
- Accessories:
  - Adjustable purging sector;
  - By-pass damper;
  - Matching ductwork flanges;
  - Return air damper; and
  - Speed controller.

EXECUTION

630 INSTALLING DRAIN TRAPS

- Air break: Locate between trap outlet and drainage system.
- Traps under suction: Install the outlet below the inlet by a depth equivalent to at least one and a half times working pressure.
- Traps under positive pressure: Install inlet and outlet at same level.

U86 AIR TREATMENT

Space within air handling units to accommodate future installation of humidification shall be provided only in Operating Theatres, HDU and Critical Care. Close control of humidity is required for the successful operation of sensitive equipment, e.g. computers.

U87 SILENCERS AND ACOUSTIC TREATMENT

PRODUCTS

The attenuators including cross talks, shall be selected and installed by . Project Co. shall appoint a specialist to select these, using the noise criteria detailed elsewhere. The permissible pressure drop on cross talk attenuators is *25* Pa and *50* Pa on other attenuators. is to provide technical submissions for the silencers and acoustic treatment.

310 CIRCULAR SILENCERS

Silencers shall be installed generally as indicated on the drawings.

Silencers shall be of the size, configuration, capacity and acoustic performance required to meet the specified acoustic criteria.

All circular silencers shall be constructed with a galvanized steel casing. All casing seams and joints shall be lock formed and sealed. All fixings to the casing to be with blind rivets to eliminate leakage.

The silencer infill to be covered in ICI Melinex to prevent particle migration. The membrane shall have a 25 year service life.

- Performance requirements: To BS EN ISO 7235 and BS EN ISO 11691.
- Casing: galvanised sheet steel minimum thickness 0.8mm
- Splitters: galvanised perforated sheet screen minimum thickness 0.8mm with an open area of at least 23%.
- Lining material: Inert, fire proof, inorganic and non- hygroscopic minimum density 48kg/m^3.
- Markings: Show direction of air flow on silencer.

320 RECTANGULAR SILENCERS

Silencers shall be installed as indicated on the drawings.

Silencers shall be of the size, configuration, capacity and acoustic performance required to meet the specified acoustic criteria.

All Rectangular silencers shall be constructed with a galvanized steel casing. All casing seams and joints shall be lock formed and sealed. All fixings to the casing to be with blind rivets to eliminate leakage.

The silencer infill to be covered in ICI Melinex to prevent particle migration. The membrane shall have a 25 year service life.

- Performance requirements: To BS EN ISO 7235 and BS EN ISO 11691.
- Casing: galvanised sheet steel minimum thickness 0.8mm
- Splitters: galvanised perforated sheet screen minimum thickness 0.8mm with an open area of at least 23%.
- Lining material: Inert, fire proof, inorganic and non- hygroscopic minimum density 48kg/m^3.
- Markings: Show direction of air flow on silencer.

330 AIR TRANSFER AND CROSS TALK ATTENUATORS

Cross Talk attenuators shall be installed in the ductwork in locations shown in the plans.

The performance of the attenuators shall be such that the privacy shall be maintained between adjacent spaces.

The attenuator shall control noise transfer, in particular speech via the ductwork.

Project Co. shall submit calculations for examination *by the acoustic consultant*.

All cross talk silencers shall be constructed with a galvanized steel casing. All casing seams and joints shall be lock formed and sealed. All fixings to the casing to be with blind rivets to eliminate leakage.

The silencer infill to be covered in ICI Melinex to prevent particle migration. The membrane shall have a 25 year service life.

- Performance requirements: To BS EN ISO 7235 and BS EN ISO 11691.
- Casing: galvanised sheet steel minimum thickness 0.8mm
- Splitters: galvanised perforated sheet screen minimum thickness 0.8mm with an open area of at least 23%.
- Lining material: Inert, fire proof, inorganic and non- hygroscopic minimum density 48kg/m^3.
- Markings: Show direction of air flow on silencer.

The cross talk attenuator shall be installed / located to avoid flanking ideally placed in the ductwork as it passes through the wall separating rooms.

350 ACOUSTIC INSULATION

’s acoustic specialist shall examine the need for acoustic lagging. Acoustic lagging shall be provided and fitted where necessary to the outside of the ductwork to achieve an enhanced Sound Reduction Index (SRI) of ductwork and hence reduce noise break in or break out.

The lagging shall consist of mineral wool density not less than 48kg/m3 and not less than 50mm thick.

The mineral wool shall be covered with an outer skin typically lead weighed PVC material or 0.8mm thick galvanised mild steel. All joints shall be suitably sealed to maintain acoustic integrity.

The lagging shall be securely fixed to the pipework / ductwork using mechanical fixings.

- Material: Lightweight mineral wool.
- Outer covering: As specification.

EXECUTION

610 ACOUSTIC LININGS

- Access: Where personnel access is provided, protect acoustic linings to prevent damage.

U88 AIR TERMINAL DEVICES

PRODUCTS

Air terminals shall be provided as indicated on the drawings, or as defined further in this specification.

shall co-ordinate the reflected ceiling plan.

Project Co. shall appoint a specialist supplier to provide the selections and schedules for the air terminal devices. ’s specialist shall select the grilles and diffusers using the locations and air volumes shown on the drawing. Project Co. shall submit these for review.

All diffusers and grilles shall be selected for quiet operation, using the noise criteria specified.

Project Co. shall provide samples of each type of air terminal device for review.

Neck velocity shall not exceed 2.5 m/s on any terminal device (diffusers/grilles etc).

310 AIR TERMINAL DEVICES, SPECIALIST UCV HOODS

The UCV shall be a Vertical-flow type system and meet all requirement of SHTM03-01 including figure 6.

The return air grilles/diffusers shall be sited so as not to cause short circuiting. Project Co. shall comply with SHTM03-01 to this regard.

Project Co. shall ensure that each face or each corner of the theatre shall have an air path to provide good air circulation and to prevent entrainment in the clean zone. Air velocities for and over the UCV shall be as SHTM/HTM 2025/03-01 as a minimum. UCV systems shall come complete with HEPA filters. A set of new filters shall be issued to the client following commissioning of the unit.

The final filters shall be installed in a leak-proof housing in a manner that allows the terminal unit, filters and their seals to be validated. A challenge test shall be carried out during commissioning to prove the effectiveness of the complete installation. Challenge test shall be as manufactures recommendations and the Method of testing/Validation with DOP shall be as set out in SHTM03-01.

The UCV shall have direct-reading pressure gauges for each final filter and a return-air filter to capture the relatively coarse particles that would otherwise significantly reduce the life of the final filter. The return air filter shall be G3 grade to BS EN 779 as a minimum.
The UCV shall not exceed NR 50. Any in line attenuation shall non-particle-shedding and fire-resistant.

The functions of the canopy circulation fans shall be continuously monitored by a BMS control unit.

Additional to this the UCV system shall have

- a set-back facility that shall reduce the air supplied through the UCV terminal to a volume that equates to an amount not less than 25 air changes per hour of the operating room's gross volume whilst still leaving the supply AHU operating at full speed;
- a facility to turn off the entire system, the supply AHU and the UCV terminal (an emergency stop is not required);
- a read-out sufficiently large to be clearly visible from the operating table that shows the temperature of the air being supplied by the UCV terminal;
- a read-out sufficiently large to be clearly visible from the operating table that shows the relative humidity of the air being supplied by the UCV terminal;
- a red indicator light that shall illuminate when either the supply AHU or the UCV terminal fails; either or both are switched off or the AHU and UCV terminal are at set-back;
- an amber indicator light that shall illuminate when the UCV terminal is at set-back and the supply AHU is running;
- a green indicator light that shall illuminate when both the supply AHU and UCV terminals are operating at full speed;
- a blue indicator light that shall illuminate when the UCV terminal's HEPA-filter resistance causes the air delivered to fall below 80% of the design flow rate.
- Performance:
  - Mixed flow applications: To BS EN 12238.
  - Sound power levels: To BS EN ISO 5135.
- Performance requirement to SHTM.
- Material: Stainless steel.

325 AIR TRANSFER GRILLES

Transfer grilles shall be non-vision type and sized for a maximum face velocity of 1.5 m/s.

- Grille type: Non-vision.
- Accessories: Transfer grilles shall not be installed in a fire rated door/wall. Transfer grilles in operating theatres shall incorporate a volume control damper to allow adjustment to room pressure

330 DIFFUSERS

Ceiling diffusers shall be installed as shown on the drawings. The diffuser shall be a square ceiling diffuser for flush mounting, comprising diffuser face with mitred perimeter border.

Louvre face diffusers shall be of the four way pattern and shall have adjustable cores to provide horizontal or vertical distribution. The air pattern shall be achieved via the use of directional blanking plates within the body of the diffuser and shall not be visible from the diffuser face. The diffuser shall be suitable for incorporation in a standard ceiling tile grid without overlapping the tile-supporting bar. Diffusers shall be complete with a security chain between the diffuser body and the core and an earth bonding tag.

Ceiling diffusers shall be suitable for direct replacement of 600 x 600 ceiling tiles or an overall size relative to the selected neck size for fitting within a cut tile.

Branches serving individual diffusers shall be provided with a manual volume control damper supplied and fitted by the ductwork installer, in addition to the grille damper where supplied. The duct mounted volume control damper shall be located as close as possible (within 1 duct diameter) of the take-off with the main branch duct.

Where extract is required via ceiling mounted devices louvre face diffusers shall be used. The diffusers shall be similar in construction and appearance to the supply diffusers.

The diffuser shall have fixed air control blades, central fixing screw with decorative cap and an opposed blade damper adjustable from the front face.

The plenum box shall be galvanised sheet metal with a rubber lip seal.

The plenum box shall have fixings for suspending the assembly from the ceiling slab.

The plenum boxes shall be suitable for side or top entry as required.

The diffuser face shall be extruded aluminium sections, natural anodised rear ancillaries in formed sheet steel, surfaces phosphate treated and stove-enamelled.

Supply and extract diffusers shall be at a distance from one another to prevent short circuiting. Supply diffusers shall be located away from one another to prevent two opposing air streams meeting and causing drafts, the individual velocities shall not be greater than 0.25 m/s.

- Performance:
  - Mixed flow applications: To BS EN 12238.
  - Sound power levels: To BS EN ISO 5135.

340 LAMINAR FLOW PANELS

Laminar flow panel diffusers shall be provided in operating theatres with a footprint that encompasses the operating site to produce a downward-displacement parallel-flow air distribution.

Diffusers, of all patterns, to operating theatres shall achieve the required velocity at the operating table position of between 0.2 and 0.3 metres per second, and achieve good air distribution throughout the remainder of the room. Particular care shall be taken to ensure that in a heating mode air discharge velocity overcomes the buoyancy of the air to achieve the required velocity at the operating table position.

The ventilation distribution arrangement must take priority over the layout of luminaires and pendants, etc.

350 TOILET SUPPLY AND EXTRACT VALVES

Extract from toilets, bathrooms and showers shall be via exhaust air disc valves. Each valve shall be constructed from sheet steel and provided with a stove-enamelled finish. The centre disc valve core shall be mounted on a threaded adjustable centre spindle complete with locking nut to provide air volume flow rate adjustment.

The centre disc assembly shall be mounted in a profiled outer ring complete with an edge seal and tamperproof sub-frame.

Generally each valve shall be installed within a cut tile. Each valve shall not require a plenum but shall be connected into a section of rigid ductwork before any flexible is used.

Each branch connecting to individual valves shall be provided with a manual volume control damper fitted as close to the upstream branch connection as possible.

360 DIFFUSERS, LINEAR

Linear diffusers shall be installed as shown on drawings.

They shall be made from aluminium extrusion, natural anodised.

Diffusers shall come complete with end caps and air control blades.

The diffusers shall have a rear mounted plenum box fitted with a side entry spigot and suspension brackets to hang the complete assembly from the ceiling.

The plenum box shall be fitted with a volume control damper adjustable from the diffuser face and be made from galvanised sheet steel.

- Performance:
  - Mixed flow applications: To BS EN 12238.
  - Sound power levels: To BS EN ISO 5135.
- Diffuser: Slot.
- Material: Aluminium.
  - Finish: Anodized.

370 DIFFUSERS, SWIRL

The swirl diffusers shall be adjustable in square or circular face plates with swirling horizontal discharge of supply air with high induction.

Diffusers shall consist of a pressed front face with radially angled air discharge sections incorporating adjustable directional air control blades.

Diffusers shall be complete with a plenum box with circular top or side entry spigots and volume control damper. The Plenum box shall be supplied with fixed hanging brackets.

The face plate shall be galvanised sheet steel with the surfaces pre-treated and powder coated white (RAL 9010).

The control blades shall be made from Polystyrol coloured black or white as required.

The plenum box is made from galvanised sheet steel with a rubber lip seal.

The plenum box shall be galvanised sheet metal with a rubber lip seal.

The plenum box shall have fixings for suspending the assembly from the ceiling slab.

The plenum boxes shall be suitable for side or top entry.
Supply and extract diffusers shall be at a distance from one another to prevent short circuiting. Supply diffusers shall be located away from one another to prevent two opposing air streams meeting and causing drafts, the individual velocities shall not be greater than 0.25 m/s.

- Performance:
  - Mixed flow applications: To BS EN 12238.
  - Sound power levels: To BS EN ISO 5135.
- Material: Galvanized steel.
  - Finish: Epoxy resin powder/ hardener coating.

390 GRILLES

Grilles shall be installed as shown on the drawings.

The grilles shall be made from extruded aluminium sections. The finish shall be as RAL number. Grilles shall be selected for quiet operation.

Grilles, shall have corner mitres and rear perimeter sealing strip with profiled front blades.

Sub frames shall be used where required.

- Performance:
  - Mixed flow applications: To BS EN 12238.
  - Displacement flow applications: To BS EN 12239.
  - Sound power levels: To BS EN ISO 5135.

400 CEILING VENTING GRILLES (CVG)

Ceiling venting grilles shall be provided along the main distribution routes for medical gas and natural gas pipework.

Ceiling venting grilles shall be of similar construction and arrangement to the supply diffusers. The diffuser body only shall be provided for these items.

The minimum size of CVGs shall be 150 x 150mm.

410 PLENUM BOXES, CEILING OR WALL MOUNTED

Plenum boxes shall be made of 0.7mm Galvanised steel plenum.

Spigot construction shall be a top or side entry plenum option robustly fabricated plenums shall come complete with all necessary fixing angles for drop rod support.

- Duty: To match grille and diffuser.
- Configuration: Single plenum box or a series of plenum boxes butted together to form a continuous length.
- Construction: Sturdy and rigid with circular inlet spigots of 65 mm minimum length.
- Fixing: Incorporate means for fixing to, or suspending from, building or other construction.

EXECUTION

610 INSTALLATION

- General: Do not distort air terminal devices. Fix securely.
- Air leakage: Prevent. Seal joints with self adhesive foam strip or equivalent.
- Appearance: Finish visible edge joints neatly. Do not leave sharp edges and protruding screws.

620 FIXING CIRCULAR AND RECTANGULAR DIFFUSERS

- Method: As per manufacturer's instructions and specification.

640 FIXING LINEAR AND SLOT DIFFUSERS

- Method: As per manufacturer's instructions and specification.

650 FIXING FLOOR MOUNTED SWIRL DIFFUSERS

- General: Fit flush with finished floor.
- Method: As per manufacturer's instructions and specification.

660 FIXING GRILLES

- Method: As per manufacturer's instructions and specification.

670 OPERATION

- General: Fit so that moving parts operate correctly and removable cores can be taken out and replaced.
- High level and ceiling applications: On removable cores, provide safety wires with quick release ends.

680 BLANKING PLATES

- Location: Where needed to restrict projection of air flow from section of grille or diffuser.

RHSC and DCN EDINBURGH
COMBINED HEAT & POWER SYSTEM

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the scheme, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by

Project Co. shall obtain the necessary supporting documentation.

This specification relates to the CHP installation to be provided as part of the Energy Centre works. It shall be read in conjunction with the other specifications issued as part of the overall works.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2,

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

Drawings

As part of the development of the scheme Project Co. shall prepare co-ordinated working drawings which shall include general arrangement drawing sections, elevations and schematics, of the works to be provided. These shall be based on the Architect's base drawings and coordinated with other services and building elements.

2.0 SCOPE

The scope of work covered by this specification is for single CHP generating system including but not limited to the following:-

- Gas fired reciprocating engine
- 11000V alternator/generator
- The provision of Low Temperature Hot Water
- Controls with computer supervision backed up by UPS c/w standby
- Full communication interface with the on-site Building Management System and Electric Network Management System
- Metering equipment to assess heat and electricity output
- Metering equipment to assess heat dumped
- Metering equipment to assess gas intake
- Metering software in the controls strategy to determine the CHP quality index as defined by Inland Revenue and carry out energy efficiency evaluations
- Mains synchronising equipment
- Operation and protection to MV system in accordance with G 59.2
- Electric motor starting system
- Power isolator
- Fuel handling system
- Fuel cut-out system
- Neutral Earthing Resistors and associated controls
- Acoustic enclosure
- Acoustic equipment
- Forced air ventilation system for the enclosure
- Flue exhaust system with support structure
- Acoustic measures including inlet and outlet attenuation
- Lighting, emergency lighting and small power in the enclosure to facilitate maintenance operations
- Fire and gas detection activated safety fuel shut-off valves
- Site mechanical and electrical installations including all connections between the components in the scope of this contract and interfaces to the site systems
- Testing
- Setting to work
- Commissioning
- Demonstration that the system meets good quality CHP, either making sufficient heat demand available at the Buffer Vessel or via use of the heat dump unit as a simulating facility. This shall include the provision of all necessary meters, including:
  - Heat
  - Power
  - Gas

3.0 SPECIFIC EXCLUSIONS

Fire alarm systems, and telecommunications systems requirements that do not form part of the CHP installation are generally covered in separate documentation, for the provision by others.

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed and installed in accordance with the requirements of SHTM 06-01, IEE Wiring Regulations BS 7671 (17th Ed.), current legislation, regulations and industry standards, including British Standards unless otherwise stated.

The complete installation shall comply with the requirements of CHPQA (Department of Energy and Climate Change Quality Assurance Programme).

5.0 DESIGN CRITERIA

Under normal conditions the CHP unit is to run to assist the LTHW demands of the heating system. The electrical power generated from the production of the Low Temperature Hot Water demand shall be used to serve the Hospital's electrical power system. With this in mind, the switching on, off and stepping up/down of the CHP units shall be matched to the requirements of the LTHW system.

The CHP unit shall however be controlled so it does not export power above any agreed limit from the RHSC & DCN electrical systems to the SPEN supply network.

6.0 LIAISON

Project Co. shall include for liaison with:-

SPEN. Project Co. shall include for liaison with SPEN to ensure the requirements for parallel operation of the CHP units and the mains incoming supplies are met.

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Project Co. shall satisfy themselves of the suitability of the products and installation details being provided by other specialists.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of the installations.

7.0 MECHANICAL

7.1 Air for Combustion & Cooling

A fan assisted ventilation system shall be provided for combustion, to dissipate heat build up within the CHP enclosure and the rejection of waste heat (e.g. from any low grade water).

Incoming ventilation air shall be ducted from louvres located on the external elevation to inside the CHP enclosure. The exhaust from the CHP enclosure shall be fan assisted ducted to the external louvres on the north wall.

Automatic multi-bladed dampers shall be provided on the inlet and discharge. The dampers shall be arranged to open on the start signal for the appropriate CHP and to close once that engine has stopped running and residual heat dispersed.

In addition a radiator coil shall be located in the ductwork, to reject low grade waste heat. This is in addition to the CHP Heat Dump facility from the Low Temperature Hot Water.

The ventilation system shall be designed, installed and set to work within the following criteria:-

a) Taking into consideration the louvre sizing and types provided, considering noise, vibration, velocity and pressure drop.

b) The intake air temperature to be used in calculating the air requirements shall be 30°C.

c) The maximum *summertime* air temperature exhausted from the louvres shall be based upon the heat dissipated from the unit and shall be no more than 50°C.

d) The maximum air volume *for combustion and cooling shall be advised by the supplier.*

e) The ductwork design and installation shall meet the requirements of Heating and Ventilation Boards Association Document DW144.

f) *The ventilation system shall* keep the CHP enclosure close to the optimum temperature for the effective operation of the CHP units. Therefore in winter, the heat from the CHP can be used to keep the enclosure warm, but *this should* not *be* above 30°C or *shall be* as required by the CHP manufacturer.

g) Acoustic details mentioned in later sections.

7.2 Sound Attenuation

Acoustic Enclosure

An acoustic enclosure shall be provided to the CHP unit. The acoustic enclosure shall include:-

- Acoustic lining
- Access doors to enable full maintenance of the CHP unit
- Air inlet and air discharge ducts connecting the enclosures to the external louvres
- Air inlet and discharge attenuators with automatically opening and closing dampers on the internal faces of the units

The discharge air paths shall be sealed against the building fabric to prevent leakage back into the CHP room.

The Tender shall be inclusive of the design, supply and installations of the acoustic enclosure to house the CHP engine plant, and confine ventilation of the CHP plant to within the enclosure.

The CHP acoustic enclosure shall form part of the route for ventilation air to avoid the need for ventilation of the entire plant area. Project Co. shall provide all necessary intake and discharge attenuation to achieve noise levels stated.

The acoustic enclosure size shall be developed to ensure that it:

- Co-ordinates with other services in the room
- Co-ordinates with the building fabric and structure
- Allows maintenance to all plant and distribution systems as detailed within the SHTMs

Project Co. shall give due consideration to the need to maintain maintenance access around the entire CHP enclosure and allow for ducting ventilation air accordingly. Internal access and spatial arrangements shall be adequate to allow all maintenance functions and repairs.

The acoustic enclosure shall achieve maximum breakout noise levels within the CHP room of 65 dBA at 1 m from the enclosure.

The enclosure shall be provided with adequate access doors for plant servicing and replacement of major components. Access doors shall have emergency escape panic facilities in the event that personnel become trapped.

Inlet and Discharge Attenuators

The necessary attenuators for the CHP room are to form part of the Sub-Contract works and Project Co. shall take account of the pressure drop across/through them when selecting/sizing the air attenuators and fans for the CHP acoustic enclosures.

Attenuators shall be of the dissipative type and constructed of specially selected high quality materials.

Outer casings shall be made of galvanised sheet steel.
Each unit shall be constructed to prevent air leakage. Internal splitter units shall have aerodynamic leading and trailing edges to reduce pressure drop across them.

The acoustic infill shall be of inorganic high density bonded long stranded rock wool sufficient to obtain the specified acoustic performance and packed under compression to eliminate voids due to vibration and settling. Infill material shall be insect, vermin and moisture proof.

The attenuators shall be manufactured in modules to enable them to be removed and replaced so that major maintenance works can be carried out, and to enable initial installations to be achieved.

The module shall have a rolled steel angle frame and shall be capable of free standing without distortion, sagging or mechanical damage.

Provision shall be made to allow fixing of mechanical and acoustic seals. The module shall be located firmly in the builders work opening.

All attenuators to have double skin casings on all four sides to prevent flanking.

CHP Flue Exhaust Attenuators

Provide attenuation within the exhaust flue system to reduce noise, at source, to the acceptable level of 60 dBA at 3 m from the flue. The CHP flue and exhaust attenuator to outside the acoustic enclosure, for connection shall be extended by the flue Installer.

Locate attenuation within the CHP Room.

Louvres

Project Co. shall liaise with the louvre manufacturer/supplier to ensure that their scheme takes full consideration of the louvres being provided. Project Co. Project Co. shall ensure that the fans provided with the CHP package are able to overcome the pressure drop through the louvres. Project Co. shall ensure that the CHP system, including noise generated velocity, pressure drop and noise, by or through the louvres, meets the design criteria.

7.3 Heating

The CHP units shall be used to generate low temperature hot water.

The CHP unit shall be connected in parallel and be piped to serve the Energy Centre.

The CHP units shall act as the lead boiler and feed the LTHW into the Primary Return header.

Circulation/shunt pumps shall be provided for the CHP unit to suit the flow rate and pressure drop into the LTHW system. The pumps shall be part of the CHP package and located within the Acoustic Enclosure.

The primary purpose of the CHP is to provide low Temperature Hot Water. In instances where there is insufficient LTHW demand for the boiler systems, then a CHP unit shall switch off and any residual heat shall be dumped via dry air coolers on the roof/wall of the Energy Centre. The dry air coolers are to be provided within the CHP package.

The BMS shall provide the CHP control system with the required LTHW load. The CHP controls system, shall modulate to ensure that the required load is provided.

The CHP Unit shall be controlled by their own controls system to provide a constant 85 °C flow.

Whilst the output from the CHP unit shall be modulated by the CHP controls system varying the speed of the unit's engine, the CHP pumps shall also be inverter driven. This is to allow the output from the unit to be modulated between 50 and 100%.

The CHP Unit shall be provided with a duplicate *variable flow* circulating pump set to circulate water through its associated CHP Unit and to the Primary LTHW header. A motorised valve on the inlet to the CHP Unit shall close when the CHP Unit is not enabled to run. Upon receiving an enable signal the valve shall open and auxiliary contact on the valve shall then enable the CHP Unit pump to run. Upon CHP Unit shut down the duty pump shall be run only when the CHP Unit is signalled to run by the sequence controller. The CHP Unit pump set shall be monitored by differential pressure switches.

The CHP unit shall be interlocked with the CHP pumps.

The design return temperature for the return to the CHP is 75 °C. Should the temperature rise above 80 °C then a three port heat dump control valve shall open to divert some of the water around the roof/wall mounted dry air coolers, until the return water temperature to the CHP units has been reduced back to 75 °C. The control of the dry air units themselves shall be by the CHP control system. The fans on the dry air coolers shall modulate to reject the unwanted heat.

The CHP *tenderer shall advise of any limitations with regards the maximum number of 'starts' over a 24 hour period.*

Each CHP unit shall have its own integral safety controls and high temperature lock out thermostats.

The temperature differences shall be adjustable to permit flexibility of operation during commissioning and general use.

The operational sequence shall allow all the control set points to be adjusted in line with the common boiler system flow temperature, as it is modulated relative to the building loads. *The operational sequence set points shall be interlocked with the CHP set points so that the performance of the CHP is not inhibited.*

When a CHP is shut down by the control system, water shall continue to pass through the CHP unit for a period of time (variable) to dissipate stored heat, at which point the CHP pump shall shut down and the motorised valve close.

Any fault that prevents the CHP from operating shall be raised as a high priority alarm.

The CHP controls shall also monitor the gas safety valve circuit.

The CHP, boilers and primary heating system shall all operate on a 24-hour continuous basis and therefore shall not be time clock controlled.

The CHP controls shall monitor the time operation of the CHP and the software shall include pump sequencing on an hours run basis.

In the event of a mains power failure, the controls shall arrange for the CHP system to restart immediately on power restoration. The CHP controls shall, by communicating with the ENMS and by monitoring of the electrical power supply and standby generators, be aware that the original shut down was not a plant fault and be ready for a sequence re-start.

In maintenance mode only the CHP shall operate on their own integral thermostats, under manual switches, but with all safety features in place to provide emergency usage in case of a BMS or controls fault.

The CHP controls shall monitor the inlet gas pressure and/or a failure of pressure, raise alarm and shut down the CHP.

The Specialist shall supply and install a common gas pressure sensor within the circuit serving the CHP units to detect loss of gas supply.

In the event of the CHP controls system monitoring a gas fault on the unit and the common gas pressure sensor signalling the required pressure, the CHP system shall automatically shut down the CHP unit.

The Specialist shall provide flue temperature sensors to monitor the temperature of flue gases within the CHP flue.

The following shall be provided by the CHP Controls system, for monitoring by the BMS:

- Grid voltage.
- CHP generator voltage.
- Grid frequency.
- CHP generator frequency.
- Synchroscope.
- Ammeter
- KWH meter.
- Engine tachometer.
- LTHW Flow Temperature
- LTHW Return Temperature
- kWhrs being dumped via the Dry Air Cooler heat rejection system
- Heat Rejection Flow Temperature
- Heat Rejection Return Temperature

7.4 Base Frames

The base frame of the CHP units shall be fabricated from mild steel sections and designed to carry and distribute the weight of all the components, without undue distortion or deflection, both when in use or in transit. The base shall be complete with all necessary holding down points, jacking points and lifting points. A suitable paint finish shall be applied at works to the whole of base frame.

All dynamic components mounted on the base frame, i.e. engine, shall be complete with anti-vibration mountings.

The engine shall be fitted with torsional damping to minimise dynamic vibration.

The complete unit shall be mounted on an inertia base designed, supplied and installed by .

Project Co. shall also identify the floor loadings required for the replacement of major plant items, e.g. alternator.

7.5 Engines

The packaged CHP set engine shall be of proven design specifically intended for static industrial power generation, with low operating stresses and an anticipated life in excess of 20 years. All wearing components such as bearings, valves, seats, pistons etc. shall be replaceable and readily available.

The engine shall be suitable for use with natural gas and shall be supplied complete with all necessary control valves, safety valves, low pressure cut off valves, and safety valve test and gas purge points as required by the design and shall not be less than those required to comply with all aspects of British Gas Publications including IGE/UP/3. All connections to the engine shall have flexible connections to stop vibration being transmitted to other equipment. The engine shall be complete with a pressurised oil lubrication system, cooling system complete with pump and all necessary controls to avoid damage due to overheating or oil pressure failure.

The engine fuel control system shall maintain the air fuel rates to the engine within the flammability level of natural gas under all load conditions.

The units shall be low Nox type to achieve Nox emissions of less than 500mg/m^3 (at 5% oxygen).

7.6 Primary Fuel Supply

The fuel supply to the CHP unit will be natural gas at a pressure of approx. 65 mbar.

Facility shall be provided on the engine for the connection of the gas supply.

The fuel supply pipework shall be brought within the CHP plant room by others. Final pipework runs and connection shall be by . This shall include flexible connections to prevent damage due to engine set vibration.

Flexible connections shall be in accordance with the Code of Practice for Natural Gas Fueled Engines, British Gas IGE/UP/3:

1. A length of flexible pipe shall be incorporated in the gas supply to the engine to isolate any vibration, whilst being as short as is practicable.

2. The flexible pipe shall be sited downstream of at least one of the safety shut-off valves.

3. The flexible pipe shall be of metal reinforced and preferably armoured construction, suitable for continuous use at 3.5 Bar (50 psi) or three times the working pressure, whichever is the greater.

4. The flexible pipe shall be able to withstand engine suction without sustaining damage.

5. The flexible pipe shall be installed in a position where it shall not be weakened by heat from the engine system.

6. The flexible pipe shall be installed so that it is not subjected to tension, torque or other forces likely to cause damage.

7. Adequate means shall be provided for sensitive test for gas tightness of the flexible pipe and its connections. Full consideration shall be given so as to ensure that leakage tests can be performed frequently as part of the scheduled maintenance procedure of the plant.

7.7 Heat Recovery

Heat recovery from the CHP set is to provide low temperature hot water.

The packaged CHP set shall be complete with on-set heat exchangers for heat recovery from the various circuits. The exchangers will be complete with all associated pumps, pipework, controls, sensors, etc to provide a complete fully functioning system, suitable for connection to the external heat recovery/rejection systems detailed elsewhere in this specification.

7.8 Exhaust Systems

The Tender shall be inclusive of the design of the exhaust system from the CHP set. This shall include exhaust gas heat exchanger, attenuation and exhaust. shall work with the specialist providing the flue exhaust. Project Co. shall provide the exhaust system, including silencers to the centre core wall. The flue specialist shall provide the flue from the centre core wall (on the side within the plantroom) to the termination point on the external flue/chimney arrangement.

Project Co. shall be responsible for the design of the whole exhaust systems installation. This shall include ensuring that the back pressure of the total exhaust system, exhaust gas heat exchanger, silencers, exhaust ductwork/pipework are within acceptable limits for the CHP engine.

The internal exhaust shall be run using thermally insulated and metal-clad mild steel tube exhaust system.

Project Co. shall include for the supply and installation of all associated exhaust system components including silencers, hanger supports, expansion compensators, drain points, explosion relief panels, flame quenching devices etc.

The number and type of silencers shall be determined from the noise criteria stated for the plant both internally and at relevant site boundaries as noted below.

It shall also be ’s responsibility to ensure that the whole of the exhaust installation is suitable for the range of temperatures and conditions applicable to the operation of their plant.

The whole of the engine exhaust system silencers and any flexible exhaust connections fitted to absorb engine vibrations shall be of sufficient strength to withstand the effects of sudden internal pressure rises such as those caused by back firing.

To reduce heat loss from the exhaust, excessive heat gain into the plant area and provide safe surface temperatures, the exhaust system is to be insulated throughout.

Project Co. shall therefore include in the Tender for insulating the engine exhaust system, including silencer(s) provided with the CHP unit.

The insulation including the silencer to be clad with plain finish Aluzinc sheet and the surface temperature of this cladding shall be below 50°C in accordance with BS.3316.

7.9 CHP Heat Dump Facilities

At some site part load conditions, it may be necessary to dump heat from the CHP plant in order to eject residual unwanted heat from the system. To allow this to take place a heat dump facility shall be provided by via a roof/ wall mounted dry air cooler.

The allowance is for a total of 300 kW of heat to be rejected via a dry air cooler, which accounts for 50% of the CHP unit heat.

Auxiliary cooling circuits shall include all fans, pumps, pipework and controls etc. to enable continuous plant operation. Where the pipework is external, it is to be fitted with trace heating.

Project Co. shall verify that this is sufficient for their needs, prior to finalising their design and/or starting manufacture.

7.10 Lifting Facilities

Project Co. shall include for the provision of lifting facilities, as required for the maintenance of the plant. Lifting beams shall be certified with maximum safe working loadings in accordance with statutory regulations will be provided by others.

7.11 Access Platforms and Ladders

Project Co. shall provide platforms and ladders to enable safe working access to all parts of the plant and particularly high level equipment. All platforms and ladders shall comply with the requirements of:-

BS.4592
BS.5395
BS.5950
BS.3049
BS.4211
and all other relevant codes of practices.

7.12 Oil Tanks

Project Co. shall provide an appropriately sized clean lubrication oil tank and similar dirty oil tank. This shall include automatic pumping facilities and all interconnecting pipework and controls. Each tank shall be double skinned, so as to have its own bund, in order to meet the latest requirements of the Scottish Environmental Protection Agency Oil Storage Regulations.

8.0 ELECTRICAL

8.1 Outline for Electrical System

The CHP unit shall normally run in parallel with main incoming MV supply to the Hospital. If either side (A or B) of the Hospital's 11000V systems are being supplied from the Hospitals standby generators then the CHP unit will normally be disconnected from the 11000V distribution systems and shut-down. The CHP unit shall not operate when the standby generators are in operation.

If the electrical load of the hospital is reduced to the level where the CHP unit is in danger of exporting power above the agreed threshold to the SPEN network the CHP, will be automatically ramped down and if necessary isolated. To achieve this it will be necessary to link the CHP controls to the BMS energy metering of the incoming supplies and set a level which individual CHP's are isolated.

The control of the MV circuit breaker through which the CHP unit connects to the MV site distribution systems shall be controlled by both the CHP control systems and the Electrical Network Managements Systems (ENMS). These controls/interfaces shall:-

- Ensure the CHP's neutral earthing resistor is in circuit while the CHP run up to speed and synchronise with the busbar voltage is then switched out of circuit as the CHP is paralleled onto the bus bar.
- The CHP MV circuit breaker (on the Energy Centre MV panels) cannot be closed unless both:-
    - The CHP controls signal the CHP is synchronised with the bus-bar voltage

The low voltage connections required for the CHP enclosure lighting and small power, battery chargers etc will be derived from the 400V 50z Three phase, Neutral and Earth systems serving the Energy Centre.

8.2 Wiring on Engine/Generator Unit

All wiring shall be:-

Carried out with LSF cable suitably bushed and having stranded copper conductors of adequate mechanical strength and current carrying capacity, with a minimum of 1.5mm² csa.

Adequately supported and protected from accidental damage, properly installed and terminated in suitable terminal boxes with flexible connections. Special arrangements are to be made where wiring is subject to movement and vibration.

Segregated for different voltages and where necessary to avoid `pick-up' from adjacent wiring.

8.3 Power Cabling and Terminations

All power connections between the CHP set and the switchboard shall be undertaken by . The connections shall be sized to carry all normal operating currents and safely withstand all potential fault currents at their point of installation.

Specification of 11 kV Cables

MV cables from the CHP to the 11000V switchpanel shall be XLPE insulated, copper conductors, steel wire armoured with pvc outer sheath to IEC502 and rated at 11000 volts.

The cores of all MV cables shall be permanently marked to indicate phases.

Cable Installation

01. General

New cables shall be installed joint-free.

02. Single Core Cables

Single core cables shall be provided c/w wire armour and copper tape screen.

Single core cables shall be laid in trefoil to reduce magnetic field induced interface.

03. Cable Termination

MV cable glands shall be rated above the prospective fault current of the system to which they are assembled. Glands shall have integral earth lugs to which equibonding copper strip shall connect to the main earth bar.

MV cable boxes shall be made of fabricated steel and air insulated termination up to 11kV. Spacing between terminals shall conform to BS 4999/145 and IEC standards for the rated voltage.

All MV terminations and terminating cable tails shall be encapsulated in heat shrinkable insulation rated at the cable voltage. Heat shrinkable insulation shall be guaranteed by a reputable manufacturer.

Terminations shall be permanently marked to indicate phasing. The far and near ends of cables shall be tested by continuity meter to confirm correct phase rotation.

04. Single Core Cables

Single core cables shall be glanded at non-magentic gland plates.

On long runs of single core cables insulated terminating glands shall be used.

The open circuit induced voltage between cable armour and earth shall not exceed 25 volts when full load current flows in the cable.

8.4 Earthing Systems

The whole of the electrical systems shall be earthed and bonded to accord with the requirements of BS 7430, BS 7671 and Scottish Power Energy Networks (SPEN). The requirements for this are interpreted onto the drawings accompanying this specification.

Under mains supply conditions the systems shall rely on SPEN's earth.

Under standby generator only conditions when all standby generators are operating in parallel the systems shall be earthed to one generator's neutral via the appropriate neutral earthing panel and its MV resister.

When the standby generator systems are operating as two 'unparalleled groups, each group shall be earthed to separate standby generators via each groups neutral earthing panel.

The CHP unit shall, however be provided with suitable Neutral Earthing facilities to enable it to be run to speed and tested off line.

The neutral earthing panels shall be equipped with a spare/paralleled circuit earth resister in a separate compartment such that one can be removed while the other is in use.

The CHP's neutral earthing shall be controlled by the CHP.

Two sets of earthing rods shall be provided to form a connection for the MV system to the general mass of earth. These shall each comprise a minimum of 4 No parallel earth electrodes driven to depth of 4.8m and contained in concrete inspection chambers. The minimum resistance to earth of each set of earth electrodes is 1 Ohm. Where this is not achieved then either additional earth rods shall be installed or the installed units shall be driven deeper.

The CHP unit shall not operate in isolation of the mains or the generators, except for testing purposes. For clarification the CHP unit shall not operate in island mode.

9.0 CONTROLS

9.1 Automatic Controls

The Controls for the CHP shall comply with the BMS specifications.

The complete electrical controls system for the CHP set shall be designed, supplied and installed by . The Controls for the CHP shall interface seamlessly with the Building Management System in all areas of monitoring and Control. The controls shall be open protocol.

A control panels shall be provided, at the end of the CHP unit to control the CHP, with a further panel to both co-ordinate the operation of the CHP unit and to communicate with the BMS. Selected information, set points, controls strategies, *maintenance mode* etc. that can be viewed and changed at the CHP panels shall also be viewed and changed at the BMS end.

All panels shall be manufactured and finished to the same specification to form a uniform suite.

The CHP set control panel suite shall comprise separately identifiable sections to provide the following functions:-

(a) Mains circuit breaker section.
(b) MCC section.

(c) Controls section.
(d) Battery panel.

Note: The MV circuit breaker will be located in the MV switchboard.

Synchronisation with site operating from REC supply.

The site shall be connected with the local REC grid through the CHP supplier automatic circuit breaker. Circuit breakers connecting CHP generators with the site medium voltage system will be open. Generators will not be running.

The CHP set is started and run up to speed set point. Automatic synchronising equipment shall govern the generator voltage, frequency, and phase until they match the grid parameters. All conditions shall be ensured prior to automatic synchronising equipment closing the generator circuit breaker.

Sequence of events when the set is running in synchronisation with grid

The CHP is planned to provide supply to a base load and operate only in parallel with the local public network. The unit shall shut off in the event of loss of mains, and shall not normally operate while the emergency generators are running. It is intended, however that the CHP shall operate when the generators are being tested.

Protection relays in compliance with the requirements of G59.2 shall be provided on the 11000Volt circuit breakers.

Excess electricity shall not be exported to the grid above the agreed limit. The CHP Controls shall adjust the electrical power output to avoid export above the agreed limit of power to the REC grid.

9.2 11000V Isolator

Voltage	11,000 V
Bus Bar Rating	630 A
Rated Short-Time Withstand Current	25 kA for _ seconds
Maximum Ambient	40°C

9.3 Motor Control Centre

The CHP unit shall be provided with an MCC panel located on the outside of the unit.

All major motor loads shall be controlled and protected through a Motor Control Centre (MCC). The MCC shall be dedicated to control motors and LV electrical loads associated with the CHP set only.

All motor gear shall be grouped into a Motor Control Centre which shall comprise of form 3b type 2 of enclosure to BS EN 60439-1&2.

The MCC shall be capable of withstanding short circuit currents of 50kA - (35MVA at 400V for one second) ASTA certified to BS.EN 60439-1&2.

Where an Installer cannot comply with this Standard, he must clearly state his intended deviation at the tendering stage.

The electrical symbols used in the circuit diagrams are to be to British Standards.
Final reproducible copies of circuit diagrams and layout drawings shall be submitted after satisfactory commissioning.

Busbars

The busbar system shall be manufactured from hard or medium hard drawn high conductivity copper, including the auxiliary busbars.

The bars shall be rigidly supported by insulators of a high electrical and mechanical strength suitable for the withstand values specified.

Any access plates to the busbar chamber should be suitably marked with appropriate warning labels and when any such access plate is removed, it should reveal busbars suitably marked with phase colours and labels “L1”, “L2” and “L3”.

The busbar system shall not contain any internal interconnecting or outgoing cabling.

Main Isolator

A main isolator shall be provided in the MCC. The isolator shall be capable of interrupting the total stalled motor current from the MCC without deterioration.

The isolator shall be interlocked with the panel door and shall have facilities to padlock it in the `off' position.

The incoming supply shall terminate directly onto the main isolating device. Termination points shall be fully shrouded and suitably labelled.

Separate ammeter and voltmeters shall be fitted to the door of the incoming isolator. Both meters shall be operated through phase selector switches.

Enclosure

Enclosures shall be of the floor mounting, free standing, flush- fronted, cubicle type.

The enclosure shall comply with a minimum degree of protection, IP54 and be suitably designed to exclude vermin.

Enclosures shall be constructed from mild steel plate (unless conditions/environments dictate otherwise) with a minimum thickness of 2mm (14 SWG).

All metalwork to be degreased, rust-proofed and stoved to match all other control panels.
Access to the enclosure interior is to be via hinged front opening doors.

All gland plates to be provided.

Components and Wiring

Components mounted on baseplates must be removable from the front of the compartments. Baseplates also must be removable.

The minimum flexible wire inside the compartment shall be 1.5mm^2.

All wires to be numbered at both terminal and contactor/relay/ fuse, etc. ends.

Ring type of markers only shall be used.

All conductors shall be identified by colours as follows:-

Earth Conductors	-	Green/Yellow	
Power Circuits	-	400 Volt	
		Phase:	Brown / Black / Grey
		Neutral:	Blue
AC and DC Control Circuits	-	as IEE wiring regulations	

9.4 Motor Control Compartments

Each starter to include:-

* Triple pole fuse switch with auxiliary contacts and provision for padlocking "Off".

* Triple pole contactors with auxiliary contacts.

* Thermal overload unit with "single phase" protection - internally reset.

* Control circuit fuses.

* Terminals to be SAK 4 minimum size manufactured from polyamide material.

Please note that selection switch manual/automatic to be via a HMI (Human Machine Interface).

Start and stop push buttons to be via a HMI (Human Machine Interface).

Where there are no external/remote requirements, the control voltage to be 230V.

Where remote pieces of equipment are used such as external push button stations/limit switches, etc., then the control voltage must be 110V AC or less, obtainable from a double wound safety isolating transformer with an earthed screen. The control transformer to be used shall be fused on both sides of the primary and the switched side of the secondary with a removable link fitted into the common line.

Earthing

A main earth bar shall be provided fitted along the whole length of the MCC.

This bar shall be of adequate cross-sectional area and manufactured from hard or medium hard drawn high conductivity copper.

The completed MCC shall be efficiently bonded together and to the main earth bar.

Each door shall have a flexible earth braid to main metal framework to provide earth continuity between housing and door.

Identification

Each compartment door shall carry an engraved identification label.

The MCC manufacturers label shall contain the following information:-

(a) Name or trademark, type, designation, serial number, date of manufacture

(b) Type of protection of enclosure

(c) The electrical system characteristics - maximum load, rates supply/control voltage, etc

(d) Rated currents of the busbar system

(e) Short circuit rating

The manufacturer shall provide certificates of tests complied with in accordance with the relevant British Standard (BS.EN 60439-1&2).

9.5 Controls Section

General

The system shall allow full control and supervision of all operation plant parameters.

The control system shall:-

- Monitor and control the engine via an engine management system.
- Monitor and control the generator voltage, frequency and phase.
- Activate automatic synchronisation following operator initiation.
- Activate alarms, shutdown plant and warn remotely stationed plant supervisors.

It is highlighted that automatic synchronisation followed by normal parallel running with the grid is required.

Engine Management System

The engine management system shall comprise of an encased dedicated electronic control system. Signals shall be transmitted from sensors located on the engine and compared with programmed control parameters to maintain performance.

Any abnormal parameters shall initiate an alarm which shall be transmitted to the main Controller. If necessary the engine shall be shutdown in a controlled manner.

All monitored signals shall be retransmitted into the Controller for onward transmission and display on the monitoring system.

Generator Control

Generator parameters shall be monitored and controlled to enable synchronisation and parallel operation with the grid. Protection relays shall prevent electrical faults causing damage to the system by opening the generator circuit breaker.

Voltage Regulator

Voltage regulation shall be solid state with the engine governing within the limits specified in BS 150 3046-1, Class A1, and satisfy the Grade 2 requirements specified hereunder.

GRADE 2

a. At any balanced load between zero and rated load and at any load power factor from 0.8 lagging to unity and at any normal service condition temperature, the output voltage is to lie between the limits of plus or minus 2.5% of rated value.

b. On suddenly increasing the load from zero to 60% rated value the initial voltage dip is not to exceed 15% of rated value and recover to at least 97% of rated value within 0.5 seconds.

Voltage Wave Forms

A sine wave shape voltage waveform within the permitted limits of BS 4999 Part 140 and BS 5000 Part 3 shall be maintained.

Frequency Control

The output frequency from the generator shall be monitored and maintained within +/- 0.5% of 50Hz.

Automatic Synchronising

An automatic synchroniser shall be installed to adjust the generator frequency. When the generator frequency matches the grid frequency and both are in phase the CHP set shall be connected to the grid. A signal shall be transmitted from the generator controls to close the CHP set circuit breaker.

Automatic synchronising shall be achieved through the electronic engine governor. The generator AVR shall match generator voltage with grid voltage during automatic synchronising.

Controllers

General

The control/monitoring of the plant and CHP shall be by industry standard Controllers with an open protocol. Each shall have separate battery supported UPS.

A common manufacturer shall be utilised throughout the project.

Tenderers must state clearly the make and type of controllers proposed, detailing the input and output units, i.e. electrical characteristics and function, etc. and where appropriate the optional facilities programmed into the Controller.

(a) Enclosure

Each MCC shall incorporate a controller(s) in a separate cubicle. A separate controller, within a panel shall be provided as an interface between the BMS and the individual CHP units.

(b) Electrical Supply

A 230V dedicated supply shall be used for mains operation. A label shall be provided as the point of supply to warn personnel that a controller is fed from this circuit.

A separate transformer within each panel shall be used to supply:-

(i) The central processor, power supply unit, programme panel and peripheral equipment outlets.

(ii) The input and output circuits.

Transformer (i) shall be of the constant voltage type and shall be fed from the live side of the mains supply via an internally mounted, fully shrouded main incoming isolator.

Transformer (ii) shall be fed from the “dead” side of the main incoming isolator via its own I/O isolator. This allows separate isolation of the I/O circuits whilst still retaining power to the central processor.

A twin RCCD 30mA protected 240V 3 pin socket outlet shall be supplied and mounted adjacent to the main central processor.

(c) Mains Isolation

Mains isolation shall be provided. The isolator shall provide isolation for all circuits with the exception of the internal lamp and heater and a warning notice shall be displayed to warn that these circuits remain alive even when the main isolator is open. A notice shall also be displayed to state where the supply is taken from. The isolator must be mounted inside the panel to ensure that it can only be operated with the door open.

(d) Power Supplies

DC output modules shall be operated on a 24V dc system. The dc voltage must be derived from within the control panel by means of a stabilised and smoothed dc power supply with constant current capabilities.

Special attention must be given to the rating of the power supply to ensure that the input/output loadings, together with a 25% spare capacity, can be supplied by the power supply.

(e) Surge Protection Device

A surge protection device shall be installed on the power supply to the control panel.

The surge protection device shall be configured to protect the PLC and power supply against overvoltage resulting from a lightning strike and/or mains switching.

The device shall be capable of reducing an 11,000 volt transient down to a value less than 400 volts.

(f) Micro Processor Based Controllers

The controls shall fail safe. All safety interlocks critical to plant operation shall be augmented by hard wired equipment independent of the controller. Upon failure of the controller or power supply safety interlocks shall safely shutdown the plant and raise alarms.

The controller shall have the following minimum features:-

(i) Modular construction for ease of expansion

(ii) Software from an industry standard manufacturer

(iii) EEPROM or battery back-up of software

(iv) Programming via an IBM compatible computer

(g) I/O System

Remote input/output devices shall only be used to reduce the complexity of the electrical installation on large systems.

I/O control circuits shall be protected with a cartridge fuse in the line conductor and a link in the neutral. Whenever an I/O control supply is taken from the Controller enclosure it shall be individually fused. Fused terminals shall be utilised. Discrimination shall ensure that the terminal fuse is first to blow in the event of a fault.

(h) System Capacity

The tenderer shall ensure that there is spare capacity or space to expand the number of inputs, outputs, terminals and programme lines by not less than 10% on each PLC. All spare inputs and outputs shall be wired to terminals.

(i) *Operator Interface*

The operator interface shall comprise of an industrial standard colour graphics display. Multiple screens for plant functions shall be selectable via membrane function keys.

Each display screen shall provide time information on all engine, generator, and auxiliary systems. Trend and historical information shall be recorded for a maximum of 8000 hours operation. Downloading facilities onto an external data storage medium shall be included.

Any alarms shall be recorded, with identification and type. Historical alarms shall be held in memory and up to a maximum of 300 no. alarms shall be retained.

(j) *Instrumentation*

Instrumentation shall be provided on the control panel for each CHP set. On each set this shall be provided via a Human/Machine Interface, as follows:

Double volt meter and phase selector switch indicating:-

(i) Grid voltage.
(ii) CHP generator voltage.

Double frequency meter indicating:-

(i) Grid frequency.
(ii) CHP generator frequency.

Synchroscope.

Ammeter phase selector switch.

KWH meter.

Engine tachometer.

Power factor meter and phase selector switch.

(k) Controls

The following operators shall be provided on the control panel for each CHP set.

(i) Engine start push button.

(ii) Engine stop push button.

(iii) Initiate automatic synchronisation push button.

(iv) Alarm mute push button.

(l) Indicating Lamps

The following indicating devices shall be provided on the control panel for each CHP set:-

(i) Alarm lamp.

(ii) Alarm sounder.

(iii) Automatic synchronisation initiated.

(iv) Generator synchronised.

(m) *External Control Systems*

Items of plant external to the CHP set shall effect operation of the CHP set. The signals will comprise of single pole volt free contacts.

Signals shall be:-

(i) Gas safety valve closed.

This shall shut down the engine and isolate the CHP set.

(ii) Remote emergency stop.

This shall shut down the engine and isolate the CHP set.

(iv) Readiness signal for synchronisation with the grid.

9.6 Battery Panel

A regulated DC power supply shall be provided to operate controls for the CHP set. A battery shall maintain the DC voltage during transient interruptions to the incoming power supply.

D.C power supply, batteries and battery charger shall be housed in a separate ventilated cubicle. The cubicle shall be installed with other CHP set control panels and shall be similarly constructed providing a uniform suite of panels.

The battery shall comprise of nickel cadmium cells in ventilated plastic containers, all interconnected. Battery charge shall be maintained through a float charger operated to maximise battery life and minimise maintenance. The battery panel shall be provided with an ammeter and voltmeter to monitor the battery output. A `power on' lamp shall indicate that the battery panel is live.

Wiring between the battery panel and control circuits shall be adequately sized. Maximum resistance limits of cable to permit normal operation of solenoids, relays, contactors etc shall not be exceeded.

9.7 Common Controls Section

A common control panel shall be provided as an interface between the BMS, ENMS and the CHP unit and therefore to select control regimes for the CHP set. Also the panel shall provide overall supervising control of the CHP set and switchgear signals.

The common controls section shall have the following control switches:

(a) Normal Operation/Back Synchronisation (selector switch spring return) to select the system from normal operation to provide control over the G59 circuit breaker. CHP sets will automatically synchronise with the grid. When the site voltage, frequency and phase match the grid the G59.2 circuit breaker will be automatically closed.

(b) Double volt meter via Human/machine interface and phase selector switch indicating

(i) Grid voltage

(ii) Site voltage (CHP set)

(c) Double frequency meter (via Human/machine interface) indicating:-

(i) Grid frequency

(ii) Site frequency (CHP set)

(d) Synchroscope

(e) An automatic circuit breaker will be provided by others under a separate contract. Sensors and signals are included on the circuit breakers as detailed below:-

1. Circuit voltage transformer
2. Busbar voltage transformer
3. Circuit current transformer
4. Busbar current transformer
5. Circuit breaker open - volt free contact (vfc).
6. Circuit breaker closed - vfc.
7. Circuit breaker opened on fault - vfc.
8. Circuit breaker opened manually - vfc.

(f) The common controls section of the CHP panel shall perform synchronisation between the site and the grid. To achieve synchronisation control of the main circuit breaker linking site and grid is required. When the site voltage, phase, and frequency are equal the circuit breaker can be closed.

The common control panel section shall contain `volt free' contacts wired to a terminal strip as listed below:-

Each volt free contact set shall comprise of 230 volt, 5 amp rated changeover contacts with all poles cabled to terminals.

(i) Close circuit breaker.
(ii) Open circuit breaker.

10.0 TESTING, COMMISSIONING AND HANDOVER

10.1 Testing and Commissioning

Project Co. shall be responsible for the complete testing and commissioning of the CHP plant, equipment and installations to prove safe and reliable operation, compliance with statutory requirements and compliance with stated plant performance criteria, including the good quality CHP index.

The testing and commissioning shall include off site testing of individual major plant items, e.g. engine or generator skid units, which shall, at the discretion of the Client, be witnessed by the Client or his representatives. *The test should include a start-up from cold conditions, a period of running (including basic response to controls), and a shutdown of the equipment. During the running period, measurement of fuel input and power output may be carried out.*

Project Co. shall include within the tender for the full commissioning of the complete CHP plant installations and all associated costs including all travelling, engineers' time, service parts, lubricants, coolants etc.

Commissioning of the CHP Plant shall also prove compliance with this specification in terms of equipment performance and with the manufacturers stated performance criteria.

All plant control and Instrumentation shall be subjected to comprehensive proof testing. Tests shall be conducted to ensure that each auxillary plant control and Instrumentation package provides the correct signal outputs to, and correctly responds to commands from, other auxillary plant packages, and the integrated Energy Centre System/Building Management System.

Project Co. shall conduct works and site testing to the point where they are able to provide documentary evidence that each system, including those associated with services provided by others, together with the interfaces between them, function correctly before the equipment is set to work.

Initial site testing shall be carried out once all the equipment has been assembled into a functioning CHP plant and the electrical and heat connections have been made. These tests shall demonstrate that individual plant items, and the entire CHP plant, are able to perform satisfactorily under the appropriate range of conditions.

Project Co. shall make allowance for seasonal commissioning by the CHP supplier when they shall be required to fine tune and prove the controls and integration of the system. This shall be carried in the winter, summer and mid-season after handover.

Project Co. shall allow the Client, with reasonable notice to witness all testing, both at works and on site.

10.2 Fuel for Commissioning

Project Co. shall indicate the expected fuel consumption in the tender.

10.3 Reliability and Performance Running

Following the satisfactory completion of site testing and commissioning and the provision of commissioning results, information and instruction of the Purchaser's staff, the complete CHP plant installation shall be continuously operated for a period of 14 days, during which time it shall have trouble and fault free operation before it is considered to be practically complete. The unit shall be deemed to be acceptable when it can be run for three consecutive 8 hour continuous shifts with an operating time of over 95% of the 24 hours, i.e. max 1.2 hours down time in all.

Performance testing shall be carried out in conjunction with the above reliability running, and is intended to demonstrate that the CHP plant achieves the guaranteed performance levels. The parameters covered shall be:

- Electrical and heat outputs.
- Fuel consumption.
- Electrical consumption by plant auxiliaries.
- Noise.
- Exhaust emissions.

The performance testing shall demonstrate that the plant meets the specified performance parameters over a period of three days.

Should the plant fail these performance tests, the Board will be required to make good the plant deficiencies and repeat the tests. The defects shall be rectified and the plant retested to meet the specified performance.

10.4 Plant Instruction

Project Co. shall include within the tender for the post commissioning instruction of the Client's staff/representatives. The plant instruction shall as a minimum, enable the Purchaser's staff to:-

(a) Satisfactorily carry out the Purchaser's plant housekeeping role as defined in the contract maintenance agreement.

(b) Overview the safety of the plant operation and respond (if present) to any emergency situations.

(c) The plant instruction shall be carried out over a minimum of 2 sessions and the training shall include a review of the final operating & maintenance instructions.

10.5 On-Site Static Pre-Commissioning Checks

Static pre-commissioning checks shall take place only after the installation of all services, connections and ancillary items are complete. This may require completion of works by others.

The static pre-commissioning checks shall be witnessed by the Purchaser or his nominated representative.

The plant pre-commissioning shall include, but not be limited to confirmation that the following are complete and can be put into service:-

(a) Fuel systems are complete, commissioned in accordance with statutory requirements and are ready for use.

(b) Exhaust systems are complete throughout and are gas tight.

(c) Medium voltage cabling to site has been tested and terminated at both ends.

(d) Satisfactory test certificates and results shall be available for medium voltage systems. This shall include proof that all medium voltage cables have undergone a successful pressure test.

(e) All low voltage cabling shall be tested for continuity, insulation resistance, and correct termination.

(f) Noise and set vibration levels shall be measured and recorded.

(g) All control and signal cabling shall be tested for continuity and insulation resistance. shall confirm that all cable cores are located in the correct terminals. Cable types shall be cross checked against the manufacturers schedule to ensure that the correct types are installed.

(h) Project Co. shall liaise with other Boards to confirm that all protection relays on the main site circuit breakers are fully functional.

(i) Dump radiator systems, pumps, pipework, etc are fully complete, tested, flushed out and filled with correct coolant and are ready to put into service.

(j) Lubrication systems are complete, tested and ready to put into service.

(k) All pumps, fans etc have been checked for correct rotation and are ready to put into service.

Static pre-commissioning checks must be satisfactorily completed and witnessed before dynamic commissioning can commence.

10.6 On-Site Dynamic Commissioning & Setting to Work

Dynamic commissioning and setting to work of the plant shall only take place following satisfactory completion of pre-commissioning checks on the complete CHP installation.

The dynamic testing, commissioning and setting to work of the plant shall be witnessed by the Client or his nominated representative and shall be satisfactorily completed, prior to reliability running of the plant.

The dynamic testing and commissioning shall prove the safe, reliable performance of the plant, compliance with stated performance criteria and guaranteed values and shall include, but not be limited to the following:-

(a) The engines shall be cranked and ignition system checked.

(b) The engine management systems shall be modulated and monitored to confirm engine speed control is stable.

(c) All safety and operational interlocks shall be tripped in turn to confirm control actions over engines.

(d) The engines shall be run for an extended period followed by checks to confirm no oil, water or cooling fluid leaks from the installations.

(e) Operation, interlocks and rotation of all motors shall be confirmed.

(f) The generator voltages and frequencies shall be measured and recorded.

(g) Operation of all plant items including dump radiators and cooling circuits shall be checked for satisfactory performance.

(h) The process of automatic synchronisation shall be checked prior to initiation of full synchronisation procedure.

(i) Project Co. shall arrange and co-ordinate testing of protection relays with the Purchaser and the REC. Tests shall confirm the generators protection complies with the requirements of the Electricity Supply Regulations (1988), the requirements of Engineering Recommendation G59/2, G53, G75 and P28 and Engineering Technical Report 113. Following approval from the REC Project Co. shall synchronise the CHP generator with the Grid.

10.7 Efficiency Testing

Efficiency testing of the CHP plant installation shall be carried out after all dynamic testing, commissioning and adjustment of the plant has been satisfactorily completed.

The efficiency tests shall be witnessed by the Client or his nominated representative and shall prove compliance with the stated plant performance criteria and guaranteed values.

Project Co. shall include for the provision of all materials, test equipment and skilled operatives to carry out the tests, which shall include but not be limited to:-

(a) Generator electrical output

(b) Generator and plant electrical parasitic losses, including all ancillaries at full load operation.

(c) Fuel consumption of the engine

(d) Thermal output/hot water production of exhaust gas, oil, water and other heat exchangers.

10.8 Maintenance

The manufacturer shall include for all required maintenance tasks throughout the period between installation and handover of the system to the Client. For dates and time periods reference should be made to the construction programme.

RHSC and DCN EDINBURGH
ABOVE GROUND FOUL DRAINAGE SYSTEM

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by Project Co.,

To carry out the development of the design, Project Co. shall obtain the necessary supporting documentation.

This specification relates to the Above Ground Foul Drainage Systems serving the RHSC-DCN Building and the adjacent Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 3,

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to, the following:-

- Above ground sanitation installation

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Below Ground/Basement/Slab Drainage
- Drainage Sumps and Pumps
- Rainwater Drainage Systems
- Gullies in Ground and Basement Slab
- Sanitary Schedules

4.0 INTERFACES AND DEMARCATIONS

The above ground foul drainage system shall comprise of the pipework system from (& including) the joint to the appliance outlet of the sanitary fitment/appliance (specified by others), to (& including) the connection to the above ground foul drainage system and in-slab/in-ground drainage system. The above ground foul drainage system shall also incorporate all plantroom gullies with the exception of the gullies in the ground and basement slabs which shall be included in the below ground drainage package.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The above ground foul drainage installation shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards and Building Regulations.

6.0 DESIGN CRITERIA

The above ground foul drainage system shall be based on a secondary ventilated system as described within BS EN 12056: Part 2. The system shall be based on the discharge unit method. Discharge unit values as listed under system III, table 2 shall be used with the following frequency factors:-

- Congested usage, for toilet areas, etc, as used by the public; k=1.0
- Frequent usage, for all other areas, etc, k=0.7
- Intermittent usage, for toilet areas within office areas, etc; k=0.5

The chemical above ground drainage system shall be based on a secondary ventilated system as described within BS EN 12056: Part 2. The system shall be based on the discharge unit method. Discharge unit values as listed under system III, table 2 shall be used with the following frequency factor:-

- Frequent usage, k=0.7

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of Parts A, B and C of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Trust's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Specialist Installers. Project Co. shall liaise with other parties as necessary to ensure that all interfaces between the above ground sanitation pipework installation and other systems are allowed for.

Any other member of the Project and Board teams concerned with planning administration of the Above Ground Foul Drainage System.

8.0 SYSTEM DESCRIPTION

This Specification is intended to cover the works involved in the above ground sanitation, chemical drainage installations, and contaminated (radioactive) waste discharge.

Above Ground Foul Drainage System

Foul drainage shall be collected from the sanitary fittings, equipment and outlets, by a system of vertical and horizontal pipework distributed within the building, to connect to the in-slab/underground drainage system.

The system shall be configured to permit foul solid and liquid waste materials to pass uninterrupted from the point of collection, i.e. from the sanitary appliance/fitting etc, to a point of discharge at ground floor level. At this level the soil and waste above ground drainage system shall discharge to the below ground drainage system. Drainage from the basement area shall connect to drainage sumps/ pumps provided in the below ground drainage.

The above ground foul drainage system shall comprise of the pipework system from (& including) the joint to the appliance outlet of the sanitary fitment/appliance (specified by others), to (& including) the connection to the above ground foul drainage system and in-slab/in-ground drainage system. The above ground foul drainage system shall also incorporate all plantroom gullies excluding gullies in ground and basement level slab.

A ventilated soil and waste system shall be provided, i.e. main soil stacks and anti-syphon ventilation stacks.

The above ground foul drainage system 'ventilation and anti-syphon pipework' shall be uPVC. Fire collars shall be installed on uPVC pipework above 40mm diameter where passing through fire barriers and in accordance with Building Regulations.

Air admittance valves shall not be used.

Insulation (for acoustic purposes) to main vertical soil and waste stacks and horizontal soil and waste branches, within ceiling voids, shall be provided on all pipework that passes through sensitive areas of the building, e.g. consulting rooms, meeting rooms and other quiet or noise sensitive areas, etc. Acoustic insulation shall be Isol Acoustic Wrap by Geberit or equal and approved, and to suit the Acoustic Consultant's requirements and strategy.

Condensate drainage shall be connected to the foul drainage discharge stacks via a trapped tundish connection.

Drainage Sump Pumps

Separate drainage sump pumps shall be provided by the structural engineer in the basement to handle the discharges from the following areas:

Main tank room: Water overflow/ drain down from storage tanks.
Sprinkler tank room: Sprinkler test drain sump.
Basement kitchen and FM accommodation: Sanitary discharges.
Heat Stations: Hot water safety discharges and drain down.

All pump sets shall be in duplicate and sanitary pump sets shall be ventilated to the above ground foul drainage system.

All pumped discharges shall rise separately and connect to the external drainage system.

Above Ground Chemical Drainage System

A separate dedicated above ground gravity chemical drainage system shall be provided for this building. The above ground chemical drainage system shall not interconnect with the above ground foul drainage system or radioactive waste system at any point.

Chemical drainage shall be collected by a system of vertical and horizontal pipework distributed within the building, to connect to the in-slab/underground drainage system.

The system shall be configured to permit chemical liquid waste materials to pass uninterrupted from the point of collection, i.e. from the appliance/fitting etc, to a point of discharge at ground floor. At this level the chemical above ground drainage system shall discharge to the below ground drainage system.

A ventilated chemical above ground drainage system(s) shall be provided, i.e. main waste stacks and anti-siphon ventilation stacks.

The above ground chemical drainage system shall comprise of the pipework system from (and including) the joint to the appliance outlet of the sanitary fitment/appliance (specified and installed by others), to (and including) the connection to the above ground chemical drainage system and in-slab/in-ground drainage system.

The above ground chemical drainage system shall be all polypropylene or HDPE to best suit the discharge. Confirmation shall be obtained from the pipework manufacturer of the suitability of the pipework material with the discharges to drain.

Air admittance valves shall not be permitted within any part of the above ground chemical drainage system.

Insulation (for acoustic purposes, on non-metallic pipes) to main vertical chemical waste stacks and horizontal chemical waste branches, within ceiling voids, shall be provided on all pipework that passes through sensitive areas of the building, e.g. consulting rooms, meeting rooms and other quiet or noise sensitive areas, etc. Acoustic insulation shall be Isol Acoustic Wrap by Geberit or equal and approved and to suit the Acoustic Consultant's requirements and strategy.

Above Ground Radioactive Drainage System

A separate dedicated above ground gravity radioactive drainage system shall be provided for this building. The above ground radioactive drainage system shall not interconnect with the above ground foul drainage system or chemical waste system at any point.

Radioactive drainage shall be collected by a system of vertical and horizontal pipework distributed within the building, to connect to the in-slab/underground drainage system.

The system shall be configured to permit radioactive liquid waste materials to pass uninterrupted from the point of collection, i.e. from the appliance/fitting etc, to a point of discharge at ground floor. At this level the radioactive above ground drainage system shall discharge to the below ground drainage system.

A ventilated chemical above ground drainage system(s) shall be provided, i.e. main waste stacks and anti-siphon ventilation stacks.

The above ground chemical drainage system shall comprise of the pipework system from (and including) the joint to the appliance outlet of the sanitary fitment/appliance (specified and installed by others), to (and including) the connection to the above ground radioactive drainage system and in-slab/in-ground drainage system.

The above ground radioactive drainage system shall be all polypropylene or HDPE to best suit the discharge. Confirmation shall be obtained from the pipework manufacturer of the suitability of the pipework material with the discharges to drain.

Air admittance valves shall not be permitted within any part of the above ground chemical drainage system.

Insulation (for acoustic purposes, on non-metallic pipes) to main vertical radioactive waste stacks and horizontal chemical waste branches, within ceiling voids, shall be provided on all pipework that passes through sensitive areas of the building, e.g. consulting rooms, meeting rooms and other quiet or noise sensitive areas, etc. Acoustic insulation shall be Isol Acoustic Wrap by Geberit or equal and approved and to suit the Acoustic Consultant's requirements and strategy.

General design considerations

Head of drain vent(s) shall be provided. This head of drain vent(s) shall connect from the in-slab/underground drainage system and pass up through the building to terminate to atmosphere at roof level or via a public health plenum at plantroom level.

All soil and waste pipework located within ceiling voids shall be a minimum diameter of 50 mm.

Pipework for gravity condensate drains shall be a minimum of 20mm diameter.

Access points shall be provided on all discharge stacks on each floor level above flood level of adjacent appliances.

Rodding access points shall be provided above the flood level of the appliance being served.

Rodding access shall be provided on all ground floor and basement connections to the below slab drainage.

Soil branch pipework at low level shall be in uPVC with fire collars where passing through fire barriers.

Waste branch pipework shall be in MUPVC. HDPE for chemical and radioactive.

Stub stacks shall be provided with rodding access located above the flood level of the appliance being served.

Individual stub stacks shall be in uPVC.

The in-slab basement and ground floor drainage shall be by the below slab drainage engineer including all sumps and pumps.

The detail of all pipework passing through the basement retaining walls shall be by the structural engineer.

Material and Workmanship Clauses

R11 Above ground foul drainage systems

ABOVE GROUND FOUL DRAINAGE SYSTEMS

GENERAL

The sanitation pipework system shall comply with Scottish Building Regulations and BS EN 12056:2.

The above ground foul drainage will be collected from sanitary fittings, equipment and outlets, by a system of vertical and horizontal pipework distributed within the building, to connect to the below ground drainage system. It will be a gravity discharge ventilated soil and waste system, i.e. main soil stacks and anti-siphon ventilation stacks. Pipework will generally be concealed within modular sanitary panels and ceiling voids. Rodding access for pipework will be provided at the floor being served and not within the ceiling void. Pipes passing through non fire rated walls shall be fitted with pipe sleeves of the same material as the pipe and of such a diameter to allow a minimum clearance for the free movement of the pipe.

When pipes are passing through a fire wall the sleeves shall comply with fire regulation and the requirement of the fire officer and building control. Soil and waste connections on the ground floor will connect directly into the below ground drainage via stub stacks with vent pipes to upper floors where required. The upper floors will have a system of soil and waste stacks and vent pipework.

Project Co. shall include for liaison with:-

- Health and Safety Professionals
- The Board.
- Other Specialist Installers.
- The Trust.
- The Architect

Project Co. shall confirm that the holes indicated on the structural engineer's drawings are incorporated on their installation drawings.

Provision for access to the full bore soil/waste and laboratory (chemical) stack access door points, thorough the wall structure, e.g. plasterboard or similar, shall be provided. The size of these access hatches shall be 300 mm x 300 mm in size, positioned centrally to the soil/waste stack, and laboratory (chemical) drainage access door. The setting out of these above ground soil/waste, and laboratory (chemical) drainage, access hatches is the responsibility of the Architect.

The in-slab/underground drainage system, including all drain connection points, shall be the responsibility of the Structural/Below Ground Drainage Engineer.

115 ABOVE GROUND FOUL DRAINAGE SYSTEM

- Sanitary and floor drainage outlets:

An above ground gravity foul drainage system shall be provided for this building with an exception of the basement which shall be pumped.

The system shall be designed to maintain the highest standards of public and environmental health.

The above ground foul drainage system shall comprise of the pipework system from (& including) the joint to the appliance outlet of the sanitary fitment/appliance (specified by others), to (& including) the connection to the above ground foul drainage system and in-slab/in-ground drainage system. The above ground foul drainage system shall also incorporate all plantroom gullies above basement and ground floor levels.

The Board shall be responsible for availing himself of the details of the sanitary fitments/appliances and the installed in-slab/in-ground drainage system, and provide appropriate adaptors/connectors to connect to same.

Nuclear medicine, endoscope washers and chemical sinks shall all have polypropylene waste pipes. Chemical and radioactive drainage shall have separate stacks from general domestic soil and waste water drainage in the above ground drainage system and will discharge into the below ground drainage. Chemical and radioactive discharges will not be retained in any form of storage.

Access points (full bore) for cleaning will be provided on all discharge stacks.

They typically will be at 1200 mm above finished floor level on each floor and will be aligned with the architectural access provision.

Soil and vent pipes shall commonly terminate to atmosphere at 300mm above finished roof level with a domical cage terminal and 1m above and 3m away from any building opening.

Rodding access points shall be provided above the flood level of the appliance being served.

Access on ground floor stub stacks will be by means of top-mounted, full bore, cleaning eyes. A ventilated soil and waste system shall be provided, i.e. main soil stacks and anti-syphon ventilation stacks.

Changes in direction of all soil and waste pipework shall be carried out using 2 No. 45 degree fittings. Air admittance valves shall not be used.

Stub stacks shall be provided with rodding access located above the flood level of the appliance being served.

- Waste pipework: To suit system type.
- Discharge stack and branch pipework: To suit system type.
- Separate ventilating pipework: To suit system type.
- Accessories: See drawings for details.
- Disposal: To below ground drainage.

SYSTEM PERFORMANCE

As part of the development of the co-ordinated working drawings Project Co. shall prepare general arrangement drawings of the above ground sanitation and internal rainwater pipework installations based on the Architect's base drawings and coordinated with other services and building elements. A proposed drawing list shall be submitted with the tender. Insulation (for acoustic purposes) to main vertical soil and waste stacks and horizontal soil and waste branches, within ceiling voids, shall be provided on all pipework that passes through sensitive areas of the building, e.g. consulting rooms, meeting rooms and other quiet or noise sensitive areas, and to suit the Acoustic Consultant's requirements and strategy.

Where exposed to view waste pipework and traps shall be white. Traps used on small bore sanitary appliances, e.g. sinks, wash hand basins, etc, shall be provided with a 75mm deep seal trap. Where chemical or radioactive wastes are installed, Identification labels shall be applied at a maximum of 3m intervals identifying the service- _Chemical Drainage or Radioactive Drainage, along with appropriate hazchem labels.

220 COLLECTION AND DISTRIBUTION OF FOUL WATER

- General: Quick, quiet and complete, self-cleansing in normal use, without blockage, crossflow, backfall, leakage, odours, noise nuisance or risk to health.
- Pressure fluctuations in pipework (maximum): ±38 mm water gauge.
- Water seal retained in traps (minimum): 25 mm.

310 FLOOR CHANNELS Install floor channels as indicated on drawings

- Manufacturer: Blucher
  - Product reference: As drawings
- Floor finish: As Architects schedules.
- Body type As schedule.
  - Material: Stainless steel.
- Sizes: As drawings
- Type of fall: Built in fall.
- Grating/ cover:
  - Loading: Heavy wheeled traffic.
  - Material: Stainless steel, screw fixed.
- Accessories: As drawings

315 FLOOR DRAINS Install floor drains as indicated on drawings

- Manufacturer: Saint Gobain
  - Product reference: As drawings
- Floor finish: As Architects schedule.
- Body type: P-trapped.
  - Material: Nickel bronze, satin finish.
- Grating/ cover:
  - Type: Flat.
  - Material: Antislip mesh.
- Outlet: Type and direction to suit pipework
- Accessories: As drawings

340 COPPER PIPEWORK Copper pipework shall be used for very hot liquid outlets and as detailed on drawings. Where uPVC pipework runs through noise sensitive areas the pipe shall be enclosed to reduce noise nuisance.

- Standard: To BS EN 1057, Kitemark certified.
  - Temper: Half hard R250.
  - Nominal wall thickness: 1.2 mm.
- Nominal outside diameters: As detailed on drawings.
- Brackets: Brass clips.
  - Fixings: To suit location.

  Size: to suit pipework.
- Accessories: Rodding eyes as per specification and drawings.

345A HDPE PIPEWORK For chemical and radioactive waste from laboratories, both hot and cold.

- Standard: To BS EN 1519-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Sizes: As drawings.
- Brackets: Pipe supports and support distances shall be as manufactures recommendations.
  - Fixings: Pipe supports and support distances shall be as manufactures recommendations.

  Size: Pipe supports and support distances shall be as manufactures recommendations.
- Accessories: As drawings.

355 POLYPROPYLENE PIPEWORK

All components shall have been designed and manufactured specifically for the safe conveyance and containment of laboratory and chemical waste, both hot and cold.

Pipes and fittings shall be manufactured in an environment compliant with and certified in accordance with BS EN ISO 9001:2008 and/or NSF-61.

Pipes and fittings shall meet the performance requirements as detailed within ASTM-F1412, the international standard specification for polyolefin pipes and fittings for corrosive waste applications.

Pipes and fittings shall be capable of safely conveying and containing chemical and corrosive waste drainage under continuous working conditions operating at temperatures from minus 20ºC to +110ºC and at temperatures up to +130ºC for intermittent use. Pipes and fittings shall be tested and meet the mechanical and chemical resistance requirements of ASTM-F1412. The system shall be suitable for use within domestic, commercial and public buildings in accordance with the requirements of BS EN 12056-2:2000 for the conveyance and discharge of chemical waste, domestic drainage and sewage as is permitted by current legislation and Water Industry Acts. The system shall have been tested in accordance with the current BS EN standards as accepted within the UK and Europe.

Pipes and fittings to be manufactured from heat stabilised co-polymer polypropylene. Pipes shall be clearly marked Chemical Pipe and include manufacturers trade name designated size and production reference number for traceability. Pipe shall have a ring stiffness of >8kNm2 and meet the mechanical requirements of EN1451 (plastic piping systems for soil and water discharge, low and high temperature, within the building structure).

Fittings to be manufactured from heat stabilised co-polymer polypropylene, using virgin material. Fittings shall be clearly marked with the manufacturers name and designated size. Fittings shall be capable of being jointed by fusion welding. Pipes and fittings shall meet the chemical resistance requirements of ASTM-D4101.

Pipes and fittings to be manufactured from flame retardant heat stabilised co-polymer polypropylene, and shall meet the requirements for ASTM-4101 of PP0210 B55042 giving a UL-94 V-2 rating.

Pipes and fittings shall be fusion jointed. The electrofusion joint shall be made using an electrofusion welder. Permanent electrofusion shall be installed for inaccessible and high risk areas.

The pipework system shall have Metric to Inch size transition fittings available.

The installation shall be carried out to the manufacture recommendations

The installation Board shall provide technical documentation relating to the same and shall have received training with regards to the correct installation procedure.

The completed system should be tested for leaks in accordance with BS EN 12056-2:2000.

The Board shall give due allowance for expansion/contraction in the installation of the drain system.

- Standard:
  - To BS EN 12056-Part 2 and Kitemark certified; or
  - To BS EN 1451-1 and Kitemark certified.

  Application area code: B.
  Opening dimensions of access fittings, design of swept fittings, stand off dimensions of pipe and fitting brackets and requirements for adaptors and plugs: To BS EN 1329-1
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Nominal sizes: As drawings.
- Colour: The pipework should be of a colour to alarm the fact that it is chemical waste.
- Brackets: Pipe supports and support distances shall be as manufactures recommendations.
  - Fixings: Pipe supports and support distances shall be as manufactures recommendations.

  Size: Pipe supports and support distances shall be as manufactures recommendations.
- Accessories: As drawings.

365 PVC-U PIPEWORK Jointing is by solvent welding. Where uPVC pipework runs through noise sensitive areas the pipe shall be enclosed to reduce noise nuisance.

- Standard: To BS EN 1329-1, Kitemark certified.
  - Weather resistance, connectors to WC pans, opening dimensions of access fittings, design of swept fittings, stand off dimensions of pipe and fitting brackets and requirements for adaptors and plugs: To BS 4514.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Nominal size: As drawing.
- Colour: Manufactures standard.
- Brackets: Manufactures standard.
  - Fixings: Manufactures standard.

  Size: Manufactures standard.
- Accessories: As drawings.

380 GREASE TRAPS AND CONVERTERS (BY KITCHEN INSTALLER)

383 INSULATION TO INTERNAL PIPELINE

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: As acoustic consultant.
- Thermal conductivity (maximum): As acoustic consultant.
- Thickness: As acoustic consultant.
- Fire performance: Class 1 spread of flame when tested to BS 476-7 or Class CL to BS EN 13501-1.

390 RODDING EYES Rodding access points shall be provided above the flood level of the appliance being served and to BS EN 12056.

- Manufacturer: As pipework.
  - Product reference: As pipework.
- Body material: As pipework.
- Cover type: As manufactures standard.
- Cover material: As pipework.

400 PAINT FOR CUT ENDS OF CAST IRON PIPES

- Manufacturer: As BS EN 12056.
  - Product reference: As BS EN 12056.

EXECUTION

- All above ground and drainage systems shall be tested the satisfaction of the Local Authority as determined by the Building inspector.
- Prior to concealment by suspended ceilings, duct covers, partition cladding etc
- On completion of the whole installation
- On completion of all work, including that of trades

601 INSTALLATION GENERALLY

- Standard: To BS EN 12056-5.
- Components: From the same manufacturer for each type of pipework.
- Electrolytic corrosion: Avoid contact between dissimilar metals where corrosion may occur.
- Plastics and galvanized steel pipes: Do not bend.
- Allowance for thermal and building movement: Provide and maintain clearance as fixing and jointing proceeds.
- Concealed or inaccessible surfaces: Decorate before starting work specified in this section.

- Protection:
  - Purpose made temporary caps: Fit to prevent ingress of debris.
  - Access covers, cleaning eyes and blanking plates: Fit as the work proceeds.

605 PIPE ROUTES

- General: The shortest practical, with as few bends as possible.
  - Bends in wet portion of soil stacks: Not permitted.
  - Routes not shown on drawings: Submit proposals before commencing work.

610 FIXING PIPEWORK

- Pipework: Fix securely plumb and/ or true to line. Fix discharge stack pipes at or close below socket collar or coupling.
- Branches and low gradient sections: Fix with uniform and adequate falls to drain efficiently.
- Externally socketed pipes and fittings: Fix with sockets facing upstream.
- Additional supports: Provide as necessary to support junctions and changes in direction.
- Vertical pipes: Provide a load bearing support not less than every storey level. Tighten fixings as work proceeds so that every storey is self supporting.
- Wall and floor penetrations: Isolate pipework from structure, e.g. with pipe sleeves.
  - Masking plates: Fix at penetrations if visible in the finished work.
- Expansion joint sockets: Fix rigidly to the building.
- Fixings: Allow the pipe to slide.

625 JOINTING FLOOR CHANNELS

- Jointing: Silicone sealant.

630 JOINTING PIPEWORK - GENERALLY

- General: Joint with materials, fittings and techniques that will make effective and durable connections.
- Jointing differing pipework systems: With adaptors intended for the purpose.
- Cut ends of pipes: Clean and square. Remove burrs and swarf. Chamfer pipe ends before inserting into ring seal sockets.
- Jointing or mating surfaces: Clean and, where necessary, lubricate immediately before assembly.
- Junctions: Form with fittings intended for the purpose.
- Jointing material: Do not allow it to project into bore of pipes and fittings.
- Surplus flux, solvent jointing materials and cement: Remove from joints.

650 JOINTING PIPEWORK - COPPER

- Jointing: Integral lead free solder ring capillary fittings:
  - Standard: To BS EN 1254-1, Kitemark certified.
- Connections to appliances and equipment:
  - Compression fittings: To BS EN 1254-2, Kitemark certified.
  - Fittings with threaded ends: To BS EN 1254-4, Kitemark certified.

655 JOINTING PIPEWORK - HDPE AND POLYPROPYLENE

- Jointing: To suite application/Manufactures recommendation.

660 JOINTING PIPEWORK - ABS, MUPVC, PVC-C AND PVC-U

- Jointing: Solvent welded.

675 COATED PIPES

- Cutting: Recoat bare metal.

680 ELECTRICAL CONTINUITY

- Joints in metal pipes with flexible couplings: Make with clips (or suitable standard pipe couplings) supplied for earth bonding by pipework manufacturer to ensure electrical continuity.

685 IDENTIFICATION OF INTERNAL FOUL DRAINAGE PIPEWORK

- Markings: To BS 1710.
  - Type: Black, with arrows to indicate direction of flow.
  - Wording: White lettering 'FOUL DRAINAGE' on a black background.
- Type: Integral lettering on pipe wall, self-adhesive bands or identification clips.
- Locations: At 500 mm centres, junctions and both sides of slabs, valves, appliances, bulkheads and wall penetrations.

695 DISCHARGE AND VENTILATION STACKS

- Terminations: Perforated cover or cage that does not restrict airflow.
  - Material: As stack.

703 FIXING INSULATION TO INTERNAL PIPELINES

- Fixing: Secure and neat. Provide continuity at supports and leave no gaps. Fix split pipe insulation with the split on 'blind' side of pipeline.
  - Method: Waterproof adhesive.
- Timing: Do not fit insulation until completion of pipe airtightness or leakage testing.

705 ACCESS FOR TESTING AND MAINTENANCE

- General: Install pipework with adequate clearance to permit testing, cleaning and maintenance, including painting where necessary.
- Access fittings and rodding eyes: Position to avoid obstruction.

COMPLETION

Project Co. shall protect the system from damage or interference during the works.

Project Co. shall Test, flush and clean the system as per SHTM/HTMs and BS EN 12056

Project Co.’s defects and liability period shall be as the contract prelims.

900 TESTING GENERALLY

- Dates for testing: Give notice.
  - Period of notice (minimum): 5 working days.
- Preparation:
  - Pipework: Securely fixed and free from obstruction and debris.
  - Traps: Filled with clean water.
- Testing:
  - Supply clean water, assistance and apparatus.
  - Do not use smoke to trace leaks.
- Records: Submit a record of tests.

905 PIPEWORK AIRTIGHTNESS TEST

- Preparation:
  - Open ends of pipework: Temporarily seal using plugs.
  - Test apparatus: Connect a 'U' tube water gauge and air pump to pipework via a plug or through trap of an appliance.
- Testing: Pump air into pipework until gauge registers 38 mm.
- Required performance: Pressure of 38 mm is to be maintained without loss for at least three minutes.

910 SIPHONAGE AND BACK PRESSURE TESTS

- Method:
  - WC pans: Test by flushing.
  - Other appliances: Test by filling to overflow level, then removing the plug.
- Number of tests: Test each appliance three times. Recharge traps before each test.
- Self siphonage testing: Test each appliance individually.
- Induced siphonage and back pressure testing: Test by discharging the following numbers of appliances simultaneously on each stack:
  - WCs: In accordance with the code of practice.
  - Washbasins: In accordance with the code of practice.
  - Sinks: In accordance with the code of practice.
  - Selection of appliances: Submit proposals.

915 PREHANDOVER CHECKS

- Temporary caps: Remove.
- Permanent blanking caps, access covers, rodding eyes, floor gratings and the like: Secure complete with fixings.

920 SUBMITTALS

- Manufacturer's instructions for grease traps and manufacturer’s instructions for maintenance of all systems and insert in WW O&M manuals as required.

RHSC and DCN EDINBURGH
RAINWATER DRAINAGE SYSTEM

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by Project Co..

To carry out the development of the design, Project Co. shall obtain the necessary supporting documentation.

This specification relates to the Rainwater Drainage Systems serving the RHSC-DCN Building and the adjacent Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to, the following:-

- Internal rainwater pipework installation

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- External Rainwater Pipework and system.
- Below Ground Drainage Systems
- Above Ground Foul Drainage Systems

4.0 INTERFACES AND DEMARCATIONS

Rainwater outlets at roof level shall be coordinated with the roofing construction. The interface with the below slab surface water drainage shall be at the connection to the ground floor drainage pop-up.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Rainwater Drainage system shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards.

6.0 DESIGN CRITERIA

Design criteria will be based upon BS EN 12056:3-2000.

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of Parts A, B and C of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Trust's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Specialist Installers Project Co. shall liaise with other Specialists as necessary to ensure that all interfaces between the internal rainwater pipework installations and other systems are allowed for.

Building Control, Project Co, shall liaise with and adhere to, the requirements of the Building Control Officer. Any other member of the Project and Board teams concerned with the planning and administration of the Ventilation System.

8.0 SYSTEM DESCRIPTION

INTERNAL RAINWATER PIPE SYSTEM

Surface water shall be collected from roof, balcony and couryard areas by rainwater water outlets connected to a system of vertical and horizontal pipework distributed within the building, to connect to the in-slab/underground surface water drainage system.

The system shall be configured to permit rainwater to pass uninterrupted from the point of collection at roof level to a point of discharge at ground floor level. At this level the rainwater pipe system shall discharge to the below ground drainage system.

The rainwater drainage system shall comprise of the pipework system from and the roof level rainwater outlets, by others, to the connection to the in-slab/in-ground surface water drainage system.

Rainwater outlets shall be specified by the Architect.

The stainless steel pipe shall be socket and spigot push fit pipe and fittings manufactured to EN 1124 Parts 1 & 2 and shall be installed in accordance with the manufacturer's recommendations in order to achieve the pressure ratings required.

The connection between the stainless steel internal rainwater pipes, of 110, 160 and 200mm OD, respectively to the below slab drainage shall be by means of a suitable coupling approved by the engineer, to ensure continuity of the pressure rating of the system.

Where there is any discrepancy between the ODs of the rainwater pipe and the plastic/cast iron drainage pipe an approved metal insert shall be provided to the drain pipe to enable the correct application of the coupling and the integrity of the system.

Insulation against surface condensation shall be provided on all internal rainwater pipes throughout the installation. Insulation shall be pre-formed mineral wool, foil faced matt with taped joints and a vapour seal.

Insulation (for acoustic purposes) to main vertical soil rainwater stacks and horizontal rainwater branches, within ceiling voids, shall be provided on all pipework that passes through sensitive areas of the building, e.g. consulting rooms, meeting rooms and other quiet/sensitive areas, etc. Acoustic insulation shall be Isol Acoustic Wrap by Geberit or equal and approved, and to suit the Acoustic Consultant's requirements and strategy.

There shall be a dedicated rainwater pipe serving the helipad, running from the helipad to the below slab drainage system. This shall connect to the helipad pipework (by helipad specialist) and the connection to the below slab drainage (by the structural engineers). The pipework shall be installed with pressure rated couplings capable of withstanding the maximum head of water possible in the event of blockage in the system.

The detail of pipework passing through the basement retaining walls shall be by the structural engineer.

MATERIAL AND WORKMANSHIP CLAUSES

R10 Rainwater drainage systems

GENERAL

The rainwater drainage system will comply with the relevant clauses of SHTM Scottish Building Regulations, BS EN 12056:3, and the descriptions and requirements set out below.

The Architect is responsible for all rainwater outlets, gutters, hopper heads and external rainwater pipes including their type, size, location, material selection, colours/surface finishes, and method of installation.

The Architect is responsible for the external rainwater pipe interface connection with the below ground/slab surface water drainage connection points.

Roof outlet shall be supplied to all flat, upside-down and green roof areas.

The in-slab/underground drainage system, including all drain connection points, shall be the responsibility of the Structural/Below Ground Drainage Engineer.

110 GRAVITY RAINWATER DRAINAGE SYSTEM

Rainwater outlets: All roof rainwater outlets, with the exception of perimeter outlets, will be of the vertical spigot, anti vortex type to give an enhanced performance. Provisions shall be made for electrical continuity on all internal rainwater pipes and should be tested in accordance with the requirements stipulated within BS EN 877.Access points (full bore) for cleaning will be provided on all rainwater pipes. They typically will be at 1200 mm above finished floor level on each floor as appropriate but especially at ground floor level, and will be aligned with the architectural access provision. A gravity, internal rainwater pipework system shall be provided for this building The system shall be designed to maintain the highest standards of public and environmental health.

Gutters: Guttering shall be part of the Architectural package.
Pipework: External down pipes shall be part of the Architectural package.
Below ground drainage: Underground drainage shall be by the Structural Engineers.
Disposal: To surface water drainage.
Controls: Not applicable.
Accessories: Insulation to internal downpipes.

SYSTEM PERFORMANCE

The design rainfall intensity will be based upon BS EN 12056:3.

221 COLLECTION AND DISTRIBUTION OF RAINWATER

- General: Complete, and without leakage or noise nuisance.

230 DESIGN PARAMETERS - GENERAL

- Roof and gutter construction and finish: The internal rainwater system shall be based upon the flow and pipe diameters given within BS EN12056: Part 3 building envelope design life of 60 years and category 2 protection for valley and parapet gutters providing + storm return period of 90 years shall be adopted.

- Design rate of rainfall: As BS EN 12056-3, National Annex NB.4.
  - Category: 2
- Design life of building: As Architects specification. 60 years.
- Available capacity of existing below ground drainage (maximum): As Structural Engineers specification.

431 STAINLESS STEEL PIPEWORK

- Standard:

All internal rainwater pipes shall be stainless steel to AISI 304 and shall be installed in a manner to withstand 3bar internal pressure within the pipework system for the rainwater pipes serving the Tower Block, and 2bar for all other areas.

The stainless steel pipe shall be socket and spigot push fit pipe and fittings manufactured to EN 1124 Parts 1 & 2 and will be installed in accordance with the manufacturer's recommendations in order to achieve the pressure ratings required.

The connection between the stainless steel internal rainwater pipes, of 110, 160 and 200mm OD, respectively to the below slab drainage will be by means of a pressure rated coupling to ensure continuity of the pressure rating of the system.

Where there is any discrepancy between the ODs of the rainwater pipe and the plastic drainage pipe an approved metal insert shall be provided to the drain pipe to enable the correct application of the coupling and the integrity of the system.

Where it is possible rainwater pipes from outlets will be connected together to reduce the number of connections to the below ground drainage. Rainwater pipes will be positioned where a straight route through the building is possible so minimising offsets.

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Shape: Round.
- Thickness: 1.0 mm.
- Nominal size: 110 mm diameter.
- Sealing rings: EPDM to BS EN 681-1.
- Brackets: To match pipework.
  - Fixings: Stainless steel screws.

  Size: As drawings and schedule.
- Accessories: Access fittings and Insulation.

445 INSULATION TO INTERNAL GUTTERS

- Material: Foil faced mineral fibre.
- Thermal conductivity (maximum): 0.045 W/m"K.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Recycled content: Submit proposals.
- Thickness: To suit guttering.
- Fire performance: Class 1 spread of flame when tested to BS 476-7 or Class CL to BS EN 13501-1.

450 INSULATION TO INTERNAL PIPELINES

- Material: Insulation against surface condensation will be provided on all internal rainwater pipes throughout the installation. Insulation will be pre-formed mineral wool, foil faced matt with taped joints and a vapour seal.
- Thermal conductivity (maximum): 0.045 W/m"K.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Recycled content: Submit proposals.
- Thickness: To suit pipelines.
- Fire performance: Class 1 spread of flame when tested to BS 476-7 or Class CL to BS EN 13501-1.

455 MASKING PLATES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material and finish: Stainless steel.
- Fixing: Raised head screws.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety regulations.

This shall include clean and tidy working and working in confined spaces.

600 PREPARATION

- Work to be completed before commencing work specified in this section:
  - Below ground drainage. Alternatively, make temporary arrangements for dispersal of rainwater without damage or disfigurement of the building fabric and surroundings.
  - Painting of surfaces which will be concealed or inaccessible.

605 INSTALLATION GENERALLY

- Electrolytic corrosion: Avoid contact between dissimilar metals where corrosion may occur.
- Plastics and galvanized steel pipes: Do not bend.
- Allowance for thermal and building movement: Provide and maintain clearance as fixing and jointing proceeds.
- Protection:
  - Fit purpose made temporary caps to prevent ingress of debris.
  - Fit access covers, cleaning eyes and blanking plates as the work proceeds

630 INSTALLING RAINWATER OUTLETS

- Fixing: Secure. Fix before connecting pipework.
  - Method: Rainwater outlet shall be installed to builder’s detail.
- Junctions between outlets and pipework: Accommodate movement in structure and pipework.

635 FIXING PIPEWORK

- Pipework: Fix securely, plumb and/ or true to line.
- Branches and low gradient sections: Fix with uniform and adequate falls to drain efficiently.
- Externally socketed pipes and fittings: Fix with sockets facing upstream.

- Additional supports: Provide as necessary to support junctions and changes in direction.
- Vertical pipes:
  - Provide a load bearing support at least at every storey level.
  - Tighten fixings as work proceeds so that every storey is self supporting.
  - Wedge joints in unsealed metal pipes to prevent rattling.
- Wall and floor penetrations: Isolate pipework from structure.
  - Pipe sleeves: As Section P31.
  - Masking plates: Fix at penetrations if visible in the finished work.
- Expansion joint pipe sockets: Fix rigidly to buildings. Elsewhere, provide brackets and fixings that allow pipes to slide.

640 FIXING VERTICAL PIPEWORK

- Bracket fixings: To suit bracket and pipework.
- Distance between bracket fixing centres up to a maximum of 3000mm but subject to the Manufacturer’s specific fixing instructions.

650 JOINTING PIPEWORK AND GUTTERS

- General: Joint with materials and fittings that will make effective and durable connections.
- Jointing differing pipework and gutter systems: Use adaptors intended for the purpose.
- Cut ends of pipes and gutters: Clean and square. Remove burrs and swarf. Chamfer pipe ends before inserting into ring seal sockets.
- Jointing or mating surfaces: Clean and, where necessary, lubricate immediately before assembly.
- Junctions: Form with fittings intended for the purpose.
- Jointing material: Strike off flush. Do not allow it to project into bore of pipes and fittings.
- Surplus flux, solvent jointing materials and cement: Remove.

655 JOINTING INTERNAL PIPEWORK

- Jointing: The stainless steel pipe will be socket and spigot push fit pipe and fittings manufactured to EN 1124 Parts 1 & 2 and will be installed in accordance with the manufacturer's recommendations in order to achieve the pressure ratings required.

680 FIXING INSULATION TO INTERNAL PIPELINES AND GUTTERS

- Fixing: Secure and neat. Provide continuity at supports and leave no gaps. Fix split pipe insulation with the split on 'blind' side of pipeline.
  - Method: Waterproof adhesive.
- Timing: Do not fit insulation until completion of pipe airtightness or leakage testing.

685 IDENTIFICATION OF INTERNAL RAINWATER PIPEWORK

- Markings: To BS 1710.
  - Type: Black, with arrows to indicate direction of flow.
- Wording: White lettering 'RAINWATER DRAINAGE' on a black background.
- Type: Permanent; integral or painted pipe colour, self-adhesive bands or identification clips.
- Locations: Junctions, both sides of slabs, bulkheads and wall penetrations.

690 ELECTRICAL CONTINUITY - PIPEWORK

- Joints in metal pipes with flexible couplings: Use clips (or suitable standard pipe couplings) supplied for earth bonding by pipework manufacturer to ensure electrical continuity.

700 ACCESS FOR TESTING AND MAINTENANCE

- General: Install pipework and gutters with adequate clearance to permit testing, cleaning and maintenance, including painting where necessary.
- Access fittings and rodding eyes: Position so that they are not obstructed.

COMPLETION

Project Co. shall protect the system from damage or interference during the works.
Project Co. shall Test, flush and clean the system as per SHTM/HTMs and BS EN 12056-2 's defects and liability period shall be as the contract prelims.

900 TESTING GENERALLY

- Dates for testing: Give notice.
  - Period of notice (minimum): 7 days.
- Preparation:
  - Pipework: Complete, securely fixed, free from defects, obstruction and debris before testing.
- Testing:
  - Supply clean water, assistance and apparatus.
  - Do not use smoke to trace leaks.
- Records: Submit a record of tests.

906 INTERNAL PIPEWORK TEST - SCOTLAND

- Standard: To BS EN 12056-2, National annex NG.

915 MAINTENANCE INSTRUCTIONS

- General: Submit to WW O&M system as required, and submit printed instructions recommending procedures for maintenance of the rainwater installation, including full details of recommended inspection, cleaning and repair procedures.

920 IMMEDIATELY BEFORE HANDOVER

- Construction rubbish, debris, swarf, temporary caps and fine dust which may enter the rainwater system: Remove. Do not sweep or flush into the rainwater system.
- Access covers, rodding eyes, outlet gratings and the like: Secure complete with fixings.

1.0 GENERAL INTRODUCTION

Purpose of Document

The procurement, development of the design, manufacture, supply, installation, wiring, setting to work, testing and commissioning of the Works described in this document shall be undertaken by the Mechanical & Electrical Installer, referred to in this document as “”.

To carry out the development of the design, Project Co. Project Co. shall where specified employ the services of a Specialist for particular elements of the Works. The Specialist shall be provided with the necessary.

This Specification relates to the mechanical and electrical services related to the site external services.

This Specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the architectural and civil engineering specifications and drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Gas supply system from incoming meter outlet to entry points to buildings.
- Water supply system, including fire fighting mains from incoming meter outlet to entry points to building.
- MV power installations from 11kV point of connection(s) to entry points to buildings, including control and monitoring.
- LV power site distribution.
- External lighting services.
- Medical gas oxygen pipework duct for pipework installation by others.

- Ducts for BMS for cable installation by others.
- Ducts for security and CCTV systems for cable installation by others.
- Telephone ducts for cable installation by others.
- Data/telecoms ducts for cable installation by others
- FM services low current cable ducts for cable installation by others.
- Provisions for water proofing below ground services penetrations through the structure.

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Existing buried services, including diversions and any temporary and/or enabling works.
- Cabling associated with Specialist's works including: automatic controls & BMS, fire detection and alarm system, security & CCTV, data and telecoms.
- Any works on utility service incoming pipe, meter and the utility owned services.
- Any works in relation to the Scottish Power Energy Networks owned services.
- Any work on existing data and telecom cables.

4.0 INTERFACES AND DEMARCATIONS

The site external services systems shall be provided as complete working systems, however the installation work shall be required to comply with the phasing and sequencing of the site works required by

Project Co. shall provide information to other parties for power supplies and fire alarm system and BMS interfaces.

5.0 APPLICABLE STANDARDS

All elements of the Works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

Underground utilities apparatus shall be positioned and colour coded in accordance with the guidelines issued by The National Joint Utilities Group.

The fire protection systems shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards listed in the SHTM's.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

The gas supply system shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards.

- The gas supply and distribution systems shall comply with the relevant clauses of BS6644,
- IGEM Guidance, Clean Air Act, and descriptions and requirements set out below.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

MV power characteristics: 11000 V, 3-phase, 50 Hz.
LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Gas pressures

Low pressure supply at outlet of meter: 65mbar

Incoming Water Main Pressure

Minimum Water Pressure: 1.0bar

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this Specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist Project Co. shall liaise with other specialist as necessary to ensure that all interfaces are allowed for.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of the site services systems.

Local authority for the disconnection of the public footpath lighting.

Any other member of the project and Hospital Board teams concerned with the planning and administration of the services.

Drawings

This Specification shall be read in conjunction with WW site services drawing No. WW-EW-XX-PL-750-001.

Site Levels

The site levels are indicated on the Architects drawings and the External Civil Engineering drawings.

8.0 SYSTEM DESCRIPTIONS

8.1 Water Supply Service

8.1.1 Site Water Mains

A combined Fire and Domestic water main shall be taken from the Scottish Water main in Craigmillar Castle Road. The main shall be run from this point which provides dual supply to the site boundary by an appropriate accredited installer who will be responsible for the design and instruction.

The supply will be split at the boundary to provide a separate metered 100mØ DI domestic supply and an unmetered 150mm fire main.

8.1.2 Incoming Water Supply

Wholesome water shall be derived from the separate incoming water supply entering the basement tank room. A water meter shall be incorporated on the supply with direct reading and a BMS interface.

8.1.3 Incoming Fire Main Supply

A 150mm unmetered fire main supply shall be taken from the 150mm water supply connection at the boundary.

The 150mm DI fire main shall be run around the RHSC-DCN Building with branches to serve underground hydrants.

The fire hydrants shall be in purpose made chambers below ground in accordance with the requirements of Water for Scotland 2 Edition, and the local Fire Authority and be fitted with a sluice valve. The hydrant cover shall be as required by Strathclyde Fire & Rescue and badged Fire Hydrant.

Fire hydrants shall be located as close as practicable to the fire main, preferably directly above the main to reduce dead leg lengths to an absolute minimum.

8.1.4 Supply to Sprinkler Tank

A 150mm DI branch shall be taken from the external fire main and enter the hospital basement at high level.

The 150mm supply shall be routed into the tank room to serve as a fill supply for the sprinkler tanks. The supply shall be capable of isolation within the tank room and shall be unmetered

8.1.5 Pipework, Installation and Testing

The installation of wholesome water services shall comply with and to the approval of Scottish Water Byelaws.

All pipework for underground installation shall be light weight ductile iron to BS EN 545.

8.2 Gas Supply

The gas supply to the site shall be fed from a twin stream metering assembly operating at low pressure (65mbar), located on the site boundary adjacent to the Old Dalkeith Road.

The meter housing and base for the metering assembly shall be provided by Smart Metering Systems.

The low pressure installation pipe down stream of the metering equipment shall be buried alongside the main entrance roadway to serve pressure regulating equipment and plant located within the Energy Centre.

The boiler plant and CHP plant located within the Energy Centre shall be fed by the low pressure gas supply, thus avoiding the need for individual plant gas boosters.

All individual gas supplies shall be locally sub-metered and provided with pulsed outputs for monitoring by the BMS system.

Pipework

Buried pipework shall be in accordance with the recommendations of the Institute of Gas Engineers and Managers Document IGEM/UP/2 Edition 2. Minimum depth and position in the ground for pipework shall comply with Table 10.

Proprietary plastic warning marker tapes or 150 mm wide mesh shall be laid along the pipe run during backfilling and positioned between 150 mm and to 225 mm below ground level, the tape or mesh to have a stainless steel wire for pipe detection on plastic pipework systems.

All gas distribution pipework shall be installed by Gas Safe Register registered installers in a manner compliant with the requirements of the Gas Safety Regulations and Institute of Gas Engineers and Managers Standards and Recommendations.

Project Co. shall install all underground pipework in gas quality MDPE pipe and fittings and in compliance with the IGEM and pipework manufacturers' recommendations.

A separation of 3000 mm shall be maintained between the MDPE pipework and all buildings. Where this separation cannot be maintained then steel pipework, black heavy weight to BS 1387, shall be installed and double wrapped with self-adhesive plastic tape or petroleum, impregnated woven cloth. Wrapping shall only take place after testing has been successfully carried out and witnessed.

All isolating valves shall be accessed via valve boxes as indicated on the drawings. The valves selected shall be suitable for this method of access.

Project Co. shall ensure that, at the end of each working period, any open pipe end is capped off to prevent the ingress of dirt, dust, water, etc

The pipework shall enter buildings above ground unless otherwise indicated. The pipework material shall change from MDPE to steel as it enters the building.

The Board shall be responsible for purging the section of pipework prior to commencing work.

Upon completion of the installation the services Board shall provide flow rate and pressure readings at all outlets.

8.3 Medical Gases Pipework Duct

For full details of the medical gas requirements refer to separate Specification WW-AP1.2.14 SMcK G1547.

The Board shall construct and install a purpose built ground duct as indicated on the drawings to accommodate the medical gas pipework between the VIE enclosure and the hospital. The pipework shall be designed and installed by the Medical Gases Specialist under a separate contract.

8.4 MV Site Distribution Systems

The information contained in this Specification is for general information only. For full details of the MV installation including the site distribution systems refer to Specification WW-AP1.2.23 SMcK G1547.

Incoming electrical supplies

SPEN are providing two incoming electrical supplies each with a rating of 3MVA. These are to be arranged such that if either fails the other is capable of taking the complete building load at 3MVA.

The incoming MV electrical supplies shall be terminated within the new sub-station located within the energy centre.

General Description

The MV systems shall be required to safely distribute the outputs from the available incoming supplies, MV standby generators, and CHP to the distribution load centres.

The cabling for these circuits shall be buried direct in soft landscapes and drawn into cable ducts and pits under roads, hard standings and extensive paved areas.

The nominal minimum depth for all buried MV cables shall be 1000mm below finished ground level, unless otherwise indicated. Cable route markers shall be installed where practical along the whole route of each cable, and warning tapes and tiles incorporated in the trench for both direct-buried and ducted cables with the exception of the incoming SPEN supplies all MV cabling will be run internally within the Energy Centre and via the service trenches and underground ducts to the main RHSC-DCN building.

Energy Centre and Site Distribution

Details of the site cable routes and the cable routes within the Energy Centre are indicated on the drawings accompanying this Specification.

8.5 LV Services for External Lighting, Signage, Car Park Control & Security – General

Project Co. shall supply and install new feeder pillars as indicated on the drawings and schedules, and shall install permanent sub-main feeds to these.

The road lighting services including the main pedestrian route lighting, for the main site traffic roads to the RHSC-DCN Building and for the main service road around the RHSC-DCN Building, shall be provided and installed under the main external roadway construction package. This lighting including its feeder pillars, controls and final circuitry, has been specified and set out by the Civil Engineer.

External luminaires other than roadway lighting are specified in the Schedule of Luminaires. The types of amenity lighting luminaires have been specified by the Landscape Architect to suit the intent of the external works Masterplan.

External amenity lighting, illuminated signs, fire brigade direction signs and indicators, and any other equipment physically mounted on the RHSC-DCN Building and the Energy Centre shall be provided and installed under the appropriate building design package, and are excluded from this external works package.

External amenity and footpath lighting, illuminated signs, car park barriers, fire brigade direction signs and any other equipment mounted independently from buildings shall be provided and installed under this external works package.

The external lighting, illuminated signs, car park barriers, fire brigade direction signs, bus shelters and any other equipment shall be served from distribution boards installed in LV external lighting feeder pillars, or within buildings and outbuildings. External LV feeder pillars shall be served by LV feeds from the RHSC-DCN Building, as shown on the drawings. These shall all be located generally as indicated on the external works drawings; their precise location co-ordinates shall be given on the Landscape Architect's layout drawings. Any illuminated external signs shall have their lighting connected to a convenient local photocell controlled external lighting circuit.

Where bus shelters incorporate a digital information system, a permanent supply for the display shall be taken from a convenient feeder pillar if no permanently live lighting circuit is available locally. Requirements for such displays shall be identified by the Specialist.

External amenity lighting control shall generally be provided by photocells. Column mounted lighting shall be controlled by photocells integral with the luminaires. Bollard and decorative or indirect lighting which cannot be fitted with individual photocells shall be controlled by photocells mounted on suitable convenient local lighting columns, a suitable dedicated pole on or adjacent the feeder pillar, or on local building fabric, switching the whole circuit via a contactor in the feeder pillar.

Where several circuits from one feeder pillar are to be switched by photocell, a single photocell switching all circuits via a multiple contactor is acceptable. The details of the circuitry are indicated on the drawings and feeder pillar distribution schedules. Each lighting control contactor shall be mounted in the relevant feeder pillar, and shall be suitable for use in that environment. The cables shall be ducted or buried direct, as indicated on the drawings.

LV power supplies for CCTV Cameras shall be taken from local external lighting circuits as required (non contactor switched circuits). The CCTV provisions and the necessary power supply requirements shall be advised by the Security/CCTV Specialist.

8.6 BMS Site Links and FM Services

Ducts and draw-pits for the BMS and Facilities Management (FM) services linking the RHSC-DCN Building and Energy Centre shall be provided around the site. These shall carry the site FM fibre optic backbone link, the BMS site links and any BMS or FM links required to existing buildings off-site. The BMS cabling shall be installed by the controls specialist. Ducts for FM dedicated LV services shall be included. Draw ropes shall be left in the duct system for the use of the Specialist.

The changeover of existing BMS and other FM services serving existing buildings shall be co-ordinated with FM department.

8.7 Telephone Ducts

The telephone cabling shall be provided by the Hospital Board's Telephone Service Provider outside the scope of this Specification. Project Co. shall provide cable ducts to allow the Telephone Service Providers telephone service to be installed to the RHSC-DCN and to provide routes for Telephone Service Provider links with other buildings around the site. The ductwork system is intended to allow diverse routes into the Hospital to enhance system resilience. The duct system shall be as indicated on the drawings.

The drawings indicate the scope and general routes and an allowance for tender purposes for ducts and draw pits for Telephone Service Provider cabling.

Project Co. shall liaise with the Telephone Service Provider and with the Board to finalise the Specification of ducts and draw pits prior to installation to ensure that the cable ways meet the Provider's requirements. In particular the location of the terminal draw pits adjacent the site boundary, and the route of the ducts from it to the RHSC-DCN, shall be agreed with the Telephone Service Provider.

Project Co. shall leave all ducts complete with draw ropes and inspection chambers/draw pits, tested and ready for installation of cables by the Telephone Service Provider.

8.8 Ducts for IT Cabling

The incoming and cross-site IT (data/telecoms) cabling (including any NHS voice communications and internal telephone communication systems) shall be provided by others outside the scope of this Specification. Project Co. shall provide cable ducts to allow the installation of the cabling for these systems. A network of ducts and draw pits shall be provided as indicated on the layout drawing to provide diverse incoming service routes around the site.

The drawings indicate the scope and general routes and an allowance for tender purposes for ducts and draw pits for IT cabling. The Board shall detail draw pits and confirm that the locations shown meet the relevant specialist's cable laying requirements.

Project Co. shall liaise with the Board to finalise the Specification of ducts and draw pits prior to installation to ensure that the cable ways meet the Hospital IT requirements.

Project Co. shall leave all ducts complete with draw ropes and inspection chambers/draw pits, tested and ready for installation of cables.

8.9 CCTV & Security

External CCTV cameras and security systems such as vehicle control barriers shall be installed to cover the car parks, building entrances and approaches. Their locations shall be confirmed by the Security/CCTV System Specialist. Security system ducts shall be provided to serve the cameras located remote from buildings. The LV supplies for cameras shall be derived from permanently live local external lighting circuits or dedicated circuits from feeder pillars as required.

8.10 Remote External Installations

The alarms for the petrol interceptors on the drainage outflow from the car parks shall be provided with indication and alarm facilities. Ducts shall be installed as indicated on the drawings to link these to the security control room in the RHSC-DCN.

The outbuildings for the external medical gas and liquid oxygen (VIE) installations and support facilities shall be provided with an LV supply, telecom/data and alarm/monitoring service duct connections as indicated on the layout drawings.

8.11 Draw Pits

Draw/valve pits shall be provided as indicated on the drawings and constructed to meet the detailed requirements of the structural engineer and in numbers and spacings indicated by and agreed with the specialist services providers. The exact location and cover finish shall be confirmed by the landscape architect, and draw-pits shall be installed to the co-ordinates provided by the Landscape Architect. The locations indicated on the External Services drawings are indicative only.

Any combined Data/Telecoms/LV draw-pits shall be divided to suit the split between Data/Telecoms and LV at each pit. The divider shall provide effective physical segregation between the two services.

8.12 Ducts Generally

Ducts for MV (11kV), LV, ELV/Comms/Data/signals/controls cables shall be of HDPE or equal and approved material, unless specifically stated otherwise elsewhere in this or another Specification.

Any vacant cable ducts shall be left sealed and provided with draw ropes/cords for the use of cable installers.

Where cables have been installed in ducts into buildings, the ducts shall be sealed around the cables to meet the applicable standards appropriate to the services involved.

Multiservices duct systems shall be installed to form the site internal services distribution network as indicated on the drawings. These shall be generally as follows, and shall share sub-divided draw pits where indicated as Site Services on the drawings:

- Comms – Site incoming main fibre optic cable ducts from the site boundaries, providing diverse incoming routes for fibre optic telecoms and data into the Hospital.

  Internal data and telecommunications services (fibre optic/multicore copper as required by Data/Comms Specialist linking the new buildings and the existing estate.

- LV (Low Current) – FM services such as LV/ELV/Security/BMS/Site-wide copper multicore and fibre-optic controls/monitoring as required by the various systems specialist designers.

The purpose of each duct shall be allocated on site according to the services to be installed in each location.

8.13 Colour Coding of Underground Ducted Services

Project Co. shall agree with the Hospital Board a colour coding system that identifies the purpose of each duct. This system shall then be used on site over the re-development process.

The ducts in the combined site data, telecoms and LV system shall be black or another colour agreed with the Hospital Board. Individual service identification shall be provided by paint marking the duct ends in draw pits. Duct service allocation shall be defined by the telecom, data and other specialist services providers.

The following services shall be identified, using colours that are not designated by British Standards for water, gas, oil and other mechanical services.

MV
LV
ELV for security and fire alarms
ELV for communication services
ELV BMS cabling

MATERIALS AND WORKMANSHIP CLAUSES

S10 INCOMING COLD WATER SUPPLY SYSTEMS

110 INCOMING WATER SUPPLY

- Water company: Scottish Water/Business Stream
- Position of incoming mains water supply: As site plan Drawing No. WW-EW-XX-PL-750-001. 1 No. mains supply shall be taken onto the site from the Scottish Water main in Craigmillar Castle Road.

Site water mains shall be installed in accordance with Water for Scotland 2nd Edition and NJUG requirements for utility, apparatus with regards to depth, colour coding, identification markers, and position, and to the requirements of Scottish Water.

Site water mains shall be WRAS approved ductile iron the BS EN 545 complete with anchor gasket joints at all tee-pieces and changes of direction suitable for the site contaminated ground conditions and approved by Scottish Water. All backfill shall be from a clean source.

A leak detection water meter shall be incorporated with direct reading and a BMS interface onto the incoming mains supply at the entry to the site and at point of entry to the basement. All sub meters shall be linked to the BMS. All water meters shall be fitted with isolation valves.

Water connection point to Scottish Water main and the provision of dual supplies are subject to confirmation by Scottish Water.

SYSTEM PERFORMANCE

- The Hot and Cold water supply system shall be install, flushed, cleaned, tested and commissioned as per Water Byelaws SHTMs and HTMs. Where any standards or documents contradict one another Project Co. shall contact the Board for further guidance.

220 COLD WATER SUPPLY

- Incoming mains water supply:
  13. Site factors: One water main from the Scottish Water main in Craigmillar Castle Road.

PRODUCTS

Project Co. shall supply and install services and equipment to perform as per Specification. Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme. Where a particular manufacture is specified, Project Co. shall include for that manufacturer.

Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration. This must be done in a timely manner and Project Co. shall provide all details including but not limited to:

14. detailed description
15. Cost comparison
16. Technical comparison
17. References to standards
18. References to SHTM/HTMs

310 DEZINCIFICATION

- Fittings, pipelines and equipment located below ground or in concealed or inaccessible locations: Resistant to dezincification, e.g. gunmetal.

320 WATER METERS

Water meters shall be installed as indicated on drawings.
Stool pieces between isolating valves shall be provided for the ease of installation of local metering at a later date. Water meters shall be removed during the flushing of the system.

- Standard: To ISO 4064-1.
- Type: In-line meters. Shall be capable of being read by the clients BMS system.
- Size: To suit service.
- Pressure class: To suit service.
- Temperature class: To suit service.
- Metrological class: To suit service.
- Connections: To suit service.
- Indicating device: Type 2 - digital.
- Features: Pulsed output for remote monitoring.
- Accessories: To BS EN 14154-2.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety regulations. This shall include clean and tidy working and working in confined spaces. Due to the size of the water systems being installed all pressure testing and commissioning equipment shall be cleaned and chlorinated before each use. This is to prevent the systems from being contaminated with pseudomonas.

620 INSTALLATION GENERALLY

- Installation: To BS EN 806 + BS 8558 and Water Byelaws
- Performance: Free from leaks and the audible effects of expansion, vibration and water hammer.
- Fixing of equipment, components and accessories: Fix securely, parallel or perpendicular to the structure of the building.
- Preparation: Immediately before installing tanks and cisterns on a floor or platform, clear the surface completely of debris and projections.

- Corrosion resistance: In locations where moisture is present or may occur, avoid contact between dissimilar metals by use of suitable washers, gaskets, and the like.

630 INSTALLING WATER METERS

- Standards: To BS EN 14154-2.
- Interconnection to Building Management System (BMS): Required.

COMPLETION

Project Co. shall protect the system from damage or interference during the works. shall Test, flush and clean the system as per section Y12, Y50,SHTM/HTM's and TR/20.
Project Co. shall submit O&M's as required by The Board
Project Co. shall provide training as per section Y12, Y40 & Y50.
Project Co. shall provide spares as per section Y12, Y40 & Y50.
Project Co's. defects and liability period shall be as the contract prelims.

910 HYDRAULIC PRESSURE TESTING OF HOT AND COLD WATER SUPPLY SYSTEMS

- Standard: To BS 6700.
- Notice (minimum): 1 week.
- Pressure: 1.5 times working pressure.
- Duration of test: 1 h.

980 DOCUMENTATION

- Manufacturers' operating and maintenance instructions: Submit for equipment and controls.
- System operating and maintenance instructions: Submit for the system as a whole giving optimum settings for controls.
- Record drawings: Submit drawings showing the location of circuits and operating controls.

990 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
- Keys: Supply keys for valves and vents.

995 MAINTENANCE

- Servicing and maintenance: Undertake.
  19. Duration: Until 24 months after Practical Completion.

S32 NATURAL GAS SUPPLY SYSTEMS

110 INCOMING GAS SUPPLY

- Gas transporter: Medium pressure main.
- Gas supplier: Smart Metering Systems (UK Gas Connection).

PRODUCTS

All elements of the work shall be in accordance with the requirements of current legislation, regulations and industry standards.

The natural gas installation shall also comply to the SHTM's, code of practices and relevant British standards.

A proposed drawing list shall be submitted by .

Project Co. shall provide working drawings for the installation and issue them for comment before work commences.

310 SECONDARY GAS METERS

Secondary gas meters shall be installed as detailed on drawing and in this Specification. Gas meters shall be installed with isolation valves for maintenance.

- Standard:
  - Gas meters: To BS EN 1359.
  - Unions and adaptors: To BS 746.
  - Low pressure meters: In accordance with IGEM/GM/6.
  - Electrical connections: In accordance with IGEM/GM/7A & B.

- Project Co. shall submit technical details of the proposed meter.
- Accessories: Pulsed output for BMS monitoring.
- Housing type: To suit gas meter type.

330 LOW PRESSURE GAS SUPPLY PIPELINES

Over ground pipes 15 mm to 50 mm nominal size inclusive (internal) shall be Black mild steel to BS1307 heavyweight grade, screwed fittings if installed in a ventilated space, otherwise fully welded. Over ground pipes greater than 50mm shall be Black mild steel to BS1387 heavyweight grade welded throughout its length. All above ground natural gas pipe shall be painted yellow ochre.

- Standards: To BS EN 1775 and in accordance with IGEM/UP/2.
- Materials: Steel, heavy weight.

335 INDUSTRIAL GAS SUPPLY PIPELINES

- Standards: In accordance with IGEM/UP/2.
  - Up to and including 0.5 bar: To BS EN 1775.
  - From 0.5 bar up to 60 bar: To EN 15001-1.

- Material: Indoor above ground shall be Black mild steel to BS1387 heavyweight grade welded throughout its length and painted yellow ochre, Underground pipe shall be yellow medium density polyethylene thick wall pipes (PE80).
- Jointing method: Steel pipe wielded throughout its length, Fusion jointing of polyethylene.

400 SAFETY AND CONTROL DEVICES

- Standard: To BS EN 13611.

410 BALL VALVES, MANUALLY OPERATED

Valve shall be suitable for type of gas pipe in which they are installed.
- Standard: To BS EN 331.
- Type: Lever operated.
- Manufacturer: Project Co. choice.
  Product reference: Project Co. choice.
- Material: Bronze or dezincification resistant brass (DZR).
- Connections: Threaded.

420 PLUG VALVES, CAST IRON

Valve shall be suitable for medium pressure gas main.
- Standard: To BS 5158.
- Type: Regular.
- Manufacturer: Project Co. choice.
  - Product reference: Project Co. choice.
- Connections: To suit pipework.
- Options: Wrench.

425 PLUG VALVES, STEEL

Valve shall be suitable for medium pressure gas main.
- Standard: To BS 5353.
- Type: Regular.
- Manufacturer: Project Co. choice.
  - Product reference: Project Co. choice.
- Connections: To suit size of pipework.

430 PLUG VALVES, TAPER

Valve shall be suitable for type of gas pipe in which they are installed.
- Standard: To BS 1552.
- Type: Project Co. choice.
- Manufacturer: Project Co. choice.
  - Product reference: Project Co. choice.
- Material: Dezincification resistant brass (DZR) copper alloy
- Connections: Threaded.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety regulations. This shall include clean and tidy working and working in confined spaces.

620 INSTALLATION GENERALLY

Installation: In accordance with IGEM/UP/10.

625 GAS SAFE REGISTRATION REQUIREMENTS

- Type of service: Non-domestic.
- Type of gas: Natural gas.
- Area of work:

The installation, testing and commissioning of the natural gas system shall be undertaken by a registered installer. A copy of the installer's certificate shall be attached to the test and commissioning documents.

630 INSTALLING GAS METERS

Secondary gas meters:
- Low pressure: In accordance with BS 6400-1.
- Medium pressure: In accordance with BS 6400-2.
- Non-domestic: In accordance with IGEM/GM/8.

650 INSTALLING GAS PIPELINES

- Installation: In accordance with BS EN 1775.

660 INSTALLING INDUSTRIAL GAS PIPELINES

- Standard: In accordance with EN 15001-1.

COMPLETION

Project Co. shall protect the system from damage or interference during the works.
Project Co. shall submit O&M's.
Project Co's. defects and liability period shall be as the contract.

930 COMMERCIAL AND INDUSTRIAL GAS INSTALLATIONS

- Soundness testing and purging: In accordance with IGEM/UP/1.
- Testing, purging and commissioning pipelines: In accordance with BS EN 1775 and BS EN 15001-2.
- Commissioning gas fired plant: In accordance with IGEM/UP/4

940 PRESSURE TESTING OF NATURAL GAS SUPPLY SYSTEMS

- Notice (minimum): 1 week.
- Pressure: 1.5 times working pressure.
- Duration of test: 1 h.

960 DOCUMENTATION

- Manufacturers' operating and maintenance instructions: Submit for equipment and controls.
- System operating and maintenance instructions: Submit for the systems as a whole giving optimum settings for controls.
- Record drawings: Submit drawings showing the location of circuits and operating controls.

970 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
- Valve keys: Supply keys for valves and meter housing.
  - Quantity: 4 of each type.

S65 FIRE HYDRANT SYSTEMS

GENERAL

Fire hydrants shall be located as close as practicable to the main, preferably directly above the main, to reduce dead leg lengths to an absolute minimum.

The fire hydrant shall conform to BS 750: 2006 Specification for underground fire hydrants and surface box frames and covers and BS EN 14339: 2005 Underground fire hydrants and Water for Scotland 2nd Ed. 2007.

Hydrant main pipework shall be ductile iron to BE EN 545 complete with anchor gasket points at all tee-pieces and charges of direction installed in accordance with the pipe manufacturers requirements.

Pipe in trenches shall be laid on a minimum of 100mm bed of <20mm gravel or coarse sand and trenches shall ensure 900mm cover, measured from the crown of the pipe.

Pressure testing shall be undertaken in accordance with the requirements of the pipe manufacturer, the local Fire Authority and Water Authority.

Backfilling shall be undertaken in such a manner so as to avoid any deformation of the pipe.

Heavy compaction equipment shall not be used with less than 300mm of cover. A marker tape shall be laid 300mm above the crown of the pipe.

110 FIRE HYDRANT SYSTEM

This underground fire hydrants shall:
a) be installed in a water distribution system;
b) be size DN 80;
c) be suitable for a maximum allowable operating pressure (PFA) of 1.6 MPa or 2.5 MPa (16 bar or 25 bar);
d) be fitted with screw-down type valves; and with one outlet.

Comply with BS 750.
WRC approved materials of construction.
Standard outlet - 2½" male hydrant round thread (other options available).
Universal inlet flange (3" BS10 Table E or 80mm BS 4504 NP16)
Blank cap, chain and frost valve provided.

- Water source: new site fire main.
- Distribution: Ductile iron to BS EN 545
- Outlets: Underground fire hydrants.
- Accessories:
  - Indicator plates;
  - Surface boxes; and
  - Warning marker tape.
- Completion: Project Co. shall test, flush and clean the system as per regulations, SHTM/HTM's, this Specification and Fire Officer requirements.

SYSTEM PERFORMANCE

All fire hydrant pipework exposed to the frost shall be insulated or trace heated to prevent freezing.

210 DESIGN

- Standards: To BS EN 806-2 and in accordance with BS 9990.
- Design: Complete the design of the fire hydrant system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
- Mains water supply to hydrants: Provide an independent water supply.
  - Evidence of capacity of mains water supply: Submit.

320 DUCTILE IRON PIPELINES

- Standard: To BS EN 545
- Manufacturer: Saint Gobain.
  - Product reference: Submit proposals.
- Jointing: Anchor Gasket (EPDM Gasket)

340 UNDERGROUND FIRE HYDRANTS

- Standards: To BS EN 1074-6 and BS 750.
- Hydrant type to BS EN 1074-6: Underground.
- Valve type to BS 750: Screw-down (type 2)

Valve shall be fully maintainable.

- Ductile iron construction.
- 2½_ London round thread gunmetal outlet to BS 750.
- Exceeds flow requirements:
- Kv = 92 minimum, 2000l/min,
- Kv = 101 maximum, 2200l/min.
- Corrosion resistant construction, compliant with BS EN 1074-6 for disinfection products.
- Universal drilled inlet flange BS EN 1092-2:1997, BS 10 Table D/E.
- Inlet is of a proprietary type.
- Auto-frost drain valve as standard.
- Draining stopper.
- Kite marked.
- Low weight design.
- WRAS approved.

- Manufacturer: Submit proposals.
- Product reference: Submit proposals.
- Duckfoot bend: Not required.
- Outlet material: Submit proposals.
- Plug: Submit proposals.
- Accessories: Spindle cap, outlet cap and frost valve.

350 INDICATOR PLATES

Shall be installed adjacent Hydrant

- Standard: To BS 3251.
  - Class: A.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Material: Cast iron.
- Finish: Vitreous enamel.
- Colours:
  - Characters: Black.
  - Front surface: Reference number 309 (Canary yellow) to BS 381C.
- Accessories: As Specification and schedule.

360 SURFACE BOXES

Shall be suitable for application e.g. footpaths, heavy traffic.

- Standard: To BS 750.
  - Grade: Submit proposals.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals (as recommended by Strathclyde Fire & Rescue).
- Material: Grey cast iron (CI).
- Finish: As structural Engineers Specification.
- Marking: 'FIRE HYDRANT' in 30 mm high letters.
- Accessories: Lifting keys and Marker posts.

370 WARNING MARKER TAPES

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Type: Continuous colour coded, heavy gauge polyethylene identification tapes.
- Wire detection aid: Required.

EXECUTION

The Board shall Test, flush and clean the system as per regulations, SHTM/HTM's, this Specification and Fire officer requirements.

610 ISOLATION

- Connection to existing fire hydrant systems: Provide an isolation valve and non-return valve.

630 INSTALLATION GENERALLY

- Fire hydrant position: Unobstructed by the parking, loading and unloading of vehicles.
- Protection: Protect from damage, e.g. by frost, traffic loads or vibration.

640 INSTALLING PIPELINES

- Depth of cover: As NJUG.
- Set out: Lay in straight lines.
- Concealment: As drawings.
- Trench excavations: Carefully prepare to a firm even base. Remove sharp objects and replace with pea gravel to give 100 mm (minimum) cover above and below the pipe.
- Installation: Thoroughly clean lengths of pipe internally before laying. Temporarily cap until jointing takes place. After laying and jointing keep leading end capped.
- Thrust blocks: Install at changes of direction and blank ends.
- Backfilling: Excavated material free from large stones and sharp objects. Leave joints exposed until after pipeline pressure test. Lay and compact in 300 mm maximum layers. Do not use heavy compactors before backfill is 600 mm deep.

650 INSTALLING UNDERGROUND FIRE HYDRANTS

- Installation: In accordance with BS 9990.
- Depth (maximum): 300 mm from hydrant outlet to finished ground level.
- Details of pit construction: Submit proposals.

660 INSTALLING SURFACE BOXES

- Clear openings: To BS 750.
- Frame depth:
  - Grade A: 100 mm.
  - Grade B: 75 mm.
- Frame width: 75 mm.
- Fit of frames and covers: Set top of cover flush with top of frame.

670 INSTALLING INDICATOR PLATES

- Aluminium plates: Aluminium alloy, zinc coated steel or copper alloy screws.
- Plastics plates: Zinc coated steel screws or adhesive.
- Ferrous plates: Zinc coated steel screws or bolts.

680 INSTALLING WARNING MARKER TAPES

- Installation: During backfilling, lay along the route of the hydrant main.
- Location, depth, colour and markings: To requirements of service undertaker.

COMPLETION

910 FLUSHING

- Operation: Fill system with water and discharge it via the hydrant. Flush out debris.

920 TESTING

- Standard: To BS 9990:2006
  - Notice before commencing testing (minimum): 1 week.
- Static pressure test: Charge the system with water twice the maximum pressure to which the installation is designed to be subjected in operation. Maintain for 1 h. During this period check that no water leaks from joints or valves.
  - Results: Submit.
- Flow test: Pass water through the system under pressure and record flow and pressure readings.
  - Timing: After static pressure test.
  - Results: Submit.

930 SYSTEM DISINFECTION

- Standard: To BS 6700.
- Certification: Submit disinfection certificate.

940 SETTING TO WORK

- Operation: Check operation of hydrant valves.
- Make ready: Check operation of frost valve and leave ready for use.

950 DOCUMENTATION

- Manufacturers' operating and maintenance instructions: Submit.
- Test records: Submit a record of inspections and tests.
- Record drawings: Submit drawings showing location of pipe runs, hydrants and valves.

960 OPERATING TOOLS

- Tools: Supply for operation, maintenance and cleaning purposes.
- Keys: Supply for hydrants.
  - Quantity: as per contract requirements.

V24 HIGH VOLTAGE CABLING

To be read with Preliminaries/ General Conditions
PRODUCTS

370 UNDERGROUND PLASTICS CABLE PROTECTION COVERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Polyethylene.
- Size:
  - Length: Submit proposals.
  - Width: 150 mm.
  - Thickness: Submit proposals.
- Jointing method: Peg.
- Identification: Laminate underground cable marker tape to top face.

380 UNDERGROUND CONCRETE CABLE PROTECTION COVERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Standard: To BS 2484.
- Type: Flat.
- Size:
  - Length: 914 mm.
  - Width: Submit proposals.
  - Thickness at outer edge: Submit proposals.

390 PLASTICS DUCTS FOR UNDERGROUND CABLES

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Standard: To ENA 12-24.
- Diameter (minimum): 150 mm.
- Accessories: Proprietary duct plugs.

400 UNDERGROUND CABLE MARKER TAPE

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Standard: To ENA 12-23.

EXECUTION

620 EXCAVATIONS

- Excavations next to existing underground services: In accordance with HS(G) 47.
- Existing underground services: Expose and identify.

650 CABLES IN TRENCHES

- Base:
  - Material: All cables and ducts to be surrounded by 75 mm sand, free of any sharp stones or flints.
- Multiple cables in same trench: Set 150 mm apart.
- Cable formation within trench: Submit proposals.
- Cables below roads and hard standings: Duct and derate if longer than 10 m. Extend ducts 1m beyond hard standing.
- Cable identification and protection: Underground cable marker tape and protective covers.

670 CABLES IN DUCTS

- Cable installation from cable drums: Submit method statement.

680 PROTECTION TAPE FOR BURIED ELECTRICITY SUPPLY CABLE

- Installation: In accordance with ENA 12-23.

V32 LOW VOLTAGE CABLING

To be read with Preliminaries/General conditions.

PRODUCTS

465 UNDERGROUND CABLE MARKER TAPE

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Polyethylene.
- Size:
  - Width: 150 mm.
  - Thickness: 0.1 mm.
- Format:
  - Background colour: Yellow.
  - Text colour: Black.
- Labelling: _CAUTION ELECTRIC CABLE BELOW_ continuous along the tape length.

470 UNDERGROUND PLASTICS CABLE PROTECTION COVERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Polyethylene.
- Size:
  - Width: 150 mm.
  - Thickness: Submit proposals.
- Jointing method: Peg.
- Identification: Laminate underground cable marker tape to top face.

475 UNDERGROUND CONCRETE CABLE PROTECTION COVERS

- Standard: To BS 2484.
- Type: Flat.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Size: 914 mm.
- Width: Submit proposals.
- Thickness at outer edge: Submit proposals.

EXECUTION

680 CABLES IN TRENCHES

- Base: Newly prepared bedding.
- Multiple cables in same trench: Set 150 mm apart.
  - Cable formation within trench: Space cables apart by a distance of half the cable diameter.
- Trefoil cable groups and protective conductors: Bind at 1 m intervals.
- Cables below roads and hard standings: Install within duct and derate cable if longer than 10m. Extend ducts 1 m each side of hard standing.

- Cable identification and protection:
  - Underground plastics cable protection covers and underground cable marker tape;
  - Underground concrete cable protection covers and underground cable marker tape; and
  - Submit proposals.

700 INSTALLING CABLE DUCTS

- Routes and arrangement: As drawings.
- Duct formation within trench: Submit proposals.
- Gradient (maximum): 1:20.
- Duct bends: Suitable for cable bending radii.
- Manholes: Provide manholes, draw pits and jointing chambers.
  - Location: Submit proposals.
- Duct alignment: Check before installing cables.
- Duct cleaning: Clean duct run before installing cables.
- Draw ropes: Install draw ropes in ducts.
  - Type: Board's choice.
- Duct ends: Plug and seal with proprietary duct plugs.

710 CABLES IN DUCTS

- Cable installation from cable drums: Submit method statement.
- Single core trefoil cable groups and protective conductors: Install within a single duct and bind at 1m intervals.

Y12 MECHANICAL CLEANING AND CHEMICAL TREATMENTS

To be read with Preliminaries/ General conditions.

PRODUCTS

310 BIODISPERSANT CHEMICALS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

320 CORROSION INHIBITOR CHEMICALS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

330 DISPERSANT CHEMICALS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

340 NON-OXIDIZING BIOCIDES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

350 OXIDIZING BIOCIDES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

360 PH CONTROL CHEMICALS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

370 SCALE INHIBITOR CHEMICALS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Subject to analysis.

EXECUTION

610 GENERALLY

- Water analysis: Analyse water samples before treatment.
- Preliminary checks: Before cleaning or chemical treatment, complete pressure tests.
- Waste products: Neutralize, and dispose of to drain.

620 FLUSHING OF HOT AND COLD WATER SYSTEMS

- Standard: To BS EN 806-4.
- Installation checks: Thoroughly inspect pipework.
- Drainage: Provide adequate drainage, preferably direct to manhole.

630 FLUSHING OF HEATING AND CHILLED WATER SYSTEMS

- Flushing: In accordance with BSRIA 1/2001.1.
- Installation checks: Thoroughly inspect pipework.
- Drainage: Provide adequate drainage, preferably direct to manhole.

640 PURGING GAS PIPEWORK

- Standards: To IGE/UP/1 and IGE/UP/1A.

650 DISINFECTION OF HOT AND COLD WATER SYSTEMS

- Standard: To BS EN 806-4.
- Samples for analysis: Provide after flushing.

660 CHEMICAL TREATMENT FOR HEATING SYSTEMS

- Treatment: In accordance with BSRIA 2/93.

670 CHEMICAL TREATMENT FOR CHILLED WATER SYSTEMS

- Treatment: In accordance with BSRIA 2/93.

700 WATER QUALITY TESTS

- Standard: To BS EN 806-4.
- Samples:
  - Sample points: Main supply to site.
  - Samples for analysis: Submit samples for bacteriological analysis.
- Water temperature: Record at each sampling point at the time of taking the sample.
- Test results:
  - Record: Details of analyses.
  - Submit: On completion.
  - Number of copies: Four.

Y50 MECHANICAL COMMISSIONING

To be read with Preliminaries/ General conditions.

EXECUTION

610 COMMISSIONING PROGRAMME

- Submission: Four weeks (minimum) before commissioning commences.
- Commissioning manager: Submit details with programme.

620 COMMISSIONING OF HOT AND COLD WATER SUPPLY SYSTEMS

- Pre-commissioning: In accordance with BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Commissioning: In accordance with BS EN 806-4, BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Notice (minimum): One week.
- Equipment: Check and adjust operation of equipment, controls and safety devices.
- Outlets: Check operation of outlets for satisfactory rate of flow and temperature.

630 COMMISSIONING OF WATER HEATING SYSTEMS

- Pre-commissioning: In accordance with BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Commissioning: In accordance with BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Variable flow systems: In accordance with CIBSE KS09 Commissioning variable flow pipework systems.
- Notice (minimum): One week.

660 COMMISSIONING OF CHILLED WATER SYSTEMS

- Pre-commissioning: In accordance with BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Commissioning: In accordance with BSRIA 2/89.3 and CIBSE Commissioning Code W.
- Variable flow systems: In accordance with CIBSE KS09 Commissioning variable flow pipework systems.
- Notice (minimum): One week.

700 PERFORMANCE TESTING PROGRAMME

- Submission: Four weeks (minimum) before performance testing commences.
- Performance testing manager: Submit details with programme.

710 PERFORMANCE TESTING

- General: Demonstrate the performance of the installations.
- Guaranteed efficiency: Tolerances defined in this specification.
- Environmental tests: Carry out environmental testing. If necessary, use artificial loads to simulate operating conditions.

- Recorders:
  - Type: Supply and maintain portable seven day space temperature and relative humidity recorders, complete with charts.
  - Number: N/A.
  - Duration of loan: N/A.
- Reports: Submit on completion.

750 INSPECTION AND TEST RECORDS

- Reports:
  - Construction phase: System commissionable.
- Records for water systems: In accordance with BSRIA 2/89.3.
- Records for air systems: In accordance with BSRIA 3/89.3.
- Record sheets:
  - Submission: On completion.
  - Number of copies: Four.

760 DEMONSTRATIONS

- Running of plant:
  - Operation: Run, maintain and supervise the installations under normal working conditions.
  - Duration: Two weeks.
- Instruction: Instruct and demonstrate the purpose, function and operation of the installations.

Specification Check / Revision Sheet

RHSC and DCN EDINBURGH
MEDICAL GAS INSTALLATIONS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by a Medical Gas Specialist and is referred to in this document as “the Specialist”.

To carry out the development of the design, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the Medical Gas Installation serving the RHSC-DCN Building.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Motors

All motors shall be selected to provide the most energy efficient solution conforming to Section 6 regulations. All motors shall have an efficiency rating of IE2 in accordance with EN 60034-30:2009 and suitable for operation in ambient temperatures of 40 degrees C.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 EXISTING SITE AND SERVICES

The Medical Gas installation shall operate as a standalone system within the new hospitals, being self contained from other systems on the hospital site.

3.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

- Medical Gas Installation
- All associated control wiring

4.0 PERFORMANCE SPECIFIED SYSTEMS

The Medical gas installation is a performance specified system and this specification outlines the requirements to be met by the system.

5.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this performance specification:-

- Power supplies to plant
- Main cable containment (other than final run outs of conduits)
- Fire and BMS interface connections
- Supply and installation of central VIE oxygen plant

6.0 INTERFACES AND DEMARCATIONS

The Medical Gas Installation shall be provided as a complete working system serving the RHSC-DCN Building.

The new VIE plants shall be provided by the Hospital Board under their existing FM contract, with the plant being terminated with valves for extension by the Specialist.

The Specialist shall liaise with the Hospital Board to ensure coordination with the VIE supplier in terms of builders work, power supplies, connection points, etc and anything else that is required to form a complete working system.

7.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Medical Gas Installation shall accord with all appropriate (SHTM) Scottish Health Technical Memoranda (HTM) Health Technical Memoranda, Codes of Practice and relevant British and European Standards listed in SHTM 02-01. Any differences/conflicts in the standards shall be brought to the Board's attention and clarification sought.

In addition to the NBS clauses noted in this specification, the medical gas system shall also meet the requirement of the NHS Model Engineering Specification Part C11.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

8.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

All low current systems to be self-rebooting following mains failure and generator test conditions.

All battery systems shall be easy to test and change, it should be possible to replace the batteries without powering down or interrupting the operation of the system.

Warning shall be provided to the BMS when battery systems are failing and require maintenance replacement.

Circuits serving control panels shall be protected by MCB's not RCD's/RBCO's.

9.0 LIAISON

The Specialist shall include for liaison with:-
Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Specialist shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist and Suppliers. The Specialist shall liase with other specialist suppliers as necessary to ensure that all interfaces between the Medical Gas Installation and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist
- VIE Plant supplier

The Electrical Services Installer. The Specialist shall liase with the Electrical Services Installer to provide details of:-

1. Medical gas installation power supply requirements
2. Cable tray requirements

Building Control. The Specialist shall liase, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of the medical gas installation, including co-ordinating the pipework installation with all the other services.

10.0 SYSTEM DESCRIPTION

General

The Medical Gas Specialist shall provide a medical gas distribution system sized to accommodate the demand of the works as defined in the ADB Sheets, with the capacity to accommodate an increase in demand (flow and consumption) of no less than 25%;

Manifolds, vacuum and medical air plant shall have a capacity of 125% of the design capacity to allow for future expansion.

Central gas storage

A medical gas storage compound will be located adjacent to the New Energy Centre as indicated on the external services layout drawings. The compound will house the oxygen VIE plant.

The positioning of the compound provides the required safe separation distances as required by SHTM 02-01. Access for tanker deliveries will be provided so as not to cause obstruction of the roadways.

Oxygen supply plant

Oxygen will be supplied from the new VIE compound. The VIE (Vacuum Insulated Evaporator) units will be arranged as main supply.

The VIE oxygen supply equipment will be sized and installed by a specialist under direct leasing arrangements with the Hospital Board; a valved connection being left in the compound for continuation by the medical gas specialist. Indicative sizes of plant for tender purposes are shown on the External Services layouts, but these shall be confirmed by the Specialist prior to construction commencing.

From the VIE unit an oxygen supply will be taken underground to enter the new building and then connect to the oxygen ring main running at ground floor level. The ring main will connect to the major risers serving the upper floors of the RHSC-DCN Building.

An emergency bottle manifold shall be provided within the medical gas manifold store.

Manifold supplied services

Nitrous Oxide will be provided from manifold room located within the Energy Centre.

A single pipeline for each service will run from the manifold room where it will run to rise within ventilated service risers to the various departments to be served.

Laboratory Helium and Nitrogen will employ local bottled supplies due to the infrequent use of the gases.

Central compressor plants

Central Plant will be located within the Level 4 and Level 2 plant rooms as detailed below for the following systems:-

(a) ***Medical Air (4Bar)***

- The medical Air 4bar plant will be installed within the Level 4 plantroom.

Emergency reserve bottle manifold to supply each of the 4bar and 7bar plant will be installed in the central manifold room within the Energy Centre.

(b) ***Medical Vacuum***

- A vacuum plant will be installed in the Level 4 plant room.

(c) ***Surgical Air (7Bar)***

The specialist shall be responsible for the design, supply and installation of any compressed air systems necessary to serve medical equipment e.g. Theatre Pendants.

The air shall be compliant with SHTM02-01.

The compressor shall be an oil free screw type with dryer, pre-filter, final filter, condensate drain and suitably sized receiver.

The compressed air unit shall be able to be operated remotely.

The compressor unit shall be located in the Level 4 plantroom.

- All round access for maintenance.
- Good lighting levels (200 lux) for maintenance.
- A dust-free, dry, well ventilated environment.
- Operating temperatures between 10-35°C.

The pressure drop from plant to the station shall not exceed 50 kPa.

The compressed air distribution pipework shall be heavy grade steel with a flexible connection to the compressor in accordance with the standard NHS specifications.

Plant Noise

The sound pressure level within the compressor plantrooms need to be carefully considered. It is, therefore, intended that screw compressors will be used whenever possible to reduce the sound pressure levels.

Anaesthetic gas scavenging systems (AGSS)

Anaesthetic Gas Scavenging Systems will be provided for wherever Nitrous Oxide is used for anaesthetic purposes, as identified on the ADB Sheets, and pumped to local exhauster sets within the Level 4 plantroom.

AGSS exhauster pumps shall be duplex with auto-changeover and duty sharing.

AGSS systems shall generally be provided to cover the same zone areas as covered by the ventilation air handling systems.

Within the departmental areas wherever AGSS terminal outlets are provided, local starter panels with plant run/fault indications will be provided.

Terminal units

Terminal units will be single outlets, wall mounted or part of a horizontal medical trunking or part of a ceiling pendant.

Within play rooms and recreation rooms all outlets shall be located in lockable areas together with masks and flow meters, etc.

Area valve service units (AVSUs)

These will be generally located for both departmental isolation units located immediately within the department adjacent to the hospital street and local area isolation units located adjacent to nurse's stations etc.

Medical gas alarms

Medical gas alarm systems will be stand-alone systems and only give status and alarm facility to the central BMS via volt free contacts *as detailed in the BMS specification*.

All central panels will have audible and visual alarms for all remote plant conditions and visual pipeline pressure fault conditions. Repeater panels will show all the alarm conditions on the control panel.

Main alarm panels will be located in the main hospital switchboard room with a repeater panel within the Hospital Estates Facilities Management office.

At the main alarm monitoring panel and repeater panels, the pipeline status in critical care areas will also be indicated, e.g. Theatres, and Intensive Care Areas

AGSS alarms will be local to the area served.

Dental Systems

Separate compressed air and vacuum systems shall be provided for the dental room, compressor shall be located within the Level 2 plant room and vacuum supplied locally. The system shall meet the requirements of SHTM 02-01.

Pathology

Separate compressed air and vacuum systems shall be provided for the Pathology Department and shall be located within the Level 4 plant room. The system shall meet the requirements of HTM08-06.

S20 MEDICAL OXYGEN SUPPLY SYSTEMS

General

110 MEDICAL OXYGEN SUPPLY SYSTEM Serving Hospital

- Primary supply: Vacuum insulated evaporator (VIE) storage vessels.
- Secondary supply: Vacuum insulated evaporator (VIE) storage vessels.
- Reserve supply: Emergency supply manifolds.
- Pipelines: Copper to BS EN 13348, as section S29.
- Pipeline ancillaries: Line valves, as section S29.
- Zone service units: Area service module, as section S29.
- Medical gas alarms: Area, as section S29 and Central, as section S29.
- Terminal units: Required.
- Bedhead units: Refer to ADB Sheets.
- Pendants: Refer to ADB Sheets and Client Equipment Specifications.
- Completion:
  - Plant and equipment identification: As section S29.
  - Commissioning: As section S29.

System performance

210 DESIGN

- Design: Complete the design of the medical oxygen supply system in accordance with SHTM 02-01 Part A
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 PRODUCTS GENERALLY

- Products: In accordance with SHTM 02-01 Part A.

340 VACUUM INSULATED EVAPORATOR (VIE) STORAGE VESSELS Sited in a dedicated compound adjacent the Energy Centre.

- Type: Vertical.
- Manufacturer: submit proposals
  - Product reference: Not applicable.
- Capacity: To be advised by specialist
- Pressure (minimum): 10.5 bar (1050 kPa).
- Accessories: To be advised by specialist

360 EMERGENCY SUPPLY MANIFOLDS To support VIE Plant
- Standard: To BS EN ISO 407.
- Type: Manually adjusted regulator.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of cylinders: To be determined by Specialist.
- Accessories: To be determined by Specialist.

370 AREA VALVE SERVICE UNITS For use at department entrances and staff bases.
- Type: Concealed wall mounted.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

380 TERMINAL UNITS For all areas.
- Standard: To BS EN ISO 9170-1.
- Type:
  - Bedhead trunking mounted;
  - Boom mounted;
  - Modular wall mounted;
  - Pendant mounted; and
  - Wall mounted flush.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: To suit fixing background.

Execution

620 INSTALLATION GENERALLY
- Installation: In accordance with SHTM 02-01 Part A.

650 INSTALLING VACUUM INSULATED EVAPORATOR STORAGE VESSELS
- Location: In accordance with SHTM 02-01 Part A, figure 23.
- Installation: In accordance with British Compressed Gases Association CP 36.

660 INSTALLING COMPRESSED GAS CYLINDERS
- Location: At ground level, and close to the delivery point.
- Pressure regulating valves: Separate for each cylinder bank.

670 INSTALLING TERMINAL UNITS
- Mounting order: In accordance with SHTM 02-01 Part A, figure 1.
- Mounting heights: In accordance with SHTM 02-01 Part A, figure 2.

Completion

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

S21 MEDICAL NITROUS OXIDE SUPPLY SYSTEMS

General

110 MEDICAL NITROUS OXIDE SUPPLY SYSTEM Serving areas of the Hospitals identified on the ADB Sheets

- Primary supply: Compressed gas cylinders.
- Secondary supply: Compressed gas cylinders.
- Reserve supply: Emergency supply manifolds.
- Pipelines: Copper to BS EN 13348, as section S29.
- Pipeline ancillaries: Line valves, as section S29.
- Zone service units: Area service module, as section S29.
- Medical gas alarms: Area, as section S29 and Central, as section S29.
- Terminal units: Required.
- Bedhead units: Refer to ADB Sheets.
- Pendants: Refer to ADB Sheets and Client Equipment Specification.
- Completion:
  - Plant and equipment identification: As section S29.
  - Commissioning: As section S29.

210 DESIGN

- Design: Complete the design of the medical nitrous oxide supply system in accordance with SHTM 02-01 Part A.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 PRODUCTS GENERALLY

- Products: In accordance with SHTM 02-01 Part A

320 COMPRESSED GAS CYLINDERS for Hospitals

- Standard: To BS EN ISO 407.
- Type: Automatic changeover.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of cylinders: To be determined by Specialist.
- Accessories: Manifold control systems.

330 EMERGENCY SUPPLY MANIFOLDS for Hospitals

- Standard: To BS EN ISO 407.
- Type: Manually adjusted regulator.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of cylinders: To be determined by Specialist.
- Accessories: To be determined by Specialist.

340 AREA VALVE SERVICE UNITS At department entrances, theatre entrances and staff bases

- Type: Concealed wall mounted.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

350 TERMINAL UNITS For all areas

- Standard: To BS EN ISO 9170-1.
- Type:
  - Bedhead trunking mounted;
  - Boom mounted;
  - Modular wall mounted;
  - Pendent mounted; and
  - Wall mounted flush.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: To suit fixing background.

Execution

620 INSTALLATION GENERALLY

- Installation: In accordance with SHTM 02-01 Part A.

630 INSTALLING COMPRESSED GAS CYLINDERS

- Location: At ground level, and close to the delivery point.
- Pressure regulating valves: Separate valves for each cylinder bank.

640 INSTALLING TERMINAL UNITS

- Mounting order: In accordance with SHTM 02-01 Part A, figure 1.
- Mounting heights: In accordance with SHTM 02-01 Part A, figure 2.

Completion

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Acconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

S22 MEDICAL COMPRESSED AIR SUPPLY SYSTEMS

General

110 MEDICAL COMPRESSED AIR SUPPLY SYSTEM Serving the hospitals

- Primary supply: Compressors.
- Secondary supply: Compressed gas cylinders.
- Reserve supply: Emergency supply manifolds.
- Pipelines: Copper to BS EN 13348, as section S29.
- Pipeline ancillaries: Line valves, as section S29.
- Pressure reducing stations: Duplex.

- Zone service units: Area service module, as section S29.
- Medical gas alarms: Area, as section S29 and Central, as section S29.
- Terminal units: Required.
- Bedhead units: Refer to ADB Sheets.
- Pendants: Refer to ADB Sheets and Client Equipment Specification.
- Completion:
  - Plant and equipment identification: As section S29.
  - Commissioning: As section S29.

System performance

210 DESIGN

- Design: Complete the design of the medical compressed air supply system in accordance with SHTM 02-01 Part A.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 PRODUCTS GENERALLY

- Products: In accordance with SHTM 02-01 Part A.

320 COMPRESSORS For all areas

- Pressure: 1100 kPa.
- Type: Quadruplex (4Bar Air), twin (7Bar Air)
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Compressor: Rotary screw.
- Flow rate: To be determined by Specialist.
- Number of vessels: To be determined by Specialist.
  - Total vessel capacity: To be determined by Specialist.
- Electrical supply type: Three phase.
- Accessories: To be determined by Specialist.

330 COMPRESSED GAS CYLINDERS For emergency reserve

- Standard: To BS EN ISO 407.
- Type: Automatic changeover.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of cylinders: To be determined by Specialist.
- Accessories: Manifold control systems.

340 EMERGENCY SUPPLY MANIFOLDS In association with compressor plant.

- Standard: To BS EN ISO 407.
- Type: Manually adjusted regulator.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

  Number of cylinders: To be determined by Specialist.
- Accessories: To be determined by Specialist.

350 PRESSURE REDUCING STATIONS as required to suit Specialist's design
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: Pressure relief valves, pressure gauges and quarter turn ball valves.

360 AREA VALVE SERVICE UNITS At department entrances and staff bases
- Type: Concealed wall mounted.

Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

370 TERMINAL UNITS For all areas
- Standard: To BS EN ISO 9170-1.
- Type:
  - Bedhead trunking mounted;
  - Boom mounted;
  - Modular wall mounted;
  - Pendent mounted; and
  - Wall mounted flush.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: To suit fixing background.

Execution

620 INSTALLATION GENERALLY
- Installation: In accordance with SHTM 02-01 Part A.

630 INSTALLING COMPRESSORS
- Location: Site to allow adequate flow of air for:
  - air intake to the compressors;
  - cooling of the compressed air by the after-coolers; and
  - cooling of the compressors.
- Air inlets: To be determined by Specialist.

640 INSTALLING COMPRESSED GAS CYLINDERS
- Location: At ground level, and close to the delivery point.
- Pressure regulating valves: Separate valves for each cylinder bank.

650 INSTALLING TERMINAL UNITS
- Mounting order: In accordance with SHTM 02-01 Part A, figure 1.
- Mounting heights: In accordance with SHTM 02-01 Part A, figure 2.

Completion

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

S23 MEDICAL VACUUM SYSTEMS

General

110 MEDICAL VACUUM SYSTEM Serving the hospitals

- Primary supply: Medical vacuum plant.
- Pipelines: Copper to BS EN 13348, as section S29.
- Pipeline ancillaries: Line valves, as section S29.
- Zone service units: Area service module, as section S29.
- Medical gas alarms: Area, as section S29 and Central, as section S29.
- Terminal units: Required.
- Bedhead units: Refer to ADB Sheets.
- Pendants: Refer to ADB Sheets and Client Equipment Specification.
- Completion:
  - Plant and equipment identification: As section S29.
  - Commissioning: As section S29.

System performance

210 DESIGN

- Design: Complete the design of the medical vacuum system in accordance with SHTM 02-01 Part A.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 PRODUCTS GENERALLY

- Products: In accordance with SHTM 02-01 Part A.

320 MEDICAL VACUUM PLANT Serving the hospitals.

- Type: Quadruplex
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of vacuum receiver vessels: To be determined by the Specialist.
- Number of pumps: To be determined by the Specialist.
- Number of motor control units: To be determined by the Specialist.
- Electrical supply type: Three phase.
- Accessories: Central control unit.
  - Other accessories: To be determined by the Specialist.

330 AREA VALVE SERVICE UNITS At department entrances and staff bases.

- Type: Concealed wall mounted.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

340 TERMINAL UNITS For all areas.

- Standard: To BS EN ISO 9170-1.
- Type:
  - Bedhead trunking mounted;
  - Boom mounted;
  - Modular wall mounted;
  - Pendent mounted; and
  - Wall mounted flush.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: To suit fixing background.

Execution

620 INSTALLATION GENERALLY

- Installation: In accordance with SHTM 02-01 Part A.

630 INSTALLING MEDICAL VACUUM PLANT

- Vacuum plant exhaust: Clear of windows, ventilation intakes and the intake of air compressors.
- Notice at discharge points: Weatherproof, stating 'MEDICAL VACUUM DISCHARGE

POINT - DO NOT OBSTRUCT'.

640 INSTALLING TERMINAL UNITS

- Mounting order: In accordance with SHTM 02-01 Part A, figure 1.
- Mounting heights: In accordance with SHTM 02-01 Part A, figure 2.

Completion

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Acconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

S25 MEDICAL ANAESTHETIC GAS SCAVENGING SYSTEMS

General

110 MEDICAL ANAESTHETIC GAS SCAVENGING SYSTEM Serving the hospitals
- Exhauster units: Required.
- Pipelines: Copper to BS EN 13348, as section S29.
- Pipeline ancillaries: Line valves, as section S29.
- Terminal units: Required.
- Remote start switch panels: Required.
- Vacuum flow regulating valves: Required.
- Bedhead units: Refer to ADB Sheets.
- Pendants: Refer to ADB Sheets and Client Equipment Specification.
- Completion:
  - Plant and equipment identification: As section S29.
  - Commissioning: As section S29.

System performance

210 DESIGN
- Design: Complete the design of the medical anaesthetic gas scavenging system in accordance with SHTM 02-01 Part A.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 PRODUCTS GENERALLY
- Products: In accordance with SHTM 02-01 Part A.

320 EXHAUSTER UNITS Serving the hospitals
- Standard: To BS EN ISO 7396-2.
- Type: Duplex.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Electric supply: Three phase.
- Integral accessories: Flexible connectors, moisture drain flask and starter isolator panel.
- Other accessories: Pressure switch.

330 TERMINAL UNITS For all areas.
- Standard: To BS EN ISO 9170-2.
- Type:
  - Bedhead trunking mounted;
  - Boom mounted;
  - Modular wall mounted;
  - Pendent mounted; and
  - Wall mounted flush.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Orifices: To be determined by Specialist.
- Accessories: To suit fixing background.

340 REMOTE START SWITCH PANELS Located in areas served by the systems
- Standard: To BS EN ISO 7396-2.
- Type: Double pole rocker switch, green NORMAL indicator, amber PLANT FAULT indicator and red PLANT EMERGENCY indicator.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Electric supply: 24 V.
- Accessories: To be determined by the Specialist.

350 VACUUM FLOW REGULATING VALVES To systems served
- Standard: To BS EN 737-2.
- Type: To be determined by Specialist.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: To be determined by the Specialist.

Execution

620 INSTALLATION GENERALLY
- Standard: To BS EN ISO 7396-2 and in accordance with SHTM 02-01 Part A.

630 INSTALLING EXHAUSTER UNITS
- Discharge outlet: At roof level, clear of ventilation inlets, opening windows and apertures.

640 INSTALLING REMOTE START SWITCH PANELS
- Location: Refer to ADB Sheets and discuss/agree with the Users.

650 INSTALLING TERMINAL UNITS
- Mounting heights: In accordance with SHTM 02-01 Part A, figure 2.

Completion

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

S29 MEDICAL GAS EQUIPMENT

Products

310 PRODUCTS GENERALLY
- Products: In accordance with SHTM 02-01 Part A.

320 AREA SERVICE MODULES Located at department entrances and staff bases.
- Type: Recessed.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of area valve service units: Refer to layout drawings.
- Integral medical gas area alarm: Required.
- Panel colour: Submit proposals.

330 MEDICAL GAS AREA ALARMS Associated with areas served by medical gases.
- Type: Concealed.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: Bezel for concealed installation and Pressure switch assemblies.

340 MEDICAL GAS CENTRAL ALARMS Associated with central plant items.
- Type: Concealed.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: Bezel for concealed installation.

420 COPPER TUBES
- Standard: To BS EN 13348.
  - Up to 54 mm R250.
  - 76 mm and above R290.
- Fittings: To BS EN 1254-1.

430 LINE VALVES For section and plant isolation
- Standards: To BS EN ISO 7396-1 and in accordance with SHTM 02-01 Part A.
- Type: Ball valve.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Connections: Submit proposals.
- Integral accessories: Copper stub pipes, padlock.

Execution

610 INSTALLATION GENERALLY
- Installation: In accordance with SHTM 02-01 Part A

630 INSTALLING AREA ALARMS
- Location: Downstream of the area valve service units.

640 INSTALLING CENTRAL ALARMS

- Location:
  - Facilities management office
  - ITU nurses station
  - Telephone switchboard
  - Operating room
  - Theatre managers desk
  - 24 hour manned FM facility

680 PLANT AND EQUIPMENT IDENTIFICATION

- Identification: In accordance with SHTM 02-01 Part A

Completion

910 COMMISSIONING OF MEDICAL GAS SYSTEMS

- Commissioning: In accordance with SHTM 02-01 Part A.
- Notice (minimum): To be agreed with the Board.

920 INSPECTION AND TEST RECORDS

- Records for medical gas systems: In accordance with SHTM 02-01 Part A
- Record sheets: Submit.
  - Number of copies: To be agreed with the Board.

S30 COMPRESSED AIR SUPPLY SYSTEMS

General

110 COMPRESSED AIR SUPPLY SYSTEM Serving specialist systems and equipment

- Manufacturer: Submit proposals.
- Source supply: Compressors.
- Pipelines: Copper.
- Pipeline ancillaries: To be determined by the Specialist.
- Pressure reducing stations: To be determined by the Specialist.
- Air receivers: To be determined by the Specialist.
- Dryers: To be determined by the Specialist.
- In line filters: To be determined by the Specialist.
- Aftercoolers: To be determined by the Specialist.
- Oil/ water separators: To be determined by the Specialist.
- Couplings: To be determined by the Specialist.
- Completion:
  - Plant and equipment identification: As section Y32.

System performance

210 DESIGN
Design: Complete the design of the compressed air supply system.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

Products

310 COMPRESSORS Serving the compressed air system

- Pressure: To be determined by the Specialist.
- Type: Duplex.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Compressor: Oil free.
- Flow rate: To be determined by the Specialist.
- Number of vessels: To be determined by the Specialist.
  - Total vessel capacity: To be determined by the Specialist.
- Electrical supply type: Three phase.
- Accessories: To be determined by the Specialist.

Execution

620 INSTALLING COMPRESSORS

- Location: Site to allow adequate flow of air for
  - air intake to the compressors;
  - cooling of the compressed air by the after-coolers; and
  - cooling of the compressors.
- Air inlets: Fit filters to the compressor inlets or inlet ductwork.

Completion

905 TESTING AND COMMISSIONING

- Requirements: To be determined by the Specialist.

910 DOCUMENTATION

O&M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/ uploaded on Aconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

RHSC and DCN EDINBURGH
PNEUMATIC TUBE SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Specialist Installer and is referred to in this document as “the Specialist”.

To carry out the development of the design, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the Pneumatic Tube Transportation System (PTS) serving the new RHSC-DCN facility.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

Motors

All motors shall be selected to provide the most energy efficient solution conforming to Section 6 regulations. All motors shall have an efficiency rating of IE2 in accordance with EN 60034-30:2009 and suitable for operation in ambient temperatures of 40 degrees C.

2.0 EXISTING SITE AND SERVICES

The PTS shall interconnect with existing facilities on the hospital site. The PTS specialist shall liaise with the Hospital Board to agreed suitable points of interface whilst causing minimum disruption to the operation of the hospitals.

3.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

- Pneumatic tube conveying system
- All associated control wiring

4.0 PERFORMANCE SPECIFIED SYSTEMS

The PTS is a performance specified system and this specification outlines the requirements to be met by the system.

5.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Performance Specification:-

- Power wiring to plant
- Main cable containment (other than final run outs of conduits)
- Fire and BMS interface connections

6.0 INTERFACES AND DEMARCATIONS

The PTS shall be provided as a complete working system serving the new RHSC – DCN Building and be as detailed within the Table below. Allowance shall be made for interface with other parts of the hospital site, with direct connection to deliver to and receive from the Pharmacy and Laboratories rooms S6107 & GS119 within the RIE.

The PTS supplier shall provide information to other parties for power supplies and fire alarm system interfaces.

Ref	Department	Pneumatic Air Tube Delivery System Required and Number	Location
RHSC SPECIFIC DEPARTMENTS			
A	**Front Door – ED/ Assessment Ward**		
A1	Emergency Department	2	1 Laboratory Area and 1 outside Resuscitation Room
A2	Paediatric Acute Receiving Unit – 34 Beds	1	Central Location Staff Base
B	**Critical Care/ HDU/ Neonatal Surgery**		
B1	PICU and HDU's – 24 Beds	2	1 close to Room 5/8 and the other close to Room 14

P1	Operating Theatres & RHSC Surgical Day Case Unit	2	1 location close to reception area in DCN & RHSC end.
Q	**Combined Radiology**		
Q1	Radiology	1	Located close to DCN Reception Area

7.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with SHTM 08-04 Pneumatic Tube Transport Systems and the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Fire Protection Systems shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards listed in SHTM 08-04.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

8.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

9.0 LIAISON

The Specialist shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Specialist shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist. The Specialist shall liase with other specialist as necessary to ensure that all interfaces between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist
- Security systems specialist

The Electrical Services Installer. The Specialist shall liase with the Electrical Services Installer to provide details of:-

3. PTS power supply requirements
4. Cable tray requirements

Building Control. The Specialist shall liase, with and adhere to, the requirements of the Building Control Officer.
Any other member of the Project and Board teams concerned with the planning and administration of the PTS.

10.0 SYSTEM DESCRIPTION

General

A PC controlled 160mm diameter pneumatic tube system (PTS) shall be installed in the RHSC-DCN with links to the existing building via the corridor link facility building.

The system shall be capable of transporting various liquids, solids and documents up to a load of 5kg at a speed of 5-6m/s. The system shall be capable of transporting all the items advised within a specified time limit. The overall performance and percentage usage of the systems capacity during a normal working day shall be demonstrated using a real-time simulation model if required.

The system shall be capable of supporting 21 transactions per hour not including the return of the capsules. The system shall have a 70% maximum system capacity.

A front end PC shall be provided complete with dedicated printer and web link for remote operation and analysis.

The system shall incorporate an advanced platform software control package with full automatic dual control redundancy to provide optimal flexibility, performance and convenience in the management and maintenance of the pneumatic tube system.

The controller shall have battery backup for system memory and status, and be capable of being remotely controlled through the PC.

The equipment shall be supplied and installed in accordance with SHTM 08-04, utilising optical carrier detectors, safety extra low voltage cabling to the stations, electronic positioning sensors, volt free contacts for BMS alarm status and fire alarm interface at the controller.

Configuration

The pneumatic tube system network shall consist of several individual zones or systems. It is a requirement that full intercommunication shall be possible between all zones and systems.

The equipment shall be configurable in any appropriate manner, and shall not be restricted to a single hub or interchange. The software shall be capable of allowing several interchanges to exist in a single network, and allow link-chaining of systems to allow carriers to be transferred between several systems between sender and receiver.

Where networks are configured to provide alternative routes between locations, the software shall intelligently decide the most appropriate route depending on operational circumstances.

Express (Power) Lines

Where destinations are more than 250m apart, the equipment shall be capable of incorporating “express” or “power” lines capable of transporting several carriers simultaneously in a single tube. These special systems shall be configured between transfer units or interchanges, or alternatively terminate directly at a station.

Stations

The stations shall generally be of front-loading design of the fully recessed pattern with a wipeable membrane type keypad. All connecting tubing and cables shall be concealed behind removable panelling.

A ‘spare carrier’ rack holding up to four carriers shall be wall mounted adjacent to the station.

The stations are to be designed to comply with the latest Health & Safety Regulations. Access to the station mechanism is to be protected by an electronically controlled opening/closing guard door with full mechanical interlock.

The stations in-built LCD display shall show:

Time and date
Carrier destination
The station the last carrier arrived from
Station status - ready, selection OK, out of use, maintenance, faulty, basket full, invalid address and purge.
The display shall also have a directory of all system station names and numerical addresses.

The stations indicators display shall show:

- A text message to prompt the user to enter the destination address.
- Text messages providing context sensitive operational guidance.
- Entered destinations shall display departmental names as well as numeric addresses.
- Ability to look up addresses on an in-built directory.
- Display of appropriate information messages.
- When appropriate, display that the station is out of use or on divert.
- Display a list of recently received carriers including carrier ID numbers.
- Display a list of recently dispatched carriers including carrier ID numbers.
- Display appropriate operational instructions when remote signal devices are used.

Stations shall be fully automatic and capable of accepting a carrier when another carrier is incoming to that station.

Destinations shall be addressed by the use of the 4 digit number or by accessing the station name through the directory.

Destinations may be restricted if required.

The destination setting can be optionally set to return to 1 of 3 settings after carrier has been sent:

Force new address input
Default to a pre-set address
Default to “last number re-dial”

Wrongly addressed carriers shall not be accepted by the system. A code reader at the station shall allow only carriers to be introduced into the system, e.g. objects such as cans shall not be accepted.

Incoming carriers shall be able to be re-directed to another station.

All stations shall be fitted with air control to ensure carrier soft arrival. This system shall provide total safety of even delicate glass samples.

The station shall automatically clear and eject a blocked carrier exit by agitating the station mechanism.

The station shall be set to automatically return a carrier to the station from where it has been received by use of a single keystroke.

Carriers shall be received into a basket with the exception of the station at the Reception desk, which shall be a cabinet. The cabinet shall have the ability to retain arriving carriers within the station which may only be released by PIN entry via the keypad, and the ability to secure the station against unauthorized use via a PIN code entered via the keypad Arrival signal units shall be able to be programmed to discriminate to different user addresses, thereby allowing urgent full carriers to be immediately notified to the user, whilst allowing no alarm for empty returns.

The use of the station shall be restricted by a user identifiable touch key and security card.

The station shall include an in-built carrier arrival indicator consisting of a warning bleep and light. The bleep is to be enabled or disabled as required at the station by the user.

Remote indicators shall be provided in some locations to indicate the arrival of a carrier at the station, as indicated in the schedule. The remote signal devices shall be configurable to sound different bleep patterns for different addresses to discriminate for priority arrivals. These are generally from the Clean Utility Rooms to the appropriate Staff Base and indicated on the Nurse Call Panel.

Carriers

Carriers shall be capable of carrying specimens, blood bags, medications and documents and shall be manufactured from transparent high impact resistant plastic material. Both ends shall have caps with “flip-swivel lids” and self-latching feature, preventing cap from opening during transportation inside the tubing. Carriers shall not have any metallic components.

Velcro type wear bands on both caps shall provide smooth travel and noise reduction. Each cap shall incorporate an elastic rubber bumper on the outside end for impact reduction.

Carriers shall be fitted with an RFID transponder in both ends of the carrier to avoid operators having to turn carriers during dispatch operation.

The following carriers shall be provided:

- 5 No. carriers per station
- 1 No. special cleaning carrier for dispersing cleaning agent throughout the system in the event of a spillage

Carriers shall be leak resistant to avoid the spillage of fluids outside of the carrier within the tube in the event of a breakage. Each carrier shall come complete with transponder technology that allows automatic redistribution and allow only correct carriers to be sent from any station.

Carriers shall be secured during both the send and receive operations.

Carriers & RFID

Every carrier shall be fitted with a RFID (radio frequency identification) transponder that uniquely identifies it.

Every station shall be fitted with a transponder reader so that the identity and location of every carrier is recorded on every transaction.

RFID shall enable the carrier to be individually identified on each transaction so that the following functionality is included as a minimum:-

- Automatically send the carrier to a carrier specific destination (e.g auto return to home location).
- Automatically send the carrier to a station specific destination (e.g auto send this carrier to A/E).
- Invoke a carrier specific priority.
- Prevent the carrier being sent to prohibited destinations. (e.g. prohibit Pharmacy carriers from being dispatched to laboratories).
- Automatically distribute the carrier according to station stock levels.
- Automatically remove the carrier from service after a pre-set number of transactions for cleaning/service.
- Re-allocate stock levels when auto-distribution is in use so that “walked” carriers are correctly accounted for without manual resetting of stock allocations.
- Identify the location of any specific carrier at any time.
- Prevent the dispatch of non-carriers (spurious payloads)

Main Control Unit.

The main control system shall incorporate the following features as a minimum:-

- Be a dedicated standard PC.
- The control software shall be installed onto Windows 7 operating system.
- The pneumatic tube system hardware shall be connected via the industry standard USB interface
- A back-up PC may be supplied so that the control PC may be quickly swapped by unplugging and re-plugging the USB interface. The back-up PC shall be pre-configured with all relevant software as a duplicate to the main PC.
- The control PC shall be configurable so that it may be accessed remotely either:- i) Through connection to a local network, or ii) via direct connection to the internet so that all PC functionality is available from several remote locations as required.
- The control PC shall be fitted with a UPS.

Control Software

The control software shall provide the following features as a minimum:-

- Automatic start up after power is switched on.
- Automatic recovery after power is restored from a failure such that all transactions are resumed.
- Overview of all operations in progress showing sending and receiving destinations, order time, transaction start time, transaction ID number, carrier ID number.
- Any systems/units in error or fault status shall be highlighted in a different colour to the rest of the display.
- Ability to allocate default (reject) stations at any location on the network, so that initially, in the case of error, delivery is attempted to a single location on the network. Secondary reject stations within individual zones and systems shall be available in case the single primary location is unobtainable.
- Automatic initiation of clearing (purge, freerun) cycles in case of error.
- Ability to initiate a manual clearing cycle (purge, freerun) selectable by individual station, individual zone or system or globally for the whole network.
- Ability to allocate priorities to individual stations, addresses and carriers as required.
- Timetable feature programmable for different times, days of the week, and holidays, so that priorities, diverting of transactions and enabling/disabling of stations may be carried out according to a predetermined schedule.
- The ability to make individual stations and/or addresses “invisible” so that they don’t appear on directories, to protect special stations and/or priorities from abuse.
- Password protected access to any service areas of the control software where configuration data may be entered.
- Individual remote control and monitoring of all elements of the network including e.g. station motors, switches, displays such that the whole network may be manipulated via the central PC control if required.

- A database of carriers available for use on the network which records: the number of transactions each carrier has made; the location of each individual carrier; the actual stock level of carriers at each station compared to the required stock.
- Provide connection facilities to fire alarms so that the system shuts down in the case of an alarm.
- Provide the facility for data exchange with BMS systems using an industry standard OPC interface so that individual and independent operation and fault signals can be transmitted if required.
- Provide the ability to freeze operation of the whole network in an emergency, stopping all operation.
- Provide a carrier stock control and management system so that each station may be allocated a specific stock of carriers that is replenished automatically according to demand using an automatic re-distribution feature. The transponder functionality shall ensure that stocks are automatically re-allocated if a carrier is “walked” between locations.
- The control software shall be automatically backed up.
- Configuration and data logs shall be transportable as a single back-up file.
- Provide the (optional) facility to broadcast operational and error status via email, SMS, pager, as required. This facility shall be configurable so that either all or only selective messages may be broadcast.

Management and Monitoring Software.

The installation shall be provided with a management and monitoring software application to allow analysis and audit of both active and historical transactions. The management software shall include the following features as a minimum:-

- Real time graphic schematic of the various systems and zones of the network showing transactions in progress in a graphical format.
- Real time floor plan graphic showing the locations of stations and diverters on individual floor plan “maps” so that the physical location of any unit in operation or fault may be easily identified.
- Carrier ID information for each station showing:- carriers recently dispatched; carriers recently received; carrier IDs of carriers currently at that station; present location of carriers allocated to that station.
- Presentation and print of textual and graphical information extracted from the transaction log. The software shall have the ability to filter by time, date, route, errors. It shall also be capable of displaying the efficiency of individual zones or systems and shall clearly identify the waiting time (queuing time), total transaction time, and transfer time for each transaction.

Error Management

The following features shall be included as a minimum:-

- Errors shall be recorded in text format in the transaction log.
- All errors shall be searchable using error type filters.
- A graphical representation shall be available showing the frequency of errors for specific time periods.

- A system in fault shall be highlighted in a different colour to systems in normal operation.
- Within the device directory the device(unit) in fault shall be highlighted in a different colour to stations in normal operation.
- Optionally, specific station/zone/network faults shall be capable of being notified via a remote alarm connected to any station on the network.

Optionally specific fault notification shall be capable of broadcast via email, SMS, pager or via the BMS system.

Diverters

Diverters may be mounted in any orientation and may be provided with 2, 3, or 4 ports depending on the design intent.

Diverters shall be installed so that service access is not impeded.

If required, diverters shall be capable of operating in such a way that they are able to manipulate the air stream away from sensitive areas as quickly as possible, and shall therefore be capable of operation with “active air”

The rest position of the diverter shall be capable of being easily changed directly from the PC through the control software.

Transfer Units (Interchange Devices)

Transfer Units or Interchange devices (other than simple diverter interchanges) shall provide the following features as a minimum:-

- Automatic transfer of carriers from one system to another.
- Ability to recognize priority carriers and process them more quickly than normal transactions.
- Modular construction so that the network may be expanded as required.
- Ability to connect directly to “Express” or “Power” lines capable of transporting several carriers simultaneously in a single tube.
- Have a throughput capacity in the order of 21 carriers/hour (not including the return of capsules).
- Provide a carrier reading device such that the individual carrier ID is logged during transfer.
- When carriers pass through the transfer device, have the ability to reinstate any carriers recognized by their individual ID to their correct transaction destination if they have been previously “rejected” through a clearing operation.
- The ability to prohibit specific transfer routes if required for operational reasons.

Blowers (Exhausters)

Blowers shall incorporate the following features as a minimum:-

- Be 3 phase units appropriate to achieve a carrier speed of 6m/s in all circumstances.
- Incorporate anti-vibration mountings.

- Have soft start using a frequency inverter.
- Incorporate speed/energy control through manipulation of the inverter.
- Provide filter screens on all inputs.
- Provide silencers for air noise reduction.
- Be provided with an appropriate air shifter/valves to control the blow and suck operations.

Tube

Tube shall be installed to the following specification:-

- Transmission tube shall be outside diameter 160 mm grey colour hard UPVC tubing specifically produced for pneumatic tube transport system according to standards DIN/ISO 8061/8062 and 6660/6661.
- Tube bends shall be manufactured from UPVC tube as specified above. Bend radius shall be 800 mm, measured from the bend centre line and shall allow passage of carriers with dimension 350 mm inside length x 120 mm inside diameter. Bends shall maintain a uniform cross-section free from wrinkles and distortions.
- Joints shall be manufactured with UPVC tube connecting sleeves that are solvent welded with special solving glue.
- Expansion joints shall be provided in locations where building movement or change of ambient temperature might cause dislocation within the UPVC tubing.
- All tubing in the system shall be adequately supported at appropriate intervals with suitable clips, rods attached to suitable fixing anchors. The maximum distance between supports shall not exceed 2.5 meters. Support also has to be provided at centre of bend radius and at equipment connections. Special brackets may be used where convenient. All supporting material shall be of galvanized steel suitably protected at cut edges.
- Where tubing passes through a wall or floor the integrity of the fire rating shall not be reduced. Intumescent (crushing) type fire sleeves shall be installed at all such points.

Cable

Cable shall be appropriate for the installation and shall have shielded data cables that ensure compliance with EMC legislation.

Cable shall be securely mounted on to the transmission tube using cable ties at appropriate intervals.

Static Electricity

The system shall be designed to minimise the build up of static electricity and facilities are provided to safely discharge to earth, such that neither system malfunction or nuisance is caused.

Condensation

The system shall be designed to minimise the potential for condensation caused by the movement of warm wet air through cold tubes. The location of air inlets shall be designed to reduce the potential for large temperature reductions on the air within the system, both during the systems peak operation periods, and during times when the system is only lightly used.

The “timetable” feature in the control system shall be capable of programming regular air movement through the system if required.

Web Link Monitoring

This shall enable external connection to allow remote technical support from the Facilities Management Department or any other external point.

Power Failure

In the event that a power failure occurs, the system shall automatically be reinitiated on restoration of power, and any carriers that are contained within the system shall be removed and taken to their pre-programmed destination or to the assigned ‘dump’ station.

Fire Alarm

In the event that the fire alarm system is activated in the RHSC-DCN building (either in a real event, by accident or a planned test) then the system shall close down following completion of any transaction in progress. In the event of a fire alarm activation within the RIE Pharmacy and Laboratories then links to these buildings shall be closed down. As and when the Fire Alarm is reset then the system shall be reinstated. This can be carried out either manually or automatically. A manual ‘test’ key shall be provided to override and disable this facility for fire alarm testing, so as to avoid disruption to the system operation. This is to be positioned at the main control location (to be agreed).

X31 Pneumatic Tube Transportation System

GENERAL

110 PNEUMATIC DOCUMENT CONVEYING SYSTEM: RHSC + DCN building

- Completion:
  - Plant and equipment identification: Mechanical plant and equipment identification.
  - Commissioning: Testing and Documentation

SYSTEM PERFORMANCE

210 DESIGN
- Design: Complete the design of the pneumatic document conveying system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

PRODUCTS

310 STATIONS: Refer to drawings for locations.

EXECUTION

620A INSTALLING STATIONS
- Location: As indicated on the Architect's drawings
- Mounting heights (maximum):
  - Top, side and front entry stations: Top of cabinet 1.6 m above finished floor level.
  - Bottom loading stations: Bottom of station 1.2 m above finished floor level.

630 INSTALLING BLOWERS
- Location: A clean, dust-free environment isolated from: Areas in which patients may be sleeping or staff working.

640 INSTALLING DIVERTERS
- Location: In service areas with good access for maintenance.

650 INSTALLING PIPELINE AND FITTINGS
- Location: Routed in ducts and ceiling voids, where possible.
- Arrangement: Use large bend radii to avoid blockages.
- Fire stopping: Where tubing passes through a wall, floor, ceiling or other barrier, ensure that the fire rating of the construction is not reduced. Install crushing type intumescent fire sleeves or collars.

COMPLETION

910 CLEANING

- Blower air intake: Free of dust, vegetation, waste, rubbish, builder's debris, or any other possible source of contamination.
- Pipelines: Purge to an open end, and clear of any dirt, dust or debris accumulated during construction.

920 TESTING

- Pre-commissioning:
  - Manual operation of equipment;
  - Static measurements and functional tests of individual components ; and
  - Visual inspection.
- Prior to handover: Ensure:
  - Access to all parts of the system is satisfactory and safe.
  - All components function correctly.
  - Electric circuits are completed, tested and energized.
  - Correct direction of rotation for electric motors.
  - Interlocks are operative and in accordance with specification.
  - Plant and installations have been provided and installed in accordance with the design specification and drawings.
  - Plant installation is complete, insulation, if required, is applied, and ducts and pipelines are identified, as specified.
  - Area containing blower is clean and dust free.

930 DOCUMENTATION

O& M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

The Specialist shall provide instruction to the clients Engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the Manufactures recommendations and best practice.

The Specialist shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

- Instructions: Submit operation and maintenance instructions for each station. .
- Label information: A directory of all available stations, clear step-by-step operating instructions, and action to be taken in the event of system failure.
- Record drawings: Provide:
  - Schematic diagrams of pneumatic air tube transport systems;
  - Schedules of blowers, stations, diverters, plant items, control sensors;
  - Schematic diagrams of control systems marked with set points; and
  - Traffic flow matrix.
- Programmes used by system: Submit full software listing.

RHSC and DCN EDINBURGH
HEATING SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as Specialist.

To carry out the development of the design to form the installation, shall obtain the necessary supporting documentation.

This specification relates to the heating systems.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

Pumps

All motors shall be selected to provide the most energy efficient solution conforming to Section 6 regulations. All pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Boilers
- Pumps
- Pressurisation Units
- Chimneys (including secondary steelwork)

- Pipework and associated items
- Heating terminal devices
- CHP

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this specification:-

- BMS and automatic controls

4.0 INTERFACES AND DEMARCATIONS

The heating system shall be provided as a complete working system serving the hospital. Project Co. shall provide information to other parties including power supplies and fire alarm system interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The heating system shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

External Design Conditions

Winter	-	-6°C sat
Sizing for air handling plant		-10°C
Summer	-	26°C db 19°C wb
Sizing for refrigeration plant	-	30°C

System Design Conditions

LTHW Flow Temperature	-	80°C
LTHW Return Temperature	-	60°C
LTHW Operating Pressure	-	3.5 bar
Incoming gas pressure		65mbar
Limiting noise criteria at site boundary	-	Refer to Acoustic Consultant's report

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Other Specialist. Project Co. shall liaise with other specialists as necessary to ensure that all interfaces between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist

Any other member of the Project and Hospital Board teams concerned with the planning and administration of the heating system.

8.0 SYSTEM DESCRIPTION

Heating Installation

Heating for the building fabric, ventilation plant and hot water generation shall be derived from a Low Temperature Hot Water (LTHW) heating system.

The total heating load for the hospital site has been assessed at 5.6MW. For resilience purposes the boiler plant shall be arranged as two boilers duty with another standby boiler. The boilers shall be housed in the main Energy Centre to the South of the main hospital building to concentrate the maintenance of heavy plant away from the main hospital building.

To provide the 5.6MW load, the boiler plant shall comprise 3 No dual fuel LTHW boilers each sized at 3.2MW output giving a total available duty capacity of 6.4MW. Operation shall be on a 2 No. run. In the event of a catastrophic failure of a boiler the standby boiler shall be brought on line contribution which will allow the site to continue.

The boilers shall fire to maintain heat supply to primary LTHW heating circuits designed to operate at nominal system flow and return temperatures of 80ºC and 60ºC respectively. Temperature schedules and flow rates shall be introduced via the BMS control to enhance load matching and control regimes.

The boilers shall be of the shell and tube type with fully modulating dual fuel burners selected to provide efficient operation at varying load conditions in conjunction with sequence controls. Natural gas shall be the primary fuel. Emergency fuel shall be provided by gas oil. Both gas and oil supplies to the boilers shall have solenoid shut off valves linked to a fire detection system.

The boilers shall be arranged with reverse return flow and return headers and each boiler shall have its own primary circulating pump. A back end protection bypass shall be incorporated into each boiler assembly.

Each boiler shall have a matched flue gas economiser fitted to improve heat output efficiency.

Combined Heat and Power Plant

A natural gas fired combined heat and power (CHP) plant shall provide electricity (at Medium Voltage) and heat (85^{o}C Flow and 75^{o}C Return. A single gas fired CHP unit will provide 400kW electrical power and 600kW heating to reduce overall site CO2 emissions.(Refer to CHP specification WW AP.1.2.18 SMcK G1547).

Chimney

The boilers, CHP units and standby generators shall each have a stainless steel twin wall insulated flue, which shall exit the Energy Centre and terminate at a height to comply with the requirements of the Clean Air Act.

Project Co. shall allow for all supporting steelwork related to the flues.

Primary Heating Circuits

Primary heating circuits shall emanate from the Energy Centre arranged as A and B circuits fed from the respective boiler system. Each of the A and B pipework circuits is sized to provide the full hospital heating requirement.

The flow and return pipework shall be routed from the Energy Centre using accessible ground level ducts to enter the basement corridor system of the main hospital. At this point the A and B circuits shall join a header which, for resilience purposes, shall allow either A or B circuits to feed the hospital.

From the hospital header LTHW radial feeds shall run via the basement corridors and risers to the hospital's plant areas to serve heat stations and domestic hot water calorifiers.

The primary LTHW heating system (A and B) shall include the following elements:

- A common heating pressurisation plant with twin pump make-up plant and multiple expansion vessels to maintain the pressure in the heating system.
- Multiple circulation pumps (including one standby unit).
- A combined dirt separator/deaeration unit on the main flow pipework.
- The system shall be capable of being treated with corrosion inhibiting chemicals via a manual-dosing unit.

Two port control valves shall be provided on all of the major load centres to allow the use of variable volume control of the primary heating circuit. The circulating pumps shall be controlled by the BMS in sequence as needed to match the varying load demand. This shall maintain the pressure differential between flow and return pipework within set limits with sensors located within the main sub-distribution pipework. The system shall incorporate a number of three port constant volume valves to act as bypasses so that the minimum flow shall not be less than 40% of a single pump in operation.

In times of low heating load, one of the Boilers shall act as the lead boiler and with the CHP system provide heat to both the A & B circuits. The switching of one boiler, to the other, to act as lead, incorporating the CHP unit, shall be achieved by the opening and closing of various 2 port motorised valves.

A constant temperature flow and return will run from the energy centre to the air handling units located in the second and fourth floor plantrooms of the main building together with door curtains and duct mounted re heat coils.

Secondary Heating Circuits

From the heat stations installed within the plantroom areas, the secondary heating circuits systems shall emanate to serve specific zones of the hospital.

Each of the main secondary heating systems shall be self-contained to provide security of supplies between the various zones.

Each secondary heating system shall include the following elements:

- Run and stand-by secondary constant temperature circulation pumps.
- The system shall be capable of being treated with corrosion inhibiting chemicals via a manual-dosing unit.

The secondary constant temperature pumps shall circulate all the secondary water through the DHW calorifier integral heat exchanger with temperature control on the secondary side of the calorifier.

The main heating secondary flow and return temperature shall operate with a nominal design condition of 80ºC flow and 60ºC return.

The primary constant temperature system shall supply:

- The heating systems
- The various air handling unit heater batteries located throughout the associated plantroom areas and remote heater batteries as appropriate.

Two port control valves shall be provided on all the air handling unit heater batteries. This shall allow the use of variable speed control on the secondary constant temperature pumps to conserve energy and reduce carbon emissions. Pump speeds shall be varied by inverter motor control units which shall be controlled by the BMS to maintain the pressure differential between flow and return pipework within set limits with sensors located in the main sub-distribution pipework. The system shall not permit the secondary constant temperature pumps to operate at less than 40% of their design maximum.

The secondary heating circuit shall serve all the occupied areas heat emitters such as - radiant heating panels, low level low surface temperature heaters/ radiators and underfloor.

The local heat emitter valves shall generally be controlled by direct acting thermostatic radiator valves or electrically operated valves in conjunction with the room cooling devices, and, therefore, the secondary variable volume pumps shall be variable speed type with control via motor inverter unit, under the command of the BMS. BMS sensors and direct acting pressure differential units shall be installed in the secondary heating pipework system, as constant temperature system. The system shall not permit the heating pumps to operate at less than 40% of their design maximum.

The systems shall be divided into sections to allow individual wards and areas to be isolated from the main system for maintenance or shutdown.

Where departments are not operated on a 24 hour basis, the local heating circuits shall incorporate motorised valves controlled by the BMS on a timed basis, with optimised control to suit the particular occupation times.

All main and subsequent department branches shall be provided with balancing/measurement and isolation valves along with drain cocks, air vents etc. to ensure proper control and regulation of water flow rates under design load condition with flushing, draining and re-filling facilities.

Heat Emitters

Heat emitters shall generally be ceiling located providing inherent safety in respect of patient care. Where heat emitters are within touch of patients or the public, the emitters shall be of the low surface temperatures type with a mean surface temperature below 43^{o}C.

The majority of heating shall be by either ceiling radiant panels, LST radiators or warm air systems.

These solutions shall limit surface temperature to prevent scalding to patients and the general public.

The individual room heating emitters (radiant heating panels, radiators etc.) shall be provided with local direct acting control valves, to restrict the water flow on rise of air temperature and provide local control facility. These shall be occupant adjustable, within set parameters.

Where emitters are located in areas provided with unitary cooling or air conditioning, controls shall be integrated to minimise energy consumption while maintaining local control.

Certain large open areas of the building, for example, hospital main entrance, atrium and Pod atrium shall be provided with underfloor hot water heating systems.

Air curtains shall be provided above entrance doors to alleviate drafts.

Domestic Hot Water Calorifiers

Domestic hot water service semi-storage calorifier equipped with integral non storage heat exchanger shall be served directly from the respective LTHW primary heating main to provide rapid recovery and optimum storage capacity.

T10 HEATING SYSTEMS

120 LOW TEMPERATURE HOT WATER HEATING SYSTEM

The LTHW system shall run from the heat stations situated at various locations around the hospital and serve the various heating circuits and emitters.

- Type: Constant temperature circuits.
- Heat source: Via dual fuel boilers and CHP located in energy centre.
- Pressurisation units: As section Y20 and schedule.
- Feed and expansion tanks: As part of the pressurisation unit for air break.
- Pumps: As section Y20 and pump schedule.
- Pipelines: As section Y10.
- Pipelines ancillaries: As section Y11.
- Thermal insulation: As section Y30.
- Vibration isolation: Inertia bases, as section Y31 and advised by the acoustic consultant.
- Heat emitters: As schedules.
- Controls: As section Y40.
- Accessories: As specification.
- Completion:
  - Cleaning and chemical treatment: Flushing and chemical treatment, as section Y12.
  - Plant and equipment identification: Mechanical plant and equipment identification, as Section Y32 and schedule.
  - Commissioning: Commissioning of heating systems, as section Y50.

SYSTEM PERFORMANCE

Project Co. shall supply and install services and equipment to perform as per specification. Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Where a particular manufacture is specified, Project Co. shall include for a product of that quality and performance.

Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration.

This must be done in a timely manner and Project Co. shall provide all details including but not limited to.

- Detailed description
- Cost comparison
- Technical comparison
- Energy and carbon performance impact
- References to standards
- References to SHTMs

275 VARIABLE FLOW PIPEWORK SYSTEMS

Where the LTHW systems utilise variable volume control systems they shall have differential pressure control valves (DPCV) installed as indicated on the drawings, and supplied and installed by .

The purpose of the DPCV is to automatically compensate for the rise in differential pressure across the circuit that it services, as the circuit flow rate falls under the dictate of the 2-port control valve(s), and vice versa.

DPCVs used in conjunction with motorised control valves and TRVs will be arranged to maintain a constant differential pressure across the circuit.

Project Co. shall, in conjunction with the BMS Specialist, liaise with the DPCV supplier to ensure the correct motorised control valve selections are made and the whole system is compatible in terms of operating pressure ranges, etc.

Similarly, Project Co. shall, in conjunction with the BMS Specialist also liaise with the pump supplier, to ensure that the pump speed control system is totally compatible between the 3 elements, i.e. DPCV, motorised/thermostatic valves and pump characteristic and control.

It shall be noted that the minimum pressure drop across combination of control valve, coil and interconnecting pipework system and accessories is to be 25kPa to suit operation of DPCV.

The maximum operating pressure of the control valve, coil and interconnecting pipework/accessories shall also be reviewed against the selection of the DPCV.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations.

This shall include clean and tidy working and working in confined spaces.

Due to the size of the water systems being installed all pressure testing and commissioning equipment shall be cleaned and chlorinated before each use.

This is to prevent the systems from being contaminated with pseudomonas.

620 INSTALLING WATER BASED HEATING SYSTEMS

- Standard: To BS EN 14336.

COMPLETION

O& M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Acconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

Project Co. shall protect the system from damage or interference during the works. Project Co. shall Test, flush and clean the system as per section Y12, Y50, SHTM's and TR/20.

Project Co. shall submit O&M's.

Project Co. shall provide training as per section Y12, Y40 & Y50.

Project Co. shall provide spares as per section Y12, Y40 & Y50.

Project Co's. defects and liability period shall be as the contract prelims.

905 HYDRAULIC PRESSURE TESTING OF SYSTEMS

- Testing: In accordance with HVCA TR20 & TR/6. Also see section Y50.
- Notice (minimum): 1 week
- Pressure: 1.5 times working pressure (LTHW)
- Duration of test: 2 h.

920 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
- Keys: Supply keys for valves and vents.

T20 GAS AND OIL FIRED BOILERS

380 DUAL FUEL FIRED STEEL SHELL BOILERS

The boilers shall be of the three pass shell and tube type with fully modulating dual fuel burners selected to provide efficient operation at varying load conditions in conjunction with sequence controls.

The entire boiler shall be clad within a heavy gauge sheet steel insulated jacket complete with inspection panels. The maximum case emission shall be no greater than 0.5% of the rated output.

Natural gas shall be the primary fuel. Emergency fuel shall be provided by gas oil to BS 2869 Grade D. The boilers shall have pressurised burners that operate on both fuels. Burners to be digital modulating with variable speed and air damper control and capacity control to achieve a high turndown ratio.

The burner shall be capable of operating safely at O_2 levels of less than 2% at high fire on gas through to 3.5% at low fire across the turndown range. On oil O_2 levels shall be 2.5% at high fire through to 4% at low fire.

Each boiler shall have a matched flue gas economiser fitted to improve heat output efficiency. The economiser shall be capable of being mounted as a stand-alone unit as well as directly attached to the boiler. Each economiser shall be fitted with an automatic motorised bypass unit which shall be activated when the boiler is operating on oil, or in the event of the economiser pump failing. This is to prevent damage to the economiser.

The boilers shall be arranged with reverse return flow and return headers and each boiler shall have its own primary circulating pump.

The boilers shall be supplied complete with burner attenuating hoods (refer to the acoustic consultants reports) to minimise noise breakout. Boilers or associated pumps shall not cause noise or vibration above that stated in this specification or SHTM's.

Safety blow of valves shall be piped to drain via a vented blowdown vessel.

All plinths/ anti vibration mounts shall be in situ prior to the delivery of the boilers so that the boilers can be sited in their permanent positions to prevent damage from moving.

- Standards: To BS 855, BS 2790 and BS EN 12953.
- Mounting: Floor mounted.
- Output (kW): As schedule.
- Seasonal efficiency: on gas 90% net excluding economiser
- Thermal performance testing: To BS 845-1.
- NOx emissions (maximum): Low NOx burner with oxygen trim control (<70mg/KWhr natural gas and <120mg/KWhr oil).
- Dual fuel burner: To BS 5885-1.
- Fuel: Natural Gas and Gas Oil to BS 2869 Grade D.
- Burner control: Modulating with turndown ratio on gas of 1:10
- Burner manufacturer – Dunphy, Weishaupt or Riello.
- Safety, control and monitoring of monobloc oil burners: To BS EN 230.
- Integral controls.

- Accessories: Both gas and oil supplies to the boilers shall have solenoid shut off valves linked to a fire detection system with battery back-up in the event of power failure, and:
  - Pressure gauge;
  - Safety valve; and
  - Temperature gauge.

A boiler instrumentation panel shall be provided and shall incorporate:-

On/off switch,
Control thermostat,
Limit thermostat (automatic reset),
Thermometer.
Burner enable relay
Safety controls/burner, water flow interlocks
Modulating controller
Remote fuel change over switch
Gas/oil key switch
Motor/control relay fuses
Valve proving lamp
Indicating Lamp for both gas and oil;

- Burner on
- Burner lock-out/fault
- Boiler excess temperature
- Gas pressure/valve proving system fault
- Gas fault
- Re-set button
- % Firing rate indicator.

Some of the above features may be duplicated on the burner control panel as described below. The burner controls shall take precedence and the duplicated elements of the boiler controls may be omitted.

The boiler control panel must be capable of being fully interrogated by the building management system through the independent network protocol.

The direct digital combustion control system shall incorporate the following features:

- membrane keypad
- programmable sequence timing control for pre-purge, ignition and post-purge
- controls fuel safety valves, ignition circuit, oil pump and fan motor
- gas and oil valve proving and leakage detection systems with continuous pressure monitoring and alarm limits
- proof of closure system for fuel valves
- choice of operation with or without pre-purge or post purge
- pilot with or without main valve
- programmable thresholds for pilot and main flame
- primary and secondary air pressure monitoring
- simultaneous firing capability

- range of self checking, fail-safe boiler pressure and temperature sensors
- servo drives on each system (power rating restricted)
- fuel/air ratio control with independent control of each valve controlling servo
- valves and dampers may open and close within the modulating section of the profile
- multiple fuel profiles
- profile change while firing
- PID for control of modulation rate from boiler sensor
- auxiliary modulation / set-point input, suitable for modulation from BMS
- adjustable boiler warming limit and period
- fail safe digital inputs for alarm / shut-down / lockout– e.g. high/low water, low oil temperature etc. with annunciation on display
- programmable relay outputs + Alarm/Fault relay
- real time clock
- hours run logged per profile
- diagnostics and 1at least 100 event history log (fault history)
- auto / manual modulation
- Comview access for commissioning data and boiler/burner data display
- variable fan speed control
- Oxygen trim

A burner mounted control cabinet shall house all primary components:

- ignition unit
- starter for oil pump
- The cabinet shall be hinged to provide access to the internal components.
- All necessary relays and circuit breakers

The digital burner management system shall control the burner by an electronic air /fuel ratio control system giving direct digital control of the air and fuel drives including motors for the air inlet damper, gas butterfly valve and oil metering valve. The accuracy of the servo motors shall be controlled to 0.1 degrees angular.

- PT 100 Modulating temperature controller
- Modbus RS 485

The oxygen and monitoring trim system shall monitor flue gas oxygen and temperature levels and provide closed loop oxygen trim control including:

- Oxygen analyser probe complete with: -
  - zirconia cell
  - in-built probe heater
  - probe mounting boss
  - air inlet temperature sensor
- Oxygen probe interface unit providing indication of: -
  - oxygen level
  - flue gas temperature
  - burner inlet temperature
  - calculated boiler efficiency

The burner gas train constructed to BS EN 161 including:

- Gas line inlet filter
- low gas pressure switch
- high gas pressure switch
- twin gas valve actuators
- valve proving system
- gas pressure test points
- terminal connection box

400 AIR SUPPLY TO APPLIANCES

- Standards: To BS 5440-2 and BS 6644.
- Sizes The boiler house shall have natural ventilation openings for combustion and ventilation in accordance with BS6644/1990.
- Location: See Drawings.

EXECUTION

Project Co. shall protect boilers from damage or interference during the works.

Project Co. shall include for the services of the presence of the boiler and burner manufacturer's skilled services engineers to start up, test and check all burner/boiler controls. The units when commissioned, shall be "Set Up" to give maximum combustion efficiency of no less than 80% when the draught over the combustion space has been regulated within the limits laid down by the boiler manufacturer. Flue gas outlet temperatures shall require to be recorded at this stage, together with all relevant details necessary to ascertain the efficiency of the plant. All of the testing shall be carried out by 's appointed specialist and then witnessed by the Board's appointed representative before the boiler plant shall be accepted from the Board. A complete set of boiler flue cleaning tools shall be supplied complete with wall mounting rack and fixings. Project Co. shall allow for instruction of the clients representative on the working of the boiler plant.

610 INSTALLING BOILERS

- Standards:
  - Gas fired boilers: To BS 6798 and BS 6644.
  - Oil fired boilers: In accordance with BS 5410.
- Fixing of equipment, components and accessories: Fix securely on purpose-made bases or supports.
- Preparation: Immediately before installation of lagging and casing, pressure test joints.
  - Results: Submit.
- Space around the boiler: Adequate:
  - to ensure sufficient air circulation for draught diverter operation;
  - to ensure sufficient air for combustion and cooling; and
  - for maintenance and servicing.
- Location: Minimum 75 mm from combustible material.
  - Access: Provide for inspection and servicing of boilers and ancillary equipment.

T30 HEAT EMITTERS

PRODUCTS

All elements of the work shall be in accordance with the requirements of current legislation, regulations and industry standards.

The installation shall also comply to the SHTM code of practices and relevant British standards.

Project Co. shall allow for supplying samples and constructing mockups for comment.

This shall include ceiling mockups for the radiant panels.
All emitters must be selected to meet the schedule and specification with particular reference to noise criteria.

All emitters shall have smooth easy clean surfaces with no sharp edges or dirt collecting gaps.

All emitters shall be suitable for hospital application.

Access doors and hatches shall be provided to service and maintenance purposes.

310 AIR CURTAINS

Warm air curtains shall be provided in entrance areas to avoid draught. All units shall be fed from the LTHW system.

The air curtain shall be suitable for the mounting height. Grilles to be powder coated to Architect's specification.

Heat exchanger tube material to be copper, fin material: aluminium.

Connections to be terminated externally on recessed models and hidden within the unit on exposed models.

All coils pressure tested to 22 bar (350 lbs/in2).

Fans to have a unit mounted two-speed switch.

Unit to be fitted with air flow device to alarm BMS in case of fan failure.

- Method for testing and rating: To BS 4856-1,-2,-3 and -4.
- Type: LTHW Water.
- Requirements: As air curtain schedule.

340 NATURAL CONVECTORS LOW LEVEL

Low level convectors shall be cased copper fined tubes with extruded aluminium grilles suitable for hospital applications.

The emitters will be of the low surface temperatures type with a mean surface temperature below 43°C.

Final sizes of convectors to be site measured by and made to order.
Control shall be via thermostatic radiator valves.

- Standards: To BS EN 442-1, -2 and -3.
- Requirements: As Natural convector schedule.
- Third party certification to RADMAC scheme: As BS 442.

355 RADIANT PANELS

Radiant panel shall be lightweight, manufactured from Aluminium plate and have copper tube pathways and have foil faced Class O encapsulated insulation fitted at the back of the panels. Radiant panel shall be suitable for ceiling type.

All panels to be of modular length to suit 600 mm ceiling tile arrangement. Strengthening sleeves should be used with compression fittings.

Any junctions between panels to be covered by a purpose made cover plate which allows for any panel expansion.

The panels shall come complete with necessary supports, headers, drains, vents, or panel interconnectors.

The face plate to be attached by an extrusion to a copper pipe grid which shall provide plain copper ends for connecting to the heating system. The extrusion shall allow for differential thermal movement when attached to the face plate without distortion.

Each panel shall have a set of plain copper ends for connection by the aub-Board.

The panel connections shall avoid excessive pressure drops.

The panel manufacture shall supply all flexible interconnections between panels where required.

In locations where no other forms of heating or cooling is supplied the panels shall be fitted with an isolation valve on the return and a TRV on the flow.

Where panels are fitted in a location with other forms of heating or cooling the panel shall be controlled via a motorized two port valve and wall-mounted room sensor.

The faceplate of the panels shall be continuously supported by a trim to allow support and thermal movement without distortion of the face plate.

The edge trim shall be supported of the perimeter wall by suitable fixings.

Project Co. shall provide a typical ward layout drawing and install a mock up as part of the contract. The mock up installation type shall be agreed upon before final installation commences. Ral colour by Architect

- Standard: To BS EN 14037-1, -2 and -3.

380 TRENCH HEATING

Trench heating shall be cased copper fined tubes with extruded aluminium grilles suitable for hospital applications.

Final sizes of convectors to be site measured by and made to order
The depth of the trench heating is to be co-coordinated with the Board to ensure the trench heating is flush with the finished floor surface.
Control shall be via two port valves with room thermostats.

- Standards: To BS EN 442-1, -2 and -3.

EXECUTION

Project Co. shall protect the emitters from damage or interference during the works.

Project Co. shall supply and install services and equipment to perform as per specification. Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Where a particular manufacture is specified, Project Co. shall include for that manufacturer.

Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration.

This must be done in a timely manner and Project Co. shall provide all details including but not limited to.

- Detailed description
- Cost comparison
- Technical comparison
- References to standards
- References to SHTM's

610 INSTALLATION GENERALLY

- Fixing: Securely and parallel or perpendicular to the structure of the building.
- Stud walls: Fix to studs and/ or noggins.
- Isolating valve: Provide on flow pipelines.
- Regulating valve: Provide on return pipelines.

620 INSTALLING UNIT HEATERS AND AIR CURTAINS

- Suspension: Fix high level supports.

T42 UNDERFLOOR HEATING

PRODUCTS

All elements of the work shall be in accordance with the requirements of current legislation, regulations and industry standards.

The installation shall also comply to the SHTM code of practices and relevant British standards.

A proposed drawing list shall be submitted by .
All items of heating plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol.

310 LOW TEMPERATURE HOT WATER UNDERFLOOR HEATING

- Standards: To BS EN 1264-1.
- Manufacturer: Project Co. choice

Project Co. shall employ a specialist underfloor heating company to design the layout, supply and install the underfloor heating where shown on the drawings.

The construction drawings shall be sent to the Board at an agreed period prior to installation.

The manifold shall be easily accessed for servicing with the minimum disturbance to the running of the hospital.

The underfloor heating shall be five layered polybutylene pipework fixed to the insulation, covering the area. All materials used I the construction of the pipework and insulation shall be free from CFCs, HFC's or HCFC's

A compatible screed shall be applied to the whole floor area, encasing the pipework.

The screed over the pipework shall be as manufacture recommendations and shall have expansion joints. Screed cover and drying times must be adhered to.

The system shall have a mixing modular manifold to allow for the lower water temperatures for the underfloor heating system and to disturbed the heating medium.

- Product reference: As schedule.
- Pipes: To BS 7291 or DIN4726.
- Material: Polybutylene (PB).
- Floor type: Solid.
- Maximum floor surface temperature:
  Floor surface temperatures shall not exceed level that will cause discomfort or damage the floor. Recommended temperatures are:
  Occupied areas 29^{o}C
  Peripheral areas 35^{o}C

- Accessories:
  - Flow control valve;
  - Manifold; and
  - Regulation valve.
- Water temperature control unit: Part of the manifold system.

Room temperature control: The underfloor heating shall be controlled by tamperproof room thermostats.

- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

EXECUTION

Project Co. shall ensure the area where the underfloor heating has been installed is clearly marked and protected to prevent damage from drilling or impact to the floor.

610 INSTALLATION

- Standard: To BS EN 1264-4.
- Fixing of manifold: With access for regulation and maintenance.
  - Location: Away from areas sensitive to noise.
- Fixing of pipes: A proprietary fixing system to locate pipes accurately until floor finish is laid.

RHSC and DCN EDINBURGH
SPRINKLER SYSTEM

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the a specialist fire protection Installer and is referred to in this document as “specialist”.

To carry out the development of the design to form the installation, Project Co. shall obtain the necessary supporting documentation.

This Performance Specification relates to the Fire Fighting Systems.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

Pumps

All pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

2.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

- Dry Riser Systems
- Automatic Sprinkler Systems

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Fire detection and alarms
- Gas suppression systems
- External fire hydrant systems
- Helipad foam fire suppression system
- Energy Centre foam protection system.

4.0 INTERFACES AND DEMARCATIONS

The fire fighting systems shall be provided as complete working systems serving the new building with interface with existing system serving Main Hospital Building and. Project Co. shall provide information to other parties including for power supplies and fire alarm system interfaces with the existing Main Building System.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Fire Fighting Systems shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards, LPC Rules, Building Control, Scottish Water Regulations.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400 / 230 V, 3 phase, 50 Hz 230 V, 1 phase, 50 Hz.

The dry riser system shall generally comply with BS9990.

Generally the sprinkler installation shall comply with the requirements of BS EN 12845:2004 + A2:2009 and LPC Rules for Automatic Sprinkler Installations 2009, life safety, and comply with the requirements of BS 9999:2008 with the following criteria:

Life Safety
Hazard classification = OHI (TBC by Sprinkler Designer)
Minimum density of discharge = 5mm/min
AMAO = 216m²
System types = wet automatic
General Sprinkler temperature rating = 68°C
Sprinkler head type: Quick Response
Single sprinkler coverage = 12m²
Highest sprinkler = 30 metre between highest and lowest.

7.0 LIAISON

Project Co. shall include for liaison with:

Health and Safety Professionals. As well as the Health and Safety requirements of Parts A, B and C of this specification, the Specialist shall include for close liaison with Health and Safety professionals including the Trust's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist installers. The Specialist shall liaise with other Specialists as necessary to ensure that all interfaces between the Fire Fighting Systems and other systems are allowed for.

Any other member of the Project and Trust teams concerned with the planning and administration of the fire fighting systems.

8.0. SYSTEMS DESCRIPTIONS

Fire Fighting Systems shall comprise of the following:-

1) Dry riser System
2) Automatic sprinkler installation

DRY RISER SYSTEM

A dry riser main shall be provided in each of the 6No protected fire fighting cores. Dry riser landing valves shall be provided on each floor landing of the fire fighting cores and the dry riser main shall extend down to basement level to serve landing valves.

Dry riser landing valves shall also be provided to serve each plant room.

Dry riser inlet boxes shall be located at the ground floor perimeter of the building to serve their respective fire fighting cores. The inlet boxes shall contain a two-way or four way dry riser inlet breeching pieces and shall complete with a 25mm diameter drain valve.

Air release valve shall be provided at the top of each riser.

Each breeching piece shall be contained within a vandal resistant box complying with the requirements Where inlet valve boxes are located in areas of aesthetic consideration an Architectural infill to the box front shall be provided as described with the equipment schedules.

Dry riser mains shall be electrically earthed. Any points which do not provide electrical continuity shall be bonded.

AUTOMATIC SPRINKLER INSTALLATION

Sprinkler System Strategy Description

A Sprinkler System shall be provided to protect the departments as detailed in the final agreed fire strategy document.

An Ordinary Hazard level of protection as described within BS EN 12845 shall generally be provided to all hospital areas identified as high hazard or adjacent area within Fire Engineering Report.

Areas that shall not be automatic sprinkler protected and these include:

- Hub Rooms
- Computer Rooms
- Sub Stations
- Areas out with those highlighted in the fire strategy

Other areas to be identified on final agreement of the Fire Engineering Report and Strategy document.

An unmetered mains water supply shall provide water to the sprinkler storage tank and shall be provided as part of the fire water main to the site. The main shall be trace heated as it enters the basement. Water storage shall be provided by 70m^3 full capacity storage in a dedicated split tank within a dedicated fire protection water tank room, situated in the plant zone in the basement of the building. Water Storage tanks to be LPC approved

Duplicate electric run/standby pump sets shall be provided to satisfy the system demand pressure as detailed in BS EN 12845:2004 + A2:2009. Both pumps shall be fed from the general electrical distribution system and off the essential services generator supported supply.

A small jockey pump shall be included in the automatic sprinkler pump set to maintain static pressure on the system. Test water shall be returned to the tanks for water preservation purposes.

Each pump shall be arranged to draw water from either tank section and arranged so that any one pump or either tank section can be isolated.

All sprinkler main installation control valves, dual sprinkler pumps and valves sets etc shall be housed within the tank room. From the sprinkler tanks water shall be pumped via sprinkler mains running in the basement corridors to run to main service risers to rise and be distributed to the various sprinkler protected areas on the upper floors.

All sprinklers system signals must be interfaced into the BMS for monitoring and maintenance purposes. Sprinkler heads shall be pendant bulb type with brass finish in plant and other associated areas, and chrome or white finish in hospital areas. Sprinkler heads shall be either exposed or semi-recessed and of the quick response type. All sprinkler heads shall be nominally 15mm diameter. On a floor where sprinkler protection is required there shall be suitably sized branch lines from the riser with flow switches and drain lines. All sprinkler heads on the local pipe ranges shall be fast response heads set at $68^{O}C$, but consideration shall be given to the likelihood of a raised ambient temperature in special process areas, where a localised hot spots could result in $68^{O}C$ being exceed.

Testing procedures shall be carried out by an LPC qualified installer and shall consist of a dry pipework test involving a charge to the system with water to a pressure of 2.5 bar (250 kPa) which shall be maintained for a 24 hour period. During this period inspect the system to check that no water leaks at joints or valves.

Standards

The Sprinkler System will be designed, installed & commissioned to comply with the intent of the following:-

- IHSL Fire Strategy Document
- SHTM82 Supplement 4
- SHTM/HTM 05-01
- BS EN12845:2004
- BS 5306 Part 2:1990
- LPC Rules for Automatic Sprinkler Installations 2009
- EMC Directive 89/336/EEC

Sprinkler Equipment and Facilities

Tanks

Standard: To BS EN 12845.

The tanks shall be sectional steel type construction free from suspended fibrous or other matter, which may accumulate in the system pipework and provided with suitable isolating valves (interlocking key type) and drain points.

Pump Sets

Duplicate electric run/standby pump sets shall be provided to satisfy the system demand pressure as detailed in BS EN 12845:2004 + A2:2009. Both pumps shall be fed from the general electrical distribution system and off the essential services generator supported supply.

A small jockey pump shall be included in the automatic sprinkler pump set to maintain static pressure on the system.

Pipework

Standard: To BS EN 12845.

Wet installation pipework shall be carbon steel tube with appropriate screwed fittings or mechanical grooved couplings and prefabricated welded sections.

All pipeline materials including any pipeline ancillaries shall be as listed and approved by the LPC.

The pipework for the sprinkler installations will be black coated steel medium weight to B.S. 1387 or BS EN 10255.

Valves will be black steel or galvanised heavyweight, depending on the requirements of the local water authority.

The fittings would be malleable iron, cast iron or welded.
From 65 mm diameter and above grooved coupling will be used.

The necessary pipe support brackets for hanging the pipework are included and will comply with the BS EN 12485 requirements for spacing and size of the components.

Sprinkler Heads

Standard: To BS EN 12259-1

The installation shall be upright or pendant in line with the architectural finish of the ceiling or void. The heads shall be chrome or white finish in hospital areas and brass where located in exposed areas such as Plant rooms.

Where appropriate the heads shall be fitted with the deflector parallel to the slope of the roof, ceiling or pitch line of the stairs and plant electrical distribution equipment.

Sprinkler heads shall be pendant bulb type with brass finish in plant and other associated areas, and chrome or white finish in hospital areas.

Temperature rating: Normally 68C, in areas of high ambient temperatures, sprinkler heads with a higher temperature will be used.

Valves

The Sprinkler System will be controlled by wet pipe control valves tested and approved to L.P.C. standards each comprising a 150mm alarm valve with flanged or grooved connections, a 150mm butterfly valve, two 100mm diameter dial pressure gauges and cocks, an alarm trim, a drain valve and butterfly valve and flow switch.

Pressure Gauges

100 mm diameter Pressure Gauges to be installed as per SHTM/HTM 05 and LPC Rules for Automatic Sprinkler Installations These will be manufactured and installed to BS EN 837-1.

The gauges shall be installed immediately downstream of the tail end valve but upstream of any subsidiary stop valve; between the supply pipe stop valve and the check valve on a town main connection; and downstream of outlet check valve and upstream of outlet stop valve on pump supply.

Trace Heating

Exposed incoming pipework shall be trace heated to provide frost protection to maintain a minimum water temperature at 4°C.

Identification and Labelling
Labelling shall be to BS 1710, BS 5499-1 and BS EN 12845. A location plate shall be provided on external wall as close as practical to the entrance nearest the installation main control valve set. Label signage shall be provided for stop valves, incorporating the main and any subsidiary stop valves. Sprinkler heads shall include the orifice size on sprinkler body or deflector.

Monitoring & Alarms

All sprinklers system signals must be interfaced into the BMS for monitoring and maintenance purposes. Alarm indication shall alert on the BMS panel, Fire Panel, Main reception and Security office

All the monitored sprinkler equipment such as pumps valves and flow switches will be wired to an addressable panel. A flow alarm switch will be provided on the alarm valve riser to give remote alarm indication.

A water motor alarm gong will be supplied with the alarm valve. All the stop valves will be completed with a tamper switch. The installation of the gong will be on the outside of an exterior wall.

Each zone valve and flow switch will be connected to an I/O box wired to the addressable panel and fire detection system.

Specialist Systems

Fire suppression systems such as the Foam Extinguishing System to the Helipad and the FM200 type gas suppression to the Server rooms are provided as a separate package provided by a specialist contractors.

These systems do not form part of the sprinkler system installation, but shall be integrated with the Fire Alarm and BMS panels in event of operation.

User Interface

A specialist sprinkler maintenance contractor shall perform the routine maintenance activities on the sprinkler installation.

Day to day operation of the system will involve monitoring of the installation status via the dedicated sprinkler control panel and the interfaces with the BMS and Fire Alarm system.

Training and O&M information shall be provided during the commissioning and handover period of the construction.

MATERIAL AND WORKMANSHIP CLAUSES

S61 Dry riser systems

To be read with Preliminaries/ General conditions:

109 GENERAL: The Board shall employ a specialist Board to design, supply and install the dry risers.

110 DRY RISER SYSTEM: [Shall be located in the protected fire cores]
Inlet breechings: [Twin inlet breeching for 100 mm nominal bore riser].
[Four way inlet breeching for 150mm nominal bore riser].
Distribution pipelines: Heavy quality galvanized wrought steel pipe.
Outlets: Landing valves.
Accessories: [As specialist Board schedules].

209 SYSTEM PERFORMANCE:
All drawings and calculations for the dry riser system shall be issued to the Consultant and Fire Officer for comment two weeks before programmed construction commences.

210 DESIGN:
Standards: In accordance with CIBSE Guide, volume E and BS 9990.
Design: Complete the design of the dry riser system.
Proposals: Submit drawings, technical information, calculations and manufacturers literature.

310 INLET BREECHINGS AND BOXES: [5No]
Standard: To BS 5041-3.
Type: [Two way] + [Four way]
Manufacturer: [Board's choice].
Product reference: [Board's choice].
Integral accessories: Instantaneous inlet coupling, cap and chain, drain valve, non return valve.
The two-way + four way inlet breeching valves shall be contained within a valve box to a pattern and colour approved by the Architect. The box is to be marked "FIRE MAIN INLET – DRY RISER".

320 LANDING VALVES AND BOXES: [To all floor landings, plant rooms and basement level]
Where the landing valves are required to be contained within a landing valve box, the pattern and colour shall be approved by the Architect. The valve box shall be marked "FIRE MAIN OUTLET – DRY RISER".
All valve boxes in risers shall be provided with fire protection cladding, to give fire integrity protection to match the riser wall specification, in accordance with Building Control requirements.
Landing valves: To BS 5041-2.
Outlet boxes: To BS 5041-4.
Type: [Board's choice].
Manufacturer: [Board's choice].
- Product reference: [Board's choice].
Integral accessories: Cap and chain, leatherstrap.
Other accessories: [Board's choice].

330 COUPLINGS:
Standard: To BS 336.
Type: [Board's choice].
Manufacturer: [Board's choice].
- Product reference: [Board's choice].

340 CAPS AND CHAINS:
Standard: To BS 336.
Manufacturer: [Board's choice].
- Product reference: [Board's choice].

350 DRAIN VALVES:
Standards: To BS 5154 or BS EN 12288, rating PN 16, and BS 5041-3.
Type: Gate valve.
Manufacturer: [Board's choice].
- Product reference: [Board's choice].
Size: 25 mm.
Handwheel: Provide with leather securing strap and notice.
Accessories: Cap and chain.

360 AIR RELEASE VALVES:
Manufacturer: [Board's choice].
- Product reference: [Board's choice].

370 NON-RETURN VALVES:
Type: [Board's choice].
Manufacturer: [Board's choice].
- Product reference: [Board's choice].

380 LEATHER STRAPS:
Manufacturer: [Board's choice].
- Product reference: [Board's choice].
Width (minimum): 12 mm.
Thickness (minimum): 2 mm.
Accessories: Small non-ferrous padlock with keys.

609 EXECUTION:
The Board shall clean, flush and test the system as per regulations, SHTM, BS 9990, this specification and to the Fire Officer's requirements.

620 INSTALLING INLET BREECHINGS:
Location: Within 18 m and within sight of access road.
- Unrestricted access: Required.
Length of connecting pipework between the inlet and the vertical run of the main riser: Minimize.
Fall: Towards the drain valve.
Inlet box mounting height: Lower edge400 - 600 mm above ground level.
Inlet boxes: Identify with permanent signage.

630 INSTALLING PIPELINES:
Appearance: Install pipes straight and parallel or perpendicular to walls, floors, ceilings, and other building elements.
Dirt, insects and rodents: Prevent ingress.

Access: Locate runs to facilitate installation of equipment, accessories and allow access for maintenance.
Changes in direction: Provide standard bends. Do not use elbows.
Pipelines finish: Smooth, consistent bore, clean, free from defects, e.g. external scratching, toolmarks, distortion, wrinkling, and cracks.
Joints, bends and offsets: Minimize.
Drains and vents: Fix to falls. Provide draining valves at low points and vents at high points.
Electrical equipment: Install pipelines a minimum distance of 300 mm from electrical equipment. Do not run pipelines through electrical plant areas or above switchgear.
Fixing: Secure and neat.
Pipeline support: Prevent strain, e.g. from valve operation.
Thermal expansion and contraction: Allow for thermal movement of pipelines. Isolate from structure. Prevent noise or abrasion of pipelines caused by movement. Sleeve pipelines passing through walls, floors and other building elements.

640 INSTALLING LANDING VALVES:
Mounting height above floor level to underside of landing valve: 750 mm.
Testing: Provide an outlet at roof level.

650 IDENTIFICATION AND LABELS:
Standards: To BS 1710 and BS 5499-1.
Valve labels: Provide stating function.
Drain valve identification: Provide notice stating ‘Dry riser drain valve’.

909 COMPLETION:

910 FLUSHING:
Operation: Fill the system with water and discharge it via the topmost outlet. Flush out debris.

920 TESTING:
Testing: In accordance with BS 9990.
Notice before testing (minimum): 3 days.
Static pressure test: Charge the system with water to a pressure of 1000 kPa. Maintain for 15 minutes. During this period, inspect the system to check that no water leaks at joints or landing valves.
- Results: Submit.

Flow test: Pass water through the system under pressure and record flow gauge readings.
- Timing: After static pressure test.
- Results: Submit.

930 SETTING TO WORK:
Operation: Check operation of non-return valves.
Make ready: Drain system and leave ready for use.

940 DOCUMENTATION:
Manufacturers’ operating and maintenance instructions: Submit.
Test records: Submit a record of inspections and tests.
Record drawings: Submit drawings showing location of pipe runs, inlets, landing valves and drain valves.

950 OPERATING TOOLS:
Tools: Supply tools for operation, maintenance and cleaning purposes.
Keys: Supply keys for padlocks and air release valves.
- Quantity: As per contract requirements.

S63 Sprinkler systems

GENERAL

Project Co. shall employ a licensed specialist to design and install the sprinkler system.

Fire Protection Services shall be provided to protect the building to meet the requirements of SHTM/HTM05, the Fire Officer, Building Control, LPC Rules for Automatic Sprinkler Installations and the current Fire Safety Design Strategy.

All items of Sprinkler plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol.

The system will protect the building from serious fire damage.

110 SPRINKLER SYSTEM

All areas identified as requiring sprinklers shall be ordinary hazard group 1 life safety.
(TBC by Sprinkler Designer)

Test water shall be returned to the tanks for water preservation purposes. From the sprinkler tank(s), water shall be pumped throughout the building and distributing to the various sprinkler protected areas via the main service risers; from dual electric run/standby pumps both supported off the standby diesel generator. A small jockey pump shall be included to maintain static pressure on the system.

Where sprinkler protection is required, there shall be suitably sized branch lines from the riser with flow switches and drain lines. All sprinkler heads on the local pipe ranges shall be fast response heads set at 68oC, but consideration shall be given to the likelihood of a raised ambient temperature in special process areas and could result in 68oC being exceed.

Wet installation pipework shall be carbon steel tube with appropriate screwed fittings or mechanical grooved couplings and prefabricated welded sections.

All pipeline materials including any pipeline ancillaries shall be as listed and approved by the LPC.

All sprinklers system signals must be interfaced into the BMS for monitoring and Maintenance purposes.

- Classification to BS EN 12845: As specialist Board schedules.
- Type: As specialist Board schedules and specification.
- Sources: As specialist Board schedules and specification.

- Distribution below ground: As specialist Board schedules and specification.
- Distribution above ground upstream of alarm valve: As specialist Board schedules and specification.
- Distribution above ground downstream of alarm valve: As specialist Board schedules and specification.
- Outlets: Sprinkler heads.
- Accessories: As specialist Board schedules and specification.
- Completion: As specialist Board schedules and specification.

SYSTEM PERFORMANCE

All sprinkler pipework exposed to the frost will be insulated or trace heated to prevent freezing.

All drain valves will be fitted at each lowest point of the sprinkler pipe work. These valves will be equipped with a padlock and a Leather straps.

The installation will be subdivided into zones in accordance with regulations. Each zone valve arrangement will comply with the Life Safety requirements and each zone will not exceeded 2400 m2. The drain on each branch will be connected to a 50mm drain collector.

Each zone valve arrangement will comprise a zone valve, a flow switch and a test and drain valve complete with a strap and padlock.

Where sprinkler main pipework runs within fire escape routes, as defined by the Fire Consultant, the pipework shall be clad in fire resistant insulation to maintain the integrity of the system to that of the fire compartment that it is running through.

210 DESIGN

- Standard: To BS EN 12845.
- Design: Complete the design of the sprinkler system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

220 EXTENT OF SPRINKLER PROTECTION

All as identified in fire engineering report.

240 PIPELINE SIZES

- Sizing: Calculate sizes to BS EN 12845.
- Method:

The sprinkler pipework will be hydraulically sized in accordance with L.P.C. Standards.

The pipework for the sprinkler installations will be black coated steel medium weight to B.S. 1387 or BS EN 10255.

Valves will be black steel or galvanised heavyweight, depending on the requirements of the local water authority.

The fittings would be malleable iron, cast iron or welded.

From 65 mm diameter and above grooved coupling will be used.

The necessary pipe support brackets for hanging the pipework are included and will comply with the BS EN 12485 requirements for spacing and size of the components. .

- Proposals: Submit.

PRODUCTS

The Boards shall submit proposals for the Sprinkle system to the Consultant, Fire Officer, and building control for comment.

310 WATER SUPPLY

A mains water supply shall provide water to the sprinkler storage tank(s) and be provided as part of the combined fire/domestic water main to the site. The sprinkler water storage shall be contained in the tank room located in the basement of the main hospital building. The sprinkler system installation control valve, sprinkler pumps, valve sets, etc, shall also be housed within the basement tank room.

Standard: To BS EN 12845.
Reliability: Ensure reliability and continuity of water supply.
Quality: Free from suspended fibrous or other matter, which may accumulate in the system pipework.

- Isolating valves on ring main: Interlocking key type.

320 SPRINKLER HEADS

Sprinkler heads shall be pendant bulb type with brass finish in plant and other associated areas, and chrome or white finish in hospital areas.

- Standard: To BS EN 12259-1.
- Sprinkler pattern: As specialist Board schedules and specification.
- Element: As specialist Board schedules and specification.
- Temperature rating: Normally 68C, In areas of high ambient temperatures, sprinkler heads with a higher temperature will be used. .
- Manufacturer: Main reception and Security office..
  - Product reference: As specialist Board schedules and specification.
- Size: As specialist Board schedules and specification.
- Accessories: As specialist Board schedules and specification.
- Corrosion protection: As specialist Board schedules and specification.

330 ALARM DEVICES

All the monitored sprinkler equipment such as pumps valves and flow switches will be wired to an addressable panel. A flow alarm switch will be provided on the alarm valve riser to give remote alarm indication.

A water motor alarm gong will be supplied with the alarm valve. All the stop valves will be completed with a tamper switch.

Each zone valve and flow switch will be connected to an I/O box wired to the addressable panel and fire detection system.

- Standard: To BS EN 12845.
- Type: As specialist Board schedules and specification.
- Manufacturer: As specialist Board schedules and specification.
  - Product reference: As specialist Board schedules and specification.
- Alarm indication: On BMS panel, Fire Panel, Main reception and Security office. .

340 ALARM VALVES

The Sprinkler System will be controlled by wet pipe control valves tested and approved to L.P.C. standards each comprising a 150mm alarm valve with flanged or grooved connections, a 150mm butterfly valve, two 100mm diameter dial pressure gauges and cocks, an alarm trim, a drain valve and butterfly valve and flow switch.

- Standards: To BS EN 12845 and BS EN 12259 -2,-3 and -4.
- Type: Match sprinkler system type.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Application: Submit proposals.

350 INDICATOR PANELS

All the monitored sprinkler equipment such as pumps valves and flow switches will be wired to an addressable panel. A flow alarm switch shall be provided on the alarm valve riser to give remote alarm indication.

A water motor alarm gong shall be supplied with the alarm valve. All the stop valves will be completed with a tamper switch.

Each zone valve and flow switch will be connected to an I/O box wired to the addressable panel and fire detection system.

- Standard: To BS EN 12845.
- Indication: Submit proposals.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

360 PRESSURE GAUGES Gauges to be installed as per SHTM/HTM 05 and LPC Rules for Automatic Sprinkler Installations

- Standard: To BS EN 837-1.
- Manufacture: Submit proposals.
  - Product reference: Submit proposals.
- Diameter: 100 mm .
- Scale subdivisions: Submit proposals.
- Material: Submit proposals.
- Connections: Submit proposals.

EXECUTION

The Board shall Test, flush and clean the system as per regulations, SHTM/HTMs, this specification and Fire officer requirements.

620 INSTALLING WATER SUPPLY

- Frost protection (minimum): Maintain water temperature at 4°C.
- Connections supplying water for other services: Separate from hydrant system and water source.

630 INSTALLING ALARM VALVES

- Location: Immediately downstream of the main stop valve.
- Water temperature (minimum): 4°C.

640 INSTALLING SPRINKLER HEADS

- Orientation: Install upright or pendant, with the deflector parallel to the slope of the roof, ceiling or pitch line of the stairs.
- Coverage, location and spacing: To BS EN 12845.
- Corrosion protection: Submit proposals.

650 INSTALLING ALARM DEVICES

- Location: At each installation main control valve set.
- Gong and water motor: Install gong on the outside of an exterior wall.
- Position of gong: Centre line not higher than 6 m above the point of connection to the alarm valve.

660 INSTALLING INDICATOR PANELS

- Position: As agreed with Fire officer and Architect. .

670 INSTALLING PRESSURE GAUGES

Location:

- Immediately downstream of the tail end valve but upstream of any subsidiary stop valve;
- Between the supply pipe stop valve and the check valve on a town main connection; and
- Downstream of outlet check valve and upstream of outlet stop valve on pump supply.

680 IDENTIFICATION AND LABELS

- Generally: To BS 1710, BS 5499-1 and BS EN 12845.
- Location plate: Provide on external wall as close as practical to the entrance nearest the installation main control valve set.
- Signs for stop valves: Provide to the main and any subsidiary stop valves.
- Sprinklers: Mark orifice size on sprinkler body or deflector.

COMPLETION

O& M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/ uploaded on Acconex.

The Specialist shall provide instruction to the clients Engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the Manufactures recommendations and best practice.
The Specialist shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

910 FLUSHING

- Operation: Fill the system with water and discharge it via the flushing valves. Flush out debris.

920 TESTING

- Notice (minimum): 3 days.
- Dry pipework: Charge the system with water to a pressure of 2.5 bar (250 kPa). Maintain for 24 h. During this period inspect the system to check that no water leaks at joints or valves.
- All pipework: Charge the system with water to a pressure of 15 bar (1500 kPa). Maintain for 2 h. During this period inspect the system to check that no water leaks at joints or valves.

930 SETTING TO WORK

- Tests: To BS EN 12845.

940 DOCUMENTATION

- Certificate of compliance: Submit.
- Test records: Submit a record of inspections and tests.
- Record drawings: Submit drawings showing location of pipe runs, sprinklers and valves.
- Operation and maintenance instructions: Submit.

FC	August 2014	All	Comments Incorporated	SMcK

RHSC and DCN EDINBURGH
HOT AND COLD WATER SUPPLY SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as "".

To carry out the development of the design, Project Co. shall obtain the necessary supporting documentation.

This specification relates to the Domestic Hot and Cold water services serving the RHSC-DCN Building and the adjacent Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the architectural drawings.

Pumps

All pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:

- Site wholesome water mains.
- The domestic cold water service
- The domestic hot water service.

3.0 SPECIFIC EXCLUSIONS

The following are specifically excluded from the scope of this specification:

- RO Water for Renal use
- RO Water for Endoscopy use
- Fire Hydrant Main
- Water Treatment Equipment

4.0 INTERFACES AND DEMARCATIONS

The domestic hot and cold water services shall be provided as complete working systems serving the RHSC-DCN Building. Project Co. shall provide information to other parties including for power supplies and BMS interfaces.

The site water mains shall be provided as complete working systems serving the RHSC-DCN Building and Energy Centre.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The domestic hot and cold water systems shall accord with all appropriate Scottish Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards, Scottish Water Regulations *(Byelaws)* and to the approval of the local Water Authority.

The site wholesome water mains shall comply with the requirements of Water for Scotland
2nd Edition 2007, and to the requirements of the Water Authority.

6.0 DESIGN CRITERIA

General the domestic hot and cold water systems shall comply with the Scottish Water Regulations and current Codes of Practice

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of *Parts A, B and C of this specification,* Project Co. shall include for close liaison with Health and Safety professionals including the Hospital Board's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Other Specialist Project Co. shall liaise with other Specialists as necessary to ensure that all interfaces between the domestic hot and cold water supply installations and other systems are allowed for.

The Local Water Supply Undertaker. Project Co. shall liaise with the Local Water Supply Undertaker or their licensed agents to ensure that all aspects of the installation comply with the Scottish Water Regulations.

8.0 SYSTEM DESCRIPTION

Incoming Water Supply

Wholesome cold water will be derived from the separate incoming water main supply entering the basement tank room. The supply will be capable of isolation by valves within the building. A water meter will be incorporated on the supply within the tank room with direct reading and a BMS interface.

The domestic water main shall feed the raw cold water break tanks in the basement plantroom. A connection shall also be provided for the landscape/ planter cold water storage tank. Duty/ standby transfer pumps will pump water to the main run water storage tanks in the roof plantroom.

Cold Water Storage Tanks

Bulk potable quality water storage tanks will be located within the roof plant room. The tanks will store 100% of the total main hospital water storage.

The tanks will be insulated and complete with raised ball valve housings, self-draining bases, flushing drain and all necessary connections to comply with Water Authority requirements. Each tank shall have a central division plate.

Ball valves shall be of the delayed action type valve.
Separate connections will be made from the main cold water storage tank header to the booster sets.

The whole of the domestic water services installation will be boosted in pressure to ensure adequate flow at outlets points, such as showers, etc.

Water Filtration

Twin filtration plant in compliance with SHTM 04-01 shall be served from the 2 No. break tanks and shall supply filtered water to the 2 No. main filtered water storage tanks.

Wholesome Water Booster Sets

Two separate packaged wholesome (potable) grade water booster sets will be provided within the roof plantroom and one in the basement tank room.

Each booster set will comprise:

- Dedicated control panel
- Multiple variable speed duty pumps to maintain a constant discharge pressure.
- Accumulator vessel

Laboratory Cold Water Storage Tanks

Category 5 cold water storage tanks will be located within the roof plantroom.

Water Booster set for Dental Chairs

A small packaged booster set with integrated break tank shall be provided to serve the dental chairs in the Children's Hospital. The unit shall be suitable for locating in a cupboard.

Domestic Cold Water System

From the bulk storage tanks, the wholesome boosted cold-water service will be routed to the basement heat stations to serve the calorifiers and rise in vertical riser to feed the various departments.

Subject to compliance with SHTMs or with Board approval, cold water service outlets which may be subject to misuse, or for clinical convenience, or temperature maintenance, and BREEAM compliance, may use proximity switching, timed flows, automatic flushing system for legionella control shut off valves and flow regulation to serve this purpose.

Flexible Supply Hoses for Final Connections

No flexible hoses (or tails) connections shall be used.

Hot Water Service Installation

General

All hot water supply systems will be designed and installed to meet the requirements of SHTM 04-01 Part A and B.

Hot Water System

The hot water distribution system will be designed for 60ºC flow and 55ºC return circulating temperature.

Domestic Hot Water (DHWS) will be generated and stored utilising high output/ low storage calorifiers. The DHWS plant and distribution system will be fed from the boosted water system, and thus be pressurised.

The DHWS plant will be directly heated from the main primary LTHW heating circuit from the Energy Centre. The storage temperature will be controlled through the BMS by 2-port control valves on the primary heating system, along with 2-port direct acting control valves to provide protection override in the case of high hot water flow temperatures.

The DHWS plant system will be capable of achieving higher storage temperatures for carrying out a pasteurising process to minimise contamination from Legionella bacterium within the storage buffer vessel. Each storage buffer vessel and plate heat exchanger will be isolated from the distribution system while the process is carried out.

The DHWS distribution system will be configured with a pumped return to maintain temperatures within the system in accordance with SHTM 04-01. The pumped return system will minimise "dead legs" and reduce water consumption by providing the correct temperature of water at the outlet with minimum delay.

The system will have isolating valves generally as the cold water system. In addition, the return water pipework will be provided with valves that isolate and automatically regulate the flow rate, in order to maintain satisfactory temperatures throughout the system.

The hot and cold water system pressures will be equalised at each service outlet for successful blending of hot and cold water through anti-scalding devices prior to use.

The anti scalding devices will be used throughout the hospital where service outlets provide water for personal hygiene washing. Designated outlets will use unmixed hot water at system temperatures where utensils or garment washing is required.

Subject to compliance with the SHTMs or with Board approval, hot water service outlets which may be subject to misuse or for clinical convenience may use proximity switching, timed flows and flow regulation for water conservation purposes as described for cold water services.

Separate water heaters shall be provided for the laboratories.

Thermostatic Mixing Valves

These valves are provided on each sanitary fitting that requires the hot water delivery temperature to be limited to a safe working maximum. All valves shall comply with the requirements of NHS Specification DO8; NHS Health Guidance Note (HGN) entitled “Safe Hot Water and Surface Temperatures” and be a WRAS listed pattern.

Where the thermostatic mixing valves are not provided the Board shall affix a permanent label adjacent to the unprotected hot tap clearly stating “VERY HOT WATER”.

Valves shall be factory pre-set to provide maximum delivery water temperatures as follows:

Bidet	-	38°C
Shower	-	41°C
WHB	-	41°C
Bath	-	44°C

Upon completion of the installation, each valves performance shall be checked in accordance with the requirements of Section 5 of the HGN for commissioning, including all necessary paperwork.

HWS Secondary Pumps

All the domestic hot water systems shall be provided with return water circulation pumps. These shall be run continuously with the standby pump supplied loose to allow removal and replacement of operational unit in the case of a fault.

Thermostatic Balancing Valves

Each HWS return loop shall be provided with a thermal balancing valve to ensure the HWS return temperature is maintained at 55°C.

The tamper-proof multi-function thermostatic balancing valves shall be suitable for use in domestic hot water circulation systems and shall include drain point, temperature gauge point and automatic disinfection point.

The valves shall provide a thermal balance in the hot water installation by keeping a constant temperature in the system, thus limiting the flow in the circulation pipes to the minimum required level. The valves shall have a minimum flow rate no greater than 0.02 litres/second.

Water Meters

Water meters shall be provided as indicated on the drawings to measure cold water consumption to various systems and parts of the building.

DOMESTIC WATER FLOW REGULATION

To reduce the overall water consumption of the development, all sanitary fittings shall be furnished with flow regulating devices to both hot and cold supplies to the fitting. These devices shall be factory fitted into the outlet side of the fitting isolating valves, and shall regulate the flow (and thus pressure) of each fitting.

MATERIAL & WORKMANSHIP CLAUSES

S10 HOT AND COLD WATER SUPPLY SYSTEMS

GENERAL

All domestic stored water shall be of wholesome quality.

The main domestic water supply tanks shall be sized for 24hr storage unless otherwise directed by the Board.

The tanks shall be joined at a header arrangement with each tank capable of being isolated for repair or maintenance.

From the raw cold water storage tanks, the water will pass through the filtration plant to the filtered clean water storage tanks. A boosted cold water supply from the tanks will be routed via the main distribution routes to the vertical risers to feed the various departments. In the basement, the filtered (potable) boosted cold water service will feed un-vented HWS calorifiers in the heat stations, and a number of direct connections to demand points within the building, including system pressurisation units, and dedicated water service systems storage tanks for laboratories, via type AB air gaps for prevention of backflow.

All specific department areas will be provided with isolation provision, with draining down facilities for maintenance and shutdown.

All main distribution and dropper connections will be provided with isolating valves, with local isolation valves installed to isolate and shut down individual ward/department areas.
It should be noted that domestic supplies can only connect to outlets and equipment that are suitable for potable quality water supplies, in accordance with the Scottish Water Byelaws.

All items of hot and cold water plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol.

The hot water distribution system will be designed for 60ºC flow and 55ºC return circulating temperature.

Anti scalding devices shall be used throughout the hospital where service outlets provide water for personal hygiene washing. Designated outlets will use unmixed hot water at system temperatures where utensils or garment washing is required.

110 INCOMING WATER SUPPLY

- Water company: Scottish Water/Business Stream
- Volume flow rate: 25 l/s from 1No incoming main supply for fire hydrants.
- Position of incoming mains water supply: As indicated on the drawings. The main supply shall be taken from the existing Scottish Water main in Craigmillar Castle Road.

Site water mains shall be installed in accordance with Water for Scotland 2nd Edition and NJUG requirements for utility .apparatus with regards to depth, colour coding, identification markers, and position, and to the requirements of Scottish Water. Site water mains shall be ductile iron suitable for the site contaminated ground conditions and approved by Scottish Water. All backfill shall be from a clean source. A water meter linked to the BMS will be incorporated with direct reading and a BMS interface the both incoming main supply at the location identified by Scottish Water. Leak detection meters shall be provided at the boundary and at the entry point to the basement on the domestic water main. All water meters will be fitted with isolation valves and be linked to the BMS.

130 PUMPED COLD WATER SUPPLY SYSTEM

Bulk wholesome quality water storage tanks and break tanks will be located within the roof plantroom of the hospital building. The tanks will store 100% of the total main hospital water storage.

The whole of the domestic water services installation will be boosted in pressure to ensure adequate flow at outlets points, such as showers, etc. duplicate packaged wholesome water grade booster sets will be provided within the tank room.

A separate general purpose water booster set will serve Category 5 outlets.
Each booster set will comprise:-
Dedicated control panel
Multiple variable speed duty pumps to maintain a constant discharge pressure including a standby pump
Accumulator vessel

Water supplies for vending machines, ice makers and chilled drinking water points shall be installed with valved-off connections for final connection by others. All incoming water for wholesome storage will pass through a filtration system with a 0.5 micron capacity.

The filtration plant will be in duplicate and served by duplicate break tanks of one third of total capacity.

Each filtration plant will be capable of supplying full peak water demand to the bulk cold water storage tanks.

- Type: Flooded suction or suction lift to directly pressurize hot and cold water systems.
- Water meters: As shown on drawings.
- Pressure booster sets: As section Y20.
- Pumps: As schedule.

- Storage tank or cistern: Glass fibre reinforced cisterns, as section Y21.
  - Accessories: As schedule and requirement for wholesome water.
- Pipelines:
  - Below ground: As section Y10 and NJUG.
  - Above ground: As section Y10.
- Pipeline ancillaries: As section Y11.
- Thermal insulation:
  - Pipelines: As section Y30.
  - Tanks: As section Y30.
- Vibration isolation: Inertia bases, to acoustic consultant recommendations.
- Sanitary appliances: All taps, shower mixers, and sanitary ware shall be as Architects schedules.
- Drinking water outlets: All domestic water shall be wholesome. Drinking water points shall be shown on drawings..
- Flush control devices: As schedules.
- Water coolers: As schedule and drawings.
- Controls: All items of Cold water plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol..
- Accessories: As schedule.
- Completion:
  - Cleaning and chemical treatment: Flushing and chemical treatment, as section Y12.
  - Plant and equipment identification: As section Y32 and as SHTM/HTM 04 .
  - Commissioning: Commissioning of cold water supply systems, as section Y50 and as SHTM/HTM 04.

160 INDIRECT HOT WATER STORAGE SUPPLY SYSTEM

Hot water storage shall be provided by high output/ low storage calorifiers. The DHWS distribution system will be configured with a pumped return to maintain temperatures within the system in accordance with SHTM/HTM 04-01, associated HGN Safe Hot Water and Surface Temperatures and SHTM/HTM 04-01. The pumped return system will minimise dead legs and reduce water consumption by providing the correct temperature of water at the outlet with minimum delay.

Capacity: As schedule.
Primary heat source: LTHW system Comprising of dual fuel hot water boiler and CHP units, as section T20.

- Primary: Sealed.
- Storage unit: Hot water storage shall be via the Storage calorifiers supplied with the plate heat exchangers.
- Pumps:
  - Primary hot water supply: Close coupled in line, as section Y20. All parts in touch with the wet system shall be stainless steel.
  - Secondary hot water supply: Close coupled in line, as section Y20 All parts in touch with the wet system shall be stainless steel.
- Pipelines: As section Y10.
- Pipeline ancillaries: As section Y11.
- Thermal insulation:
  - Pipelines: As section Y30.
  - Cylinders: As schedule.

- Controls: All items of Hot water plant and system controls must be capable of being fully interrogated by the building management system through the independent network protocol.
- Sanitary appliances: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.
- Accessories: As schedule.
- Completion:
  - Cleaning and chemical treatment: Flushing and chemical treatment, as section Y12.
  - Plant and equipment identification: As section Y32.
  - Commissioning: Commissioning of Hot water supply systems, as section Y50 and as SHTM/HTM 04.

SYSTEM PERFORMANCE

The hot and cold water supply system shall be install, flushed, cleaned, tested and commissioned as per Water Regulations SHTMs and HTMs. Where any standards or documents contradict one another Project Co. shall contact the Board for further guidance.

220 COLD WATER SUPPLY

- Incoming mains water supply:
  - Site factors: The water mains from the external water main shall run separately in the ground. The main shall enter the basement of the RHSC-DCN Building and run at high level in the basement corridor to enter the basement cold water storage tank room. The supply will connect to the duplicate break tanks.

A pumped supply shall feed the bulk storage tanks in the roof plantroom.

From the bulk storage tanks, the wholesome boosted cold-water service will be routed via the main distribution routes and vertical risers to feed the various departments. See drawings for details.

- Type of system: Pumped from a storage tanks.
- Design parameters: To SHTM/HTM 04-01.
- Daily consumption: As schedule.
- Storage capacity: The main domestic water supply tanks shall be sized for 24hr storage.

250 PIPELINE SIZES

- Sizing: Calculate sizes to meet simultaneous demand for the building in accordance with BS 6700 Appendix D or BS EN 806-3. Submit proposals.
- Performance:
  - Water velocity (maximum): 1.3 m/s for hot water and 1.5 m/s for cold water.
  - Filling time (maximum) for cold water storage cistern: 8 hours.

PRODUCTS

Project Co. shall supply and install services and equipment to perform as per specification. The Board shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Where a particular manufacture is specified, the Board shall include for that manufacturer. Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration. This must be done in a timely manner and Project Co. shall provide all details including but not limited to:

- detailed description
- Cost comparison
- Technical comparison
- References to standards
- References to SHTM/HTMs

310 DEZINCIFICATION

- Fittings, pipelines and equipment located below ground or in concealed or inaccessible locations: Resistant to dezincification, e.g. gunmetal.

320 WATER METERS

Water meters shall be installed as indicated on drawings. Stool pieces between isolating valves will be provided for temporary removal of the meters during the flushing of the system or when meters are removed for repair.

- Standard: To ISO 4064-1.
- Type: In-line meters. Shall be capable of being read by the clients BMS system. .
- Manufacturer: As schedule.
  - Product reference: As schedule.
- Size: To suit service.
- Pressure class: As schedule.
- Temperature class: To suit service.
- Metrological class: As schedule.
- Connections: As schedule.
- Indicating device: Type 2 - digital.
- Features: Pulsed output for remote monitoring.
- Accessories: To BS EN 14154-2.

480 FLUSH CONTROL DEVICES

All taps, shower mixers, and Sanitary ware shall be as Architect's schedules.

- Manufacturer: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.
  - Product reference: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.
- Flush rate: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.
- Water supply valve: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.

- Sensor unit:
  - Material: All taps, shower mixers, and sanitary ware shall be as Architect's schedules. Movement detector: All taps, shower mixers, and sanitary ware shall be as Architect's schedules. Power supply: All taps, shower mixers, and sanitary ware shall be as Architect's schedules.

490 WATER COOLERS

- Manufacturer as Architects Schedules

Water coolers, drinks and vending machines shall be supplied and installed by others.
Project Co. shall supply services to the coolers and vending machines at locations shown on drawings and agreed with the Board.

- Product reference: Supplied by others.
- Type: Supplied by others.
- Flow rate: Supplied by others.
- Temperature of delivered water: As SHTM/HTM 04-01.
- Water inlet: As required.
- Power supply: As required.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces. Due to the size of the water systems being installed all pressure testing and commissioning equipment shall be cleaned and chlorinated before each use. This is to prevent the systems from being contaminated with pseudomonas.

620 INSTALLATION GENERALLY

- Installation: To BS 6700.
- Performance: Free from leaks and the audible effects of expansion, vibration and water hammer.
- Fixing of equipment, components and accessories: Fix securely, parallel or perpendicular to the structure of the building.
- Preparation: Immediately before installing tanks and cisterns on a floor or platform, clear the surface completely of debris and projections.
- Corrosion resistance: In locations where moisture is present or may occur, avoid contact between dissimilar metals by use of suitable washers, gaskets, and the like.

630 INSTALLING WATER METERS

- Standards: To BS EN 14154-2.
- Interconnection to Building Management and Monitoring System (BMMS): Required.

660 UNVENTED HOT WATER STORAGE DISCHARGE PIPES

- Fall (minimum): 1 in 80.
- Discharge: Via an air break and tundish.
  - Size: At least the diameter of the outlet of the safety device.
  - Tundish discharge: At least one diameter larger than the outlet of the safety device.
  - Discharge point: As shown on drawings.

COMPLETION

Project Co. shall protect the system from damage or interference during the works.

Project Co. shall Test, flush and clean the system as per section Y12, Y50, SHTM/ HTM's and TR/20.

Project Co. shall submit O&M's as required by The Board

Project Co. shall provide training as per section Y12, Y40 & Y50.

Project Co. shall provide spares as per section Y12, Y40 & Y50.

Project Co's. defects and liability period shall be as the contract prelims.

910 HYDRAULIC PRESSURE TESTING OF HOT AND COLD WATER SUPPLY SYSTEMS

- Standard: To BS 6700.
- Notice (minimum): 1 week.
- Pressure: 1.5 times working pressure.
- Duration of test: 1 h.

980 DOCUMENTATION

O& M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/uploaded on ZUTEC.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

990 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
- Keys: Supply keys for valves and vents.

RHSC and DCN EDINBURGH
NATURAL GAS SUPPLY SYSTEMS

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the installer and is referred to in this document as “Project Co”.

To carry out the development of the design, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the mechanical services related to the gas supply system.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Gas supply system from incoming meter outlet to final points of consumption

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Automatic controls & BMS
- Fire detection and alarm system

4.0 INTERFACES AND DEMARCATIONS

The gas supply system shall be provided as a complete working system.

Project Co. shall provide information to other parties for power supplies and fire alarm system interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The gas supply system shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time.

The gas supply and distribution systems shall comply with the relevant clauses of BS6644, IGE Guidance, Clean Air Act, and descriptions and requirements set out below.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Gas pressures

Low pressure supply at outlet of meter: 65mbar

7.0 LIAISON

Project Co. shall include for liaison with:-
Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Specialist Installers. Project Co. shall liaise with other specialist Installers as necessary to ensure that all interfaces are allowed for.

Building Control. Project Co. shall liaise with, and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of the gas supply system.

8.0 SYSTEM DESCRIPTIONS

Gas Mains Installation

The gas supply for the RHSC-DCN Building shall run from Old Dalkeith Road to a new meter position adjacent the Energy Centre oil tanks and run as a medium pressure supply (65mbar) in a soft dig trench alongside other site piped services to the Energy Centre.

All meters shall provide pulsed outputs for monitoring of the BMS.

Energy Centre

The medium pressure supply into the Energy Centre shall be taken to the heating boilers and CHP unit for direct use at this pressure, thus avoiding the need for individual plant gas boosters. All gas/dual fuel boilers and CHP plant shall be individually metered and linked to the BMS system.

Gas pipework below ground shall be medium density polyethylene PE80 with fusion joints. Pipework above ground shall be in heavy duty mild steel with screwed/welded joints.

S32 NATURAL GAS SUPPLY SYSTEM

110 INCOMING GAS SUPPLY

- Gas transporter: Medium pressure main.
- Gas supplier: Smart Metering Systems UK Gas Connection.

120 NATURAL GAS SUPPLY SYSTEM

Individual supply branches shall be complete with a manual isolating valve and gas solenoid valve as required on the drawings and within the specification.

All gas pipework shall be routed through ventilated service routes to prevent the build up of gas in the event of any leak.

Project Co. shall supply, install and commission an energy centre automatic gas safety system comprising electro-thermal links over each boiler burner and CHP unit (fire melting temperature as advised by manufacturers), wired to emergency knock off buttons at each exit door to each plant area.

The system shall include natural gas detection sensors, the incoming gas solenoid valve and an interlink with the fire control panel.

The complete gas safety system shall be compliant with BS 5839 as a minimum requirement.

The gas safety circuit shall also interface with the oil fuel safety circuit where serving the boiler plant.

The safety valves shall be suitable for the Gas system in which they are installed.

Safety valves shall be provided in accordance with BSEN161.

Activation of the emergency knock off buttons, detection by any of the thermal links or natural gas detection sensors shall close the associated shut off valve. This shall also close the associated oil shut off valves. The systems shall be interlinked with the fire alarm and BMS installations as detailed in the controls specification *and include an automatic reset facility*.

- Metering: Secondary gas meters shall be installed as per drawings.
- Gas pipelines: Low pressure pipelines.
- Gas valves: Valves shall be installed as per regulations, SHTMs and as shown on drawings.
- Gas equipment: As per regulations, SHTMs and as shown on drawings.
- Gas outlets: Combined heat and power plant, as section T25 and Gas fired boiler, as section T20.
- Completion:
  - Plant and equipment identification: As section Y32

PRODUCTS

All elements of the work shall be in accordance with the requirements of current legislation, regulations and industry standards.

The natural gas installation shall also comply to the SHTM, code of practices and relevant British standards.

A proposed drawing list shall be submitted by .

Project Co. shall provide working drawings for the installation and issue them for comment before work commences.

310 SECONDARY GAS METERS

Secondary Gas meters shall be installed as detailed on drawings and in this specification. Gas meters shall be installed with isolation valves for maintenance.

- Standard:
  - Gas meters: To BS EN 1359.
  - Unions and adaptors: To BS 746.
  - Low pressure meters: In accordance with IGE/GM/6.
  - Electrical connections: In accordance with IGE/GM/7.

- Project Co. shall submit technical details of the proposed meter.
- Accessories: Pulsed output for BMS monitoring.
- Housing type: To suit gas meter type.

330 LOW PRESSURE GAS SUPPLY PIPELINES

Over ground pipes 15 mm to 50 mm nominal size inclusive (internal) shall be black mild steel to BS1387 heavyweight grade, screwed fittings if installed in a ventilated space, otherwise fully welded. Over ground pipes greater than 50mm shall be Black mild steel to BS1387 heavyweight grade welded throughout its length. All above ground natural gas pipe shall be painted yellow ochre.

- Standards: To BS EN 1775 and in accordance with IGE/UP/2.
- Materials: Steel, heavy weight.

335 INDUSTRIAL GAS SUPPLY PIPELINES

- Standards: In accordance with IGE/UP/2.
  - Up to and including 0.5 bar: To BS EN 1775.
  - From 0.5 bar up to 60 bar: To EN 15001-1.
- Material: Indoor above ground shall be Black mild steel to BS1387 heavyweight grade welded throughout its length and painted yellow ochre, Underground pipe shall be Yellow medium density polyethylene thick wall pipes (PE80).
- Jointing method: Steel pipe wielded throughout its length, Fusion jointing of polyethylene.

340 GAS SOLENOID VALVES

Project Co. shall supply, install and commission an energy centre automatic gas safety system comprising electro-thermal links over each boiler burner and CHP unit (fire melting temperature as advised by manufacturers), wired to emergency knock off buttons at each exit door to each plant area. The system shall include battery back up to maintain the solenoid valves open in the event of loss of power.

The system shall include natural gas detection sensors, the incoming gas solenoid valve and an interlink with the fire control panel.

The complete gas safety system shall be compliant with BS 5839 and BS EN 161 as a minimum requirement.

The gas safety circuit shall also interface with the oil fuel safety circuit where serving the boiler plant. Should the gas safety circuit be activated both the related gas and oil safety valves shall shut.

Activation of the emergency knock off buttons, detection by any of the thermal links or natural gas detection sensors shall close the associated shut off valve. The systems shall be interlinked with the fire alarm and BMS installations as detailed in the controls specification.

- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Type: to submit proposals.
- Mounting: In Line
- Speed of opening: Submit proposals.
- Connections: Manufacturer's standard.
- Pressure rating to BS EN 1333: Suitable for gas pipe pressure.
- Solenoid supply voltage: Submit proposals.
- Actuation method: Sensor above each burner, knock of button and fire alarm.
- Reset: Manual.
- Accessories: Submit proposals.

390 GAS PROVING SYSTEMS & EMERGENCY VALVES

Project Co. shall supply and install, in the locations shown on the drawings, a combined gas proving system and emergency shut off valve on the natural gas supplies.

The system shall provide an automated means of proving the integrity of the downstream natural gas installation prior to opening the emergency shut off valve on a regular and routine basis.

The system shall be key switch operated and be interlinked with the BMS system in order to repeat and log alarm conditions.

- Manufacturer: to submit proposals.
  - Product reference: to submit proposals.
- Pressure application: Detection of positive pressure changes.
- Accessories: Submit proposals.

400 SAFETY AND CONTROL DEVICES

- Standard: To BS EN 13611.

410 BALL VALVES, MANUALLY OPERATED

Valve shall be suitable for type of gas pipe in which they are installed.

- Standard: To BS EN 331.
- Type: Lever operated.
- Manufacturer: choice.
  - Product reference: choice.
- Material: Bronze or dezincification resistant brass (DZR).
- Connections: Threaded.

420 PLUG VALVES, CAST IRON

Valve shall be suitable for Medium pressure gas main

- Standard: To BS 5158.
- Type: Regular.
- Manufacturer: choice.
  - Product reference: choice.
- Connections: To suit pipework.
- Options: Wrench.

425 PLUG VALVES, STEEL

Valve shall be suitable for Medium pressure gas main

- Standard: To BS 5353.
- Type: Regular.
- Manufacturer: choice.
  - Product reference: choice.
- Connections: To suit size of pipework.

430 PLUG VALVES, TAPER

Valve shall be suitable for type of gas pipe in which they are installed.

- Standard: To BS 1552.
- Type: choice.
- Manufacturer: choice.
  - Product reference: choice.
- Material: Dezincification resistant brass (DZR) copper alloy
- Connections: Threaded.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety regulations. This shall include clean and tidy working and working in confined spaces.

620 INSTALLATION GENERALLY

- Installation: In accordance with IGE/UP/10 and ICE/UP/2.

625 GAS SAFE REGISTRATION REQUIREMENTS

- Type of service: Non-domestic.
- Type of gas: Natural gas.
- Area of work: The installation, testing and commissioning of the natural gas system shall be undertaken by a registered installer. A copy of the installer's certificate shall be attached to the test and commissioning documents.

630 INSTALLING GAS METERS

- Secondary gas meters:
  - Low pressure: In accordance with BS 6400-1.
  - Medium pressure: In accordance with BS 6400-2.
  - Non-domestic: In accordance with IGE/GM/8.

650 INSTALLING GAS PIPELINES

- Installation: In accordance with BS EN 1775.

660 INSTALLING INDUSTRIAL GAS PIPELINES

- Standard: In accordance with EN 15001-1.

COMPLETION

Project Co. shall protect the system from damage or interference during the works.

Project Co. shall submit O&M's.

Project Co's. defects and liability period shall be as the contract.

930 COMMERCIAL AND INDUSTRIAL GAS INSTALLATIONS

- Soundness testing and purging: In accordance with IGE/UP/1.
- Testing, purging and commissioning pipelines: In accordance with BS EN 1775 and BS EN 15001 2.
- Commissioning gas fired plant: In accordance with IGE/UP/4

940 PRESSURE TESTING OF NATURAL GAS SUPPLY SYSTEMS

- Notice (minimum): 1 week.
- Pressure: 1.5 times working pressure.
- Duration of test: 1 h.

960 DOCUMENTATION

O& M documentation shall be issued at least three months before completion of any part of the contract.

The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

The Specialist shall provide instruction to the clients Engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the Manufactures recommendations and best practice.

The Specialist shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

970 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes.
- Valve keys: Supply keys for valves and meter housing.
  - Quantity: 4 of each type.

RHSC and DCN EDINBURGH
COOLING SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as "".

To carry out the development of the design, Specialist shall obtain the necessary supporting documentation.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Fans & Pumps

All fan assemblies shall incorporate fan impeller and motors selected to provide the most energy efficient solution conforming to Section 6 regulations. All fans and pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Cooling System, comprising:

  Chillers, pumps, pressurization units. Pipework, valves and ancillaries, cooling terminal devices.

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- BMS and automatic control systems

4.0 INTERFACES AND DEMARCATIONS

The cooling system shall be provided as a complete working system serving the RHSC-DCN Building.

Project Co. shall provide information to other parties for power supplies and fire alarm system interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The cooling system shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

6.0 DESIGN CRITERIA

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

External Design Conditions		
Winter	-	-6°C sat
Sizing for AHU plant		-10 °C
Summer	-	26.2°C db 18.5°C wb
Sizing for refrigeration plant	-	30°C
Chilled Water Operating Pressure	-	2.5 Bar
Limiting Noise Criteria at Boundary		Refer to Acoustic Consultant's report

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Specialist Installers. Project Co. shall liaise with other Specialist Installers as necessary to ensure that all interfaces between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Hospital Board teams concerned with the planning and administration of the cooling system.

8.0 SYSTEM DESCRIPTION

Cooling Plant Arrangement

The total cooling load shall be met by 3 air cooled chillers at 800kW each. The total installed chilling capacity shall therefore be 2,400kW. Three air cooled chillers shall be located in the level four external chiller plant area.

Chilled water shall be used as the main cooling medium for the ventilation and air conditioning systems.

The total load to be supported by the chiller system shall therefore be some 2,400kW, which shall be met by chillers. Therefore, each cooling plant shall approach a capacity of 33% of the total building load, which shall be sufficient to allow the hospital to continue to function in the event of a catastrophic failure on one system.

Each chiller shall be provided with acoustic attenuation packages to meet not only the day/night boundary sound level limitation, but also the intrusive noise level limits into the hospital. The acoustic treatment shall be in accordance with the recommendations of the acoustic consultant.

All items of cooling plant and system control shall be capable of being fully interrogated by the building management system through the independent network protocol (open protocol). Water pumping and pressurisation equipment shall be located in level 4 plantroom. From the plantroom, the chilled water pipework systems shall run to serve air-handling equipment in the various plantroom areas, and terminal cooling equipment in selected spaces.

The chilled water system shall be 100% water with trace heating protection where the pipework is exposed on the roof. Primary chilled water circuits shall emanate from the chilled water plantroom.

The primary circuit shall operate at nominal design flow and return temperatures of 6ºC and 12ºC respectively scheduled to outside air temperature.

The Primary chilled water system shall include the following elements:

- Chilled water pressurisation plant with twin pump make-up pumps and expansion vessels to maintain the pressure in the primary chilled water system.
- Multiple circulation pumps.
- A dirt separator unit on the main flow pipework.
- An active deaeration unit on the main flow

The system shall be capable of being treated with corrosion inhibiting chemicals via a manual-dosing unit.

It is proposed to provide 2-port control valves with differential-pressure-control valves (DPCV's) on all of the major load centres to allow the use of variable volume control of the primary chilled water circuit. The circulating pumps shall be controlled by the BMS in sequence as needed to match the varying load demand. This shall maintain the pressure differential between flow and return pipework within set limits with sensors located within the main sub-distribution pipework. The system shall not permit any of the primary circuit pumps to operate at less than 40% of their design maximum. A motorised bypass valve shall be provided on each pump set to ensure that a minimum of 40% is achieved. The DPCVs shall protect the downstream control valves from excessive pressures and nullifying the effects of pressure variations caused by the movement of control valves in other branches. This shall also aid commissioning. Care should be taken not to over tighten the DPCVs during commissioning.

The chilled water system shall include the following elements:

i) Chilled water pressurisation plant with twin pump make-up plant expansion vessel to maintain the pressure in the secondary chilled water system.

ii) Run and stand-by secondary circulation pumps serving air handling plant cooling coils and fan coil units.

iii) An active deaeration and dirt separator unit on the main flow pipework.

iv) The system shall be capable of being treated with corrosion inhibiting chemicals via a manual-dosing unit.

It is proposed to provide 2-port control valves on all the air handling unit cooling coils. This shall allow the use of variable speed control on the secondary circulation pumps, achieved by inverter motor control units located within the plantroom area. These shall be controlled by the BMS to maintain the pressure differential between flow and return pipework within set limits with sensors located in the main sub-distribution pipework. The system shall not permit the secondary circulation pumps to operate at less than 40% of their design maximum.

All circuits shall have Differential-pressure-control valves (DPCVs) to protect the two port valves from excessive pressures and nullifying the effects of pressure variations caused by the movement of control valves in other branches.

The systems shall be divided into sections to allow individual areas to be isolated from the main system for maintenance or shutdown.

All main and subsequent department branches shall be provided with balancing/measurement, DPCV's and isolation valves along with drain cocks, air vents etc. to ensure proper control and regulation of water flow rates under design load condition with flushing, draining and re-filling facilities.

Local cooling, where required, shall be provided via ceiling mounted fan coil units.

Buffer Vessel

A buffer vessel shall be provided on the cooling water system to provide sufficient cooling capacity within the system to provide five minutes of full cooling output in the event of a power failure and before the standby generators are available to supply the main chilled water circulation pumps and chillers.

T50 CHILLED WATER SYSTEMS

110 CHILLED WATER SYSTEM

- System: Two pipe.
  - Pipeline circuits: Variable flow.
- Cooling source: Air cooled liquid chillers.
- Pressurization units: As section Y20.
- Pumps: Close coupled in line pumps, as section Y20.
- Pipelines: As section Y10.
- Pipelines ancillaries: As section Y11.
- Thermal insulation: As section Y30.
- Vibration insulation: Inertia bases in accordance with acoustic consultants recommendations.
- Emitters:
  - Air handling units, as section U81;
  - Cooling coils and fan coil units.
- Controls: As specification Y40.
- Accessories: As schedule and specification.
- Completion:
  - Cleaning and chemical treatment: Flushing and chemical treatment as section Y12.
  - Plant and equipment identification: As section Y32.
  - Commissioning: Commissioning of chilled water systems, as section Y50.

SYSTEM PERFORMANCE

Project Co. shall supply and install services and equipment to perform as per specification. Project Co. shall submit details of all mechanical equipment for comment and place orders in a timely fashion to ensure delivery as per programme.

Where a particular manufacture is specified, Project Co. shall include for a product of that quality and performance.

Where considered appropriate, provide for equivalent standard alternatives to be offered for consideration.

This must be done in a timely manner and the Board shall provide all details including but not limited to:

- Detailed description
- Cost comparison
- Technical comparison
- References to standards
- References to SHTM's

265 VARIABLE FLOW PIPEWORK SYSTEMS

Where chilled water systems utilise variable volume control systems they shall have differential pressure control valves (DPCV) installed as indicated on the drawings, and supplied and installed by .

The purpose of the DPCV is to automatically compensate for the rise in differential pressure across the circuit that it services, as the circuit flow rate falls under the dictate of the 2-port control valve(s), and vice versa.

DPCVs used in conjunction with motorised control valves and TRVs shall be arranged to maintain a constant differential pressure across the circuit.

Project Co. shall, in conjunction with the BMS Specialist, liaise with the DPCV supplier to ensure the correct motorised control valve selections are made and the whole system is compatible in terms of operating pressure ranges, etc.

Similarly, Project Co. shall, in conjunction with the BMS Specialist also liaise with the pump supplier, to ensure that the pump speed control system is totally compatible between the 3 elements, i.e. DPCV, motorised/thermostatic valves and pump characteristic and control.

It shall be noted that the minimum pressure drop across combination of control valve, coil and interconnecting pipework system and accessories shall be 25kPa to suit operation of DPCV.

The maximum operating pressure of the control valve, coil and interconnecting pipework/accessories shall also be reviewed against the selection of the DPCV.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

Due to the size of the water systems being installed all pressure testing and commissioning equipment shall be cleaned and chlorinated before each use.

This is to prevent the systems from being contaminated with pseudomonas.

COMPLETION

O& M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Acconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

Project Co. shall protect the system from damage or interference during the works. Project Co. shall test, flush and clean the system as per section Y12, Y50, SHTMs

Project Co. shall submit O&M's.

Project Co. shall provide training as per section Y12 & Y50.

Project Co. shall provide spares as per section Y12 & Y50.

905 HYDRAULIC PRESSURE TESTING OF CHILLED WATER SYSTEMS

- Testing: In accordance with HVCA TR/6.
- Notice (minimum): 1 week.
- Pressure: 1.5 times working pressure.
- Duration of test: 1 h.

920 OPERATING TOOLS

- Tools: Supply tools for operation, maintenance and cleaning purposes. Quantity: Supply tools for operation, maintenance and cleaning purposes. Supply keys for valves and vents.

T60 CENTRAL REFRIGERATION PLANT

320 SAFETY AND ENVIRONMENTAL REQUIREMENTS

- Standard: To BS EN 378-1, -2, -3 and -4.
- Leak detection: Gas detection and alarm system.

The Unit control system shall provide the unit with protection against the following:

- Loss of refrigerant charge.
- Reverse rotation.
- Low chilled water temperature.
- Low oil pressure (per compressor).
- Current imbalance.
- Compressor thermal overload
- Automatic compressor unloading in case of excessive air temperature
- High condensing pressure.
- Electrical overload.
- Loss of phase.

Fan motors shall be individually protected by a circuit breaker. Controls shall provide a separate general alert (minor incident) and alarm (circuit shut down) remote indication.

330 AIR COOLED LIQUID CHILLERS

Standards: To BS EN 14511-1, -2, -3 and -4.
Type: The chillers shall be of the fully packaged air-cooled type complete with multiple screw compressors.

Chillers shall have variable speed head pressure control with load and efficiency optimised head pressure and chilled water flow temperature control to improve seasonal efficiency.

Project Co. shall provide acoustic treatment to the chillers to meet the Limiting Noise Criteria in accordance with the recommendations of the acoustic consultant.

The chillers shall be fitted with a water flow switch to prevent damage to the chillers in the event of pump failure.

The chillers shall be factory assembled single piece air-cooled liquid chiller. Each unit shall comprise all factory wiring, piping, controls, refrigerant charge (HFC-134a), multiple refrigeration circuits, screw compressors, electronic expansion valves and equipment required prior to field start-up. Each unit shall be rated in accordance with EN14511 and certified by Eurovent (where applicable).The packaged air cooled chillers shall be of the high efficiency type provided an ESEER exceeding 3.9. The compressors shall utilise Chlorine free refrigerants with zero Ozone Depletion Potential values and offering refrigerant coefficient of performance values of 95% or better.

The chiller construction shall comply with European directives:

" Pressurised equipment directive (PED) 97/23/EC
" Machinery directive 98/37/EC, modified.
" Low voltage directive 73/23/EEC, modified
" Electromagnetic compatibility directive 89/336/EEC, modified, and the applicable
recommendations of European standards:
" Machine safety: electrical equipment in machines, general regulations, EN 60204-1
" Electromagnetic emission EN 50081-2.
" Electromagnetic immunity EN 50082-2.

Unit shall be designed, manufactured and tested in a facility with a quality assurance system certified to ISO 9001 and an environmental management system certified to ISO 14001.

Units shall be run tested and witnessed at the factory.

The frame shall be made of galvanized steel U beam and protected by two layers of protection (primer and final coating) with an average thickness of 200 microns. The control / electrical cabinets shall be steel with an oven-baked polyester-paint finish, and be capable of withstanding a 500-hour salt spray test in accordance with the ASTM B-117 standard (U.S.A.).

Condenser fans shall be direct-driven, shrouded-axial type, shall be statically and dynamically balanced, and made of recyclable material with inherent corrosion resistance.

Air shall be discharged vertically upward. Fans shall be protected by coated steel wire safety guards. Condenser-fan motors shall be 3-phase, IP55, with permanently lubricated bearings and Class F insulation Units shall have semi-hermetic twin-screw compressors with internal relief valve and check valve to avoid reverse rotation on shut down.

Each compressor shall be equipped with a discharge shut-off valve.

Capacity control shall be provided by a variable speed operation capable of reducing compressor capacity down to 15% of full load. Compressor shall start in unloaded condition.

Motor shall be cooled by suction gas and protected by internal winding temperature sensors. Compressor bearings shall be oil free magnetic type.

The oil separator, separated from the compressor, shall not require an oil pump and shall incorporate an internal muffler to reduce discharge gas pulsations.

Each compressor and oil separator shall be installed within an insulated acoustic enclosure. Enclosure access panels can be readily removed for service using ¼ turn fasteners.

Evaporator shall be tested and stamped in accordance with applicable European pressure code for a refrigerant-side operating pressure of 2100 kPa and for a maximum water-side pressure of 1000 kPa (standard).

The evaporator shall be mechanically cleanable, shell-and-tube type with removable heads. Tubes shall be internally and externally enhanced, seamless-copper, and shall be rolled into tube sheets. Shell shall be insulated with 19 mm closed-cell foam with a maximum K factor of 0.28. Evaporator thermal insulation shall be factory fitted with aluminium cladding to provide mechanical protection and ensure protection against UV rays.

The evaporator shall have a drain and vent in each head.

The evaporator shall incorporate an active refrigerant level control system to ensure optimum heat transfer performance under all load conditions.

Chiller shall have only one water inlet & one water outlet connection using victaulic couplings to provide vibration isolation and to accommodate minor pipe-work misalignment.

Evaporator shall be fitted with an electronic water flow switch. Paddle switches or differential pressure switches shall not be acceptable.

The condenser shall be made of multiple coils in V configuration to provide protection against hail damage. Coil shall have integral sub cooler, and shall be constructed from a single material throughout to eliminate the risk of galvanic corrosion. Condenser coils shall be capable of being cleaned with a medium-pressure jet washer (up to 69 bar).

Condenser coils shall be leak tested with helium and shall be pressure tested at 3400 kPa. Condenser shall be 3 years factory guaranteed against leaks and corrosion (according to warranty policy).

Refrigerant circuit components shall include; compressor, oil separator, high and low side pressure relief devices, liquid line shutoff valves, refrigerant economizer, filter driers, moisture indicating sight glasses, long stroke electronic expansion device, and complete operating charge of refrigerant HFC-134a. To facilitate service and maintenance and avoid refrigerant charge transfers, it shall be possible to isolate the following components and systems independently: filter driers, oil filters, expansion devices and compressor (with compressor suction service valve option fitted). Pressure and temperature sensors may be replaced without the need to pump-out the refrigerant charge Unit controls shall include as a minimum: microprocessor with non-volatile memory, picture guided unit/operator interface, LOCAL/OFF/REMOTE/CCN selector and a touch-screen display with multiple language capability.

Pressure sensors shall be installed to measure suction, discharge, and oil pressures. Thermostats shall be installed to measure cooler entering and leaving temperatures and outside air temperature.

- Unit shall be capable of performing the following functions:
- Automatic change-over and cycling of compressors to equalize running hours and number of starts.
- EXV control to optimise evaporator refrigerant level, control discharge superheat and condenser sub-cooling.

- Capacity control based on leaving chilled fluid temperature with return fluid temperature sensing.
- Limit the chilled fluid temperature pull-down rate at start-up to an adjustable range of 0.1°C to 1.1°C per minute to prevent excessive demand spikes at start-up.
- Enable reset of leaving chilled water temperature according to the return water temperature
- Provide a variable set point for the leaving chilled water temperature activated by a remote contact closure signal or by the built in time clock.
- Enable a 2-level demand limit control (between 0 and 100%) or a maximum current drawn limit activated by a remote contact closure or by the built in time clock.
- Control evaporator water pump and, if installed, stand-by pump operation.
- Allow two time scheduling programs to enable unit start-up control, demand limit and setpoint changes.
- Enable lead lag control of two *or more* chillers running in series or parallel.

Display module shall be capable of displaying set points, system status including temperatures and pressures, current for each compressor, run time and percent loading.

The control system shall allow a quick test of all machine elements to verify the correct operation of every switch, circuit breaker, contactor and sensor before the chiller is started.

Unit shall be capable of starting and running at full or part load at outdoor ambient temperatures from –10°C to 55°C.

Unit shall be capable of starting up with 45°C entering fluid temperature to the evaporator. Leaving chilled water set point may be between 3.3°C and 15°C.

Unit shall operate on 400 volt (+ 10%), 3-phase power supply without neutral. A factory-installed transformer shall provide control power.

Unit shall be supplied with factory-installed fused isolator(s). Compressors shall be fitted with inverter drives as standard to limit electrical inrush current.

- Output: As chiller schedule.
- Refrigerant: R134a.
- Evaporator fouling factor: As chiller schedule.
- Energy efficiency ratio (EER): as schedule
- Sound pressure level: As chiller schedule.
- Electrical supply type: As chiller schedule.
- Number of refrigerant circuits: As chiller schedule.
- Evaporators: As chiller schedule.
- Condenser coils: Internally enhanced, seamless copper tubes mechanically expanded into aluminium alloy fins with full height collars. Integral sub cooler circuit.
- Condenser fan discharge: Vertical.
- Warning indication: As schedule.
- Accessories: Anti-vibration mountings.

EXECUTION

Project Co. shall protect chillers from damage or interference during the works. shall include for the services of the manufacturer's skilled services engineers to start up, test and check all the chillers and dry air coolers and controls.

This shall include all tests to prove that all the cooling equipment is working with and responding to the clients BMS network and head end. The units when commissioned shall be "Set Up" to give maximum efficiency. The Energy Centre cooling equipment shall be witnessed by the Board's representative before the cooling plant is accepted from the Board. Project Co. shall allow for instruction of the clients representative on the working of the equipment.

610 INSTALLATION GENERALLY

- Fixing of equipment and components: Fix on purpose made bases or supports.
- Pressure testing of joints: Immediately before installation of lagging and casing.

  - Results: Submit.

620 INSTALLING CHILLERS

- Location: Provide adequate space around chillers: Access around all cooling plant shall be as manufactures instructions.
- Access: Provide for inspection and servicing of chiller and ancillary equipment.

640 INSTALLING REFRIGERANT PIPEWORK

- Standards: To BS EN 378-3 and -4.
- Refrigerant lines: Short and straight.

RHSC and DCN EDINBURGH
FUEL OIL SUPPLY SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the manufacture, supply, installation, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Specialist and is referred to in this document as “the Specialist”.

To carry out the development of the installation drawings and details, Project Co. shall obtain the necessary supporting documentation.

This Specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Oil tanks
- Oil pipework
- Associated oil equipment (such as pumps, pipeline accessories, and oil fill point)

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this performance specification:-

- Power supplies to plant
- Fire and BMS interface connections
- All controls wiring

4.0 INTERFACES AND DEMARCATIONS

The fuel oil system shall be provided as a complete working system serving the Energy Centre.

Project Co. shall provide information to other parties for power supplies and fire alarm system and BMS interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated. This includes those related to Scotland in particular.

The fuel oil supply shall accord with all appropriate Scottish Health Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform to all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time.

Project Co's. shall comply with the Water Environmental (Oil Storage) (Scotland) Regulations 2006, to which the fuel oil system must adhere.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this Specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Other Specialist. Project Co. shall liaise with other specialists as necessary to ensure that all interfaces are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Trust teams concerned with the planning and administration of the fuel oil system.

8.0 SYSTEM DESCRIPTION

The fuel oil is to provide supplies for the new generators and boilers in the new Energy Centre. The oil is to be as required by BS 2869, Class D with a maximum sulphur content of 1000 ppm (0.1%).

Two tanks shall be located externally at ground level adjacent to the Energy Centre sized at 185m³ each and are to serve the Energy Centre boilers and Generators.

Each tank of the tanks is to have its own individual oil fill connection complete with oil fill indicator.

Two pump and filter sets are to be provided to serve respectively:-

- Boilers - Energy Centre
- Generators - Energy Centre

Class D 35 sec oil has been selected as the fuel for the standby diesel generators and emergency (dual fuel/standby) for the main boiler plants. The storage tank volumes are based on the generators and boilers operating at full load and for a period of 200 hours for the generators and 120 hours for the boilers.

Each generator shall have an individual 8 hour gravity feed day tank complete with filling line and level alarms that shall be linked to the BMS. The boilers shall be duel fuel with the fuel oil used as a back-up for the natural gas installation. The main tanks located externally on the ground floor shall be in a common bund capable of retaining a minimum of 25% of the total fuel oil brimful storage capacity.

The bund will incorporate a rainwater sump and a base with angle fillets at any junction with a vertical face to deflect ice. The sump must not connect directly with any drain or sewer.

All electrical equipment, motors, switches, lighting, etc. installed within the oil storage tank areas shall be explosion proof.

Oil check meters shall be installed, as indicated on the drawings. Each meter shall incorporate a 'Y' type strainer to suit the oil meter size and have a mesh not less than 100 micron. Oil meters shall be suitable to provide a pulsed output to the BMS system

Each tank shall be complete with all necessary fill and outlet components, level indicators etc. and access ways.

Leak detection shall be provided below each tank, main tank and day tank linked to the BMS.

A sump unit complete with a float switch shall be provided in the oil pump room to form part of the safety circuit to shut the fire valves on the daily service tanks and stop the generator oil transfer pump should the sump unit become flooded due to leakage from the flow and return pipes to each generator.

is to provide and fit on the wall adjacent to the oil sump in the main oil storage tank area a semi-rotary hand pump suitable for handling oil fuel which has leaked and drained into the sump.

A foot valve shall be fitted to the end of the suction pipe in the sump and the discharge pipe shall be routed through the external wall to terminate at a suitable height to empty into a collection vessel.

Overflows shall be as follows:-

- From the generator day tanks to the ground floor sumps

The vents shall be as follows:-

- From the generator day tanks to their own integral bund
- From the external bulk oil tanks to within the bund

S41 FUEL OIL SUPPLY SYSTEMS

110 FUEL OIL SUPPLY SYSTEM

Storage capacity
- Diesel Generators 200 hours and
- LTHW Boilers 120 hours

- Type: Fuel oil transfer from the bulk oil storage tanks to serve the oil main system for the Boilers and generators shall be provided by a duplex (duty and standby) packaged pump set situated in the Energy Centre.

Each packaged duplex pump set shall incorporate the following:-

- Manifold pressure relief valve, control panel, pressure gauges and isolating cocks connected to the suction and discharge side of the pumps
- Suction strainers/filters
- All assembled on a drain pan bed plate
- Each pump fitted with an integral relief valve
- Differential pressure switch piped across the common suction and discharge
- Automatic changeover in fault condition and duty sharing.

The oil transfer pumps shall be capable of manual or automatic operation. The pumps shall be interlocked to the level sensors in the main and daily storage tanks. The oil transfer pumps serving the generators and boilers shall automatically transfer oil when the engines/burners run and level switches dictate.

- Storage tanks: Carbon steel.
  - Tank accessories: Contents gauges and Overfill alarms and overfill prevention devices
- Oil heating methods: Not required.
- Pipelines: As section Y10.
  - Pipeline accessories:
    Electronic shut off fire valves shall be provided on inlets to each daily service tank and bulk tank which shall operate in the event of a fire alarm situation, or on a signal from the gas alarm system. The day tanks shall be provided with an extra low level sensor which shut the generators down.
  - Filters;
  - Remote acting fire safety valves
  - Strainers.
- Oil pump: Burner pump and duel Transfer pump, as section Y20.
- Outlet: Dual fuel fired cast iron boiler, as section T20 and generators.
- Controls: A central control panel shall be provided by the BMS Specialist which shall be interfaced with the fire alarm system and provide a common alarm to the BMS via volt free contacts. For details of controls and interlocks with plant, see BMS Specification. All controls shall be capable of being fully interrogated by the building management system through the independent network protocol.
- Completion:
  - Plant and equipment identification: As section Y32.

PRODUCTS

Project Co. shall ensure that all equipment is ordered to arrive in a timely fashion and to meet the programme, with particular reference to the main fuel oil tanks.

330 OIL STORAGE TANKS, CARBON STEEL

Tanks shall be single skinned tanks of equal capacity. Each tank shall be complete with all necessary fill and outlet components, level indicators etc and access ways as required by British Standards and SHTM

The external bulk tanks are to be in a bunded sump. Tanks to be single piece connected with a header arrangement.

The tanks shall be manufactured in accordance with BS 799: Part 5.

- Single skinned
- Oil fill pipe and connection
- Vent pipe and connection with vent pipe pressure relief valve and vent guard
- Drain connections with drain valves
- Supply outlet connection
- Spare plugged connection
- 600 mm dia. raised manhole access with cover
- Suitable number of connections for contents gauge sensors
- Suitable number of connections for level control/alarm sensors
- Earthing points
- Caged access ladder with platform and handrail
- Tank details notice showing BS, Type, capacity, date of manufacture, manufacturer and fuel type.
- Inspection openings.

The contents/oil level of the bulk tank shall be monitored by the BMS via the contents gauge sensor.

- Standards:
  - Tank: To BS 799-5 and OFS T200.
- Type: Single skinned
- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Number of manholes or inspection covers: To suit statutory requirements
- Fittings: As required by the drawings and specification
- Accessories: As required by the drawings and specification

350 CONTENTS GAUGES

Each Tank shall have a contents gauge showing the actual contents not just full/empty.

- Standards: To BS 799-5 and OFS E103.
- Type: Submit proposals.

- Manufacturer: Project Co. choice.
  - Product reference: Project Co. choice.

360 OVERFILL ALARMS AND OVERFILL PREVENTION DEVICES

A labelled oil fill cabinet shall be provided for each of the main bulk storage tanks.

The cabinet shall have a top hinged front door complete with a glass observation panel, a supporting strut for use in the open position, and a car type level lock with 2 No. keys. The
whole unit is to be weatherproof and finished internally and externally with a durable paint. The cabinet is to house a gun-metal cap with a retention chain padlock and 2 No. keys and plainly labelled with the tank identification number and grade of oil.

The cabinets shall also include the contents gauge and overfill alarm for the tank and a
Light fitting and switch. The fill cabinets shall contain a 100 mm contents gauge of the hydrostatic continuously reading type, calibrated in litres to suit the tank, and marked 'empty' at the lower limit of usable oil.

The tank transmitter(s) are to be readily replaceable without the need to drain the tank and the connecting tubing is to be armoured and fully supported and clipped on galvanised cable tray throughout its length.

The fill cabinet shall contain a tank overfill alarm(s) connected to the tank to give an
Audible warning when the tank has been filled to 95% of its total volume with a muting and test switch.

The float detector units associated with these tanks are to be completely weatherproof and are to be fixed in suitable connections at the top of the tank, close to the manholes and access platforms.

The overfill alarm shall have a connection for an alarm to the BMS.

The cabinets shall be complete with drip tray capable of containing 110% of the fill pipe volume to contain any spillage.

- Standard: To OFS E105.
- Manufacturer: Project Co. choice
  - Product reference: Project Co. choice

430 FILTERS

Duplex oil filters – 1st and 2nd stage - shall be provided in the suction lines to each oil transfer pump set as shown on the drawings, also upstream of the oil meters.

- Standard: To OFS E104.
- Manufacturer: Project Co. to submit proposals.
- Product reference: Project Co. to submit proposals.

440 REMOTE ACTING FIRE SAFETY VALVES

A solenoid shut off valve shall be installed in the main diesel oil supplies to the boilers and diesel daily service tanks. The valve shall be interlocked with the emergency knock off button.

- Standards: To BS 799-5 and OFS E101.
- Type: Electrical with battery back up to maintain valve open in the event of loss of power Manufacturer: Project Co. to submit proposals.
  - Product reference: Project Co. to submit proposals.

450 STRAINERS

Strainers shall be provided with meters

- Standard: To OFS E104.
- Manufacturer: Project Co. to submit proposals.
  - Product reference: Project Co. to submit proposals.

EXECUTION

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

620 TANK INSTALLATION

- Standards: To BS 799-5 and in accordance with BS 5410-2.
- Steel tanks: Support on masonry piers built on concrete foundations. Run piers across the shortest base dimension of the tank.
  - Pier width: Slightly wider than the tank.
  - Fall: Arrange tank to slope slightly to drain off cock end.

630 OIL SUPPLY PIPELINES INSTALLATION

- Installation: In accordance with BS 5410-2 and OFTEC Technical Book 3.
- Buried pipelines: To OFTEC Technical Book 3.

COMPLETION

Project Co. shall protect the system from damage or interference during the works. Project Co. shall commission the fuel oil system as per section Y50 and 910 this shall include proving the pumps for auto change over and level indicators and alarms on all of the fuel oil system/fill system.

Project Co. shall submit O&M's. Project Co. shall provide training as per section Y50. Project Co. shall provide spares as per section Y50. 's defects and liability period shall be as the contract prelims.

910 COMMISSIONING

- Commissioning: In accordance with OFTEC Technical Book 2 and 5.

920 DOCUMENTATION

- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

RHSC and DCN EDINBURGH
FIRE HYDRANT SYSTEMS

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, setting to work and commissioning of the works described in this document shall be undertaken by the Project Co..

To carry out the development of the design, Project Co. shall obtain the necessary supporting documentation.

This specification relates to the fire hydrants.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- External Fire Hydrant System

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Performance Specification:-

- Incoming water mains to site
- External potable water supply pipes

4.0 INTERFACES AND DEMARCATIONS

The fire hydrant shall be provided as a complete working system serving the RHSC-DCN Building.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Fire Protection Systems shall accord with all appropriate Hospital Technical Memoranda, Codes of Practice and relevant British and European Standards.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time:

The hydrant mains supply and fire hydrants shall comply with the requirements of BS 9990:2006; BS 9999:2008; Water for Scotland 2nd Edition 2007; Scottish Building Standards: Technical Handbook: Non-domestic Section 2.12, 2.13, and 2.14; and the requirements of the local Fire Authority and Water Authority respectively.

- The fire hydrant main services systems shall comply with the relevant clauses of SHTM 2023, 2027, 2040, SHTM 04-01, BS 9990, Scottish Water Byelaws 2004, and descriptions and requirements set out below.

6.0 DESIGN CRITERIA

To meet the requirements detailed in Water for Scotland 2nd Edition Section 2.3.9 and building control requirements.

7.0 LIAISON

The Specialist Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist. The shall liase with other Specialists as necessary to ensure that all are allowed for.

Building Control. The Project Co. shall liase, with and adhere to, the requirements of the Building Control Officer, Fire Officer, Fire Engineering Consultant and any other member of the Project and Trust teams concerned with the planning and administration of the Fire Hydrant System.

8.0 SYSTEM DESCRIPTION

Incoming Fire Main Supply:

A separate fire main will run from the site boundary to serve fire hydrants and sprinkler tanks.

The fire mains will be unmetered.

The fire mains shall run around the main hospital building with 6No. 80mm DI minimum sub branches to serve the underground fire hydrants, and a 150mm DI branch to serve the sprinkler tanks.

The fire hydrants shall be in purpose made chambers below the ground in accordance with the requirements of Water for Scotland 2Nd Edition and the local Fire Authority and be fitted with a sluice valve.

The hydrant cover shall be as required by Strathclyde Fire & Rescue and badged fire hydrant.

A separate 150mm fire main branch from the site hydrant main shall enter the Acute/Children's Hospital at basement level and run within the basement corridor and water tank room to serve the Sprinkler tanks. This supply shall be unmetered.

Fire Cladding

The incoming fire main shall be fire clad where is passes through any non sprinklered areas on its route to the fire tank room.

S65 FIRE HYDRANT SYSTEMS

General

Fire hydrants shall be located as close as practicable to the main, preferably directly above the main, to reduce dead leg lengths to an absolute minimum.

The fire hydrant shall conform to BS 750: 2006 Specification for underground fire hydrants and surface box frames and covers and BS EN 14339: 2005 Underground fire hydrants

Hydrant main pipework shall be light weight ductile iron to BS EN 545 installed in accordance with the pipe manufacturers requirements.

Pipe in trenches shall be laid on a minimum of 100mm bed of <20mm gravel or coarse sand and trenches shall ensure 900mm cover, measured from the crown of the pipe.

Pressure testing shall be undertaken in accordance with the requirements of the pipe manufacturer, the local Fire Authority and Water Authority.

Backfilling shall be undertaken in such a manner so as to avoid any deformation of the pipe. Heavy compaction equipment shall not be used with less than 300mm of cover. A marker tape shall be laid 300mm above the crown of the pipe.

110 FIRE HYDRANT SYSTEM

This underground fire hydrants shall:

a) be installed in a water distribution system;
b) be size DN 80;
c) be suitable for a maximum allowable operating pressure (PFA) of 1.6 MPa or 2.5 MPa (16 bar or 25 bar);
d) be fitted with screw-down type valves; and with one outlet.

Comply with BS 750.
WRC approved materials of construction.
Standard outlet - 2½" male hydrant round thread (other options available).
Universal inlet flange (3" BS10 Table E or 80mm BS 4504 NP16)
Blank cap, chain and frost valve provided.

- Water source: Dedicated water storage and pumping facility.
- Distribution: High density (HPPE) polyethylene 100 to SDR 11 pipelines.
- Outlets: Underground fire hydrants.
- Accessories:
  - Indicator plates;
  - Surface boxes; and
  - Warning marker tape.
- Completion: The Board shall Test, flush and clean the system as per regulations, SHTM/HTM's, this specification and Fire officer requirements.

System Performance

All fire hydrant pipework exposed to the frost will be insulated or trace heated to prevent
freezing.

210 DESIGN

- Standards: To BS EN 806-2 and in accordance with BS 9990.
- Design: Complete the design of the fire hydrant system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
- Mains water supply to hydrants: Provide an independent water supply.
  - Evidence of capacity of mains water supply: Submit.

320 DUCTILE IRON PIPELINES

- Standard to BS EN 545
- Manufacturer: Saint Gobain
  - Product reference: Pam Natural Blutop
- Jointing: Anchor gasket

340 UNDERGROUND FIRE HYDRANTS

- Standards: To BS EN 1074-6 and BS 750.
- Hydrant type to BS EN 1074-6: Underground.
- Valve type to BS 750: Screw-down (type 2)
  Valve shall be
  Fully maintainable.
  " Ductile iron construction.
  " 2½_ London round thread gunmetal outlet to BS 750.
  " Exceeds flow requirements:
  -Kv = 92 minimum, 2000l/min,
  -Kv = 101 maximum, 2200l/min.
  " Corrosion resistant construction, compliant with BS EN 1074-6 for disinfection products.
  " Universal drilled inlet flange BS EN 1092-2:1997, BS 10 Table D/E.
  " Inlet is of a proprietary type.
  " Auto-frost drain valve as standard.
  " Draining stopper.
  " Kite marked.
  " Low weight design.
  " WRAS approved. .
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Duckfoot bend: Not required.
- Outlet material: Submit proposals.
- Plug: Submit proposals.
- Accessories: Spindle cap, outlet cap and frost valve.

350 INDICATOR PLATES Shall be installed adjacent Hydrant

- Standard: To BS 3251.
  - Class: A.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .

- Material: Cast iron.
- Finish: Vitreous enamel.
- Colours:
  - Characters: Black.
  - Front surface: Reference number 309 (Canary yellow) to BS 381C.
- Accessories: As specification and schedule.

360 SURFACE BOXES Shall be suitable for application e.g. footpaths, heavy traffic.

- Standard: To BS 750.
  - Grade: Submit proposals.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Grey cast iron (CI).
- Finish: As structural Engineers specification.
- Marking: 'FIRE HYDRANT' in 30 mm high letters.
- Accessories: Lifting keys and Marker posts.

370 WARNING MARKER TAPES

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Type: Continuous colour coded, heavy gauge polyethylene identification tapes.
- Wire detection aid: Required.

Execution

The Board shall Test, flush and clean the system as per regulations, SHTM/HTM's, this specification and Fire officer requirements

610 ISOLATION

- Connection to existing fire hydrant systems: Provide an isolation valve and non-return valve.

630 INSTALLATION GENERALLY

- Fire hydrant position: Unobstructed by the parking, loading and unloading of vehicles.
- Protection: Protect from damage, e.g. by frost, traffic loads or vibration.

640 INSTALLING PIPELINES

- Depth of cover: As NJUG.
- Set out: Lay in straight lines.
- Concealment: As drawings.
- Trench excavations: Carefully prepare to a firm even base. Remove sharp objects and replace with pea gravel to give 100 mm (minimum) cover above and below the pipe.
- Installation: Thoroughly clean lengths of pipe internally before laying. Temporarily cap until jointing takes place. After laying and jointing keep leading end capped.
- Thrust blocks: Install at changes of direction and blank ends.

- Backfilling: Excavated material free from large stones and sharp objects. Leave joints exposed until after pipeline pressure test. Lay and compact in 300 mm maximum layers.
- Do not use heavy compactors before backfill is 600 mm deep.

650 INSTALLING UNDERGROUND FIRE HYDRANTS

- Installation: In accordance with BS 9990.
- Depth (maximum): 300 mm from hydrant outlet to finished ground level.
- Details of pit construction: Submit proposals.

660 INSTALLING SURFACE BOXES

- Clear openings: To BS 750.
- Frame depth:
  - Grade A: 100 mm.
  - Grade B: 75 mm.
- Frame width: 75 mm.
- Fit of frames and covers: Set top of cover flush with top of frame.

670 INSTALLING INDICATOR PLATES

- Aluminium plates: Aluminium alloy, zinc coated steel or copper alloy screws.
- Plastics plates: Zinc coated steel screws or adhesive.
- Ferrous plates: Zinc coated steel screws or bolts.

680 INSTALLING WARNING MARKER TAPES

- Installation: During backfilling, lay along the route of the hydrant main.
- Location, depth, colour and markings: To requirements of service undertaker.

Completion

910 FLUSHING

- Operation: Fill system with water and discharge it via the hydrant. Flush out debris.

920 TESTING

- Standard: To BS 6700.
  - Notice before commencing testing (minimum): 1 week.
- Static pressure test: Charge the system with water twice the maximum pressure to which the installation is designed to be subjected in operation. Maintain for 1 h. During this period check that no water leaks from joints or valves.
  - Results: Submit.
- Flow test: Pass water through the system under pressure and record flow and pressure readings.
  - Timing: After static pressure test.
  - Results: Submit.

930 SYSTEM DISINFECTION

- Standard: To BS 6700.
- Certification: Submit disinfection certificate.

940 SETTING TO WORK

- Operation: Check operation of hydrant valves.
- Make ready: Check operation of frost valve and leave ready for use.

950 DOCUMENTATION

O& M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Acconex.

The Specialist shall provide instruction to the clients Engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the Manufactures recommendations and best practice.
The Specialist shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

- Manufacturers' operating and maintenance instructions: Submit.
- Test records: Submit a record of inspections and tests.
- Record drawings: Submit drawings showing location of pipe runs, hydrants and valves.

960 OPERATING TOOLS

- Tools: Supply for operation, maintenance and cleaning purposes.
- Keys: Supply for hydrants.
  - Quantity: as per contract requirements.

RHSC and DCN EDINBURGH
WATER TREATMENT EQUIPMENT

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as

To carry out the development of the design, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the Water Treatment Equipment serving the RHSC-DCN Buildings.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:

- The Water Filtration Plant for the raw incoming mains water supply
- The Endoscopy washer plant

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification.

- The domestic cold water service
- The domestic hot water service
- Site Water Mains

4.0 INTERFACES AND DEMARCATIONS

The Water Filtration plant shall be provided as complete working systems serving the RHSC-DCN Building. The Project Co. shall provide information to other parties including for power supplies and BMS interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The water treatment plants shall accord with all appropriate Scottish Health Technical Memoranda, Scottish Health Technical Notes, Codes of Practice and relevant British and European Standards, Scottish Water Regulations and to the approval of the local water authority.

6.0 DESIGN CRITERIA

Generally the water filtration plant shall comply with the Scottish Water Regulations and current Codes of Practice

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of Parts A, B and C of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Trust's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist. Project Co. shall liaise with other Specialists as necessary to ensure that all interfaces between the water treatment equipment installations and other systems are allowed for.

The Local Water Supply Undertaker. Project Co. shall liaise with Scottish Water or their licensed agents to ensure that all aspects of the installation comply with the Scottish Water Regulations.

Any other member of the Project and Board teams concerned with the planning and administration of the Water Treatment Equipment.

SYSTEM DESCRIPTION

General

Water treatment equipment shall be provided to meet user requirements and shall include membrane filtration. Separate plants shall be provided to the following areas:-

Roof Plant Room (Water Filtration plant)

Basement Tank Room

Water Filtration Plant Equipment

Twin packaged membrane filtration plant units shall be housed in the basement tank room and shall be served from the raw cold water storage tanks connected to the incoming water mains. The filtration plant shall filter the water to the criteria set out in SHTM 04-01 with 0.5 micron filtration.

The twin package filtration plant shall supply the storage tanks also housed within the basement tank room. Each package unit shall be capable of supplying 50% of the total flow required to the main tanks.

Each of the two package filtration plants shall be supplied and fitted with their respective air receivers and compressors, internal pumps, and control panels. These items are to be fitted as part of the package unit and shall be supplied by the filtration unit manufacturer.

Hourly backwash of the filter membranes shall be by a compressed air/water mix and shall discharge to a sealed holding tank within the main tank room prior to pump discharge to drain.

The twin filtration units shall be connected to the BMS and shall be fitted with a shut down warning and alarm.

MATERIALS AND WORKMANSHIP CLAUSES

S12 WATER TREATMENT EQUIPMENT

330 FILTRATION UNITS

All Incoming water for wholesome storage shall pass through a low pressure filtration system. This system shall be duplicated and served by duplicate break tanks. Each filtration unit shall be capable of supplying 50% peak water demand to the bulk cold water tanks.

Each filtration unit shall be a complete package unit including air compressor/receiver, control panel and integral pump.

Manufacturer: [TBC].
Product reference: [TBC].
Water flow rate: [TBC].
System pressure: [TBC].
System temperature: [4C-15C].
Particle removal capability: [0.5 micron].

All pipework to be in PVC.

EXECUTION:

The Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety regulations.
This shall include clean and tidy working and working in confined spaces.

COMPLETION:

The Project Co. shall protect the system from damage or interference during the works.
The Project Co. shall Test, flush and clean the system.
The Project Co. shall submit O&M's as per section
The Project Co. shall provide training as per section Y12, Y40 & Y50.
The Project Co. shall provide spares as per section Y12, Y40 & Y50.
The Project Co. defects and liability period shall be as the contract prelims.

910 DOCUMENTATION:

O& M documentation shall be issued at least three months before completion of any part of the contract.
The contents and format shall be agreed with the Board. The document shall be issued/uploaded on Aconex.

Project Co. shall provide instruction to the clients engineers and maintenance staff in the safe operation of all systems and items of equipment for an adequate and reasonable period of time based on the manufactures' recommendations and best practice. Project Co. shall provide adequate and qualified staff in order to carry out their maintenance and repairs during the defects liability period.

920 SPARES AND CONSUMABLES:

Required spares:
- Filters: [2 of each type].

RHSC and DCN EDINBURGH
COMPUTER ROOM COOLING SYSTEM

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as “”.

To carry out the development of the design to form the installation, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the single computer room cooling services for the RHSC-DCN Building.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Fans & Pumps

All fan assemblies shall incorporate fan impeller and motors selected to provide the most energy efficient solution conforming to Section 6 regulations. All fans and pumps shall be fitted with IE2 efficiency motors to EN 60034-30:2009 as standard, and suitable for operation in ambient temperatures of 40 degrees C.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Computer room cooling equipment
- Power distribution to all equipment associated with the installation
- BMS interfaces

3.0 PERFORMANCE SPECIFIED SYSTEMS

The following is specifically excluded from the scope of this specification:-

- BMS and automatic control systems

4.0 INTERFACES AND DEMARCATIONS

The computer room cooling systems shall be provided as a complete working system serving the NHS-DCN Building. Project Co. shall provide information to other parties for BMS and fire alarm system interfaces.

5.0 APPLICABLE STANDARDS

All elements of the works shall be in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

The Fire Protection Systems shall accord with all appropriate Health Technical Memoranda, Codes of Practice and relevant British and European Standards listed in SHTM2009.

The equipment supplied shall conform with all relevant standards and regulations in force. The equipment shall be supplied with relevant Declarations of Conformity to certify compliance with the EMC directive 89/336/EEC-92/31/EEC and the Machinery Safety Directive 89/392/EEC-91/368/EEC-93/44/EEC. Also the equipment and installation shall comply with all relevant statutory requirements in force at the time.

6.0 DESIGN CRITERIA

Mains Chilled Water System

Mains Chilled Water Flow Temp	-	6°C
Mains Chilled Water Return Temp	-	12°C

Computer Room Cooling Water System

Cooling Water Flow Temp	-	6°C
Cooling Water Return Temp	-	12°C

7.0 LIAISON

The Specialist Installer shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Specialist Installers. Project Co. shall liase with other specialist Installers as necessary to ensure that all interfaces between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

- Building Management System specialist
- Fire Alarm and Detection specialist

The Electrical Services Board. Project Co. shall liase with the Electrical Services Installer to provide details of:-

5. Computer room cooling power supply requirements
6. Cable tray requirements

Building Control. Project Co. shall liase, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Trust teams concerned with the planning and administration of the PTS.

8.0 SYSTEM DESCRIPTION

General

There is a single core server room within the hospital located on the second floor of the main building.

The main core server room air-conditioning systems shall be fed from the main chilled water system. The computer room shall be provided with an independent system via a dedicated secondary chilled water circuit having its own plate heat exchanger and circulating pumps.

CRACs shall be floor standing ‘downflow’ type and shall be capable of being fully interrogated by the building management system through the independent network protocol.

To comply with these directives appropriate national & harmonised standards have been applied. These are listed on the Declaration of Conformity, supplied with each product.

Unit cabinets shall be manufactured from galvanised sheet steel coated with epoxy baked powder paint to provide a durable finish. Internal strength and rigidity shall be provided by a welded space frame constructed of channel profile folded steel. Cabinets shall be lined internally with fire resistant 20mm foam (UL94 V0) for thermal and acoustic insulation. Cabinets shall meet the Hospital acoustic and vibration requirements. The cabinet doors are full height, hinged and key lock secured. Door arrangement shall allow flexible door opening/removal for improved access. Doors shall have rubberised door seals reduce sound breakout and eradicate leakage.

The units shall have large surface area coil(s) to optimise airflow and heat transfer, manufactured from refrigeration quality copper tubes with mechanically bonded aluminium fins.

Fins shall be coated with a non-stick acrylic film to provide additional corrosion protection and efficient surface water removal for improved performance.

Coil headers shall be circuited to ensure low water pressure drops. The cooling coils shall be mounted over a full width stainless steel condensate tray. Chilled water flow shall be via a factory fitted 3 port modulating control valve.

All coils shall be Factory pressure tested to 20Bar.

Fans shall be backward curved impellers, direct drive centrifugal fan assemblies with integral rotor mounted motor which is statically and dynamically balanced for quiet operation. Designed for high corrosion resistance, the impellers shall be laser welded aluminium with galvanised rotor and die cast aluminium EC power module. An inbuilt EC fan control module shall allow the fan to modulate from 15-100%.

Filters shall be 97mm pleated disposable panel filters in a rigid frame. Conform to BS EN 779-G4.

Access and removal from unit front. An adjustable diaphragm pressure switch fitted across the filter assembly shall monitor pressure drop which shall initiate a filter dirty alarm.

The control panel shall have fan motor contactors and overloads, transformer, sub circuit protection, volt free contacts, mains and inter-connecting terminals. The panel shall be fitted within the cabinet and be hinged for easy access to other components within the unit. The electrical control panels shall be wired to the latest European standards and codes of practice.

To ensure complete unit isolation of the electrical panel during adjustment and maintenance a door interlocking isolator shall be provided as standard.

Units shall be fitted with the microprocessor controller which shall have a real time clock and a communication port plus networking and Bac Net BMS connections. A backlit LCD door mounted display keypad assembly shall be fitted to view the unit status and allow operator adjustment.

The condensate pump shall have a reservoir with a capacity of 5 l/m at a head of 10.8m.
Leak detection tape suitable for sensing water droplets shall be supplied loose for remote mounting on site.

- Project Co. shall provide technical proposals.
- Arrangement: Vertical.
- Casing: Steel frame with acoustically lined steel panels.
- Finish: Manufacturer's standard.
  - Colour: Manufacturer's standard.
- Controls: All controls must be capable of being fully interrogated by the building management system through the independent network protocol.

Controls

The terminal cooling units shall be fitted with a microprocessor controller which provides analogue and digital control to meet a wide range of monitoring and control features including a real time clock and a communication port plus networking and BMS interface connections.

The cooling units shall be capable of being fully interrogated by the building management system through the independent network protocol.

The cooling units shall be provided with “fail safe” mode: in the unlikely event of failure the units shall automatically switch to maximum cooling output.

The cooling units shall be fitted with a display and local controls to view the status and allow operator adjustment.

The following values shall be monitored:

- Return Air Temperature
- Return Air Humidity
- Supply Air Temperature
- Cooling Water Flow Temperature
- Cooling Water Return Temperature
- Fan Speed Control
- Operating Status
- Audible Alarm

An alarm shall be generated on the BMS system under the following conditions:

- Return air temperature high limit
- Return air temperature low limit
- Return air humidity high limit
- Return air humidity low limit
- Supply air temperature high limit
- Supply air temperature low limit
- Airflow failure
- Filter change alarm
- Manual override
- Power fail reset
- Communications failure
- Maintenance (once hours run limit exceeded)

Metering

The computer room cooling's plant shall be separately metered in order to monitor the operational Power Utilisation Efficiency (PUE).

The computer room chilled water system shall be provided with heat meters in order to monitor the operational Power Utilisation Efficiency (PUE).

Electrical meters monitoring the lighting and general power for the computer rooms shall be provided separately.

Cooling Units

The cooling units shall be supplied with condensate pumps and backup drip tray drainage. The backup drip tray drainage shall fall to drain.

All cooling units shall be supplied with associated control valves which shall be compatible with the hydraulic characteristics of the cooling water system and the BMS system.

All cooling units shall be capable of having their fans replaced without shutting down that particular cooling unit.

The cooling unit shall be provided with EC motor drive fan assemblies in order to minimise the energy usage of the system.

The pipework system from the header to the cooling units shall be installed as a single length of pipe, shall be insulated and be provided with leak protection. Flexible Multi-Layer Composite Pipework (MLCP) is recommended.

Execution

All pipework and headers shall be pressure tested to at least twice the working pressure of the cooling water system.

Project Co. shall ensure all works carried out shall be done is a safe manner and comply with Health and Safety Regulations. This shall include clean and tidy working and working in confined spaces.

RHSC and DCN EDINBURGH
SMALL POWER SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The development of the design, manufacture, supply, installation, wiring, setting to work and commissioning of the works described in this document shall be undertaken by the Mechanical and Electrical Installer and is referred to in this document as

To carry out the development of the design, the Specialist shall obtain the necessary supporting documentation.

This specification relates to the Water Treatment Equipment serving the RHSC-DCN Buildings.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include the following:-

- Metal encased prefabricated wiring systems
- Small power installation

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

Materials and Workmanship clauses for Small Power accessories (covered by refer to Section Y65; Specification WW AP.1.2.22 Common Electrical Clauses)

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of SHTM 06-01, NBS clause V40, IET Wiring Regulations BS 7671 (17th Ed.) IEE Guidance Note 7, MEIGaN v2.0 September 2007, BSEN60601-1-1-2001, current legislation, regulations and standards stated in materials and workmanship clauses.

5.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Drawings

As part of the development of the design Project Co. shall prepare general arrangement drawings of the Small Power System based on the base drawings and coordinated with other services and building elements. A proposed drawing list shall be submitted with the tender.

6.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Any other member of the Project and Hospital teams concerned with the planning and administration of Small Power installations.

7.0 SYSTEMS

This part of the Specification shall be read in conjunction with the attached NBS clause V40 and the Common Electrical Clauses specification, WW AP.1.2.22 which contains clauses for cables, conduits, trunking, cable supports and wiring accessories.

7.1 Prefabricated Wiring Systems

Project Co. shall supply and install a metal encased prefabricated wiring system installation complete with all necessary components as detailed in the attached NBS clause V40 to provide the required system wiring as detailed on the small power layouts.

Note also that the lighting installation specification WW AP.1.2.30 includes clause V50 which includes specific requirements for metal encased prefabricated wiring systems for the lighting installation.

7.2 Small Power System

Description

Project Co. shall supply and install the complete small power installation, including the following:-

- All cable containment required for the complete small power installation
- All wiring required for the complete small power installation
- All supports necessary for the complete small power installation
- All accessories, sockets, etc, for the complete small power installation
- Connections to equipment
- Connections to local mechanical services equipment outside of the plantrooms e.g. smoke dampers, fan coil units, over door heaters
- Connections to power supplies for specialist low current systems e.g. fire alarms, security, nurse call, etc.

General Requirements

The drawing series WW-PL-531 shall indicate the allocation of circuits to each room, together with a set of wiring 'rules' to be followed. The services drawings shall be read in conjunction with the Distribution Board Schedules which specify breaker ratings and types and cable sizes and types for final circuits. The services drawing shall also be read in conjunction with the loaded 1:50 drawings which indicate locations and ADB codes of all power outlets required by the Hospital.

All areas except where indicated below shall have flush small power installations.

The exceptions to this are:-

- plantrooms
- risers
- switch cupboards
- lift motor rooms
- ceiling voids
- switchrooms
- substations
- FM Workshops
- UPS rooms
- Basement corridors

These areas shall have surface installations.

Surface mounted installations shall have metal clad accessories.

In SHTM 06-01 Clinical Risk Category 1 and 2 areas, accessories for flush or recessed installations shall have white plastic accessory plates.

“Category 1 – Support service circulation. …… The areas include circulation spaces, waiting areas, offices and nonpatient care areas such as laboratories or finance departments.…” extract from SHTM 06-01.

“Category 2 – Ambulant care and Diagnostics. …..The areas may include patients in consultation (excluding examination) or general out-patient areas. Loss of supply may give rise to disruption, inconvenience and a reduced environmental quality but would not directly compromise patient clinical treatment and safety…” extract from SHTM 06-01.

In SHTM 06-01 Clinical Risk Category 3, 4, and 5 areas, socket outlets shall have metal accessory plates.

“Category 3 – Emergency care and Diagnostics …..These areas relate to the patient environment of group 0 under Chapter 10 in ‘IEE Guidance Note 7’. Patients are not generally connected to any electro-medical equipment. However, medical monitoring or medical test equipment may occasionally be used and connected externally to the patient’s body for a short or intermittent time (for example patient monitors or ultrasound machines). ….” extract from SHTM 06-01. Such rooms would include treatment rooms, exam rooms, consultation rooms where examination occurs, Exercise Test Lab, Investigation room, Assessment room and Audiology booths.

“Category 4 – Patients in special medical Locations. These areas will relate to the patient environment of group 1 under Chapter 10 [now 9] in ‘IEE Guidance Note 7’…. “ extract from SHTM 06-01.

Category 4 circuits will be identifiable by virtue of the fact that they will be RCD protected. Bedded areas in Wards shall be considered to be Category 4 areas, as shall endoscopy rooms, ECG, EEG, nuclear medicine, emergency centre, haemodialysis, parts of category 5 areas outside the patient environment, urology treatment, ultrasound.

“Category 5 – Life support or complex surgery These areas will relate to the patient environment of group 2 under chapter 10 in ‘IEE Guidance Note 7’. The areas are defined as operating theatre suites, critical care areas, cardiac wards, catheterising rooms, accident & emergency resuscitation units, MRI, angiographic rooms, PET and CT scanner rooms. Patients may have electro-medical equipment, medical monitoring or medical test equipment (for example intracardiac procedures) connected externally or internally to their bodies.. “ extract from SHTM 06-01.
Category 5 circuits will be identifiable by virtue of the fact that they will be IPS protected.

Socket outlets fed by IPS units shall be double pole or un-switched, clean earth sockets, with metal front plates, colour-coded blue, engraved in white lettering ‘Medical equipment only’. If white sockets are preferred, they shall be mounted on a blue background, approximately 2 cm larger than the socket. The socket to be engraved ‘Medical equipment only’ in blue. Engraving shall be filled to allow clinical cleaning.

The small power allocation drawings indicate the Clinical Risk Category and MEIGaN grouping of each room.

The finish shall be consistent throughout the installation.

Where accessories are flush mounted within partition walls, Project Co. shall ensure that fire and acoustic integrity are maintained. This also applies to concealed service drops within partition walls. Where services or accessories are installed on both sides of partition walls, back-to-back services drops or recessed accessory boxes shall not be permitted.

A and B side cables shall be run in separate containment up to bedhead trunking unit.

The wiring system shall generally be a metal encased prefabricated system. Armoured flexible conduits shall be run on wire cable baskets.

The small power installation shall be installed by means of metal encased prefabricated wiring systems except in areas of non demountable ceilings, such as Theatre suites, where they shall be wired by means of single core LSZH insulated copper single core cables run in a loop in conduit system whereby access to the wiring system is only at accessories. This shall also apply to conduits provided for power cabling to Theatre panels and Theatre PACS units.

Project Co. shall refer to the Architects general arrangement, wall elevations for detailed mounting locations.

Where several accessory plates are located together, these shall be mounted at the same height in a horizontal row, as appropriate, unless indicated otherwise on Architects drawings. All socket outlet fused connection unit boxes shall be fitted with an earth screw terminal pillar. Project Co. shall bond the socket outlet or fused connection unit to this terminal using green/yellow coloured LSF insulated cable in compliance with BS7671 (17th Ed.).

Note: All power circuits serving patient areas shall be provided with a 30 mA RCD (with Class A characteristics), together with the associated protective MCB at the circuit origin at the distribution board (i.e. an RCBO).

Socket Outlets

Unless otherwise specified, socket outlets shall be switched 13A, 3-pin to BS 1363.

Where socket outlets are required to be inset into cable trunking they shall be of the panel mounted type, unless noted otherwise in later sections of this specification or shown on the drawings. In metal trunking the plastic insets around the socket receptacles shall project above the surface of the metal trunking, in accordance with the British Standard.

In SHTM 06-01 Clinical Risk Category 1 and 2 areas, where sockets are to be mounted in plastic dado trunking, completely recessed plastic faced socket outlets shall be used and a suitable means of maintaining segregation provided.

Trunking in SHTM 06-01 Clinical Risk Category 3, 4 and 5 areas shall be metal, fitted with socket outlets with metal front plates, as required by SHTM 06-01.

Where sparkless switch socket-outlets are specified, they shall have single pole switches (tilting mercury pattern) which shall interlock with the plug.

Switches shall be of the micro gap pattern and sockets shall have insulating sleeves around the pin apertures. Sockets shall be shuttered on the live and neutral outlets so that entry of three pins of the plug is required to open the shutters.

Plug tops of the finger-shield pattern with insulated pins shall be provided for each outlet installed including outlets in floor outlet boxes.

All power circuits shall be provided with high integrity earthing. Refer to WW AP.1.2.25 for earthing requirements.

Small power circuits wired by means of 4mm^2 radial circuits in metal conduits will achieve high integrity earthing as a matter of course without the need for any further special measures.

Fused Connection Units

Fused connection units shall be manufactured in compliance with BS 1363 with captive fuse holder and fuse rated at 13 A, or to suit the item of equipment services, as appropriate. Where switched, the switch shall be of the micro gap pattern.

Fused connection units shall be provided with fuse carriers that remain attached to the frontplate when opened and can be padlocked for safety. Tamperproof screws on fuse carriers shall be provided for fused connection units in public areas.

Concealed conduit shall be provided from any fused connection unit to other accessories served by it (e.g. unswitched socket outlets for refrigerators).

Face plates, boxes, finishes, etc. shall be as specified for socket outlets.

The outgoing cables from fused connection units shall not be rated less than the fuse rating.

Accessories Requiring Ingress Protection

In areas where water is likely to come into contact with electrical services, accessories shall have a suitable degree of protection. In all such areas the minimum degree of protection shall be IP56. Refer to Room Data Sheets for IP protected accessories.

Cleaners Sockets

All cleaner sockets shall be engraved with the legend “CLEANERS USE ONLY” in 4 mm high black uppercase letters. Engraving shall be filled to allow clinical cleaning. Cleaners socket finishes shall match other sockets in the room.

Childproof Socket Outlets

In waiting areas or any other area where small children are likely to be present, 13 A socket outlets shall be childproof. This shall be achieved by at least meeting the requirement that the shutters permit the insertion of pins into the socket only if all three pins are simultaneously inserted.

Imaging Department Supplies

Power supplies to diagnostic imaging and radiotherapy rooms / suites shall be compliant with the MEIGaN V2.0 September 2007 document published by MHRA.

The steel wire armour of supply cables to fixed imaging equipment shall not be used as the mains supply earth conductor. Three phase supplies shall utilise 5 core cables, single phase supplies shall utilise 3 core cables.

Isolators in imaging rooms shall be lockable in the off position.

A remotely operated contactor shall be fitted in the mains supply of three phase medical devices sited adjacent the mains supply isolator and Earth Reference Bar (ERB) (see separate earthing & bonding systems specification, WW AP.1.2.25). ERB, contactor and isolator enclosures shall be white. The contactor shall isolate all three phase contacts, including the neutral, and shall be capable of interrupting maximum load. The contactor control circuit shall be on the same phase as the room socket outlets. The contactor and isolator shall both be of a grade suitable for frequent use.

Three-phase supplies feeding medical devices shall have a phase rotation and voltage monitoring device installed, except where such a device forms part of the installed equipment. This device shall prevent the contactor from energising with:

- under- or over-voltage condition on any phase
- incorrect phase sequence
- phase loss
- neutral loss
- phase-neutral faults.

The under- and over-voltage limits shall be provided by the equipment manufacturer. The monitoring device shall be interlocked to prevent disconnection of the supply during an exposure.

The contactor shall be switched ON by a green momentary push and OFF by a red push. Red emergency OFF buttons shall be located in a suitable location in the room and shall incorporate a protective shroud and key reset.

Illuminated warning signs shall derive supply from the contactor.

All accessory boxes in imaging rooms shall be plastic, including for light switches.

Illuminated warning signs

For all X-ray equipped rooms, the X-ray warning signs external to each room shall be interlocked with the equipment such that when the X-ray power supply in a room is energised the ‘radiation warning’ section illuminates, and when the equipment is in operation the “do not enter” section illuminates.

For all laser equipped rooms, the laser warning signs external to each room shall be interlocked with the equipment such that when the laser power supply in a room is energised the ‘laser in use’ section illuminates, and when the equipment is in operation the “do not enter” section illuminates.

NHS to ensure equipment is compatible with warning signs.

Sockets serving portable equipment to be provided with additional contacts for illuminated warning signs.

Controlled Drugs Cabinet Supplies

Any fused connection unit serving a controlled drugs cupboard alarm shall be installed inside the cabinets so that access to it is possible only when the cupboard is open. These connection units shall be of the unswitched type.

Lead Lined Walls

Project Co. shall review the final layout wall construction drawings and note where lead lined walls are provided. These are normally associated with the imaging department. Where lead lining is provided, all the lead lining shall run behind the recessed accessory box, or a lead plate is to be installed behind the recessed accessory box and oversized as necessary to block all possible beam angles possible through the cut out. In any case, the solution must be agreed with the Radiation Officer.

Lead lining to be bonded to the Earth Reference Bar (ERB) within the associated room.

Provisions for Catering

Freezer/ Cold Room: Kitchen in Basement and Restaurant Kitchen on 4th Floor

The freezer rooms and cold rooms in the main kitchen in the basement and the restaurant kitchen will be provided and partially fitted out by a Specialist. The lighting within the cold rooms will be provided by Catering Specialist. The small power in the cold rooms shall be installed by . Conduits will be provided by the Catering Specialist in the cold room walls terminating above the ceiling for the use of .

Project Co. shall provide a power supply to a connection point for each cold room control panel. Cabling details are indicated on the distribution board schedules.

Project Co. shall provide power supplies to the cold room condenser units.

Kitchens: Restaurant Kitchen on 4th Floor

Power supplies to catering equipment shall be provided by . Generally all fixed outlet wining points shall be installed to within 1m of the point of connection. The Catering Specialist will then be responsible for all final connections and commissioning of the equipment.

Fourth floor and basement kitchen distribution boards shall be fitted with emergency power off contactor and two shrouded knock off buttons provided.

Provisions for Workshops

Circuits serving workbenches within workshops shall be fitted with emergency power off buttons as identified on the architect's fully loaded drawings.

Core Server Room

Small power in the core server room will be provided as detailed on the power and UPS schematics.

In general terms power supplies to each cabinet shall be twin 32A ‘Commando’ sockets derived from a separate A+B side PDU.

Hub room power requirements will generally depend on the quantity of racks/ cabinets provided however as a rule each cabinet will be provided with the following:

- 1 No. 32A ‘Commando’ type socket outlets
- 1 No. 13A switched fused connection unit

Both supplied from within the Node room shall be derived from a single dedicated Node room DB.

V40 Small power systems

To be read with section Preliminaries/ General conditions.

GENERAL

110A HARD WIRED LOW VOLTAGE SMALL POWER SYSTEM WITH CONDUIT

- Origin of supply: Low voltage distribution system, as section V30.
- Final circuit cabling:
  - Types: LSZH singles, as section V32.
  - Sizes: As Circuits schedule.
- Containment: Rigid conduit, as section Y60 and Trunking or ducting, as section Y60.
- Rewireable installation: Required.
- Concealed installation: Required.
- Final connections: Required.
- Partial installation: Not required.
- Outlets:
  - Electrical accessories as section Y65 - refer to specification WW AP.1.2.22

  Common Electrical Clauses;
  - As room data sheets; and
  - As architect's load drawings at 1:50 scale.

  Completion:
  - Electrical identification: As section V80.
  - Testing and inspection: As section V39.

120 LOW VOLTAGE SMALL POWER SYSTEM WITH PREFABRICATED WIRING Generally.

- The Board shall ensure that there is at least one spare circuit available in each home run cable. Origin of supply: Low voltage distribution system, as section V30.
- Standards

  System generally: BS 8488

  Connectors: BS EN 61535 and BS EN 61984 as appropriate

  Final circuit cabling:
  - Types: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Sizes: As Circuits schedule.
- Containment: Cable basket, as section Y63.
- Rewireable installation: Required.
- Concealed installation: Required.
- Final connections: Required.
- Partial installation: Not required.
- System components:
  - Connection cables;
  - Extender leads;
  - Home run cables;
  - Master distribution boxes;
  - Slave distribution boxes;
  - Starter leads; and
  - 'T' connector

- Outlets: - Electrical accessories as section Y65 - refer to specification WW AP.1.2.22 Common Electrical Clauses;
  - As room data sheets; and
  - As architect's load drawings at 1:50 scale.
- Accessories: Not applicable.
- Completion:
  - Electrical identification: As section V80.
  - Testing and inspection: As section V39.

PRODUCTS

335 PREFABRICATED CABLING PRODUCTS GENERALLY

- Connectors:
  - Standard: To BS EN 61535 and BS EN 61984 as appropriate. Submit certification
  - Type: Manufacturer's standard.

340 PREFABRICATED LSZH INSULATED SINGLES IN FLEXIBLE CONDUIT

- Standards:
  - Cable: To BS 7211.
  - Flexible conduit: To BS EN 61386-23. Submit certification
- Approval: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Flexible thermosetting insulated single core cables (LSZH singles, H07Z-K):
  - Construction: To BS 7211, table 3b.

350 CONNECTION CABLES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board's choice.
  - Size: Board's choice.
- Length: Board's choice.
- Connectors:
  - Arrangement: One fully shrouded male connector and one fully shrouded female connector.
  - Poles: Board choice.

355 MASTER DISTRIBUTION BOXES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Distribution box: Galvanized sheet steel with recessed input and outgoing connections.
- Rating: Board's choice.
- Connectors:
  - Power input connection: Hard wired via home run cable.
  - Power output connector type: Fully shrouded female connector.
- Outgoing connections:
  - Quantity: Board's choice.
  - Poles: Board's choice.

360 SLAVE DISTRIBUTION BOXES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Distribution box: Galvanized sheet steel with recessed input and outgoing connections.
- Rating: Board's choice.
- Connectors:
  - Power input connection: Board's choice.
  - Power output connector type: Fully shrouded female connector.
- Outgoing connections:
  - Quantity: Board's choice.
  - Poles: Board's choice.

365 HOME RUN CABLES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: 6 circuit or 9 circuit.
  - Size: Board's choice.
- Length: Board's choice.
- Connector arrangement: One fully shrouded male connector and one free cable end.

370 STARTER LEADS Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board's choice.
  - Size: Board's choice.
- Length: Board's choice.
- Connectors:
  - Arrangement: Board's choice.
  - Poles: Board's choice.

375 'T' CONNECTORS Prefabricated wiring system.

- Standard: To BS EN 61535. Submit certification
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board's choice.
  - Size: Board's choice.
- Length: Board's choice.
- Connectors:
  - 'T' arrangement: One fully shrouded male connector and one fully shrouded female connector.

EXECUTION

610 SMALL POWER INSTALLATION

- Standard: To BS 7671.

630 INSTALLING CABLING TO SOCKET OUTLETS

- General: Wire in radial final circuits without spurs as distribution board schedules.

670 INSTALLING PREFABRICATED WIRING

- Connection arrangement: Form circuits using a male connector working away from any master distribution boxes.
- Fixing master/ slave distribution boxes: Board's choice.
- Fixing cabling:
  - Maximum distance between clips:

  Prefabricated LSZH insulated singles metal encased in flexible conduit (home run cables): 1000 mm.

  Prefabricated LSZH insulated and sheathed multi-core: 500 mm.
  - Clipped in accordance with manufacturers recommendations.
  - Bends: Not permitted within 150 mm of connectors.

COMPLETION

920 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Operation and maintenance instructions: Submit.
- Kit of parts of prefabricated wiring system: Submit.
- Record drawings: Submit.

RHSC and DCN EDINBURGH
LOW VOLTAGE DISTRIBUTION

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

APPENDICES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Low voltage distribution system including switchgear and cables
- Installation of transient overvoltage surge suppression devices within the main LV switch boards
- Integration with the LV switchboards of suitable controls for the ENMS (electrical network management system).
- Busbar trunking

- Automatic Power Factor Correction equipment
- Provision for future Harmonic Filtering Equipment.
- Voltage optimisation equipment

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Low voltage cabling (Materials and Workmanship clause V32 covered by Specification WW.A.P.1.2.22)
- Electrical identification (Materials and Workmanship clause V80 covered by Specification WW.A.P.1.2.22)
- Conduit, trunking and ducting (Materials and Workmanship clause Y60 covered by Specification WW.A.P.1.2.22)
- Cable supports (Materials and Workmanship clause Y63 covered by Specification WW.A.P.1.2.22)
- Medium Voltage Installation (Specification WW.A.P.1.2.23)
- ENMS (Electrical Network Management system) (Specification WW.A.P.1.2.37)

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in materials and workmanship clauses.

Space for maintenance & access shall be provided in accordance with SHTM 2023.

5.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

6.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Low Voltage Distribution System.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Hospital teams concerned with the planning and administration of the Low Voltage Distribution installation.

7.0 SYSTEMS

7.1 Low Voltage Distribution

General Description

This Specification should be read in conjunction with all other engineering services & specifications for the development.

And this part of the Specification shall be read in conjunction with NBS clause V31.

The facility shall be provided with 2 pairs of substations, as indicated on the LV schematics. The sub-stations shall be located in the basement plant rooms.

All LV equipment shall be suitable for use with 230 V/400 V single/three-phase 50 Hz four-wire and earth systems, except reduced LV systems.

Each sub-station shall comprise, 11kV ring main unit switchgear, a step down cast resin transformer and a Main LV switchboard. Each pair of sub-stations shall be interlinked on the LV side via cables or bus bar and changeover switches, one on each Main LV switchboard.

Each pair of Main LV switchboards shall be electrically interlocked to prevent the transformers being connected in parallel as indicated on the schematic drawings. The transformers are described in the MV Installation Specification, WW.A.P.1.2.23.

Low voltage air circuit breakers shall be provided on the load side of the transformers before the main LV switchboards. All main LV switchboards shall be constructed to Form 4 Type 6 with MCCBs. All sub LV switchboards shall be panel board format constructed to Form 4 Type 2.

Main LV switchgear shall be provided with electronic protection selected to allow short circuit, over-current and time grading for full co-ordination and discrimination. All ACB's shall be fitted with monitoring units to capture and relay switchgear status, energy consumption, harmonic content, operation counter and fault indication via the Electrical Network Monitoring System, ENMS as described in the ENMS Specification, WW.A.P.1.2.37 though non-critical parameters such as the operation count and harmonic content may be signalled via the BMS.

Specifically, energy metering information shall be routed to and captured by the BMS.

Open protocol industry standard software must be used. All software shall be 'backwards compatible'.

The main LV switchboards shall be provided with the following:-

- Automatic power factor correction to correct to at least 0.95 and provided with a hard wired automatic drop out facility during generator run and reset on return to mains;
- Surge protection; (including MCCB)
- Provision of voltage optimisation unit.
- Provision for future harmonic filters (MCCBs, CTs and sensing wiring plus space for free standing filters to be provided in each switchroom);
- Electronic multi-function meter connected to the BMS system as shown on LV schematics;
- Voltage and current socket for harmonic analyser;
- Thermographic screening; to allow for live thermographic testing.
- Fully rated neutral busbars;
- Spare compartments unequipped;
- Extensibility provision;
- Control section housing change-over logic and load shedding controls;
- IP 2X ingress protection rating (or better)
- Through the ENMS, remote control shall be possible of incomer switches, bus-section switches and those outgoing feeder switches which need be controllable for purposes of the generator load acceptance switching.

The sub-main LV switchboards shall be provided with the following:-

- Electronic multi-function meters connected to the BMS system as shown on LV schematics; (WW-XX-XX-SC-530-002 and 003).
- Thermographic screening; to allow for live thermographic testing.
- Fully rated neutral busbars;
- Spare compartments unequipped;
- IP 2X ingress protection rating (or better).

Motorised breakers shall be controlled and monitored via the Electrical Network Monitoring System, ENMS.

Interfaces for ENMS control shall be provided in the Main LV Switchboards to permit the ENMS to control various circuit breakers for the purpose of load control and matching the loads to the various supply scenarios (various 11kV network configurations, generator start-up or generator testing). The circuit breakers involved shall be motorised as indicated on the drawings and shall principally involve:

- For Main LV switchboards:
  - Incoming ACBs,
  - Bus-Section (Interconnector) ACBs,
  - Various outgoing ACBs and MCCBs (Plant and Lifts and Large Medical Equipment) as detailed on LV schematics (see note below about power factor correction)
- For Sub-main LV Boards:
  - Not applicable (manual operation only)

The power factor correction equipment for each of the individual main LV switchboards shall also be controlled by the ENMS. It shall be arranged such that all capacitor steps are switched out of service if the board is energised wholly by the generators or by the generators in parallel with the mains.

Sub-main LV boards do not provide for automated pick-up or shedding of load, therefore lifts and various equipment shall be controlled in the field by signal from the ENMS directly to the respective drive/control panel or contactor.

The status of all devices controlled by the ENMS (open, closed, tripped, racked out, unavailable, drive blocked, etc) shall be signalled to the ENMS for display by the ENMS on its various graphic display screens.

Control principles, behaviour tables and further details of the ENMS interfaces for Substation LV switchboards and for Sub-Main LV switchboards shall be described during detailed design.

Note that UPS Input Boards are a special case of sub-main switchboards. This is mentioned in the appendices, but the requirements are given in UPS specification.

Thermographic screening facilities shall be provided to the main LV switchboards to permit safe access for thermographic survey of the switchboard without exposure to live components. Busbar cubicles of main LV switchboards shall be fitted with perforated screens with an IP20 mesh of holes, clear Perspex sheeting or proprietary windows.

All floor-mounted switchboards shall be fitted with plinths integral to the switchboard construction.

Where indicated on the LV schematics, the main and sub-main LV switchboards shall include interlocked dual incoming isolators and bus section to permit selection of dual supplies. It shall not be possible to parallel the incoming feeds. For Main LV Switchboards, the incoming isolators and bus-section switches shall be configured as an automatic change-over. In the case of sub-main LV boards, only manual operation need be provided, and the interlocking in this case shall be mechanical and implemented by linkages or keys (Ronis or Castell types or equal and approved)

For the Main LV Switchboards, time delayed phase failure relays shall be fitted to the incomers on the LV switchboards. Similarly, phase failure relays shall be fitted to all bus sections with an adjustable 0-10s UPS module, or a suitable change-over controller shall be provided.

Main LV switchboards shall be provided with front access or alternatively front and back access and top entry provision for cabling.

Sub-main LV switchboards shall be provided with front access and top entry provision for cabling.

Generally, unless shown otherwise on the LV schematics, each department shall be provided with a minimum of two 3-phase combined lighting and power distribution boards fed from the sub-main LV switchboards with one distribution board to be fed from the A side of the LV distribution system and the other to be fed from the B side (the final circuits throughout the department to be split between each distribution board to provide further resilience).

A number of departments do not require A and B side distribution boards as indicated on the schematics. Refer to the LV Schematics as noted above and db location drawings (WW-S2-XX-PL-523 Series) for details of dual / single distribution board provision.

The distribution boards shall be contained within electrical cupboards within each department. Space within each of these electrical cupboards shall be allocated to housing ancillary components such as power supplies to nurse call panels, fire alarm interface units, security control equipment, door hold equipment and if necessary data racks for engineering systems.

Details of the protective devices, settings and fault levels and device settings shall be developed during detailed design stage.

Spare Capacity

The LV distribution network is designed to provide spare capacity in the following ways:

- Transformers – sized to accommodate 25% load growth;
- Main LV switchboards – rated to accommodate 25% load growth and a minimum 1No. spare outgoing way rated to 25% load growth;
- Sub LV switchpanels – rated to accommodate 25% load growth and a minimum 1No. spare outgoing way rated to 25% load growth;
- Departmental distribution boards – rated to accommodate 25% load growth and 25% spare ways, no future spare MCB's provided;
- Cables – sized to accommodate 25% load growth;
- Containment – sized to accommodate 25% future cabling.

Spare space in the switchboards shall be fitted with blanks which can be equipped with a circuit breaker at a later date. Breakers shall be installed in the quantities and of the frame sizes indicated on the schematics. No spare MCB's will be provided within the departmental distribution boards.

The spare ways within the pre-fabricated home run cables serving the departmental distribution boards shall be terminated within an enclosure adjacent to the distribution boards. Spare ways shall be labelled to assist identification.

Auxiliary DC Power Supply for Main LV switchpanels

An auxiliary DC power supply shall be provided for each side of the main LV switchpanel which shall be used to drive the motorised circuit breakers and bus-couplers within the main LV switch panel.

Within each main LV switchroom an A & B circuit from the local distribution board shall feed a 24Vdc battery and charger via a changeover device. The battery will then support a DC distribution board which shall drive the motorised breakers.

The battery shall be sized to provide sufficient capacity to drive all motorised devices on the associated main LV switchpanel for a minimum 6 operations. The batteries shall be VRLA with a life expectancy of 10 years.

The auxiliary DC power supplies shall interface with the BMS system to provide status indication, and mains fail, battery fail, etc. alarms.

Switch Rooms and Risers

Main switch rooms housing the main LV switch boards are sized upon generic manufacturer's data.

Final selection of Main and Sub LV Switchboards and distribution boards shall take cognisance of the space allocated.

The electrical risers have been sized assuming that final selected Sub LV Switchboards will be of a space saving Form 4 Type 2 panelboard type of construction, the smaller examples possibly being wall mounted.

The electrical risers shall be arranged so that space is allocated for Sub LV Switchboards, sub main distribution cables and low current system cables and containment.

Sub-Main Cabling

Refer to Common Electrical Clauses WW.A.P.1.2.22 and WW LV Cable Schedules for cable selection details.

Sub-main cabling shall generally be by means of XLPE/SWA/LSF multi-core armoured cables laid on cable ladders or slotted cable trays as indicated on the containment drawings. Power supply cabling to life safety and fire fighting applications is selected in accordance with the requirements of BS 8518:2010 and shall be as follows, or equal and approved. Refer to the Common Electrical Clauses WW.A.P.1.2.22, section V32, Clause 420 for full technical specification requirements of cables required for each life safety and fire fighting system.

Emergency lighting final circuits. Local central battery system.
- As Prysmian Cables FP Plus or equal and approved

Sprinkler pump and Helipad foam spray system power supplies.
- As Prysmian Cables FP600S or equal and approved

Fire lifts and escape lifts.
- As Prysmian Cables FP600S or equal and approved

Motorised fire and smoke dampers, supply and control cabling
- As Prysmian Cables FP Plus or equal and approved

Power supplies to powered smoke and heat exhaust ventilation, smoke fans, powered smoke shafts, and pressurisation.
- As Prysmian Cables FP600S or equal and approved

Powered sliding doors across escape routes.
- As Prysmian Cables FP Plus or FP600S or equal and approved

Gaseous extinguishing systems.
- As Prysmian Cables FP600S or equal and approved

Power supply cabling to fire fighting applications shall be selected and routed in accordance with the requirements of BS 8519 and LPC Technical Bulletin 210. Note shall be taken that cable cross sectional areas and protective device ratings are determined for these circuits against requirements in the latter document, and which allow for passage of locked rotor current for certain time and for cable selection based on 150% of the largest envisaged full load current. Selections have been made on the basis of provisional pump data, and before installing cables for these circuits, the Board shall submit for cable design review full details of the pumps and other loads to be served, and the measured cable route length intended.

Moulded Case Circuit Breakers

This part of the Specification shall be read in conjunction with NBS clause V31.

The MCCB tripping mechanism shall be as detailed in the Device Settings Schedules.

Where plug-in type MCCB's are used It shall be possible to extract and/or rapidly replace the circuit breaker without touching the connections on the base. The plug-in configuration shall be made by use of a "plug-in kit" with a fixed device. A safety trip shall be fitted to avoid connecting or disconnecting the power circuits under load conditions, the safety trip shall cause automatic tripping if the device is ON, before engaging or withdrawing it.

Except where otherwise indicated or agreed, MCCBs shall have the following number of poles:-

Single phase	-	Single pole (SP)
Three phase	-	Three pole (3P)

Each switch shall be provided with facilities for padlocking in the "OFF" position. In addition, switches serving sprinkler pump supplies and helipad foam spray pump supplies shall have operating handles lockable also in the 'ON' position.

Motorised breakers are shown on the schematics.
Such circuit breakers shall:

- incorporate a motor drive mechanism for closing of the breaker or charging of a spring actuator as applicable
- incorporate an electrical shunt trip coil (so that opening of the breaker can be effected with minimal delay by an electrical signal)
- be configured for local & remote operation through electrical signals
- shall include an interlock to prevent remote closing if the breaker has tripped on a protection/fault operation.

Low Voltage Air Break Switches and Switch Disconnectors

This part of the Specification shall be read in conjunction with NBS clause V31.

Low voltage air break switches shall comply with the following.

Motorised breakers are shown on the schematics.

Air break switches shall have the following number of poles:-

Single phase	-	Double pole (DP)
Three phase	-	Four pole (4P)

Each switch shall be provided with facilities for padlocking in the "OFF" position. In addition, switches serving life safety systems such as sprinkler pumps, helipad foam spray pumps, smoke extract/clearance systems, stair/lift pressurisation systems, fire fighting lifts, etc. shall be lockable also in the 'ON' position.

To prevent accidental contact with live parts, switches of the withdrawable chassis isolating type shall have either fully shrouded fixed contacts or insulated cover plates.

Switches in individual compartments within a switchboard shall have an earth terminal, and the construction and cabling arrangements shall both meet the degree of protection specified for the switchboard and have the operating mechanisms interlinked with the access door.

Switch disconnectors in plant rooms shall have the following features:

- Minimum IP54 protection,
- insulated plastic enclosure,
- fitted with padlockable rotary red handle,
- fitted with 2 x N.O. auxillary contacts,
- earth terminal,
- switch interlocked with cover.

Final selection of switch disconnectors: Project Co. shall utilise manufacturer's switch disconnector co-ordination tables to ensure that his selected circuit protective devices and selected switch disconnectors co-ordinate at the fault levels present at the point of installation of the selected switch disconnector.

Low Voltage AC Contactors and Coils

Contactors shall comply with BS EN60947 and shall be of utilisation category AC-3.

Contactors shall be electro-magnetically operated, suitable for local and remote control via an in-built LOCAL/OFF/REMOTE control selector switch.

Contactor operating coils shall be AC suitable for the phase to neutral voltage of the supply and shall be protected by means of a cartridge fuse.

The number of main poles shall be as indicated on the LV schematics, for feeds from sub LV panels, or distribution board schedules for final circuits. As a minimum one pair of auxiliary contacts shall be provided unless stated otherwise.

Individually mounted contactors shall be fitted with integral isolating switches having a rated duty, a load rating and utilisation category compatible with the respective contactor.

Individually mounted contactors and their associated control operating components shall be housed in pressed steel.

The enclosures for contactors installed inside buildings shall provide a minimum degree of protection of IP4X, and in plantrooms IP54. The enclosures for contactors installed externally shall provide a minimum degree of protection of IP65.

Coils for switching relays, contactors and other applications shall be capable of withstanding a 15% drop in voltage without the armature or switching apparatus dropping out of position. Key resets shall be provided to re-energise the coils following mains failure; unique keys shall be supplied.

Contactors being controlled by the ENMS are identified on the LV schematics and shall be located in the cupboard adjacent to the associated sub LV switchpanel or departmental distribution board. The contactors shall be a latching type and controlled by a pulsed ENMS signal which shall operate in the following manner:

- Load pickup - ENMS pulsed signal closes contacts which remain held closed;
- Load shed - ENMS pulsed signal opens contacts which remain open;
- Loss of mains - contacts open and remain open.

Metering

This part of the Specification shall be read in conjunction with NBS clause V31.

Electronic multi-function meters connected to the BMS system shall be provided at the main LV switchboards and elsewhere as detailed on the LV schematics.

Distribution Boards

This part of the Specification shall be read in conjunction with NBS clause V31.

Final circuit distribution boards shall be Type A or B with miniature circuit breakers (MCB) and residual current breakers with overload (RCBO) located within risers and dedicated cupboards.

Distribution boards shall be surface wall-mounted and shall comprise the components, labels and inter-connections, all as indicated on the design drawings and elsewhere in this Specification. Final selection of distribution boards shall take cognisance of the space allowed upon the architectural layouts. Refer to materials & workmanship clauses for specification details.

All distribution boards shall be provided with fully opening sheet metal doors (wardrobe doors may be required).

Removable gland plates shall be provided on the top and bottom of all distribution boards, suitable for conduit, trunking and cable, except in the case of prefabricated wiring systems for lighting and small power final circuits, prefabricated plug and socket arrangements may be factory fitted to the top of the distribution boards for outgoing home run cables. In this case, distribution boards shall be internally pre-wired to the plug and socket arrangement at the top of the distribution board. Wiring for unused circuits shall be terminated at ‘dummy’ mcbs and shall not be left unconnected. One further three phase unequipped way shall be left spare for future use by non-standard circuits. Distribution boards have been sized on the basis that prefabricated home run cables will be 6 circuit or 9 circuit or a mixture of both.

Neutral and earth bars shall have the same number of terminals for outgoing cables as there are outgoing ways on the board, and these shall be numbered to relate to the outgoing ways. Particular note shall be taken of the quantity of final circuit earths in accordance with Section 543.7 within Chapter 54 of BS 7671 (17th Ed.), and this shall be reflected in the earth bar terminal capacity.

Outgoing devices shall be arranged so that they may be removed with ease.

Distribution board bus bar assemblies shall have switched connectors to connect each outgoing device to the bus bars.

Cable containment requirements routes for final circuits are shown on the drawings. These shall be developed during detailed design stage.

The distribution boards shall accept MCBs, RCDs, RCBOs or MCCBs as indicated on the distribution board schedules. Outgoing devices are specified elsewhere in this Specification.

Distribution boards are sized with capacity for 25% future growth of load. Spare ways will not generally be equipped.

Generally, distribution boards need no automation, and need not transmit any monitoring signals to the ENMS.

However consideration will be given to controlling larger loads e.g. kitchen, restaurant this shall be itemised in the detailed design and a power reinstatement matrix produced.

Miniature Circuit Breakers

This part of the Specification shall be read in conjunction with NBS clause V31.

Miniature Circuit Breakers (MCBs) shall comply with the following.

All MCBs incorporated in distribution boards shall be capable of clearing the prospective short circuit current indicated on the LV Schematics.

All MCBs shall be of the type which provides positive means of isolation.

MCBs shall be padlockable in the OFF position and two isolation devices and padlocks shall be provided for each distribution board.

Residual Current Devices

RCBOs shall be of the type which occupy a single way.

RCDs shall have the same short circuit withstand capability as MCBs and shall be capable of making, carrying and breaking the full short circuit current. This requirement shall apply whether or not the RCD is the sole or main circuit breaker at any point in the system.

Unless used as circuit breakers, RCDs shall be connected in series with the overload and short circuit devices in the system. RCDs shall not be used as the sole means of protection against direct contact.

Every RCD shall be provided with a test button and an engraved, clearly legible label stating **“TEST FREQUENTLY”**.

The residual current characteristic of RCDs and RCBOs shall be A type (not to be confused with type A, B, C, D overcurrent characteristic of MCBs and RCBOs).

Isolated Power Supplies for Areas of Medical Use

General

The Board shall provide isolated power supply units for areas of medical use. These will provide Type IT power supplies to meet the requirements of SHTM 06-01, BS.7671 Guidance Note 7 Chapter 9 and MEIGaN guidance published by MHRA.

The medical locations covered by isolated power supplies are as indicated on the LV schematics and small power circuitry drawings.

Each isolated power supply unit shall incorporate:-

- A safety isolating transformer to DIN VDE 0551: Part 1 (minimum efficiency 95%)
- A local alarm and test module
- Remote alarm and test stations (normally in staff bases or operating theatre surgeon's panels)
- Transformer insulation temperature monitor
- A load monitor
- A distribution board, ratings and numbers of outgoing 20A type B miniature circuit breaker ways as indicated on the distribution board schedules (Note that MCBs serving IPS circuits shall be DP therefore the DB shall be purchased with the appropriate number of ways)
- Output 230 V, 50 Hz, single phase, earth free
- Protective Earth Terminal
- Earth Fault Detection System

kVA ratings of IPS units shall be as indicated on the LV schematics.

The units shall comply with EN 60439-1: Part 1, DIN VDE 0107:1994-10, DIN VDE 0660 Part 500 and IEC439-1: Part 1. The insulation monitor shall comply with DIN VDE 0413:T2/01.73 or ASTMF 1209-89.

Each isolated power supply unit shall monitor the insulation impedance to earth of the transformer secondary circuit. It shall raise an alarm if this falls below an adjustable pre-set value and shall trip the IPS unit if it falls below a second lower pre-set adjustable limiting value.

Each isolated power supply insulation monitor shall continuously indicate the insulation impedance by means of a bar graph LED indicator.

A load monitor shall raise an alarm if the load rises to a pre-set adjustable limit and a temperature monitor shall alarm if the transformer temperature rises above a pre-set limit.

It shall be possible, locally and at the remote stations, to test the operation of the above monitors from the appropriate remote station.

It shall be possible to operate any isolated power supply unit for 4 hours at 150% rated load without tripping the thermal protection.

The remote alarm/test stations shall incorporate indication of the operational status of the appropriate unit. The Earth Fault Detection System shall identify which outgoing circuit is in fault, both locally and at the remote alarm/indicator unit. The status of the UPS supporting the IPS shall also be indicated at remote alarm/indicator units. Remote indication of IPS circuit faults and UPS status at staff bases shall be incorporated within an integrated panel which shall include nurse call and fire alarm indication. UPS and IPS alarms shall also be available at the BMS.

For the operating theatres, the remote alarm/indicator units shall be provided in the theatre.

The alarm/indicator units in the theatres shall be built into the surgeon's panel. shall allow for providing this free issue to the surgeon's panel manufacturer and wiring to them when installed in the theatres.

The operational status of the mains supply to each isolator power supply shall be relayed to the building management system. NO/NC Volt-free contacts and terminals shall be provided to allow connection of the building management system wiring into isolated power supply unit.

The isolated power supplies shall be contained within metal floor standing cabinets having an ingress protection rating of at least IP42. They shall have lockable front covers and shall incorporate suitable ventilation facilities for the designed duty. They shall be provided as single, dual or triple units as indicated on the schematic drawings. Within each dual or triple unit, each module shall be totally electrically independent of the others and shall be electrically and physically segregated.

The design has been based on the following Bender/ Starksroom supplied dimensions:-

Single:	375 W x 425 D x 1900 H
Dual:	625 W x 425 D x 1900 H
Triple:	875 W x 425 D x 1900 H

Alternative manufacturers may be used if equal & approved and alternative units can be accommodated within the space allocated.

IPS Distribution Boards

IPS Distribution boards shall comply with the following:-

- Distribution boards and MCBs with the requirements of NBS clause V31.

- All distribution boards shall be covered by the doors of the Isolated Power Supply Unit, which shall have locks of an approved make. All live parts shall be fully shrouded by an insulated mask fitted internally giving access to MCB toggles only, with the doors open.

Note that circuit wiring fed from IPS units is earth free and as such both lines are designated as live (+115V and -115V) conductors and shall be colour identified as such.

MCBs shall be double pole.

Transient Overvoltage Surge Suppression Systems

Transient overvoltage surge suppression devices shall be installed within the main LV switch boards as detailed within this specification and LV schematics.

The Lightning Protection Specialist shall undertake a risk assessment to determine if any additional transient overvoltage surge protection devices are required elsewhere; this is out with the scope of this specification. Refer to the Lightning Protection Performance Specification, WW-218, for further details.

Imaging Department Supplies

Power supplies to diagnostic imaging and radiotherapy rooms / suites shall be compliant with the MEIGaN V2.0 September 2007 document published by MHRA.

Supplies to fluoroscopy machines and those imaging machines used for invasive procedures shall be provided with dual final sub-circuit cables via automatic changeover devices as described elsewhere within this specification. Single final sub-circuit cables shall be provided to all other imaging machines as detailed on the LV schematics.

The steel wire armour of the final sub-circuit cables to fixed imaging equipment shall not be used as the mains supply earth conductor. Three phase supplies shall utilise 5 core cables, single phase supplies shall utilise 3 core cables. Distribution circuit cables from the main LV switchboards to sub LV imaging switchpanels shall not be provided with an integral earth conductor.

Isolators in imaging rooms shall be lockable in the off position.

A remotely operated contactor shall be fitted in the mains supply of three phase medical devices sited adjacent the mains supply isolator and Earth Reference Bar (ERB) (see separate earthing & bonding systems specification, WW.A.P.1.2.25). ERB, contactor and isolator enclosures shall be white. The contactor shall isolate all three phase contacts, including the neutral, and shall be capable of interrupting maximum load. The contactor control circuit shall be on the same phase as the room socket outlets. The contactor and isolator shall both be of a grade suitable for frequent use.

Three-phase supplies feeding medical devices shall have a phase rotation and voltage monitoring device installed, except where such a device forms part of the installed equipment. This device shall prevent the contactor from energising with:

under- or over-voltage condition on any phase
incorrect phase sequence
phase loss
neutral loss
phase-neutral faults.

The under- and over-voltage limits shall be provided by the equipment manufacturer. The monitoring device shall be interlocked to prevent disconnection of the supply during an exposure.

The contactor shall be switched ON by a green momentary push and OFF by a red push. Red emergency OFF buttons shall be located in a suitable location in the room and shall incorporate a protective shroud and key reset. Locations are indicated on the 1:50 loaded drawings.

Illuminated warning signs shall derive supply from the contactor.

7.2 Busbar Trunking

Description

This part of the Specification shall be read in conjunction with NBS clause V33.

Distribution of LV power within the risers shall be by three-phase vertical bus-bar trunking with full size phase, neutral and earth conductors. Should a full size earth conductor not be provided then the metal casing shall be utilised to provide the required cross sectional area in excess of that required. A minimum of 3No tap offs shall be provided at each floor to serve distribution boards for lighting and power.

Each tap off shall contain a circuit breaker to provide full electronic time graded fault protection.

7.3 Automatic Power Factor Correction Equipment

This part of the Specification shall be read in conjunction with NBS clause V36.

Power factor correction units complete with multiple automatic detuned capacitor banks shall be provided for each side of each main LV switchboard, refer to LV schematics for details. The unit shall correct to at least 0.95 and be provided with a hard wired automatic drop out facility during generator run and reset on return to mains.

The Board shall perform the capacitor bank selection and scheme design, based on the following:

- Capacitors shall be rated at higher voltage than the system voltage to account for increased voltage being expected on the capacitors due to the presence of detuning reactors. If no other proposal is made by the Board and accepted, the capacitor rated voltage shall be no less than 110% of the system voltage.
- On each side of the main LV switchboard an automatic detuned power factor correction scheme shall be installed. Capacitor bank sizes shall comprise 4 to 6 steps of capacitors, but subject to there being no need to use capacitor step sizes below 25kVAr (this step size equating to the equivalent reactive power rating at nominal system voltage).

Each bank has been sized for the respective ‘A’ or ‘B’ side loads, with summation CT’s on bus-section and incomers so that each bank responds to the net load on each section of the board (i.e. each relay responds to the load on its end of the busbar, regardless of whether the power flows through the natural incomer or via the bus-section switch).

- Each bank shall include a reactive power relay, wired to monitor and respond to the reactive content of the current to be corrected (i.e. the current through the respective incomer, or through summated incomer & bus-section paths as appropriate)
- A panel mounted indicating instrument shall be mounted near each reactive power relay to show the corrected power factor of the overall load served by the respective section of busbar,
- The control wiring or control relay itself shall permit manual or automatic operation of each power factor correction scheme (selectable by panel mounted control switch(es) or by switches on the relay facias),
- Under manual control, an operator shall be able to switch individual steps in or out of service, and a timed interlock feature shall prevent energising of a capacitor that has recently been energised and may not be adequately discharged (Indicator lamps shall indicate when a capacitor step is unavailable for such reason),
- Under automatic operation, the reactive power relay shall switch capacitor steps in and out of service as necessary to limit the reactive power drawn (and thereby maintain the target power factor). The relay shall operate with a switching algorithm and/or time delay feature which prevents energising a capacitor step which has not had time to discharge to a safe level.
- Unless otherwise agreed the detuning reactors (inductances) shall be selected with ratings which (when calculated with the power factor correction capacitor steps) correspond to a detuning frequency between 211 and 218Hz.
- Provision shall be made, on each capacitor bank for inputs, status, alarm and quantitative signals from/to the ENMS and/or BMS. The required points/signals list shall include at least the following:
  - Input signal – Generator operation
  - Output signal (status) - Bank active/inhibited
  - Output signal (status) - Bank selected off Auto
  - Output signal (alarm) – General alarm
  - Output signal (quantity/measureands) – VARs compensation (or, if agreed, Power factor. Envisaged port RS485 Modbus, but final selection to be made to suit the ENMS equipment).

7.4 Harmonic Filtering Equipment (Future)

Refer to NBS clause V37.

7.5 Labels to Life Safety Systems

This part of the Specification shall be read in conjunction with NBS clause V31, section 970.

For electrical circuits serving fire sprinkler pumps, fire-fighting foam spray system, fire alarm panels and fire-fighters' lifts, prominent labels shall be affixed to the switchpanel from which the power supply is derived, indicating the function of the circuit and warning against it being switched off. Additionally, if the circuit will remain live even after the board's main incoming switch is opened, such fact shall be similarly communicated.

7.6 Automatic Transfer Switches for Life Safety Circuits

7.6.1 Introduction

This part of the Specification shall be read in conjunction with NBS clause V31 (in particular its sub-clause 380) and with BS EN 60947-6.1.

For circuits supplying fire-fighters' lifts and sprinkler systems, and for other life safety functions as may be indicated or necessary (e.g. helipad lighting, smoke vents, smoke extract fans, etc.) dual supplies shall be provided by means of diverse routes to an automatic transfer switch to be installed in the same fire compartment as the life safety equipment/plant itself.

The automatic transfer switch shall be a change-over device fed from two sources and which latches into either position without the need for continued application of electrical control power. It shall be a 4-pole change-over device, with the neutral breaking after (and making before) the corresponding phase switching operation. A bypass/isolator switching arrangement shall be provided to permit manual connection of the load to either source and isolation of the transfer switch itself for test or maintenance

7.6.2 Automatic Transfer and Bypass-Isolation Switch

a) General, Make and Standards:

The required ratings and configurations shall be as indicated on the drawings and in any schedules applicable. The expected manufacturer & range is ASCO (Emerson) 7000 series, (or Schneider Series or equivalent)

Each automatic transfer switch shall, as denoted on the drawings, be either:

- a basic automatic transfer switch with open transition (i.e. break before make), or
  a delayed transition automatic transfer switch,

Automatic Transfer switches shall comprise withdrawable switch units and preference will be given to types where:

- for the basic transfer switch a single operator drives a double throw power transfer switch mechanism, or
- for the delayed transition transfer switch two operators drive independently two single throw power switch mechanisms and these are arranged to introduce a deliberate delay between disconnecting one source and connecting the other (for applications where out-of-phase conditions between the two sources might affect the loads if switching took place)

The entire switch shall be factory assembled and tested.

b) Latching/mechanically-held Transfer Switch:

The transfer switch shall be electrically operated and mechanically held (positively latched) in either position and unaffected by momentary outages. The switch shall be mechanically interlocked to ensure that the load can be energised from only one of the two possible sources.

Auxiliary contacts on the switch mechanism, and signal contacts at the controller, shall permit transmission of status information to a remote fire control room, remote lamp indicator panel, local lamp indication and a data acquisition network (BMS or ENMS).

c) Bypass-Isolation Switch

A bypass-and-isolation switch system shall provide manual bypass of the load to either source and permit isolation of the automatic transfer switch for test or maintenance. Bypass to the load-carrying source shall be accomplished with no interruption of power to the load (make before break contacts).

After switching into a bypass condition, it shall be possible to isolate the transfer switch mechanism by withdrawing the switch mechanisms/carriage from the fixed part of the enclosure. For the purpose of testing all aspects of the switch operation, a method shall be provided for retaining/reconnecting the control connections to the transfer switch after the main (power) circuit has been isolated. It shall also be possible to isolate all power, control and auxiliary circuits should full isolation be required.

d) Controller

A microprocessor based controller shall be provided to sense and analyse the voltage supply conditions on each incomer (voltage, frequency, phase & rotation) and operate the transfer switching equipment. It shall be equipped to communicate to an electrical network monitoring system through volt-free contacts and a serial communication module, and shall drive two remote lamp indicator panels (the latter for firefighters' information). All external connections shall be wired to a common terminal block.

The controller shall include a phase co-incidence monitor which, by permitting or delaying transitions according to degree of synchronisation between the two sources, shall control transfer so that motor load inrush currents do not exceed normal starting currents, and shall not require external control of power sources.

All controller settings shall be readily accessible and displayed and shall be easily adjustable.

The controller shall include rechargeable battery back-up (using a 10-year life battery) to safeguard all important information (programme, setting parameters, real time clock & calendar, etc.).

e) Enclosure

The enclosures shall be suitable for the areas in which they are to be installed, and the requirements shall be taken as:

- Plantrooms IP54
- Elsewhere IP 30

Labelling shall be in accordance with Section 7.5 of this specification.

f) Operational Behaviour

Transfer from primary source to reserve, and retransfer from reserve source to primary shall be effected according to principles and timing delays along the following lines:

Automatic transfer & retransfer:

i. On interruption of supply on either incomer (source) a timer powered from stored energy shall allow an adjustable time delay up to 6 seconds during which no transfer shall occur. The delay is intended to prevent the switch responding to momentary power outages, and to allow time for the various substation switchboards to effect their own auto change-overs on the LV distribution system (to select between substation 'A' & 'B' sides and route a healthy supply to the primary side input on the automatic transfer switch).

ii. On detected loss of supply on the primary source, and if the reserve supply is available and within satisfactory limits, the switch shall wait for an adjustable period and then transfer the load to the reserve supply. The waiting period (adjustable between 0 and 3000 seconds, but envisaged as being set between 1 and 9 seconds) is intended to allow controlled take-up of load on the reserve supply (staggered take-up across various ATS units).

iii. If the reserve supply is not immediately available, transfer need not take place until the reserve supply has:

- become live and been measured as within acceptable limits, and
- been allowed an adjustable time to stabilise (0 to 6 seconds range, initially likely to be set at 3 seconds), and
- been subjected to the deliberate waiting period as described in (ii) above.

iv. If after waiting for the time delays set above at (i) & (ii), however, there is no supply on either the primary source or the reserve source, the transfer switch shall simply await the appearance of supply on one of the inputs, and shall respond to the first to appear, subject to the 0-6 second confirmation time delay to check that the returned supply is stable. In the event that both sources return simultaneously to healthy conditions, the logic shall select the primary source as the preferred choice and behave as if retransferring the loads to the primary source. (See (iv) below).

v. On restoration of power supply to the primary source, the control scheme shall allow a 0 – 6 second confirmation delay to assess the restored supply as healthy, and then retransfer the load to the primary source, subject to any intentional delays introduced for retransfer operations. Two time delay modes (which are independently adjustable) shall be provided on re-transfer from reserve source to primary source. One time delay shall be for actual primary power restoration and the other for the test mode function. The time delays shall be adjustable from 0 to 60 minutes, but are envisaged as being set initially in the range 2 minutes for the real condition and 0.1 minutes for the test condition. The intentional time delay shall be automatically bypassed if the reserve source fails during the retransfer process, in which case the primary source shall then be reconnected immediately.

vi. If, in the absence of the primary source, the reserve source fails while carrying the load, the control scheme shall automatically prepare the switch for retransferring the load to the first source to become available, as per (iii) above.

Manually initiated transfer:

Where transitions from one source to the other are to be manually initiated, transitions and retransfers shall be effected, using delay periods and checks as above.

g) Additional Features

One or more test switches shall be provided to permit simulation of a primary source failure, and restoration to normal conditions after completion of the test.

LED indicating lights shall be provided on the operating fascia to show as appropriate:

- Primary source available & healthy
- Reserve source available & healthy
- Primary source connected to load
- Reserve source connected to load

Repeat signals for the same conditions shall be transmitted to a remote fire control room, and in the case of firefighters' lifts additionally to lamp indicator panels installed adjacent to the firefighters' lift shafts at the Ground Floor.

In addition to signal contacts mentioned already, the automatic transfer switch shall provide signal contacts for communicating to a remote monitoring system (the ENMS or Electrical Network Management System) at least the following. All signal contacts shall be wired to an easily accessible terminal block.

- Alarm - ATS Controller alarm (power supply fail, watchdog timer, extended time on non-auto operation, etc.)
- Alarm – Primary source fail/out-of-limits
- Alarm – Reserve source fail/out-of-limits
- Status indication – Primary source available & healthy
- Status indication – Reserve source available & healthy
- Status indication – Primary source connected to load
- Status indication – Reserve source connected to load
- Status indication – ATS test switch(es) active
- Status indication – ATS bypassed to primary supply
- Status indication – ATS bypassed to reserve supply
- Status indication – ATS Isolated

A full duplex RS485 interface shall be installed in the ATS controller to enable serial communications. The serial communications shall be capable of a direct connect or multi-drop configured network. This module shall allow for the seamless integration of existing or new communication transfer devices. The interface shall allow transmission of all setting data, operating parameters, and status & alarm conditions.

h) Remote indicator panels:

For each instance where an automatic transfer switch is applied to serve a firefighters' lift, a remote IP44 indicator panel shall be supplied, installed and commissioned to provide illuminated lamp indication to firefighters regarding the status of the supplies serving said lift:

- Primary source available & healthy
- Reserve source available & healthy
- Primary source connected to load
- Reserve source connected to load

The indicator panel shall be located in accordance with and provide the functions required of it under BS 9999 (clause 29) and BS 5588-5 (clause 14.3).

All interconnecting cabling shall be run within the respective fire protected lift/stair core or shall be fire resistant, rated for 120 minutes fire survival time according to BS 8519 (as Prysmian Cables FP600S) or equal and approved.

V30 Low voltage distribution systems

To be read with Preliminaries/ General conditions

GENERAL

110 LOW VOLTAGE DISTRIBUTION SYSTEM

- Connection to low voltage supply: at transformer secondary of step down transformers. Refer to LV schematic diagrams.
- Switchgear: Cubicle switchboards, as section V31.
- Cable type: Single-core XLPE/ AWA/ LSZH and Multi-core XLPE/ SWA/ LSZH, as section V32 - refer to Specification WW.A.P.1.2.22 Common Electrical Clauses.
- Rewireable installation: Required.
- Concealed installation: Required in occupied spaces.
- Containment: Cable ladders and Cable trays, as section Y63 - refer to Specification WW-532-247 Common Electrical Clauses.
- Accessories: Cable cleats, as section Y63 - refer to Specification WW-532-247 Common Electrical Clauses.
- Transient over-voltage surge suppression devices for mains power supplies, as section Y67 - refer to Specification WW.A.P.1.2.27 Lightning Protection Systems.
- Completion:
  - Electrical identification: As section V80 - refer to Specification WW.A.P.1.2.22 Common Electrical Clauses.
  - Testing and inspection: As section V39 - refer to Specification WW.A.P.1.2.21 Electrical Testing and Inspection.

SYSTEM PERFORMANCE

220A GRADING STUDY

The calculations forming the basis of the design of the LV distribution system are theoretical based upon cable lengths measured from drawings, theoretical fault levels, voltages and impedances and Schneider Electric protective device data which may or may not correlate with those finally selected. Project Co. shall undertake a grading study based upon the actual installed measured characteristics of the LV distribution system and actual equipment selected.

The study shall be undertaken under all ‘worst case’ conditions i.e. mains healthy, on minimal generator supply, mains and generators in parallel, and taking into account the effect of the CHP units on fault levels.

- Scope: Complete low voltage distribution system.
  - Qualifications of study author: Member of the Institute of Electrical Engineers (IEE).
- Fault calculations: Include fault impedance, and short circuit fault current analysis.
- Protective devices: Coordinate the selection and adjustment of protective device settings to achieve discrimination throughout the fault level range. Grade so that a fault on any outgoing branch circuit is cleared by the switching device installed in the faulted branch circuit without affecting the other outgoing branch circuits. Demonstrate discrimination using time-current coordination curves with single line diagrams, in the study report. See also V31 clause 375A for co-ordination of switch disconnectors with circuit protective devices.

- Manufacturers' details and recommended settings: Include in study report.
- Study report: Submit.
  - Format: A4 hard copy.

EXECUTION

420 INSTALLING LOW VOLTAGE DISTRIBUTION SYSTEMS

- Standard: To BS 7671.
- Layout: Position cabling and equipment to provide safe and easy access for operation and maintenance.

COMPLETION

920 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with proposed document management system
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.
  - Number of copies: 2.

V31 Low voltage switchgear

To be read with Preliminaries/ General guidance

PRODUCTS

310 LOW VOLTAGE SWITCHGEAR GENERALLY

- Switchgear: Factory built.
- Free standing switchgear: Provide lifting bolts within reinforced top frame.
- Neutral terminations: Match current carrying capacity of phase conductor.
- Insect proofing: Cover assembly openings with non-combustible and non-corroding insect proof mesh.

320 DISTRIBUTION BOARDS AND CONSUMER UNITS Generally

- Standard: To BS EN 60439-3.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Distribution board and consumer unit type tests: Fully type tested.
  - Approval: ASTA certified.
  - Evidence of certification: Required.
- Enclosure:
  - Ingress protection to BS EN 60529: IP31 generally, and IP54 in plantrooms.
  - Material: Metal.
  - Finish: Powder coated.
  - Colour: Manufacturer's standard.
- Locking mechanism: Cylinder locks with the same key for all distribution boards.
- Incoming device:
  - Type: Switch-disconnector.
  - Rating: As Circuit schedules.
  - Poles: 2P or 4P.
- Busbars and connections: Fully shrouded.
  - Position within enclosure: Locate in same position relative to protective device for each pole.
- Neutral and earth bars: Individual terminal for each outgoing circuit.
- Outgoing devices:
  - Type: As Circuit schedules.
  - Poles: As Circuit schedules.
  - Quantity: As Circuit schedules.
- Spare current carrying capacity (minimum): 25%.
- Identification:
  - Neutral and earth bar terminals: Label with the outgoing circuit reference.
  - Cable terminations: Label with circuit reference, with push-on plastics markers.
- Accessories:

330 CUBICLE SWITCHBOARDS Main LV Switchboards

- Standard: To BS EN 60439-1.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

- Switchboard type tests: Fully type tested.
  - Approval: ASTA certified.
  - Evidence of certification: Required.
- Short-time withstand current (1 s): 50kA.
- Enclosure: Manufacturer's standard.
- External design type: Multi-cubicle.
- Intended location: Indoors.
- Mobility: Stationary.
- Internal separation: To BS EN 60439-1 National Annex.
  - Form: 4 type 6.
- Busbar and connections: Required.
- Incoming device: W (withdrawable).
  - Type: As drawings.
  - Rating: As drawings.
  - Poles: 4.
- Outgoing devices: D (disconnectable).
  - Type: Circuit breakers.
  - Poles: 4.
  - Quantity: As drawings.
- Spare current carrying capacity (minimum): 25%.
- Spare plug-in MCCB bases to be provided as indicated on LV schematics.
- Auxiliary circuits: D (disconnectable).
- Terminals: Suitable for the connection of copper conductors.
- Service conditions:
  - Pollution degree category: 2.
  - EMC environment: B.
  - Special conditions: None.
- Anti-condensation heater and thermostat: Required.
- Full length copper earth bar mounted on top of switchboard: Required.
  - Size: Board's choice.
- Mounting arrangement for Electricity Distributor's metering equipment: Not applicable.
- Identification:
  - Neutral and earth bar terminals: Label with the outgoing circuit reference.
  - Cable terminations: Label with circuit reference, with push-on plastics markers.
- Accessories:
  - Digital multi-function metering equipment;
  - Safety matting; and
  - Switchgear tripping units

  Where indicated on the LV schematics outgoing MCCBs shall be metered. Incoming ACB’s shall be metered.
- ENMS & BMS control modules to be provided
- Protective devices to be AC with the exception of bus-couplers which shall be 24Vdc capable of 6 operations.

330B PANEL BOARDS Sub Switchboards in Risers

- Standard: To BS EN 60439-1.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Switchboard type tests: Fully type tested.
  - Approval: ASTA certified.
  - Evidence of certification: Required.
- Short-time withstand current (1 s): 36kA.
- Enclosure: Manufacturer's standard.
- External design type: Panel board.
- Intended location: Indoors.
- Mobility: Stationary.
- Internal separation: To BS EN 60439-1 National Annex.
  - Form: 4 type 2.
- Busbar and connections: Required.
- Incoming device: D (disconnectable).
  - Type: As drawings.
  - Rating: As drawings.
  - Poles: 4.
- Outgoing devices: D (disconnectable).
  - Type: Circuit breakers.
  - Poles: 4.
  - Quantity: As drawings.
- Spare current carrying capacity (minimum): 25%.
- Spare plug-in MCCB bases to be provided as indicated on LV schematics.
- Auxiliary circuits: D (disconnectable).
- Terminals: Suitable for the connection of copper conductors.
- Service conditions:
  - Pollution degree category: 2.
  - EMC environment: B.
  - Special conditions: None.
- Full length copper earth bar mounted on top of switchboard: Required.
  - Size: Board's choice.
- Mounting arrangement for Electricity Distributor's metering equipment: Not applicable.
- Identification:
  - Neutral and earth bar terminals: Label with the outgoing circuit reference.
  - Cable terminations: Label with circuit reference, with push-on plastics markers.
- Accessories:
  - Digital multi-function metering equipment;
  - Safety matting; and
  - Switchgear tripping units: Where indicated on the LV schematics outgoing MCCBs shall be metered.

360 PROTECTIVE DEVICES GENERALLY

- Operation:
  - Power factor: Continuously monitored.
  - Handles: Not to be removable.
  - Locking: Provide for padlocking in the OFF position.
  - Rated duty: Uninterrupted.

365 CIRCUIT BREAKERS- ACB

- Standard: To BS EN 60947-2.
- Manufacturer: Board's choice.
- Door interlocks: Prevent enclosure doors being opened while circuit breakers are closed.
- Properties:
  - Short-circuit breaking capacity: As Circuit schedules.
  - Where practicable, circuit breakers shall be selected so that their service breaking capacity Ics is equal to their ultimate breaking capacity Icu.
  - Where the characteristics of the selected circuit breaker are such that Ics < Icu then Ics shall exceed the prospective short circuit current at the point of installation of the circuit breaker.
  - Rating: As Circuit schedules.
  - Utilization category: B.
  - Interrupting medium: Air.
  - Design: Moulded case.
  - Operating mechanism: Independent manual operation.
  - Isolating type: Required.
  - Provision for maintenance: Maintainable.
  - Method of installation: Withdrawable.
  - Ingress protection to BS EN 60529: IP40.
  - With RCD: No.
  - Mechanical interlocking: refer to clause V31 560.
  - To be supplied with auxiliary contacts/control module for ENMS/BMS monitor/control.

365A CIRCUIT BREAKERS- MCCBs (GENERALLY)

- Standard: To BS EN 60947-2.
- Manufacturer: Board's choice.
- Door interlocks: Prevent enclosure doors being opened while circuit breakers are closed.
- Properties:
  - Short-circuit breaking capacity: As Circuit schedules.
  - Where practicable, circuit breakers shall be selected so that their service breaking capacity Ics is equal to their ultimate breaking capacity Icu.
  - Where the characteristics of the selected circuit breaker are such that Ics < Icu then Ics shall exceed the prospective short circuit current at the point of installation of the circuit breaker.
  - Rating: As Circuit schedules.
  - Utilization category: B.
  - Interrupting medium: Air.
  - Design: Moulded case.
  - Operating mechanism: independent manual operation.
  - Isolating type: Required.
  - Provision for maintenance: Maintainable.
  - Method of installation: Plug-in. 4 pole
  - Ingress protection to BS EN 60529: IP40.
  - With RCD: No.
  - Mechanical interlocking: refer to clause V31 560.

365B CIRCUIT BREAKERS- MCCBs (ENMS/BMS)

- Standard: To BS EN 60947-2.
- Manufacturer: Board's choice.
- Door interlocks: Prevent enclosure doors being opened while circuit breakers are closed.
- Properties:
  - Short-circuit breaking capacity: As Circuit schedules.
  - Where practicable, circuit breakers shall be selected so that their service breaking capacity Ics is equal to their ultimate breaking capacity Icu.
  - Where the characteristics of the selected circuit breaker are such that Ics < Icu then Ics shall exceed the prospective short circuit current at the point of installation of the circuit breaker.
  - Rating: As Circuit schedules.
  - Utilization category: B.
  - Interrupting medium: Air.
  - Design: Moulded case.
  - Operating mechanism: independent manual operation.
  - Isolating type: Required.
  - Provision for maintenance: Maintainable.
  - Method of installation: Plug-in. 4 pole
  - Ingress protection to BS EN 60529: IP40.
  - With RCD: No.
  - Mechanical interlocking: refer to clause V31 560.
  - To be supplied with auxiliary contacts/control module for ENMS/BMS monitor/control.

375A SWITCH-DISCONNECTORS Loose gear.

- Standard: To BS EN 60947-3.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Properties:
  - Short-time withstand current (1 s): will vary depending upon fault level and device nominal rating. Grading study to confirm co-ordination of selected switch disconnectors and circuit protective devices.
  - Rating: as indicated on LV schematics and plans.
  - Poles: as indicated on LV schematics and plans.
  - Utilization category: AC-23 generally or AC-3 for starting, accelerating and stopping of motors.
  - Operation: Frequent (category A).
  - Isolating type: Required.
  - Terminals: Suitable for the connection of copper conductors.
- Enclosure: Required.
  - Ingress protection to BS EN 60529: IP31. (IP54 in plant rooms)
  - Material: Polycarbonate.
  - Finish: Manufacturer's standard
  - Colour: Manufacturer's standard.

380 AUTOMATIC TRANSFER SWITCHING EQUIPMENT (TSE) FOR LIFE SAFETY EQUIPMENT.

- Standard: To BS EN 60947-6.1.
- Manufacturer: ASCO (Emerson), though others may be considered if supported by declaration of conformity/variance from specification.

- Product reference: Submit proposals, and allow for product model which includes bypass switching from either supply, and for isolation of load if required.

- Rated operational current (Ie): As Circuit schedules and drawings - unless otherwise indicated these will be for AC 50Hz current and 4-pole configuration.
- Classification:
  - Short circuit capability: CC.
  - Method of controlling transfer: ATSE.
- Properties:
  - Method of operation: Electromagnetic.
  - Operating sequence: Refer to Section 7.6 in the M&E Specification.
  - Operating mechanism: Interlocked to prevent simultaneous connection to both primary and alternative supplies.
  - Utilization category: AC-33A.

390 RESIDUAL CURRENT CIRCUIT BREAKERS WITH INTEGRAL OVERCURRENT PROTECTION

- Standard: To BS EN 61009-1.
- Manufacturer: Board's choice.
- Properties:
  - Short-circuit breaking capacity: As Circuit schedules.
  - Rating: As Circuit schedules.
  - Poles: As Circuit schedules.
  - Sensitivity: 30 mA.
  - Time delay: Not required.

400 MINIATURE CIRCUIT BREAKERS

- Standard: To BS EN 60898-1
- Manufacturer: Board's choice.
- Properties:
  - Short-circuit breaking capacity: As Circuit schedules.
  - Where practicable, circuit breakers shall be selected so that their service breaking capacity Ics is equal to their ultimate breaking capacity Icu.
  - Where the characteristics of the selected circuit breaker are such that Ics < Icu then Ics shall exceed the prospective short circuit current at the point of installation of the circuit breaker.
  - Rating: As Circuit schedules.
  - Poles: As Circuit schedules.

435 DIGITAL MULTI-FUNCTION METERING EQUIPMENT

- To be compatible with MODBUS protocol read over site protocol
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Display: LCD.
- Ingress protection to BS EN 60529: Match assembly enclosure.
- Metering functions:
  - Voltage between phases (V);
  - Voltage between phases and neutral (V);
  - Phase currents (A);
  - Frequency (Hz);

- Power factor;
- Active power (W);
- Reactive power (V·A(r));
- Active energy (kW·h);
- Apparent power (V·A);
- Current demand (A);
- Active power demand (W);
- Apparent power demand (V·A);
- Peak current demand (A);
- Peak active power demand (W);
- Peak apparent power demand (V·A); and
- Pulsed output (kW·h).

- Mounting: Recessed into switchgear assembly or integral to MCCBs if appropriate.

440 INDICATOR LAMPS

- Lamp type: Clustered LED with bezel. Standardize lamp type.
- Lens colour: To BS EN 60073.
- Lamp mounting: Recessed.
- Common lamp test facility: Required.
- Access for lamp replacement: Externally from enclosure front.

445 PADLOCKS AND KEYS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Locking mechanism: Six lever.
- Material: Brass.

465 SAFETY MATTING

- Standard: To BS 921.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Thickness (minimum): 6.5 mm.
- Width (minimum): 900 mm.
- Length (minimum): Match low voltage switchgear assembly.

470 SWITCHGEAR TRIPPING UNITS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Enclosure: To BS EN 62208.
  - Material: Manufacturer's standard.
  - Method of fixing: Wall mounting.
  - Intended location: Indoor.
  - Ingress protection to BS EN 60529: IP31.
  - Mechanical protection to BS EN 62262: IK01.
  - Rated insulation voltage: Submit proposals.
  - Lockable hinged door: Required.
  - Finish to enclosure and supporting framework: Board's choice.
  - Colour: Board's choice.
- Incoming supply protection: Miniature circuit breaker to BS EN 60898.
- Charger type: Constant voltage current limiting.
  - Operating temperature range: -10°C to 45°C.

- Battery type: VRLA.
- Output:
  - Type: d.c. (direct current).
  - Voltage: As ENMS/BMS (24Vdc).
- Digital voltmeter: Required.
- Indicator lamps:
  - Mains supply healthy.
  - Mains supply fail.
  - Charger fail.
  - Float charge.
  - Boost charge.
  - Low voltage.
  - High voltage.
  - Positive and negative earth fault alarms.
  - Low electrolyte (vented cells only).
- Common fault relay contact: Volt free.
- Vented battery labelling: Describe the treatment required following contact with the electrolyte and warn of the explosion risk caused by naked flames.

FABRICATION

515 PROPOSALS

- Content: Include the following:
  - Overall dimensions.
  - Degree of ingress protection.
  - Protection against electric shock.
  - Form of internal separation and details of busbar and terminal shrouding.
  - Mounting and fixing details.
  - Builder's work requirements and plinth details.
  - Fault level and rated short circuit characteristics.
  - Functional unit details.
  - Details of internal and external paint systems and colour finishes.
  - Door swings.
  - Access panel details.
  - Schedule of labels.
  - Dimensioned general arrangement drawings, plans, elevations and sections.
  - Shipping sections.
  - Gland plate details.
  - Routing of cabling within assembly.
  - Busbar arrangements, links and supports.
  - Internal controls, instrument and meter wiring diagrams.

540 LAYOUT

- Phase sequence: Set-out phase sequence for phases L1, L2, and L3, from left-to-right, top-to-bottom, and back-to-front when viewed from the front of the assembly.
- Fuseholders: Mount such that fuses can be withdrawn towards the operator and away from live parts.

- Heights of components (from finished floor level to underside of component):
  - Equipment requiring operation or maintenance: 500-1600 mm.
  - Instruments: 1200-2000 mm.
  - Emergency switching devices: 800-1600 mm.
- Busbars and connections:
  - Supports: Insulated.
  - Identification: Provide 25 mm wide colour bands to busbars at 500 mm intervals with a minimum of one band in each compartment.
  - Future extensions: Pre-drill busbars for future extensions and extend busbar droppers into spare functional unit locations.

560 WITHDRAWABLE DEVICES

- Mounting: Mount within assembly on a withdrawable carriage with racking gear for insert and withdrawing.
- Gear to positively fix devices in the following positions: Connected, test-and-isolated, disconnected.
- Interlocking: Interlock to prevent devices being inserted or withdrawn unless in a tripped condition.
  - Closure: Prevent devices being closed unless in either the connected or test-and isolated position.
- Discharge of stored energy: Automatic by racking operation.
- Labelled automatic shutters: Locate over exposed connections.
  - Padlock facility: Required in the closed position.

580 FACTORY INSPECTIONS

- Notice before inspection and testing: 14 d.
- Equipment for inspection and testing: All switchgear assemblies.
- Factory inspections:
  - Fabrication: Inspection required.
  - Assembly completed, busbars exposed and functional units assembled: Inspection required.
  - Factory testing of assembly: Inspection required.

EXECUTION

620A INSTALLING SWITCHGEAR GENERALLY

- Switchgear cubicles: Arrange in modular form to facilitate future extension.
- Clearance (minimum):
  - Front access switchgear: 800mm access space in front, over and above any space required for openable doors or withdrawable gear.
  - Rear access switchgear: 800mm access space in front, over and above any space required for openable doors or withdrawable gear, plus 800mm behind and 800mm at each end.
- Fixing equipment: Fix independently of wiring installation with zinc electroplated fasteners.
  - Indoor equipment: Fix using internal lugs.
  - Outdoor equipment: Fix using external lugs.
- Extension boxes: Provide where necessary.
- Gland plates: Non-ferrous for single core cables.

640 INSTALLING METERING EQUIPMENT

- Digital metering equipment: Connect to building management system.

650 INSTALLING CURRENT TRANSFORMERS

- Identification details: Mount current transformers so that polarity markings and name plate details are easily viewed in situ.

670 INSTALLING SAFETY MATTING

- Front access equipment: Install safety matting in front of the equipment.
- Rear access equipment: Install safety matting in front of and behind the equipment.
- Installation: Fix securely to the floor.
  - Location: In front of main LV switchboards.

COMPLETION

910 TESTING AND COMMISSIONING GENERALLY

- Standard: To BS 7671.

920 TESTING AND COMMISSIONING OF SITE-ASSEMBLED SWITCHGEAR

- Notice before testing and commissioning: 7 d.
- Switches and circuit breakers: Vacuum clean.
- Protective devices settings: Configure to match the grading study.
- Routine testing and commissioning: Submit results.
- Switchboard monitoring: Continuous for 30 minutes following first energizing.
- Additional inspection and testing:
  - Check levelling and alignment of assembly.
  - Check operation of instruments and metering devices.
  - Check and adjust tightness of busbar connections and supports
  - Check tightness of bolted connections.
  - Check busbar joints with ductor resistance measurements.
  - Check earth connections at compartments, switches and earth electrodes.
  - Check clearance of live parts from direct contact.
  - Check polarity and phase sequence of protective devices.
  - Check operation of protective devices using secondary and primary current injection.
  - Manually operate protective devices.
  - Carry out earth fault protection simulation tests.
  - Check functional operation of circuit breakers.
  - Check operation of switch tripping devices.
- Inspection and test results: Submit.

930 TESTING AND COMMISSIONING OF SWITCH TRIPPING DEVICES

- To be tested as per details within WW Electrical Inspection & Testing specification, WW-532-202
- Tripping function: Verify correct operation.
- Indicators: Verify correct operation.
- Results: Submit.

935 SPARES AND CONSUMABLES

- Manufacturer's recommended spares: Supply two sets.
- Operating handles for circuit breakers and switches: One per device.

940 SPARE TOOLS

- Tools: Supply the tools, necessary for maintaining the equipment, including racking handles and a torque spanner.
- Tool cabinet: Include name plate, labelled shelves and non-lockable door. Size for storing racking handles, special tools, spare lamps, spare fuse links and other equipment necessary for satisfactory assembly operation.
  - Location: Board's choice.

960 PADLOCKS AND SPARE KEYS

- Quantity per item of switchgear: 2.
- Padlock keys: Two for each padlock.
- Padlock identification: Stamp padlock (describing its function on schedule).
- Keys for switchgear door locks: Supply 2 of each key type.

970 LABELLING

- Switchgear terminals: To BS EN 60445.
- Anti-condensation heaters: Provide caution notices advising against accidental switching off.
- Standby power: Provide danger warning notices stating that assemblies may be energized from more than one source.
- Indicator lamps: Label each lamp describing its function.
- Fuses, terminal blocks and other assembly components: Label describing their purpose.
- Spare fuses: Label, describe their rating and associated outgoing ways.
- Cabinets for padlocks and spare keys: Label.

980 CALIBRATION CERTIFICATES

- Certificates of calibration for meters and instruments: Submit.

V33 Busbar trunking

To be read with Preliminaries/ General conditions

PRODUCTS

320A POWER BUSBAR TRUNKING HORIZONTAL BUS BARS WITHIN PLANTROOMS

- Standard: To BS EN 60439-2. Submit certification.
- Type: Low voltage.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Assembly: Fully type-tested.
- Current rating: As detailed on LV schematics.
- Configuration: As detailed on LV schematics and plantroom plans.
- Place of installation: Indoor but suitable for plant room environments.
- Attitude: Horizontal.
- Protection against electric shock: Submit proposals.
- Prospective rated short circuit current (1 s): As detailed on LV schematics.
- Casing:
  - Standard: To BS EN 62208.
  - Material: Steel.
  - Finish: Corrosion-resistant paint.
  - Colour: Submit proposals.
  - Ingress protection to BS EN 60529: IP54.
- Conductors: Board's choice.
- Supports: Board's choice.
- Accessories: Sealed jointing sleeves.
  Board's choice.

320B POWER BUSBAR TRUNKING VERTICAL BUSBAR RISERS

- Standard: To BS EN 60439-2. Submit certification.
- Type: Low voltage.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Assembly: Fully type-tested.
- Current rating: As detailed on LV schematics.
- Configuration: As detailed on LV schematics and plans.
- Place of installation: Indoor within electrical risers.
- Attitude: Vertical.
- Protection against electric shock: Submit proposals.
- Prospective rated short circuit current (1 s): As detailed on LV schematics.
- Casing:
  - Standard: To BS EN 62208.
  - Material: Steel.
  - Finish: Corrosion-resistant paint.
  - Colour: Submit proposals.
  - Ingress protection to BS EN 60529: IP4X.
- Conductors: Board's choice.
- Supports: Wall brackets.
- Accessories: Sealed jointing sleeves.
  Board's choice.

320C POWER BUSBAR TRUNKING LINKING MAIN LV SWITCHBOARDS
Included as alternative option to cables.
Busbar trunking which connects two separated main LV switchboards and thus for part of its route leaves the switchrooms shall be fire rated to 2 hours.
Busbar which connects two main LV switchboards in immediately adjacent switchrooms and passes directly through a shared wall need not be fire rated.
Penetrations through fire walls shall be fire sealed.

- Standard: To BS EN 60439-2. Submit certification.
- Type: Low voltage.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Assembly: Fully type-tested.
- Current rating: As detailed on LV schematics.
- Configuration: As detailed on LV schematics and plantroom plans.
- Place of installation: Indoor but suitable for plant room environments.
- Attitude: Horizontal and vertical.
- Protection against electric shock: Submit proposals.
- Prospective rated short circuit current (1 s): 50kA.
- Casing:
  - Standard: To BS EN 62208.
  - Material: Submit proposals.
  - Finish: submit proposals.
  - Colour: Submit proposals.
  - Ingress protection to BS EN 60529: IP54.
- Conductors: Board's choice.
- Supports: submit proposals. For 2 hour fire rated bus bars the supports shall also withstand the effects of fire for 2 hours.
- Accessories: Sealed jointing sleeves.

340 TAP-OFF UNITS GENERALLY: PLANTROOM AND VERTICAL RISING BUSBARS
- Standard: To BS EN 60439-2. Submit certification.
- Type: Plug-in.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Rating: As detailed on LV schematics.
- Phase: Three phase for three phase distribution boards and single phase for single phase distribution boards.
- Assembly: Partially type-tested.
- Circuits: To match busbar trunking.
- Accessories: Each tap off to be sealed with a blanking plate when not in use in order to maintain required IP rating.
- 4 pole circuit-breaker with interlocks to prevent live loads being connected or disconnected.

350 FEED UNITS END FEED UNITS
- Standard: To BS EN 60439-2. Submit certification.
- Type: End feed.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Circuits: To match busbar trunking.

- Accessories: Riser base support unit.
  Submit proposals.
  IP54 rating in plantrooms. IP4X in risers.

370 FIRE BARRIER UNITSFOR BUSBAR TRUNKING RUNNING THROUGH FIRE COMPARTMENTS AND AT EACH FLOOR

- Standard: To BS EN 60439-2. Submit certification.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Fire protection: Submit proposals. To suit fire rating of compartment boundary.
- Circuits: Match busbar trunking.
- Accessories: Submit proposals.

EXECUTION

605 INSTALLING BUSBAR TRUNKING GENERALLY

- Joints: Manufacturer's jointing fittings. Maintain rigidity of trunking across joint.
  - Number of joints: Minimize.
  - Lengths of trunking: Maximize.
  - Open ends: Blank using manufacturer's removable end caps.
  - Electrical continuity: Maintain at each joint with a copper link fitted on the outside of the trunking.
- Connections to trunking covers: Minimize. Submit proposals for lid removal.
- Electrical continuity of covers: Electrically continuous with the trunking or provide protective conductors.
- Access: Provide space around trunking to permit access for installing and maintaining cables. Set out access with covers on a continuous face to allow cabling to be laid in throughout its entire length.
- Trunking passing through building fabric openings: Provide fixed trunking covers and extend these 50 mm from both sides of the opening.

620 INSTALLING POWER BUSBAR TRUNKINGGENERALLY.

- Generally: In accordance with BS 7671.
- Location: As detailed on electrical services layouts.
- Expansion joint interval: At each joint, integral to system design.
- Supports and fixings:
  - Supports: Submit proposals.
  - Finish and colour: Match trunking.
  - Locations where moisture may occur: Corrosion resistant, selected to prevent deterioration by electrolytic action.

630 INSTALLING TAP OFF UNITS HORIZONTAL BUS BARS IN PLANTROOMS.

- Generally: In accordance with BS 7671.
- Location: As drawings.
- Tap-off point intervals: as required by plant layout.

630B INSTALLING TAP OFF UNITS RISING BUS BARS.

- Generally: In accordance with BS 7671.
- Location: As drawings.
- Tap-off point intervals: 3 tap-off outlets per floor, always positioned at the same height above the floor.

640A INSTALLING FEED UNITSGENERALLY.

- Generally: In accordance with BS 7671.

650A INSTALLING FIRE BARRIER UNITSGENERALLY.

- Generally: In accordance with BS 7671.

COMPLETION

910 CLEANING

- Trunking: Clean immediately before energising.

920 TESTING AND COMMISSIONING GENERALLY

- Standard: To BS 7671.

930 TESTING AND COMMISSIONING OF SITE-ASSEMBLED BUSBAR TRUNKING

- Notice before testing and commissioning: 5 working days.
- Protective devices settings: As detailed in electrical specification and LV schematics.
- Routine testing and commissioning: Submit results.
- Additional inspection and testing:
  - Check and adjust tightness of busbar connections and supports.
  - Check tightness of bolted connections.
  - Check busbar joints using ductor resistance measurements.
  - Check earth connections.
  - Check clearance of live parts from direct contact.
  - Carry out earth fault protection simulation tests.
- Inspection and test results: Submit.

950 LABELLING

- Busbar terminals: To BS EN 60445.

960 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Drawings: Submit, showing the busbar trunking and tap-off units.

V36 Automatic power factor correction equipment

To be read with Preliminaries/ General conditions

PRODUCTS

310 AUTOMATIC POWER FACTOR CORRECTION EQUIPMENT GENERALLY. Compensation for harmonic content shall be by means of an automatic capacitor bank with blocking reactors (de-tuned filters).

- Operation:
  - Power factor: Continuously monitored.
  - Differences between the required power factor and the actual setting: Rectified by adding or removing capacitor banks.
- Enclosure: Separate.
- Power capacitors: Integral.
- Main isolation: Integral.
  - Type: Circuit breaker.
  - Operating handle: Padlock loop.
  - Mounting: Front of panel.
- Controls: Solid state microprocessor based.
  - Illuminated display: Required.
  - Selection of required power factor: Adjustable between 1.00 and 0.75.
  - Operating modes: On, off and automatic.
  - Power factor sensing and control: Automatic.
  - Capacitor banks: Switched individually.
  - Identification of energized capacitor banks: LED indicating lamps.
  - Undervoltage sensing: Disconnects capacitor banks at pre-set adjustable under voltage and upon supply failure.
  - Alarms:
  - Capacitor overload;
  - Frequency not detected;
  - Loss of capacitance;
  - Low power factor;
  - Overcurrent;
  - Overtemperature;
  - Overvoltage;
  - Undervoltage;
  - Excessive voltage total harmonic distortion (THD).
  - Mounting: Front of panel.
- Remote monitoring output: Connect to central controls and BMS, as section Y40. - Signals: Alarms.
- Current transformers: Type, configuration and ratio to suit sensing and mounting conditions.
- Contactors: Three pole, rated for repetitive high inrush switching duty.

320 CAPACITOR BANK SIZE

- Number of capacitor banks: To suit total requirement, provided in banks of 25kVAr and 50kVAr.

330 PERFORMANCE OF POWER FACTOR CORRECTION EQUIPMENT

- Power factor when corrected: Minimum 0.95 lagging.
- Capacitor bank size and number of stages: Submit proposals.
- Power factor equipment sizing calculations: Submit.

350 SEPARATE ENCLOSURESGENERALLY

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Purpose: To house all power factor correction equipment.
- Material: Board's choice.
- Finish to enclosure and supporting framework: Board's choice.
  - Colour: Board's choice.
- Internal separation to BS EN 60439-1 National Annex: Form 4 type 6.
- Ingress protection to BS EN 60529: IP31.
- Mechanical protection to BS EN 62262: Board's choice.
- Incoming cabling access: Top entry.
- Outgoing cabling access: Top entry.
- Cable termination chambers with gland plates: Required.
  - Conductor termination size (minimum): As detailed in electrical specification and LV schematics.
- Mounting: Floor.
- Doors:
  - Internally hinged with padlock loop.
  - Interlocked with controls or main isolator to de-energize capacitors when door is opened.

370 ILLUMINATED DISPLAYS

- Type: LED or LCD.
- Indicate:
  - Required and actual power factors: Accuracy to within 1% of measured value.
  - Capacitor banks in use.
  - Bank reconnection delay.
  - Real and reactive currents.
  - Voltage THD.
  - System alarms.

410 POWER CAPACITORS

- Standards: To BS EN 60831-1 and BS EN 60831-2.
- Type: Dry, metallized dielectric, self-healing.
  - Encapsulation: Vacuum liquid treated with thermosetting resin within plastic container.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Capacitor housing: Sheet steel enclosure filled with inorganic, inert and fire proof granules.
  - Thermal equalizers: Required.
- Voltage rating: 440 V.
- Dielectric Loss: 0.2W/kVAr.

EXECUTION

610 INSTALLING POWER FACTOR CORRECTION EQUIPMENT

- Separate enclosures: Arrange in modular form to facilitate future extension.
- Clearance (minimum):
  - refer to requirements for switchboards.
- Fixing equipment: Fix independently of wiring installation with zinc electroplated fasteners.
- Indoor equipment: Fix with internal lugs.

- Outdoor equipment: Fix with external lugs.
- Extension boxes: Provide where necessary.
- Gland plates: Non-ferrous for single core cables.
- Close coupled switchgear: Interconnect.
  - Cable type: Multi-core XLPE/ SWA/ LSZH, as section V32.
  - Containment: Cable tray, as section Y63.

620 POWER FACTOR ANALYSIS

- Data logging: As section V30.

680 FACTORY INSPECTIONS

- Not required

COMPLETION

910 INSPECTION, TESTING AND COMMISSIONING GENERALLY

- Standard: To BS 7671.
- Notice before testing and commissioning: 7 d.
- Capacitors, wiring, components, connections and equipment installation: Inspect.
- Operation of instruments and displays: Check and confirm correct operation.
- Controls: Commission and adjust for optimum power factor correction.
- Testing and commissioning results: Submit.

V37 Harmonic filtering equipment (If required)

To be read with Preliminaries/ General conditions

PRODUCTS

310 ACTIVE FILTERS PROVISIONAL ALLOWANCE

Project Co. shall make space allowance plus dedicated breaker, CTs and sensing wiring for the post occupation installation of 2 no. active filters on each of the A and B sides of each main LV switchboard. Refer to clause 620 below for details of post occupation harmonic analysis survey to be carried out by to determine the precise specification of active harmonic filters.

Project Co. shall allow to revisit the site during the post occupancy period to carry out the survey and to fit, whilst planning for minimal disruption, any necessary active filters. The space allowance for the post occupation installation of filters may be wall space or floor space.

EXECUTION

610 GENERAL INSTALLATION

- Standard: To BS 7671.

620 SURVEY

- Objectives: **Post completion. In the period immediately after occupation of the building and the commissioning of client supplied equipment, carry out a harmonic analysis survey. Determine the level of harmonic content within the electrical installation, recommend mitigation measures to comply with Energy Networks Association G5/4-1 and determine specification of active filters if necessary**.
- Scope of survey: Carry out tests without interfering with the plant, including analysis of harmonics from 2nd to 25th order.

630 INSTALLING HARMONIC FILTERS

- Point of installation: Main LV switchboards as detailed on LV schematics.
- Mounting: Floor mounted free standing.
- Clearance (minimum):
  - Front access: Manufacturer's standard.
  - Rear access: Manufacturer's standard.
  - Top access: Manufacturer's standard.
  - Bottom access: Manufacturer's standard.
  - Side access: Manufacturer's standard.
- Gland plates: Form common slot to all holes to prevent eddy currents.

640 INSTALLING CLOSE COUPLED ACTIVE FILTERS

- Close coupled active filters: xxxx
- Close coupled switchgear: Interconnect.
  - Cable type: LSZH singles, as section V32.
  - Cable size: As detailed on LV schematic and electrical specification.
  - Containment: Trunking, as section Y60.
- Control cables between close coupled active filters: Interconnect.

650 INSTALLING CURRENT TRANSFORMERS (CTS)

- Mounting: In direction of current flow as indicated on CT.
- Connection to filter:
  - Cable type: Manufacturer's standard.
  - Cable size: Minimum 0.75 mm².
  - Containment: Trunking, as section Y60.
- Connecting to filters: With cables provided by manufacturer. Where cables are of insufficient length, extend with terminal block and equivalent cable.

COMPLETION

910 INSPECTION, TESTING AND COMMISSIONING GENERALLY

- Standard: To BS 7671.
- Commissioning of filters: By manufacturer.
- Notice before testing and commissioning: 7 d.
- Filters, CTs, wiring, components, connections and equipment installation: Inspect.
- Operation of instruments and displays: Check and confirm correct operation including:
  - Supply current (rms) L1, L2, L3 and neutral current.
  - Load current (rms) L1, L2, L3 and neutral current.
  - Supply THD % L1, L2, L3.
  - Load THD % L1, L2, L3.
  - Supply voltage.
  - Load level % L1, L2, L3.
  - Detailed load current spectrum display.
  - Detailed supply current spectrum display.
  - Reactive compensation.
  - Selection of harmonic orders for mitigation.
  - Number of parallel connected filters.
  - Alarm functions.
  - Communication port function.
  - Identification function.
- Controls: Commission and adjust for optimum harmonic mitigation and reactive power compensation.
- Inspection, testing and commissioning results: Submit.
  - Number of copies: 3.

Y67 Transient overvoltage surge suppression devices

To be read with Preliminaries/ General conditions

PRODUCTS

310 TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIESFOR LOW VOLTAGE DISTRIBUTION SYSTEM - MAIN LV SWITCH BOARDS

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Standard: BS EN 61643-11 and IEEE C 62.41.
- Operating voltage and frequency (nominal): 400 V at 50 Hz.
- Operating voltage (maximum): 500 V.
- Phase arrangement: Three.
- Surge current (minimum) between any two conductors: 10 kA/350uS.
- Let-through voltage (maximum): Must not exceed the equipment transient design level (ETDL) supplied by the equipment manufacturer. Submit proposals.
- Current rating: Submit proposals.
- Thermal overload protection: Submit proposals.
- Mode of protection: Lines to earth, lines to neutral, neutral to earth.
- Protection status indicators: Full protection status
- Remote indication of status (including loss of phase/ supply): Required.
- Effect on mains power supplies during normal operation:
  - No corruption to normal mains supply.
  - No break or shutdown of mains supply.
  - No excessive earth leakage current.
- Enclosure: Within switchboard.

340 ENCLOSURES.FOR SEPARATELY MOUNTED DEVICES

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Ingress protection (minimum): Submit proposals.
- Material: Manufacturer's standard.
- Finish: Manufacturer's standard.
- Colour: Manufacturer's standard.

EXECUTION

620 INSTALLATION GENERALLY

- Standards:
  - To BS 7671;
  - DD CLC/TS 61643-12; and
  - DD CLC/TS 61643-22.
- Equipment: Provide electrical supplies to equipment requiring power.
- Fixings: Non-corroding and compatible with the environment where they are installed.

630 INSTALLING TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIES

- Point of installation: Main switchboard
- Transient overvoltage suppression devices: Interconnect.
- Control cables between transient overvoltage suppression devices and BMS: Interconnect.
- Interconnecting cable:
  - Cable type: Submit proposals.
  - Cable size: submit proposals.
  - Cable length (maximum): 250 mm.
  - Cable installation: Tightly bind connecting leads together.
- Fuse protection: Provide fuse protection to transient overvoltage surge suppression devices.
- Isolation: Not required.

650 LABELLING

- Electrical equipment: Labels indicating the purpose of the equipment.
- Safety signs: Install where voltages above ELV exist.
- Voltage warning notices: Label equipment where voltage exceeds 230V.
- Format: To BS 5499-5. Include warnings of the voltage present.

APPENDIX A

LV CONTROL PRINCIPLES

B1. SUBSTATION LV SWITCHBOARDS: CONTROL REQUIREMENTS

B.1.1. INTRODUCTION

Each substation shall step down the 11kV 'A' & 'B' supplies for LV distribution, delivering power into 400V 'A' & 'B' systems via two main LV switchboards.

The Main LV Switchboards shall be arranged to provide both

- manual control of the incoming, bus-section & outgoing circuits and
- automatic control of the incoming, bus-section & selected outgoing circuits.

The automatic control scheme should achieve both change-over of incoming supplies under mains failure conditions and remote control by the ENMS for the purpose of load control. In outline, the control functions shall provide:

- changeover to the other supply if either one of the 'A' or 'B' 400V supplies is lost (to be effected by opening the incoming ACB on the failed supply and closing the bus-section switches),
- opening of both LV incomers and the bus-section switches in the event that both 'A' & 'B' supplies fail, in readiness for generator start-up, and closing of the incomers on signals from the Electrical Network Management System (ENMS) that the network is ready to have loads applied.
- progressive or grouped energisation or de-energisation of outgoing feeder circuits for situations where prioritisation of loads is required - typically for matching loads to available network capacity during generator start-up or under abnormal 11kV network conditions.

B.1.2. GENERAL

The LV switchboard and its control scheme shall include at least the following basic features:

- Electrical interlocking (hardwired on breaker auxiliary contacts, not via a PLC) to prevent paralleling of the incoming supplies,
- Functional interlocking and safety interlocks on the switchgear, these remaining active at all times (e.g. trip & close interlocks, anti-pumping arrangements on the closing circuit).
- A three position Master Control Selector Switch to allow choice of control as 'Local Manual', 'Remote ENMS (with auto change-over deactivated)' or 'Remote ENMS (with auto change-over active)' [though alternative control selector switch arrangements may be considered],
- Provision for remote control from, and signalling of status and alarm conditions to, a central control room by means of the ENMS,
- Arrangements such that protection tripping is not disabled by the position of the control selector switches.
- Electrically operated incomer and bus-section switches, and electrically operated feeder switches where the latter are necessary for load acceptance/load shedding under generator capacity controls. This will necessitate motor driven spring wind mechanisms on ACB's and motor driven MCCB's on feeder circuits - note these may need to be DC operated,

- It shall be possible to easily re-programme (or connect /reconnect) the individual circuit breaker controls for activation by any specific one of the load priority signals received from the ENMS,
- Local operator control shall, for ACB incomer and bus-section switches, be via electrical pushbutton action, with all interlocks and safety features active at all times. Any buttons or linkages which act directly on the mechanism shall be shrouded and padlocked to prevent inadvertent access. Manual control of motorised moulded case circuit breakers is not envisaged but, if provided, shall be limited to operation through electrical pushbuttons or switches.

B.1.3. AUTOMATIC CHANGE-OVER

The broad requirements are as follows:

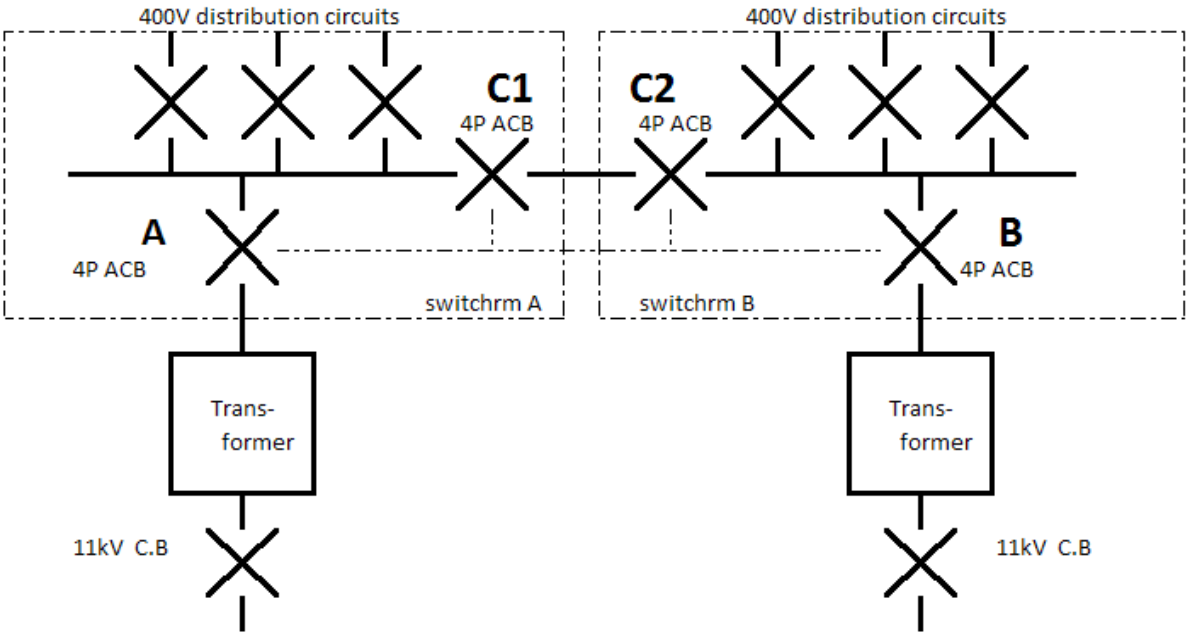
- In the event of loss of one incoming 400V supply, the affected section of the board shall be switched over to the remaining healthy 400V supply by opening the circuit breaker incomer on the failed supply side and closing the bus section switch(es). The change-over shall not however be performed if the loss of supply involves a protection trip by the Incomer ACB serving that section of the board.
- The restoration control arrangement shall provide that upon return of both 400V supplies (both to mains, or both to generator provided there is no priority load constraint at the time) then the Switchboard shall require manual reinstatement if it is desired to return to any preferred configuration. This manual intervention may be at the switchboard (local) or via ENMS (remote) depending on the operational policy. (This is consistent with a policy of the operators having to pre-agree interruptions before reconfiguring supplies from a substation.)

More detailed requirements include:

- Change-over response shall be slugged sufficiently to avoid responding to transient events (including in situations where two incoming supplies are being energised but one is available fractionally before the other).
- Exact timing arrangements shall be agreed later, but it is envisaged that the Main LV switchboards will affect their auto changeovers within 5 seconds [0 – 10 second timer required].
- Reinstatement timing does not apply, on the basis that manual restoration is expected.
- The automatic changeover scheme shall be modified during periods when load pick-up is underway under ENMS control. During such times, the bus-section switches shall be held open and auto change-over blocked, but such blocking condition shall be removed after an enabling signal level has been reached by which both incomers should have been energised.
- The automatic changeover scheme shall be modified during periods when generators are being tested on hospital load. The modified behaviour shall allow switching for a mains supply to pick up loads if they were fed from a generator supply which has just failed, but shall block any changeover which might try to switch additional loads onto the generators under test.

Using the diagram below as a guide, the required operation of the incomers and bus-section switches shall be as tabulated in Table B1.

SUBSTATION MAIN LV SWITCHBOARDS



Refer to TABLE B1: Auto Change-over Behaviour (for conditions where ACB C2 is taken to be the preferred normally open point).

B.1.4. REQUIREMENTS FOR GENERATOR START-UP PERIODS & LOAD SHEDDING

To cater for the possibility that the multiple generators on site may need to pick up load in progressive or grouped stages, and to allow load shedding in the event that available generator or mains capacity is insufficient to match the prospective load, a scheme shall be developed to assign 'load priority' numbers to the various circuits and schedule the pick-up or shedding in favour of the more important loads. The control is expected to apply on the LV Switchboards (and downstream on various electrical & stand-alone plant loads (eg lifts, freezers and possibly some large system components and some kitchen equipment), and via the BMS system to control mechanical plant).

Background design information is provided in subsection B.1.6. Proposals for load priority numbers shall be tabulated in a schedule and shown for ease of reference on the schematics. The scheme assumes that the ENMS will signal to each of the LV Switchboards a number of signals against which the LV Switchboard controls will close or open individual circuit breakers on their outgoing feeders. The LV board shall determine from the combination of signals it receives the nature of the supply, and shall respond accordingly. The scheme further requires that the ENMS and the BMS will be capable of communicating so that mechanical loads can be managed through the BMS system.

A few ‘Condition’ signals will be transmitted to the LV Switchboard by the ENMS to indicate whether the supplies at the 400V incomers are derived from mains or generator, and whether generators on either side are being tested. Signals are expected for these functions, as listed below, but it should be noted that the final signal functions will be determined during detailed design by the ENMS specialist working from the ENMS specification.

- MV incomer A available
- MV incomer B available
- MV incomer A open/ closed
- MV incomer B open/ closed
- Mains Active, Supply A (‘A’ connected to Mains)
- Mains Active, Supply B (‘B’ connected to Mains)
- Generator Active, Supply A (‘A’ connected to Generator)
- Generator Active, Supply B (‘B’ connected to Generator)
- Generators on Test, Supply A
- Generators on Test, Supply B

A number of ‘Enabling’ signals shall be transmitted by the ENMS to give load priority enabling signals.

The scheme will require the assignment of priorities to groups of load across the site (life safety systems, departmental loads, imaging equipment, etc.).

B.1.5. INTERFACE FOR ENMS CONTROL

The LV switchboard shall include facilities as described in the ENMS specification, such that remote control may be implemented and remote detection made of switch status and alarm conditions.

A three position master control selector switch on the board shall provide an overall means of limiting control to one station at a time. This master switch shall provide for selection of control to one of the following:

Manual (Local)
ENMS only
ENMS and Auto Change-Over

Further 3-position control selector switches shall be located on individual ACB or MCCB compartments to block remote or automatic operation of the individual circuit device if an operator at the board selects the control mode for that circuit to ‘Manual’ or ‘off’.
Control switch positions shall be labelled:

Manual (Local)
Off
Auto/ENMS

Unless otherwise agreed, the signals to and from the ENMS shall be provided by means of volt-free contacts, and the LV switchboards shall incorporate isolating terminals (sliding link style) for connections to/from all remote control/signalling contacts.

Unless defined elsewhere, or unless additional signals need be transmitted to suit the ENMS design, the table overleaf shall be taken as showing the requirements for remote control and indication.

Main LV Switchboards & Related Equipment - Interface Requirements to ENMS and BMS Symbols: • To be transmitted via ENMS ○ To be linked to BMS * To be handled by either ENMS (preferred) or BMS. (Board/specialist to submit proposals)		Main LV Switchboards					Related Equipment		
		General	Incomers	Bus-Section(s)	Outgoing feeder circuit (controlled)	Outgoing feeder circuit (uncontrolled)	Power Factor Correction Banks	Harmonic Compensation (Future)	Battery Chargers & DC System

	Springs discharged or auxiliary supplies failed		*	*	*				
	Common/grouped Alarm					*	*	*	*
Outputs (measureands)	kWh signals for metering – on circuits indicated on drawings or to satisfy the metering strategy (impulsing or otherwise to suit BMS)		•		•	•			
	Amps		•	•	•	•	•		
	Operations Count		•	•	•	•			
	kVAr compensation						•		
	Harmonic content (or total harmonic distortion)		•						

Notes:
(1) If these signals cannot be used to initiate blockage of Power Factor control when generators are running, then a separate input signal shall be transmitted via the ENMS.
(2) Term 'racked out' applies specifically to ACBs.

B.1.6. SUPPLEMENTARY DESIGN INFORMATION ON ENMS CONTROL

The control is envisaged as:-

- limiting the application of load during generator start-up (constrained by generator load acceptance limits) in three steps of 46.6%, 44.4% & 9% the combined rating of synchronised generator sets,
- being programmed to switch suitably sized blocks of load for any number of generators between (minimum) and 3 (total installed),
- Switching load blocks in a way which serves the above and always energises or keeps energised the higher priority loads (see the table at the end of this sub-clause),
- Being based primarily on the following concepts:
  - automatic change-overs to be effected at the various substation main LV switchboards,
  - motorised breakers at the main LV switchboards to connect or disconnect downstream loads during generator start-up or incidents on the 11kV network,
  - manually operated sub-panel switchboards (with 2-out-of-3 Ronis key interlocking),
  - ENMS control applied directly to lifts and various other loads, to supplement load control achievable at main LV switchboards,
  - BMS control of mechanical plant, again to supplement other load controls, and in order that motorised breakers can be avoided or minimised at sub-panels.
- Being cabled & connected so the ENMS can enable/disable various loads as follows:-
  - In Regen Kitchens, part of the catering load can be contactor controlled (energised & held on via a contactor, dropping off on loss

of supply or on ENMS disable signal and being re-energised by means of local reset button operable only if an ENMS enable signal is present),

- Lifts, via signal input to the respective controller
- Some large system components, via signal input to the control panel
- Kitchen freezer/refrigeration plants, via signal input to the control panel
- Restaurant main equipment akin to Regen Kitchens above
- Imaging Equipment: Automatic change-overs at each imaging switchpanel or individual imaging equipment (as depicted on schematics) for selection between 'A' & 'B' supplies. Load shed control & supply restoration would be applied at motorised source breakers (upstream, at the main LV switchboards), but ENMS signal to be brought to the imaging board/equipment to serve as permissive signal for the intended managed restart of the imaging suites.

The scheme shall support a feature of the ENMS which should permit:

- Initially, electrical loads to be switched against a 'list' of priority number allocations (diversified demands as estimated to be within the available generator capacity for the number of sets on-line & synchronised)
- After the complete start-up cycle and allowing a stabilising period for plant pick-up, and by reference to the margin between calculated generator capacity and measured generator load, electrical loads to be switched to more closely match the available generator capacity, retaining (where conditions permit) a spare set (i.e. N+1 operation). The envisaged ENMS behaviour would be to call for the next priority level loads if the capacity margin so permitted, or switch out one or more priority levels if the margin were negative. i.e. to 'step-up' or 'step-down' the priority levels.

Based on the assessed size/number of priority groups which must be provided (for combining into the multitude of possible switching steps related to 3-stage load application on any number of operable generators between 1 & 3), the table below indicates the envisaged switching blocks depending on the number of generator sets which start. The priority numbers are tabulated in the Load Priority Schedule and marked on the schematics against the individual electrical loads.

Number of 2MW Generators available	Load Pick-Up (Energising Load Group Priority Numbers as listed)			
	1st Step – [est 15 seconds]. (Simultaneous or rapid sequential application of first 46.6%)	2nd Step. (Simultaneous or rapid sequential application of next 44.4%)	3rd Step. (Simultaneous or rapid sequential application of remaining 9%)	Net loads groups supported without redundancy after generator run-up
One	P1	P2 to P4	P5, P6	P1 to P6
Two	P1 to P2	P3 to P8	P9, P10	P1 to P10
Three	P1 to P3	P4 to P9	P10	P1 to P10

P1-P10 Stage shown for information actual quantity subject to detail design.

B2. SUB-MAIN LV SWITCHBOARDS: CONTROL REQUIREMENTS

B.2.1. INTRODUCTION

Each Sub-Main Switchboard, described hereafter as a panelboard, receives two 400V supplies ('A' & 'B' supplies from the respective main LV Switchboard) and further distributes the electrical power (maintaining the dual 'A' & 'B' supply arrangement) to a number of distribution boards in the various user departments. The distribution boards are generally arranged with lighting and small-power circuits interleaved within the User departments to minimise the inconvenience of a power supply failure.

The panelboards shall be arranged to provide manual control of the incoming, bus-section & outgoing circuits. Neither automatic change-over of the incomers, nor automatic control of any outgoing circuits is required.

B.2.2. GENERAL

The Panelboard shall include at least the following basic features:

- Mechanical interlocking (Ronis or Castell keys, or other mechanical means if agreed) to prevent paralleling of the incoming supplies.
- Signalling of status and alarm conditions to, a central control room by means of the ENMS, but no need for remote control.

B.2.3. AUTOMATIC CHANGE-OVER

Automatic change-over is not required as automatic change over is a db level.

B.2.4. REQUIREMENTS FOR GENERATOR START-UP PERIODS & LOAD SHEDDING

Even during periods of generator start-up, or if load shedding is required during periods when the available generator capacity is insufficient to match the prospective load, no automatic control at the Sub-Main LV Boards (Panelboards) is required. Panelboards will therefore be energised & de-energised from upstream as complete entities, or the load control will be effected downstream by ENMS signal direct to lift controllers, plant control panels or contactors etc.

B.2.5. INTERFACE FOR ENMS CONTROL

The Panelboard shall include facilities as described in the ENMS specification, such that remote detection is made of switch status and alarm conditions.

Unless otherwise agreed, the signals to the ENMS shall be provided by means of volt-free contacts, and the panelboards shall incorporate isolating terminals (sliding link style) for connections to/from all remote control/signalling contacts.

Unless defined elsewhere, or unless additional signals need be transmitted to suit the ENMS design, the table overleaf shall be taken as showing the requirements for remote alarm and indication.

Sub-Main LV Switchboards (Panelboards) - Interface Requirements to ENMS and BMS Symbols: • To be transmitted via ENMS ○ To be linked to BMS * To be handled by either ENMS (preferred) or BMS. (Board to submit proposals.)		General	Incomers	Bus-Section	Outgoing feeder circuit

RHSC and DCN EDINBURGH
ELECTRICAL INSPECTION AND TESTING

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Electrical inspection
- Electrical testing
- Test certificates

3.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of:-

- current legislation:
- SHTM 06-01 Chapter 17;
- Part 6 of the IEE Wiring Regulations; (BS. 7671);
- Annex to MEIGaN 'Healthcare Interpretation of IEE Guidance Note 7...' the initial verification tests specified in section 2.24 'Verification';
- MEIGaN V2.0 Chapter 11; and
- industry standards referred to in the materials & workmanship section.

4.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

5.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Board. Project Co. shall liaise with the Board through whom all communications must flow. Drawings and other documentation will be available via the Board. Project Co. shall include for liaison with members of the Board's team with an interest in the planning and administration of the Electrical Inspection and Testing.

The Hospital. Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Electrical Inspection and Testing.

6.0 SYSTEMS

6.1 Electrical Inspection and Testing

This document shall be read in conjunction with all mechanical and electrical specifications for the Sick Children, Child and Adolescent Mental Health Services.

Testing and verification in all areas shall be undertaken in accordance with Chapter 17 and Appendix 2 (Sample Test & Record Sheets) of SHTM 06-01.

In areas covered by the requirements of the Annex to MEIGaN 'Healthcare Interpretation of IEE Guidance Note 7...' the initial verification tests specified in section 2.24 'Verification' shall be carried out and recorded prior to commissioning. Testing and verification in these areas shall also be carried out in accordance with chapter 11 of MEIGaN V2.0.

V39 Electrical inspection and testing

To be read with Preliminaries/ General Conditions.

COMPLETION

910 ELECTRICAL INSPECTION AND TESTING TYPE
- Type: Initial verification.

915 ELECTRICAL TEST ENGINEER: General

- Approval: NICEIC/SELECT.
  - Evidence of approval: Submit.

915A ELECTRICAL TEST ENGINEER: MEIGaN
- Electrical test engineer: The inspection and testing of the installation shall be carried out by a suitably appointed 'Competent Person'. This person shall be assessed and appointed in writing by the 'Authorised Person (LV)' who shall verify that the proposed Competent Person possesses the necessary technical knowledge, skills and experience relevant to the nature of the installation to be tested and includes a knowledge of the requirements of the MEIGaN document. Independent MEIGaN specialist.
- Testing and verification shall be carried in accordance with BS 7671 'Requirements for electrical installations' including latest amendment.
- MEIGaN compliance to be determined against requirements of MEIGaN V2.0 chapter 11.

920 GENERAL
- Standards: To BS 7671 and in accordance with IEE Guidance note 3.
- Notice before commencing tests (minimum): 24 h.
- Installed equipment standards: Verify and confirm compliance with the relevant equipment standards.
- Electronic devices: Isolate to prevent damage during testing.
- Continuity of protective conductors:
  - Parallel earth paths: Isolate before testing.
  - Equipment: Continuity tester with short circuit current of at least 200 mA, and a no load d.c. or a.c. voltage between 4 V and 24 V.
- Insulation resistance (minimum):
  - SELV and PELV circuits: 1 megohm.
  - Other circuits less than or equal to 500 V: 2 megohm.
  - Circuits less than or equal to 500 V: 2 megohm.
- External earth fault loop impedance: Direct measurement.
- Connection of test equipment to existing switchgear: Submit proposals.
  - Timing: in accordance with commissioning programme.
- Earth fault loop impedance:
  - Method: Direct measurement or Calculated from measurement of the sum of the resistance of the phase conductor and the resistance of the circuit protective conductor.
- Measurement locations: Origin, switchgear, fixed equipment and outlets, circuit extremities.
- Prospective fault current:
  - Method: Direct measurement.
  - Location: Origin, and at points where protective devices are required to operate under fault conditions.

- Phase sequence & rotation: Verify.
- Cable containment: Measure electrical continuity and insulating properties of containment. Submit results.

940 TEST EQUIPMENT CALIBRATION

- Test equipment calibration: UKAS approved.

950 INSPECTION AND TEST RESULTS

- Standard: To BS 7671.
- Certificates: Submit.
  - Number of copies: 2.
- Test equipment identity: Record on test certificates.
- Certificates of calibration: Submit for each test instrument.
- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with proposed document management system.

960 ELECTRICAL INSTALLATION CERTIFICATES

- Format: To BS 7671 appendix 6.
- Schedule of test results: Submit.
- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with the proposed document management system.

RHSC and DCN EDINBURGH
COMMON ELECTRICAL CLAUSES

CONTENTS

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

1.1 Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

1.2 Life Expectancy & Life Cycle Costing

The building services components shall be designed with materials, components and techniques that are readily available, reliable, sustainable and easily maintainable in use. supports buildings constructed of proven technology components, with high life expectancy, leading to minimum cost in use. Equipment shall be selected and installed match or exceed the indicative life of building services components as listed in CIBSE Guide M Appendix 13.A1.

Project Co. shall demonstrate that the theoretical design life proposed for any element will be achieved

Materials and components forming part of the Works, which require maintenance and replacement within the life of the Works, shall be selected, located and fixed in such a way as to minimise future inconvenience, disruptions and to avoid temporary closure of the Works.

Project Co. shall ensure that all plant and systems are selected and configured to provide high quality, efficient, resilient, modular flexible and maintainable Building Services solution.

1.3 Action following mains failure/generator test conditions

All low current systems to be self-rebooting following mains failure and generator test conditions.

1.4 Low current systems with battery back-up

All battery systems shall be easy to test and change.

1.5 Document Management System

Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Document Management System.

V32 Low voltage cabling

PRODUCTS

310 CABLES GENERALLY

- Standard: To BS 7671.
- Proposed selection of low voltage cables: Submit drawings, technical information, calculations and manufacturer's literature. Submit British Approvals Service for Cables (BASEC), and where appropriate Loss Prevention Certification Board (LPCB), certification for ALL cables.
- Conductor sizes (minimum):
  - Sub main cables: 16 mm².
  - Lighting final circuits (including CPC): 2.5 mm².
  - Power final circuits (including CPC): 4 mm².
  - Spare capacity (percentage of current carrying capacity): 25%.
- Cable sizes as per cable schedules and distribution board schedules

315 CABLES, CORDS AND CONDUCTORS IDENTIFICATION

- Identification: Throughout cable length.
- Colour identification of cores: To BS 7671.
- Phase rotation: Identify with the coding L1, L2 and L3.

330 FLEXIBLE CORDS

- Standard: To BS 6500.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Light duty PVC insulated and sheathed flexible cords (LD PVC/ PVC cord, H03VV-F):
  - Construction: To table 26.
  - Sheath colour: Board's choice.
- Ordinary duty PVC insulated and sheathed flexible cords (PVC/ PVC cord, H05VV-F):
  - Construction: To table 27.
  - Sheath colour: Board's choice.
- Ordinary duty 90ºC PVC insulated and sheathed flexible cords (HR PVC/ PVC cord, H05V2V2-F):
  - Construction: To table 29.
  - Sheath colour: Board's choice.

340 INDUSTRIAL FLEXIBLE CORDS

- Standard: To BS 7919.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Heavy duty, heat resisting EPR insulated and sheathed flexible cords (HD HR rubber cord, H07BB-F):
  - Construction: To table 12.

350 PVC INSULATED CABLES FOR SWITCHGEAR AND CONTROL GEAR

- Standard: To BS 6231.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Single core type CK flexible heat resisting cables (single core tri-rated):
  - Construction: To table 9.

360 SINGLE-CORE HEAT RESISTING INSULATING CABLES

- Standard: To BS 6007.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Heat resisting rubber insulated cable (HR rubber singles, H07G-U):
  - Construction: To table 3.

370 THERMOSETTING INSULATED CABLES Small power & lighting circuits and earth conductors

- Standard: To BS 7211.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Rigid thermosetting insulated single core cables (LSZH singles, H07Z):
  - Construction: To table 3a.
- Thermosetting insulated and sheathed single core cables (LSZH/ LSZH singles):
  - Construction: To table 5.
- Thermosetting insulated and sheathed cables with circuit protective conductor (LSZH/ LSZH with CPC):
  - Construction: To table 7.

380 THERMOSETTING INSULATED AND PVC SHEATHED CABLES (XLPE/ PVC SINGLES) FOR BURIED EARTH CONDUCTORS

- Standard: To BS 7889.
- Third party certification: British Approvals Service for Cables (BASEC) certified .
- Manufacturer: Submit proposals .
  - Product reference: Submit proposals .
- Conductors: Copper.

393A THERMOSETTING INSULATED AND LSZH SHEATHED ARMOURED CABLES General low voltage sub mains distribution (excluding 5 core cables).

- Type: Multi-core XLPE/ SWA/ LSZH and Single-core XLPE/ AWA/ LSZH .
- Standard: To BS 6724.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

- Insulation: Cross-linked polyethylene GP 8.
- Rated voltage: 600/ 1000 V.
- Conductors: Copper.

393B THERMOSETTING INSULATED AND LSZH SHEATHED ARMOURED CABLES General low voltage sub mains distribution (5 core cables).

- Type: Multi-core XLPE/ SWA/ LSZH.
- Standard: In accordance with the requirements of BS 6724.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Insulation: Cross-linked polyethylene GP 8.
- Rated voltage: 600/ 1000 V.
- Conductors: Copper.

420 FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Fire detection and alarms cabling.

- Standard: To BS 7629-1.
  BS 8434-2 (enhanced 120 minutes)
  Enhanced grade cable as defined by BS 5839-1:2013.
  BS 8519:2010, 120 minute fire survival.
  SHTM 05-03 Part B
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP Plus.
  - Product reference: Submit proposals.

420A FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Emergency lighting final circuits. Central battery system.

- Standard: To BS 7629-1.
  BS 5266-1.
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP Plus.
  - Product reference: Submit proposals.

420B FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Sprinkler pump power supplies.

- Standard: To BS EN 12845.
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals.

420C FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Fire lifts and escape lifts.

- Standard: To BS 9999.
  BS 8519:2010, 120 minute r fire survival.
  SHTM 05-03 Part E
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.

- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals.

420D FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Motorised fire and smoke dampers, supply and control cabling

- Standard: To BS EN 12101
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP Plus.
  - Product reference: Submit proposals.

420E FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Power supplies to: powered smoke and heat exhaust ventilation, smoke fans, powered smoke shafts, pressurisation.

- Standard: To BS EN 12101
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals

420F FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Activation and monitoring of: powered smoke and heat exhaust ventilation, smoke fans, powered smoke shafts, pressurisation.

- Standard: To BS EN 12101
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP Plus.
  - Product reference: Submit proposals

420G FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Powered sliding doors across escape routes.

- Standard: To BS 7273-4
  BS 8519:2010, 60 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals

420H FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Gaseous extinguishing systems.

- Standard: To BS EN 12094
  BS 8519:2010, 60 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals

420J FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Sprinkler pumps.

- Standard: To BS EN 12845
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals

420K FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Suppression system monitoring.

- Standard: To BS EN 12845
  BS 8519:2010, 60 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP Plus.
  - Product reference: Submit proposals

420L FIRE RESISTANT, INSULATED AND SHEATHED CABLES. Sub mains from Central Battery System to local distribution boards.

- BS 5266-1.
  BS 8519:2010, 120 minute fire survival.
- Third party certification: British Approvals Service for Cables (BASEC) certified and LPCB.
- Manufacturer: As Prysmian Cables FP600S.
  - Product reference: Submit proposals.

440 SPLIT CONCENTRIC, INSULATED AND SHEATHED CABLES

- PVC insulated and sheathed: To BS 4553-1.
- Thermosetting insulated and PVC sheathed: To BS 4553-2.
- Thermosetting insulated and LSZH sheathed: To BS 4553-3.
- Third party certification: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Conductor: Copper.

460 INSULATING TAPE

- Standards: To BS EN 60454-1.

470 UNDERGROUND PLASTICS CABLE PROTECTION COVERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Polyethylene.
- Size:
  - Width: 150 mm.
  - Thickness: 18 mm.
- Jointing method: Peg.
- Identification: Laminate underground cable marker tape to top face.

480 CABLE ACCESSORIES

- Cold-pour resin compound: To BS 7933-1.
- Heat-shrink joints: To BS 7933-2.
- Glands: To BS EN 50262.
- Terminations for mineral insulated cables: To BS EN 60702-2.

EXECUTION

610 CABLE INSTALLATION GENERALLY

- Standard: To BS 7671.
- Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
- Preparation: Store cables above 5°C for 24 hours before installation.
- Installation temperature (minimum): 5°C.
- Cables: Install in one length.
- Cable pulling: Do not overstress. Prevent kinks and twisting of the cable.
  - Installation method: Submit proposals.
- Cables passing through walls: Sleeve with conduit or pipe duct. Bush at both ends.
- Cables surrounded or covered by insulation: Derate.
- Jointing: At equipment and terminal fittings only.

620 CABLE ROUTES

- Cables generally: Conceal wherever possible.
  - Concealed cable runs to wall accessories: Run vertically from the accessory.
  - Exposed cable runs: In plantrooms only.
- Distance from other services running parallel: 150 mm minimum.
  - Heating pipes: Position cables below.

630A CABLES CONCEALED IN WALLS AND PARTITIONS: EXTRA LOW VOLTAGE
Protection: Rigid pvc conduit.

630B CABLES CONCEALED IN WALLS AND PARTITIONS: LOW VOLTAGE
Protection: Rigid steel conduit, as section Y60.

640 CABLES IN VERTICAL TRUNKING AND DUCTS

- Supports: Pin racks or cleats at each floor level or at 5 m vertical centres, whichever is less.
- Heat barriers: Required.

660 CABLES ON CABLE SUPPORTS

- Position: Place cables side by side.
- Fastenings: Enable any cable to be individually removed.

670 SURFACE MOUNTED CABLES

- Fastening Minimum 25 mm between cable face and structure.
- Orientation: Dress cables flat, free from twists, kinks and strain.
- Terminating cables when not using glands: Take sheathing of cables into accessory boxes and equipment and protect against abrasion with grommets.

680 CABLES IN TRENCHES

- Base: Newly prepared bedding.
- Multiple cables in same trench: Set 150 mm apart.
  - Cable formation within trench: Space cables apart by a distance of half the cable diameter.

- Trefoil cable groups and protective conductors: Bind at 1 m intervals.
- Cables below roads and hardstandings: Install within duct and derate cable if longer than 10 m. Extend ducts 1 m each side of hard standing.
- Cable identification and protection: Underground plastics cable protection covers and underground cable marker tape.

710 CABLES IN DUCTS

- Cable installation from cable drums: Submit method statement.
- Single core trefoil cable groups and protective conductors: Install within a single duct and bind at 1 m intervals.

720 CABLES IN CONDUIT AND TRUNKING

- Cable installation: Install cables so that they are orderly and capable of being withdrawn.
- Single core wiring: Arrange using the loop-in method.
- Cables within trunking: Tie at 2 m intervals for cables of the same circuit reference. Label ties with circuit reference number at 10 m intervals.
- Cables in vertical conduit: Provide cable clamps in accessible conduit boxes at 10 m intervals.

740 INSTALLING ARMOURED CABLES

- Galvanized steel guards: Provide where cables are vulnerable to mechanical damage.
- Earthing: Bond armour to equipment and main earthing system.
- Connections to apparatus: Moisture proof, sealed glands and shrouds.

750 INSTALLING FLEXIBLE CORDS

- Cords: Grip securely at connections. Where cord grips do not form an integral part of the accessory or equipment, provide separate proprietary cord grips.

760 JOINTING AND TERMINATING ARMOURED CABLES

- Preparation: Cut cable ends immediately before jointing or terminating.
  - Cables left unconnected for more than 24 h: Seal to prevent moisture ingress.
- Cable stripping:
  - Length of exposed cores and conductors: Minimize. Leave no exposed conductor after termination.
  - Strands: Do not damage when stripping cable cores. Twist together. Do not reduce number. Secure at terminations.
- Joints and terminations: Use qualified cable jointers, using jointing materials, components and installation techniques recommended by the cable manufacturer and the jointing accessory manufacturer.
- Tooling certificate: Submit before installing connectors.
- Cable glands: Provide in accordance with BS 6121-5.
- Cold pour resin and heat shrink joints: Provide in accordance with BS 6910-2 or BS EN 50393.
- Plastics sheathed cables: Seal with proprietary shrink-on end caps.
- Bolted terminal connections to equipment and switchgear without integral cable clamping terminals: Compression or solder type lugs, of correct bore.
- Compression joints: Provide in accordance with BS 7609.
- Conductor labelling: Identify cable conductor cores at each end of cable and at joints.
- Unused cable cores: Connect to earth.

770 JOINTING AND TERMINATING ELASTOMER AND PLASTICS INSULATED CABLE

- Cable glands: Shroud.
- Core connections to equipment without integral clamping terminals: Compression lugs.

780 TERMINATING MINERAL INSULATED CABLES

- Standard: To BS EN 60702-2.
- Terminating copper sheaths: Earth to non-ferrous plate fixed to enclosure.
- Connections to vibrating equipment: Loop cables in a complete circle next to the point of connection.
- Connection to equipment and boxes: LSZH shrouded glands.
- Conductor cores: Identify at cable ends.
- Insulation resistance: Test at the time of termination and 24 h later.
  - Test report: Submit.

V80 Electrical identification

PRODUCTS

310 IDENTIFICATION AND NOTICES
- Standards: To BS 7671, HTM 06/02, HTM 06/03 BS 5499-1 and -5.

330 ELECTRICAL SHOCK TREATMENT SIGNS
- Type: Plastics encapsulated.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

FABRICATION

510A EQUIPMENT LABELS FOR DISTRIBUTION BOARDS
- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Distribution Board reference
  Department served
  Incoming supply cable reference

510B EQUIPMENT LABELS Local isolation switches in plantrooms
- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Reference of equipment served
  Incoming supply cable reference

510C EQUIPMENT LABELS Switch Boards
- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Switchboard reference
  Incoming supply cable reference

510D EQUIPMENT LABELS Functional Units on Main and Sub Switch Boards

- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Description, location and reference of equipment served
  Outgoing cable reference

510E EQUIPMENT LABELS Busbar trunking in risers and in plantrooms

- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Bus bar reference at each floor where in riser and at 5m centres in plant rooms.
  End feed to be labelled with incoming supply cable reference.
  Tap offs to be labelled with description and reference of equipment served.

510F EQUIPMENT LABELS Local isolation switches and fused connection switches in occupied spaces - domestic type

- Material: Face engraved rigid plastic laminate.
- Label size: Submit proposals.
- Colour:
  - Background: White.
  - Lettering: Black.
- Typography:
  - Font: Helvetica medium.
  - Size: submit samples.
- Content:
  Circuit reference.
  Description of equipment served.

520 DIAGRAMS

- Material: Paper print, encapsulated.
- Format: Single line engineering drawings to BS EN 61082-1.
- Information to be included:
  - Supply characteristics.
  - Maximum demand.
  - Cable types and sizes.
  - Switchgear ratings.
  - Protective device types, ratings and function.
  - Prospective fault current values: At each item of switchgear.

- Earth fault loop impedance values: At each item of switchgear.
- Circuits containing equipment vulnerable to testing: Label.

- Mounting: Wall.

EXECUTION

610 LOCATION OF ELECTRICAL IDENTIFICATION AND NOTICES

- Standards: To BS 7671, BS 5499-1 and -5.

620 SAMPLES

- Labels: Submit samples showing material, style, colour, lettering, and fixing method for each label type.

630 ARRANGEMENT

- Location: Submit proposals.
- Fixing: Secure, plumb and level.
  - Type: Rivets.

650 IDENTIFYING SUB-MAIN CABLES

- Labels at both ends: Include circuit reference and cable size.
  - Marker type: Nylon clip-on cable markers.

660 FUNCTIONAL EARTHS

- Labels at cable ends: State the purpose of functional earth cables.
- Instructions for operation and maintenance: Encapsulated card at cable ends.

670 PROTECTIVE CONDUCTORS

- Labelling of busbar and bare conductors: In each compartment or unit and at each accessible position.

680 EQUIPMENT LABELLING AND VOLTAGE WARNING NOTICES

- Electrical equipment: Install labels indicating purpose.
- Safety signs: Install where voltages above ELV exist.
- Voltage warning notices: Label equipment when the voltage exceeds 230 V.
  - Format: To BS 5499-5 8.A.0044, include warnings of the voltage present.

690 CIRCUIT CHARTS

- Location: Distribution boards and consumer units.
- Format: Card within a reusable clear plastics envelope.
  - Size A4.
- Typed information: State outgoing circuit references, their device rating, cable type, cable size, circuit location and number of points served.
- Fixing: Fit to the inside of each unit with nylon hoop and loop self-adhesive pads.
- Switchgear outgoing ways: Label corresponding to the circuit chart.

700A LABELLING OF ELECTRICAL ACCESSORIES BY PROPRIETARY TAPE SYSTEM

- Fused connection units and isolators: Describe function and Identify circuit reference. Socket outlets: Identify circuit reference.
- Text colour: Black.

710 INSTALLING DIAGRAMS

- Location: At main switchgear and At section boards.
  - Installation: Wall mounted with cup & screw fixings.

720 INSTALLING PERIODIC INSPECTION NOTICES

- Location: At the incoming point of supply.
- Frequency of inspection: 3 year.

730 INSTALLING MAINTENANCE NOTICES

- Maintenance procedures: Install notices describing essential maintenance procedures and their frequency.
  - Location: At relevant equipment.

740 INSTALLING ELECTRIC SHOCK TREATMENT SIGNS

- Location: Rooms containing electrical switchgear.
  - Installation: Wall mounted with cup & screw fixings.

750 INSTALLING HAZARD SIGNS

- Location: At each item of switchgear.

Y60 Conduit, trunking and ducting

PRODUCTS

310 CONDUIT, TRUNKING AND DUCTING GENERALLY

- Standard: To BS 7671.
- Proposals: Submit drawings, technical information, calculations and manufacturer's literature.
- Conduit, trunking and ducting sizes not stated: Submit proposals and calculations.

320A RIGID CONDUIT PLASTIC

Final run outs from metalic trays for Extra Low Voltage wiring including, but not limited to, the following systems:
CCTV,
Intruder alarms,
Fire alarms,
Access Controls,
BMS wiring,
Public address,
Induction loops,
TV and radio distribution,
Nurse call,
Assistance alarms.
Structured cabling

- Standard: To BS EN 61386-21.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: PVC-U.
  Electrical properties: With electrical insulating properties.

320B RIGID CONDUIT: BLACK ENAMEL

For lighting and small power cabling generally

- Standard: To BS EN 61386-21.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel.
- Mechanical properties:
  - Resistance to bending: Rigid.
  Electrical properties: With electrical continuity properties.
  Resistance to corrosion to BS EN 61386-1: Class 2.

320C RIGID CONDUIT: GALVANISED

For lighting and small power cabling in plant rooms and areas exposed to the weather

- Standard: To BS EN 61386-21.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel.
- Mechanical properties:
  - Resistance to bending: Rigid.
  Electrical properties: With electrical continuity properties.
  Resistance to corrosion to BS EN 61386-1: Class 4.

380A CABLE TRUNKING AND CABLE DUCTING SYSTEMS FOR MAIN CABLE CONTAINMENT RUNS - GENERALLY SUSPENDED

- Standards: To BS EN 50085-1 and BS EN 50085-2-1 or to BS 4678-4.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel.
- Construction: To include means of preventing contact between liquids and insulated conductors and live parts.
- Type: 2.
  Resistance to flame propagation: Required.
- Electrical properties: With electrical continuity characteristics.
  Protection against corrosive and polluting substances: Medium protection outside and inside.
- Access method: With tools.
- Screening: Not required.
  Sizes:
  - 38 x 38 mm;
  - 50 x 38 mm;
  - 50 x 50 mm;
  - 75 x 50 mm;
  - 75 x 75 mm;
  - 100 x 50 mm;
  - 100 x 75 mm;
  - 100 x 100 mm;
  - 150 x 100 mm;
  - 150 x 150 mm; and
  - 200 x 100 mm.
- Compartments:
  - 1;
  - 2; and
  - 3.
- Accessories and fittings: Factory made of the same material type and finish as trunking or ducting.

380B CABLE TRUNKING AND CABLE DUCTING SYSTEMS METAL WALL MOUNTED

TRUNKING (INCLUDING BEDHEAD & DADO TRUNKING) - IN SHTM 06-01 CLINICAL RISK CATEGORY 3, 4 AND 5 AREAS ONLY.

Refer to Small Power specification for description of Category 3, 4, 5 areas.

- SHTM 06-01 paragraph 14.35 recommends the use of metal trunking & conduit within category 4 & 5 areas. Paragraph 16.50 recommends the use of metal finished sockets in category 3 areas therefore metal trunking & conduit is required in category 3, 4 & 5 areas.
- Standards: To BS EN 50085-1 and BS EN 50085-2-1 or to BS 4678-4.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Metallic.
- Construction: To include means of preventing contact between liquids and insulated conductors and live parts.
- Type: 2.
  Resistance to flame propagation: Required.

- Electrical properties: With electrical continuity characteristics.
  Access method: Without tools.
- Screening: Required.
- Sizes: approximately 210 x 60 mm.
- Compartments: 2.
- Accessories and fittings: Factory made of the same material type and finish as trunking or ducting.

380C CABLE TRUNKING AND CABLE DUCTING SYSTEMS PLASTIC WALL MOUNTED (EXCLUDING BEDHEAD TRUNKING) TRUNKING - IN SHTM 06-01 CLINICAL RISK CATEGORY 1 AND 2 AREAS ONLY.
Refer to Small Power specification for description of Category 1, 2 areas.

- SHTM 06-01 paragraph 14.35 recommends the use of metal trunking & conduit within category 4 & 5 areas. Paragraph 16.50 recommends the use of metal finished sockets in category 3 areas therefore it is permissible to use plastic trunking & conduit in category 1 & 2 areas.
- Standards: To BS EN 50085-1 and BS EN 50085-2-1 or to BS 4678-4.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: PVC-U.
- Construction: To include means of preventing contact between liquids and insulated conductors and live parts.
- Type: 2. Resistance to flame propagation: Required.
- Electrical properties: With electrical insulating characteristics. Access method: Without tools.
- Screening: Not required.
- Sizes: approximately 210 x 60 mm.
- Compartments: 2.
- Accessories and fittings: Factory made of the same material type and finish as trunking or ducting.

460 CONDUIT FITTINGS Generally

- Standards: To BS EN 61386-1 and to BS EN 61386-21, -22, or -23 as appropriate or to BS 4607-1.
- Manufacturer: Match conduit.
- Material: match conduit.
  - Finish: Match conduit.
- Conduit boxes: Fit covers of same material and finish as boxes. Include brass earthing terminals in PVC-U boxes.
- Plugs
  - For metallic boxes: Slotted brass.
  - For non metallic boxes: Hexagon screwed PVC-U.
- Locknuts:
  - For metallic boxes: Hexagonal steel.
  - For non metallic boxes: Hexagonal PVC-U.

475 INTUMESCENT LINEAR GAP SEALS

- Standard: To BS EN 1366-4.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

EXECUTION

610 INSTALLING CONDUIT, TRUNKING AND DUCTING

- Standards: To BS 7671 and in accordance with IET Guidance Note 1.
- Cable trunking or ducting: Provide when multiple conduits running in parallel exceed: 3.
- Preparation: Cut square.
  - Burrs and sharp edges: Make smooth.
- Cross-sectional area: Maintain throughout the conduit, trunking and ducting length.
- Arrangement: Position vertically and horizontally in line with equipment served, and parallel with building lines.
- Conduit in walls: Avoid concealed horizontal runs.
- Distance from other services running parallel (minimum):
  - Generally: 150 mm.
  - Above radiators: 1000 mm.
  - Steam services: 300 mm.
- Fire barriers: Provide to maintain integrity of fire compartments.
- Rewireable installations: Enable rewiring from accessible boxes or accessories only.
- Support: Independently fix and support conduit, trunking and ducting from building structure.
- Cleaning: Clean insides of conduit, trunking and ducting before installing cables.
- Cabling: Install when conduit, trunking and ducting enclosure is complete.
- Submittals: Submit manufacturer's technical information and drawings showing the proposed routes of conduit, trunking and ducting and the location of service outlets.

620 PROTECTION OF METALLIC CONDUIT, TRUNKING AND DUCTING

- Joints and ends: Remove grease, oil, dirt and rust before applying protective paint. Paint immediately following installation.
- Protective paint: Compatible with conduit, trunking and ducting finish.
  - Type: Match factory finish.

630 INSTALLING CONDUIT GENERALLY

- Fixing: Fix securely. Fix boxes independently of conduit.
- Changes of direction: Conduit boxes or bends site formed by machine. Do not use elbows, tees or inspection bends.
- Joints: Manufacturer's jointing fittings.
  - Number of joints: Minimize.
  - Lengths of conduit: Maximize.
  - Open ends: Plug.
  - At movement joints in structure: Manufactured expansion coupling. Install adaptable boxes on both sides of joint at a maximum distance of 300 mm.
- Connections to boxes, trunking, equipment and accessories: Screwed couplings with rubber bushes at open ends.

- Conduit boxes: Install flush with finished surfaces. Provide extension rings if required.
  - Fixing screws: Countersunk, or round-headed screws.
  - Number of fixings (minimum): For conduit boxes use 2. Larger fittings use 4.
  - Lids: Fasten with brass slot pan head screws.
- Rear outlet boxes: Locate where surface conduits pass through walls to external equipment.
- Draw-in boxes:
  - Spacing (maximum): 10 m.
  - Number of bends between draw-in boxes (maximum): 2.
  - Floors: Do not install draw-in boxes in floors.
- Suspended ceiling installations: Fasten outlet boxes to structure above ceiling.

640 INSTALLING RIGID METALLIC CONDUIT

- Fixings: Spacer bar saddle.
- Joints: Screwed.
- Threaded conduits: Tightly screw to ensure electrical continuity, with no thread showing.
- Conduit connections to boxes and items of equipment, other than those with threaded entries: Earthing coupling with male brass bush and protective conductor.

650 INSTALLING RIGID NON METALLIC CONDUIT

- Fixings: Spacer bar saddle.
- Joints: Threaded.
- Conduit connections to boxes and items of equipment: Threaded bushed entries.

660 INSTALLING PLIABLE AND FLEXIBLE CONDUIT

- Fixings: Spacer bar saddle.
- Joints: Threaded.
- Connections to trunking: Female adaptors and externally screwed brass bushes.
- Connections to equipment: Threaded bush.

670 INSTALLING CONDUIT IN CONCRETE

- Fastening: Fix securely to reinforcement. Fix boxes to formwork to prevent displacement of boxes.
- Concrete cover to conduit: 30 mm.
- Conduit in structural slabs: Submit drawings showing proposed route and location.

680 INSTALLING CONDUIT CONNECTIONS TO EQUIPMENT

- Surface mounted equipment:
  - Concealed conduit: Conceal the final connection.
  - Exposed conduit: Contain the final connection from the conduit box within flexible metal conduit.
- Equipment subject to vibration: Flexible metal conduit terminating in swivel connectors.
  - Length of conduit: Adequate for removal of equipment for maintenance.
- Connections to external equipment: galvanised conduit.

690 INSTALLING TRUNKING GENERALLY

- Supports/ mounting arrangement: Suspension rods and steel channels.
- Joints: Manufacturer's jointing fittings. Maintain rigidity of trunking across joint.
  - Number of joints: Minimize.
  - Lengths of trunking: Maximize.
  - Open ends: Blank using manufacturer's removable end caps.
  - Metal edging: Protect with PVC edging strip.
  - Electrical continuity: Maintain at each joint with a copper link fitted on the outside of the trunking.
- Connections to conduit, boxes, equipment and accessories: Screwed couplings, adaptors, connectors and glands, with rubber bushes at open ends.
- Connections to trunking covers: Minimize. Submit proposals for lid removal.
- Electrical continuity of covers: Electrically continuous with the trunking or provide protective conductors.
- Access: Provide space around trunking to permit access for installing and maintaining cables. Set out access with covers on a continuous face to allow cabling to be laid in throughout its entire length.
- Trunking passing through building fabric openings: Provide fixed trunking covers. Extend covers 50 mm from both sides of the opening.
- Cable retaining straps: Required except when trunking cover is on top.

720 DRAINAGE OF CONDUIT, TRUNKING AND DUCTING

- Drainage outlets: Locate at lowest points in conduit, trunking and ducting installed externally, and where condensation may occur.

770 SUPPORTS AND FIXINGS

- Suspension systems: Proprietary, comprising channel sections with return lips and accessories.
  - Finish and colour: Match conduit, trunking or ducting as appropriate.
- Supports and fixings: Select to prevent deterioration by electrolytic action.
- Supports and fixings in locations where moisture may occur: Corrosion resistant.

COMPLETION

910 CLEANING

- Electrical equipment: Clean immediately before handover.

920 INSPECTION AND TESTING

- Standard: To BS 7671.
- Electrical properties: Measure electrical continuity and insulating properties of conduit, trunking and ducting. Submit results.

930 DOCUMENTATION

- Drawings: Submit, showing the location of conduit, trunking, ducting and service outlets.
  - Dimensions: Include sufficient to locate components accurately.
- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system

Y63 Cable supports

PRODUCTS

310 SELECTION OF CABLE SUPPORTS
- Standards: To BS 7671 and in accordance with IET Guidance Note 1.
- Proposals: Submit drawings, technical information, calculations and manufacturer's literature.
- Sizes not stated: Submit proposals and calculations.
- Spare capacity: 25%.

320 CABLE BASKETS for main wiring runs:
CCTV,
Intruder alarms,
Fire alarms,
Access Controls,
BMS wiring,
Public address,
Induction loops,
TV and radio distribution,
Nurse call,
Assistance alarms,
Structured cabling.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel wire.
  - Diameter: Submit proposals.
- Coating material: Hot dip galvanized.
- Sizes:
  - Width: Submit proposals.
- Side height: Submit proposals.
- Features:
  - Segregation: Cable dividers.
  - Protective cover: Not required.

330A CABLE LADDERS For 11,000V cables
- Standard: To BS EN 61537.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel.
- Resistance against flame propagation: Non flame propagating.
- Electrical properties:
  - Continuity characteristics: With electrical continuity.
- Conductivity characteristics: With electrical conductive system component.
- Coating material: Hot dip galvanized.
  Mechanical properties:
  - Cable ladder free base area: Board's choice.
  - Resistance to impact: Up to 50 J.
- Width:
  - 100 mm;
  - 200 mm;
  - 300 mm;
  - 400 mm;
  - 500 mm;

- 600 mm;
- 800 mm; and
- 1000 mm.

- Features:
  - Segregation: Not required.
  - Protective cover: Required.

340A CABLE TRAYS 400/230V Sub mains cabling

- Standard: To BS EN 61537.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Steel.
- Resistance against flame propagation: Non flame propagating.
- Electrical properties:
  - Continuity characteristics: With electrical continuity.
  - Conductivity characteristics: With electrical conductive system component.
- Coating material: Hot dip galvanized.
  Mechanical properties:
  - Cable tray free base area: Board's choice.
  - Resistance to impact: Up to 50 J.
- Width:
  - 100 mm;
  - 200 mm;
  - 300 mm;
  - 400 mm;
  - 500 mm;
  - 600 mm;
  - 800 mm; and
  - 1000 mm.
- Features:
  - Flanged: Return flanged.
  - Segregation: Not required.
  - Protective cover: Not required.

350 CABLE SUPPORT COMPONENTS

- Components generally: Corrosion resistant where moisture may occur.
- Joints and expansion couplers: Use cable support manufacturer's products.

360 PROTECTIVE COVERS

- Type: Flanged.
  - Profile: Flat.

370A CABLE SUPPORT BRACKETS: SUBMAINS CABLES

- Standard: To BS 6946.
- Type: Board's choice.
- Finish: Match cable supports.

380A CABLE FASTENINGS

- Use and types:
  - Submain cables<95 mm²: Polyethylene one piece overlapping single fixing clamps.
  - Submain cables >95 mm²: Aluminium two piece twin fixing clamps.
  - Trefoil grouped submain cables: Aluminium trefoil single or twin fixing clamps.

  Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Fire resistant power supply cables: cast iron cleats.

385 CABLE CLEATS

- Type:
  - Aluminium trefoil twin fixing clamps;
  - Aluminium two piece twin fixing clamps; and
  - LSZH two piece twin fixing clamps.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Fire resistant power supply cables: cast iron cleats.

390 CABLE TIES

- Type: Wrap around self locking releasable.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
  - Material: Nylon.

395A CABLE BANDS: FIRE ALARMS CABLING

- Type: Perforated metal bands.
  - Material: Copper.
  - Protective covering: LSZH.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

EXECUTION

610 INSTALLING CABLE SUPPORTS

- Standards: To BS 7671 and in accordance with IET Guidance Note 1.
- Preparation:
  - Burrs and sharp edges: Make smooth.
  - Cutting: Minimize. Cut square along an unperforated line. Make good edges.
  - Treatment of cut surface: Extend 25 mm beyond the cut. Match finish of cable supports.
- Width: Maintain throughout the cable support length.
- Access: Provide space around cable supports to permit access for installing and maintaining cables.
- Joints and expansion couplers: Locate between the bracket support and the quarter point.
  - Number of joints: Minimize.
  - Lengths of cable supports: Maximize.
  - Ends: Blank with end plates
- Holes in cable supports for the passage of cables: Grommet.
- Fire barriers: Provide where required to maintain fire performance of fabric.

- Support: Independently fix and support from building structure.
  - Clearance from building fabric (minimum): 20 mm.
  - Proposals: Submit.
- Components: Avoid contact between dissimilar metals.
- Routing of cable supports: Submit drawings showing the proposed routes.

620 MULTIPLE CABLE RUNS

- Cable supports: Required when cables running in parallel exceed: 3.

630 INSTALLING CABLE TRAY AND CABLE LADDER

- Changes of size and direction: Manufacturer's accessories of the same material type, pattern, finish and thickness as cable supports.
  - Site-formed bends: Not permitted.
  - Cable bends: Radiused.

640 INSTALLING CABLE BASKET

- Joints:
  - Cut: Adjacent cross basket wires.
  - Earth conductors: Connect across joints.
- Accessories: Form on site and connect with basket manufacturer's coupling components.

650 INSTALLING PROTECTIVE COVERS

- Location: Cables requiring mechanical protection.

660 CABLE INSTALLATION

- Cabling: Install when cable supports are complete.
- Preparation: Clear cable path of debris.
- Cable pulling: Submit method statement.
- Fastening: Secure cables, do not indent sheaths.
  - Spacing (maximum): 600 mm.

670 INSTALLING CABLE SUPPORTS ON ROOFS

- Location: Elevate above roof.
- Mounting: Load spreading supports.

680 INSTALLING BRACKETS FOR CABLE SUPPORTS

- Suspensions: Threaded rod fixed to channel with shake proof washers and hex nuts.
- Cable supports: Hold down with clamps and spring channel nuts.

COMPLETION

910 INSPECTION AND TESTING

- Standard: To BS 7671.
- Electrical properties: Measure electrical continuity and insulating properties of cable supports. Submit results.

Y65 Electrical accessories

PRODUCTS

310 PRODUCTS GENERALLY
- Standard: To BS 5733.
  - Switches: To BS EN 60669-1.

320 ELECTRICAL ACCESSORIES Occupied spaces
- Electrical accessories manufacturer: Board's choice.
  - Product reference: Board's choice.
- Plate:
  - Material: Plastics.
  - Finish: White.
  - Insert colour: Manufacturer's standard.
- Mounting: Recessed.
- Earthing terminal: Required.
- Cable termination:
  - Method: Screw.
  - Arrangement: Board's choice.

320A ELECTRICAL ACCESSORIES Plant rooms
- Electrical accessories manufacturer: Board's choice.
  - Product reference: Board's choice.
- Plate:
  - Material: Aluminium.
  - Finish: Manufacturer's standard.
  - Insert colour: Manufacturer's standard.
- Mounting: Surface.
- Earthing terminal: Required.
- Cable termination:
  - Method: Screw.
  - Arrangement: Board's choice.

340 LIGHT SWITCHES Occupied spaces.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Application: Internal.
- Ingress protection to BS EN 60529: IP 2X.
- Rating: 20 A.
- Actuating method: Standard rocker bar.
- Mounting: Flush.
- Poles: Double pole.

340A LIGHT SWITCHES Plant rooms.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Application: Internal.
- Ingress protection to BS EN 60529: IP 2X.
- Rating: 20 A.
- Actuating method: Standard rocker bar.
- Mounting: Surface.
- Poles: Double pole.

350 DIMMER SWITCHES AND CONTROLS Where required

- Standards: To BS EN 60669-2-1 and BS EN 55015.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Type: Board's choice.
- Rating: 1000 W.
- Suitable for the following loads: Fluorescent.
- Control: Momentary.

360 FUSED CONNECTION UNITS GENERALLY

- Standard: To BS 1363-4.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Control: Switched.
- Indicator lamp: Required.
- Fuse carrier access: Screw.
- Poles: Double pole.
- Flex outlet: Base entry.

370 CABLE OUTLETS GENERALLY

- Standard: To BS 5733.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Flex outlet: Base entry.

380A STANDARD SOCKET OUTLETS: SHTM06-01 CLINICAL RISK CATEGORY 3, 4 & 5
AREAS METAL FRONT PLATE

- Standard: To BS 1363-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Type: Twin.
- Control: Switched.
  - Switch position: Submit proposals.
  - Indicator lamp: Not required.
- Interlock: 3 pin equal pressure.
- Accessories:.

MATERIALS - METAL FRONT PLATE

380B STANDARD SOCKET OUTLETS: SHTM06-01 CLINICAL RISK CATEGORY 1 & 2 AREAS PLASTIC FRONT PLATE

- Standard: To BS 1363-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Type: Twin.
- Control: Switched.
  - Switch position: Submit proposals.
  - Indicator lamp: Not required.
- Interlock: 3 pin equal pressure.
- Accessories:.

MATERIALS - PLASTIC FRONT PLATE

380C STANDARD SOCKET OUTLETS: ISOLATED POWER SUPPLY IPS SOCKETS GENERALLY

- Standard: To BS 1363-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Type: Twin.
- Control: Switched - DOUBLE POLE.
  - Switch position: Submit proposals.
  - Indicator lamp: Not required.
- Interlock: 3 pin equal pressure.
- Accessories: Dual earth terminals

MATERIALS - METAL FRONT PLATE

MEIGaN COMPLIANT CLEAN EARTH SOCKET
ENGRAVED AS MEIGaN REQUIREMENTS

400 INDUSTRIAL SOCKET OUTLETS Single phase - internally

- Standards: To BS EN 60309-1 and BS EN 60309-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 44.
- Material: Polycarbonate.
- Voltage rating: 200-250 V a.c..
- Current rating: as drawn.
- Frequency rating: 50 60 Hz.
- Pin configuration: 2 pole and earth.
- Mounting: Surface angle mount.
- Controls: Integral switch with interlock.

400A INDUSTRIAL SOCKET OUTLETS Single phase - externally

- Standards: To BS EN 60309-1 and BS EN 60309-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 67.
- Material: Polycarbonate.
- Voltage rating: 200-250 V a.c..

- Current rating: as drawn.
- Frequency rating: 50 60 Hz.
- Pin configuration: 2 pole and earth.
- Mounting: Surface angle mount.
- Controls: Integral switch with interlock.

400B INDUSTRIAL SOCKET OUTLETS Three phase - internally

- Standards: To BS EN 60309-1 and BS EN 60309-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 44.
- Material: Polycarbonate.
- Voltage rating: 380-415 V a.c..
- Current rating: as drawn.
- Frequency rating: 50 60 Hz.
- Pin configuration: 3 pole, neutral and earth.
- Mounting: Surface angle mount.
- Controls: Integral switch with interlock.

400C INDUSTRIAL SOCKET OUTLETS Three phase - externally

- Standards: To BS EN 60309-1 and BS EN 60309-2.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 67.
- Material: Polycarbonate.
- Voltage rating: 380-415 V a.c..
- Current rating: as drawn.
- Frequency rating: 50 60 Hz.
- Pin configuration: 3 pole, neutral and earth.
- Mounting: Surface angle mount.
- Controls: Integral switch with interlock.

405 INDUSTRIAL PLUGS GENERALLY

- Standards: To BS EN 60309-1 and BS EN 60309-2.
- Manufacturer: As electrical accessories manufacturer.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: as socket.
- Material: Polycarbonate.
- Voltage rating: as socket.
- Current rating: as socket.
- Frequency rating: 50 60 Hz.
- Pin configuration: as socket.
- Number to be supplied: one per socket.

450 SHAVER SUPPLY UNITS GENERALLY

- Standard: To BS EN 61558-2-5.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 41.
- Mounting: Flush.

- Output voltage: 115 V and 230 V.
- Rating: 20 V·A.
- Isolating transformer: Integral.

460 DOUBLE POLE SWITCHES GENERALLY in occupied spaces

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Rating: as drawings.
- Indicator lamp: Not required.

460 UNSWITCHED DOUBLE POLE SWITCHES GENERALLY in occupied spaces

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Rating: as drawings.
- Indicator lamp: Not required.

470 COOKER CONTROL UNITS GENERALLY

- Standard: To BS 4177.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Supply to cooker: as drawings.
- Switched socket outlet: Not required.
- Indicator lamp: Required.

480 COOKER CONNECTION UNITS

- Standard: To BS 5733.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 2X.
- Mounting: Flush.
- Individual terminal block capacity (minimum): 10 mm² stranded cable.

500 CEILING LIGHT SWITCHES GENERALLY

- Standard: To BS EN 61058-2-1.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Ingress protection to BS EN 60529: IP 4X.
- Mounting: Surface.
- Rating: 10 A.
- Configuration: As drawings.
- Cord colour: White.

EXECUTION

610 INSTALLING ELECTRICAL ACCESSORIES

- Standard: To BS 7671.

620 ARRANGEMENT

- Locations: As drawings.
  - Coordinate with other wall or ceiling mounted equipment. Submit proposals.
- Positioning: Accurate and square to vertical and horizontal axes.
- Alignment: Align adjacent accessories on the same vertical or horizontal axis.
- Fixing: Secure, plumb and level.
- Mounting heights (finished floor level to underside of accessory):
  - Light switches: 1200 mm.
  - Single voltage shaver outlets: 1200 mm.
  - Shaver supply units: 1200 mm.
  - Socket outlets: 450 mm.
  - Fan isolators: Adjacent fan.
  - Cooker control units: 200 mm above worktop.
  - Cooker connection units: 600 mm.
- Separation distance between adjacent accessories: (minimum): 30 mm.

630 GRID SWITCH PLATES

- Spare modules: Provide blank inserts.

640 INSTALLING LIGHT SWITCHES

- Multigang switches: Connect so that there is a logical relationship with luminaire positions.
  - Unused switch spaces: Fit with blanks.
  - Segregation: Internally segregate each phase with phase barriers. Include warning plates.

COMPLETION

910 FINAL FIX

- Accessory faceplates (Grid accessories only): Fit after completion of building painting.

RHSC and DCN EDINBURGH
MV INSTALLATIONS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central energy centre to the South of the hospital houses heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Incoming Electrical Supplies and Main MV Switch Panels
- MV Site Distribution Systems
- MV Standby Generation
- MV Earthing Systems
- Electrical Network Management Systems

The foregoing summary is intended for the general guidance of the Board in the preparation of his Tender. Any omission from it shall not relieve him of his obligation to carry out the whole of the works herein described and/or indicated on the drawings

3.0 SPECIFIC EXCLUSIONS

Fire alarm systems, lightning protection systems and telecommunications systems requirements are generally covered in separate documentation.

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of SHTM 06-01, IEE Wiring Regulations BS 7671 (17th Ed.), current legislation, regulations and industry standards unless otherwise stated.

5.0 DESIGN CRITERIA

Electricity Supply Characteristics

The site will be provided with two new 11000Volt 50Hz, three phase electrical supplies from SPEN's MV network. These individual electrical supplies will be derived from the outgoing terminals of SPEN's automatic change over arrangement which shall be located in the adjacent switch room.

Drawings

As part of the development of the design Project Co. shall prepare general arrangement drawings of the works to be provided. These shall be based on the Architect's base drawings and coordinated with other services and building elements. A proposed drawing list shall be submitted with the Tender.

6.0 LIAISON

Project Co. shall include for liaison with:-

SPEN. Project Co. shall include for liaison with SPEN for the design of the services in/for the 11kV sub-station building The systems to be provided in the main 11kV substation include primary and secondary lighting, small power systems, fire alarm systems and comms systems for which further details are contained in other specifications

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety Regulations.

Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the small power System.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of small power installations.

7.0 SYSTEMS

7.1 Incoming Electrical Supplies

SPEN are providing two incoming electrical supplies each with a rating of 3MVA. These are to be arranged such that if either fails the other is capable of taking the complete building load.

The incoming MV electrical supplies will be terminated into the circuit breaker switch board which is designed to supply the electrical needs of the new development and includes an auto change over arrangement and two feeder breakers for the project which all need be monitored by the Electrical Network Management Systems (ENMS).

SPEN shall make volt free contacts available for status monitoring of the 4 devices which shall be run to a wall mounted interface demarcation box.

Project Co. shall liaise with SPEN examining their design drawings and proposals to verify the equipment being provided by SPEN is compatible with both the MV cables and the ENMS monitoring he is providing.

The RHSC-DCN supplies shall be terminated into the RHSC-DCN circuit breaker board which shall be designed to integrate with the generator circuit breaker board and provide supplies to the RHSC-DCN ring mains.

7.2 MV site distribution systems

Outline description

The MV systems will be required to safely distribute the outputs from the available incoming supplies, MV standby generators, to the distribution load centres indicated on the drawings. The systems shall be designed and installed to maximise the security of supply to each of the load centres.

The MV systems to be provided principally include MV switch panels, cables, ring main units, cast-resin transformers and generators all as indicated on the drawings WW-XX-XX-SC-530-001.

The outgoing circuits shall be interlaced between the four ring main units with the open point loaded in Sub-Station 2. The cabling for these circuits will be buried direct in soft landscapes and drawn into cable ducts and pits when under hard standings and either laid in cable trenches or cleated to cable ladder when installed within buildings.

The minimum normal depth for all buried MV cables will be 1000mm below finished ground level.

Details of the MV switchgear are contained on the drawings and in the NBS clauses accompanying this specification.

The MV ring main shall operate on an open circuit basis, effectively as two radial feeds, such that in the event of a single cable fault only one of the radial feeds is isolated by the MV circuit breaker. Each of the ring main units shall however be fitted with earth fault passage indicators to show the direction/location of the earth fault around the circuit.

Energy Centre and Site Distribution

Details of the site cable routes and the cable routes within the Energy Centre are indicated on the drawings accompanying this specification.

7.3 MV Standby Generation

General

The standby generation facilities to be provided principally include:-

- 3No 2000kW, 2500MVA, 50hz 11000V three phase, diesel engine powered generators.
- Monitoring and control equipment
- Control and switch gear
- Acoustic treatment of the generator rooms to ensure the specified noise levels are not exceeded.
- Engine exhaust systems
- Fuel storage and transfer systems

The systems shall be as noted on the drawings, as described in this specification and as described in all appropriate specifications prepared for the electrical engineering works.

Each of the individual standby generators shall be complete with a dedicated control panel as described hereinafter. These panels shall be located in the control room and shall be linked to an adjacent ENMS control panel.

Fuel Storage

Local storage and transfer systems shall be provided to give approximately 6 hours of full load run time for each generator.

The Individual generators shall each be provided with a local daily service fuel tank to hold a minimum of 3200 litres of fuel. The daily service tanks shall be provided with a minimum of a further 15% of overfill capacity into which the high level float switches shall be fitted.

The fuel transfer/pumping systems to this local tank from the bulk storage tanks are outlined in a separate specification. The daily services tank shall however be fitted with low and high level alarm switches and contacts for:-

- Tank ‘empty’ alarm output to the BEMS – set at 15% level.
- Tank ‘emptying’ float switch and contact to signal the re-filling pump to start and inlet valve to open. This shall also have an output to the BEMS – set at 25% level

- Tank ‘full’ float switch/contact and cut-out for shutting down the re-fill pump and closing the refill valve. This shall also have an output to signal to the BMS system – set at 100% level
- Tank ‘over full’ switch/contact to both close a second motorised valve and to give an over full alarm output the BMS – to be at 110% level.

The daily service tanks shall be fitted with a fuel dump control valve and pipe/line.

The daily service tanks to each generator engine hall shall be linked to a common fire wire system that in the event of a local fire shall cause:-

- The local fuel to be dumped back into the bulk storage on the ground floor.
- Close a free fall fire valve on each fuel pipe entering the engine hall
- Cause a fire alarm to be sounded

Fuel flow and return pipework will be provided from each generator to its daily service tank.

All fuel pipework, tanks and valves shall be compliant with the requirements noted in specification WW.A.P.1.2.17.

Where fuel pipework is to be installed at low level accross floors it shall be protected against mechanical damage and/or treated to ensure it does not form a tripping hazard. This shall be by installing it into a floor trench (subject to Structural Engineers approval), or installing it immediatly beneath the floor slab or providing a high visibility chamferred edged cover.

Required Noise Levels

The whole of the installation shall be acoustically treated to ensure the following sound pressure levels are not exceeded:-

- 3m from the Energy Centre - 62dB (A).
- 3m from the exhaust discharge – 62dB (A).
- Within the generator control rooms and MV switch rooms – 50 dB (A).

Combustion/Cooling Air and Sound Attenuation.

The acoustic treatment to be provided as part of the works shall include:-

- Acoustic air inlet and discharge weather louvres.
- Air inlet and discharge attenuators with automatically opening and closing dampers on the internal faces of the units.
- Acoustic lining of the generator hall walls and ceilings.
- Acoustic wall and doors, as required, between each pair of generators to reduce sound reverberation and thereby reduce the overall noise output.

The discharge air paths shall be sealed against the building fabric to prevent leakage back into the engine rooms and thereby assist with the prevention of overheating of individual generating sets or groups of generating sets.

Weather Louvres

Louvres shall be provided for the air inlet and discharge from each set (3 No).

The louvres shall be selected to form part of the overall acoustic treatment of the generator installations and shall prevent water ingress into the building under all operating conditions.

The inlet louvres shall be sized and fixed/sealed to the building fabric in such a way as to enable them to be removed and to enable individual inlet attenuators to be removed and replaced through their louvre openings.

The discharge louvres shall be sized and fixed/sealed to the building fabric in such a way as to enable them to be removed and to enable removal/ replacement of the discharge attenuators and the generator sets through their openings.

Each of the inlet and discharge louvres shall have a long lasting finish to a colour to be agreed with the Architects.

Each louvre shall be complete with a bird mesh grill.

Inlet and Discharge Attenuators.

Separate air inlet and discharge attenuators pairs shall be provided for each of the 3 No generators set being provided as part of the current works.

The attenuators shall be selected to form part of the overall acoustic treatment of the generator installations.

Attenuators shall be of the dissipative type and constructed of specially selected high quality materials. Outer casings shall be made of galvanised sheet steel.

Each unit shall constructed to prevent air leakage

Internal splitter units shall have aerodynamic leading and trailing edges to reduce pressure drop across them.

The acoustic infill shall be of inorganic high density bonded long stranded rock wool sufficient to obtain the specified acoustic performance and packed under compression to eliminate voids due to vibration and settling. Infill material shall insect, vermin and moisture proof.

The louvres shall be structurally designed to withstand the pressure drops across them under operating conditions.

Automatic multi-bladed dampers shall be provided on the inlet attenuators. The dampers shall be arranged to open on the start signal for the appropriate standby generator and to close once that engine has stopped operating.

Engine Exhausts

Each engine shall be complete with its own exhaust systems designed to safely discharge the exhaust gasses to atmosphere and to silence the noise output to acceptable levels.

Each engine being provided with both primary and secondary silencers that shall be fitted in series.

The primary silencers shall be of a multiple chamber reactive type designed for low frequency attenuation. The secondary exhaust silencers shall be straight through absorptive type for mid to high frequency attenuation.

Silencers shall be of welded steel construction. The acoustical infill shall be formed from inorganic high density bonded material capable of operating at the maximum service temperatures of 650 degrees celsius.

Exhaust pipe shall be constructed from high quality steel with welded joints.

The noise level 3 m from the exhaust discharge with 3 sets running, shall be no more than 62 dB (A).

The whole of the internal exhaust systems shall be complete with thermal insulation and stucco aluminium cladding to reduce the temperature of the accessible exhaust components to safe levels.

Vertical runs of discharging exhaust shall have drain pipes and drain valves.

7.4 Earthing Systems

The whole of the electrical systems shall be earthed and bonded to accord with the requirements of BS 7430, BS 7671 and Scottish Power Energy Networks (SPEN). The requirements for this are interpreted onto the drawings accompanying this specification.

Under mains supply conditions (Mains only and generators paralleling with the mains) the systems shall rely on SPEN's earth.

Under generator only conditions when all generators are operating in parallel the systems shall be earthed to one generator's neutral via the appropriate neutral earthing panel and its MV resistor.

The neutral earthing panels shall be equipped with a spare/paralleled circuit earth resister in a separate compartment such that one can be removed while the other is in use.

The neutral earthing shall be controlled by the Electrical Network Management System and the generator control panels

Two sets of earthing rods shall be provided to form a connection from the MV earth bars to the general mass of earth. These shall each comprise a minimum of 4 No parallel earth electrodes driven to depth of 4.8m and contained in concrete inspection chambers. The minimum resistance to earth of each set of earth electrodes is one Ohm. Where this is not achieved then either additional earth rods shall be installed or the installed units shall be driven deeper.

7.5 Electrical Network Management Systems

Generally

The new MV electrical systems will principally comprise two incoming supplies feeding into a distribution network whose principle equipment includes approximately 18 No MV circuit breakers, 4No transformers, 3No MV Generators, as well as outputs for the connection of generator testing load bank modules and the CHP unit.

The Main LV systems will principally comprise approximately 4No main LV switch panels, 30No sub-main panels supplying the Life Safety, critical, essential, less-essential and non-essential electrical systems throughout the new development. The Sub-main LV distribution systems will comprise sub-main panels, bus-bars, switches/circuit breakers etc as shown on the drawings.

An Electrical Network Management System (ENMS) will be required to monitor and automatically control the electrical systems/network during normal and abnormal conditions.

The ENMS will be required to:-

- Work in conjunction with the protection devices provided throughout the MV and LV distribution systems and where necessary carry out alternative switching of the systems as a result of MV or LV devices switching or tripping.
- Provide ‘event’ alarms at each control panel and on each display panel.
- Have password controlled ‘event’ acknowledgement at each control panel and in the FM office.
- Record MV and LV system events and, when required, provide print-outs showing all events.
- Enable authorised persons to control and carry out selective switching of the systems (manual override of any controlled/monitored device). This facility is to be password protected at each control/interface point and shall be available only in the generator control rooms and in the control rooms associated with the main incoming MV switch panel.
- Have separate passwords (higher levels of authorisation) for control of the MV systems.
- Have separate passwords for each user of the system and be able to record which user carried out which operation, alarm acknowledgement etc.
- Provide indication of the condition of the electrical network (hierarchical schematics) including the status of each item connected/monitored. This shall be achieved by the displaying of systems schematics on each of the display panels and identifying which of the devices are Closed, open, tripped withdrawn etc.
- Under partial or total mains failure conditions match the available supplies to the load and where necessary match the connected load to the available supplies.
- Control the switching of loads to meet the load step limits of the mains and the generators under all conditions.

- Provide output enable signals to the BMS to enable the BMS to start and stop (By the absence of the signals) the mechanical plant including chillers, fans, pumps, boilers, humidifiers etc. In this connection it should be noted that the BMS will need to be specially designed to accept the connection or removal of these ENMS signals as 'priorities' which need to be acted upon at a speed to suit the switching requirements of the Electrical systems.
- Apply the loads to the generators in an expedient manner to an agreed priority schedule.
- Control the necessary synchronisation with the mains and switching of the systems for both generator testing and when the mains are re-established after mains failure.
- Provide agreed control of the neutral earthing resistors for the various mains/generator paralleling situations.
- Capture and relay switchgear status, energy consumption, harmonic content, operation counter and fault indication to each of the interface control units and display these on the indicated schematics
- Be modular in its nature and be able to be extended
- Have 25% spare capacity.

The ENMS shall use dedicated cables that are not used for any other purpose.

Separate 'A' and 'B' ENMS system control units will be required and will be linked to provide the required hot standby and increased resilience. The linking between the two systems shall be as indicated in the concept schematic.

ENMS user display and control units will be required at the following locations:-

- The Energy Centre control room— control panel and systems display.
- Main MV Switchroom — control panel and systems display.
- Main LV Panel; A1 - systems display
- Main LV Panel; A2 - systems display
- Main LV Panel; B1 - systems display
- Main LV Panel; B2 - systems display
- the Estates Office – display unit and control unit with only facilities to accept alarms (i.e. it shall not be possible to control switching from this location)
- Security Control room – display unit and control unit with only facilities to accept alarms (i.e. it shall not be possible to control switching from this location)

Each systems display unit shall provide hierarchical schematics of the systems showing the status of the devices controlled and/or monitored. This including switchgear status, energy consumption, harmonic content, operation counter and fault indication

Power supplies to local ENMS panels shall be provided from local battery backed power supply units that have sufficient autonomy to maintain the local systems for a minimum period of 72 hours under mains failure conditions. Each of these power supply units shall be monitored such that alarms are raised in the event of a failure.

Systems Operation

General

The ENMS will be arranged/programmed to control the electrical systems to make the best use of the available sources of supply (be that mains and/or generators).

- Matching of the Generators to required load
  - When the load is less than the capacity of the sets available (including synchronised/paralleled units and available non-running units) then a minimum of 500kVA of spinning reserve shall normally be paralleled.

- Matching of the load to the available generators.
  - Low priority numbers (less essential) shall be disabled until sufficient generators are available.
  - Allocation of 'load priorities' to various load centres, energy users, load types etc. all to enable the highest priority loads to be connected first or disconnected last while maintaining the systems within design limits.

Although the exact load prioritisation schedule will need to be agreed with the Hospital Board it is expected to include various priority ratings such as those noted in the table below:-

Priority Rating	Outline description of Load
1	Statutory requirements – Evacuation lifts, smoke extract/pressurisation fans, sprinkler pumps, wet riser pumps etc. Generator auxiliary supplies
2.1	Riser 1 Category 4 and 5 area life safety lighting and small power.
2.2	Riser 2 Category 4 and 5 area life safety lighting and small power.
2.3	Riser 3 Category 4 and 5 area life safety lighting and small power.
2.4	Riser 4 Category 4 and 5 area life safety lighting and small power.
3.1	Riser 1 Category 3 area Heating and Vent systems
3.2	Riser 2 Category 3 area Heating and Vent systems
3.3	Riser 3 Category 3 area Heating and Vent systems
3.4	Riser 4 Category 3 area Heating and Vent systems
4	Essential heating and systems
5	Vertical transportation
6	Imaging equipment supplies
7.1	Less Essential Heating and Ventilation Systems
7.2	Less Essential Heating and Ventilation Systems
8	Imaging equipment supplies
9.1	Chillers and cooling – stage 1
9.2	Chillers and cooling – stage 2
9.3	Chillers and cooling - stage 3

It should be noted that some of these load priorities may, subject to actual loads, be either switched together or switched at different times or even be sub-divided further as the design is finalised.

Mains failure – When RHSC MV systems healthy

Under normal mains failure conditions (when the RHSC-DCN MV infrastructure is healthy) the standby generator systems will be required to start and synchronise sufficient generator sets to permit the following minimum RHSC-DCN loads to be re-connected:-

Elapsed Time from generator start signal	**Outline description of loads to be connected**	**Load STEP to be connected (kVA)**
15 seconds	RHSC-DCN and energy centre - Lighting, small power and statutory life safety	1000
25 seconds	RHSC-DCN and energy centre - General loads	1000
35+ Seconds	RHSC-DCN I and energy centre - Non essential loads	1000

Under extreme conditions when generators sets may not be available to start (due to maintenance of individual units or switchgear not being available etc) the 15 and 25 second loads to be applied shall also be as the above table with loads adjusted proportionally for the number of units available to start.

Under Mains failure conditions the initial load sequencing shall be as follows:-

- Start signal to transfer to alternative SPEN supply (Wait 1 second)
- Start Signal to Generator (Wait 2 second)
- Generator Synchronising Period (+12 seconds)
- Transfer to alternative SPEN supply (If available)
- Commence sequential load connection process
- If alternative SPEN supply not available
  - RHSC Main Breakers open
- Review available synchronised generators and commence sequential load connection process

After the initial load sequencing, the ENMS shall continue to match the connected load of the site to the available generators by:-

- Enabling greater loads by enabling further load priority signals and starting of available generators up to the capacity of the generators available
- Starting/synchronising/paralleling of further generators when the site load increases.

- Disabling loads priorities when the site load exceeds the available generator capacity

Mains failure – Elements of MV systems tripped or isolated.

If both the Incoming supplies fail while elements of the MV Systems are out of circuit then the ENMS shall automatically work to restore electrical supplies to the loads without supplies in accordance with the Truth Table (to be progressed at Preferred Bidder stage).

Where the above requires the generators to be started to supply the failed loads then the generator starting and load sequencing shall generally be similar to that noted for normal mains failures. It should however be noted that, unless specifically required by the Truth Table, healthy supplies to RHSC-DCN loads should not be isolated in the process.

Operating Scenarios

The systems will need to be programmed to ensure the best use is made of the available sources. This is expected to include:-

Condition	**Response**
Normal operation-	Electrical systems operates from preferred incoming supply
Single supply failure-	All loads transfer to the single healthy supply.
Twin supply failure- (with normal Generator start conditions)	After the pre-set monitoring period (adjustable 0 - 5 seconds) Generators start and synchronise as one common group. After 12 seconds from the generator start signal the transformer are energised in two stages. After 15 seconds from the generator start signal the maximum permissible load step is applied to the generators (1.5MVA) After 25 seconds from generator start signal a further maximum permissible load step is applied to the generators (1MVA) The remaining plant load is then introduced
Twin supply failure- (with abnormal Generator start conditions)	After the pre-set monitoring period (adjustable 0 - 5 seconds) Generators start and synchronise as one common group. After 15 second from the generator start signal maximum permissible loads are applied - Loads commensurate with the number of generators synchronised. After 25 seconds from the generator start signals maximum permissible additional loads are applied – Loads

Condition	Response
	commensurate with the number of generators synchronised. At 10 second intervals additional maximum permissible loads are applied until all generators are fully loaded.
Normal running on generators	The number of generators synchronised and supplying load are optimised to ensure that the number of units running matches the load with 2000kW spare. (i.e. N+1 generators on line)

MATERIALS AND WORKMANSHIP CLAUSES

V10 High voltage connection

To be read with Preliminaries/ General conditions

GENERAL

110 INCOMING ELECTRICITY SUPPLY
- Nature of current: Alternating.
- Phase: Three.
- Voltage: 11000 V.
- Source: Electricity Distributor.

120 ELECTRICITY DISTRIBUTOR
- Details: SPEN.

SYSTEM PERFORMANCE

210 DESIGN
- Design: Complete the design of the high voltage connection in accordance with the
- Electricity Distributor's guidelines.
- Proposals: Submit drawings showing equipment positions and routes, technical information and calculations.
- Evidence of agreement with Electricity Distributor: Submit.

220 SUPPLY CHARACTERISTICS
- Anticipated maximum demand: 3MVA.
- Maximum prospective short-circuit current: 7.9kA.
- Load voltage unbalance (maximum): In accordance with Engineering Recommendation P29.
- Supply arrangement: 2 No alternate supplies terminated Multi-breaker MV panel with two outgoing feeders that is supplied as part of SPEN's works.

EXECUTION

630A MANAGEMENT
- Establishing the supply: Manage and liaise with the Electricity Distributor and Electricity Supplier to establish the incoming electricity supply.
- Examine the installation and proposal drawings submitted by SPEN for the dual use switch panel and verify that the proposed outgoing MV cables can be installed and terminated

COMPLETION

920 DOCUMENTATION
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

V12 Generator systems

To be read with Preliminaries/ General conditions

GENERAL

115 RECIPROCATING INTERNAL COMBUSTION ENGINE DRIVEN ALTERNATING CURRENT GENERATOR SYSTEM Generators G1 to G3.

- System manufacturer: Board's choice.
- Internal combustion engine: Required.
  - Type: Compression engine.
- Internal combustion engine electrical equipment: Required.
- Governor: Required.
- Alternator: Required.
- Automatic voltage regulators: Required.
- Control panel: Required.
- Fuel: Diesel supply systems, as section S40.
  - Storage tanks: Day tank and Storage tank, as section S40.
- Exhaust and silencer: Custom.
- Vibration isolation mountings: As section Y31.
- Gas detection and alarm systems:
- Generator housing: Plant room and Submit design and cost proposals.
- Earthing: as drawings.
- Signs and notices: As section N15.
- Ventilation: Metal louvres, as section L10 and Submit design and cost proposals.
- Accessories:
  - Drip tray;
  - Emergency stop buttons;
  - Load bank; and
  - Safety guards and stone guards.

120 SYSTEM CONFIGURATION

- Configuration: To BS ISO 8528-1.
- Installation: Fixed.
  Mounting: With a base frame, integrally mounted control gear, switchgear and auxiliaries.
- Mounting type: Fully resilient.
  - Accessories: Lifting points.
- Engine and alternator connection:
  - Coupling: Manufacturer's standard.
  - Assembly: Manufacturer's standard.

140 INTERNAL COMBUSTION ENGINE ANCILLARIES

- Electrical equipment: Required.
  - Operating voltage: 24 V d.c.
  - Earth polarity: Negative.

SYSTEM PERFORMANCE

210 DESIGN

- Design: Complete the design of the generator system.
- Prime mover and alternator size: Take into account connected loads including ancillaries, harmonics and transient operation.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature. Include:
  - General arrangement drawings.
  - Control diagrams.
  - Prime mover and alternator data.
  - Power output curves.
  - Generator system efficiency at 50%, 75% and 100% full load.
  - Start up temperature (minimum).
  - Fuel and lubricating oil characteristics and consumption, as outlined in BS ISO 3046-1.
  - Minimum run time without fuel and lubricating oil tank replenishment.
  - Calculations for performance of acoustic enclosures and silencers.
  - Maintenance access dimensions.
  - Details of plinths and anti-vibration mountings.

215 LOAD CHARACTERISTICS

- Total load (active power): 2.0MW - Each unit.
- Total load (reactive power): 2.5MVA - Each unit.
- Load type/ size:
  - Air conditioning;
  - Battery charger;
  - Discharge lighting;
  - Fluorescent lighting;
  - Small power;
  - Lifts;
  - Medical imaging equipment;
  - Motors; and
  - UPS.

225 PERFORMANCE OF GENERATOR SYSTEMS

- Standard: To BS ISO 8528-1.
- Application: Continuous power.
- Electrical characteristics:
  - Number of phases: Three.
  - Voltage: 11000V.
  - Frequency: 50 Hz.
- Site criteria: Land use.
- Operation: Parallel operation with other generator systems and with the incoming electrical supply.
- Start-up mode: Automatic.
- Full load acceptance: for multiple synchronised generators
  55% Full load in 15 seconds
  90% full load in 22 Seconds
  100% full load 29 seconds.
  - Start-up time to full load acceptance (maximum): 29 seconds.
- Performance class: G3.

240 GENERATING SYSTEMS FOR SAFETY SERVICES

- Standard: To BS 7698-12.

- Performance class: 3.

250 SERVICE CONDITIONS

- Environment: Inside.
- Site temperature:
  - Maximum: 30°C.
  - Minimum: - 20°C.
- Altitude (above sea level): 100.
- Humidity (RH): Submit proposals.
- Atmospheric conditions: Within 10 km of coast.

260 SYSTEM MODE OF OPERATION

- Details: Refer to description of operation given in the outline scope of works document for greater details - However the general principles will be upon mains failure: The system senses mains failure, starts the generators while isolating the mains supply.

  The generators run up to rated speed, synchronise and applies the load in a controlled manner. The system monitors for system faults and alarms, and initiates emergency shutdowns/actions where required.

  The systems monitors the load and ensures the number of units running is commensurate with it.

  The systems monitor the applied load and ensures it is commensurate with the number of units available.

  On restoration of mains supply manual intervention will be required to synchronise the systems with the mains and hand the load back to the mains.

  The systems shall be capable of being tested using the site load without a break in the supply to the load.

265 GENERATOR SYSTEMS OPERATING IN PARALLEL

- Synchronization: Automatic.

270 FUEL AND OIL CONSUMPTION

- Fuel consumption (maximum): 520 Litres per hour per set at rated load.
- Oil consumption (maximum): Submit proposals.

275 DIESEL EXHAUST EMISSIONS

- Emission standard: E.U. Directive 2004/26/EC compliant.

280 CONNECTING GENERATORS TO THE PUBLIC SUPPLY NETWORK

- Standard: To Energy Networks Association G59/1.

290 NEUTRAL EARTHING

- Type: Switched neutral connection to earth.

PRODUCTS

310 GENERATOR SET

- Standards: To BS ISO 8528-1.
  - Internal combustion engine to BS ISO 8528-2 and BS 5514-6.
  - Governor: To BS 5514-4.
  - Alternator: To BS 5000-3, and BS ISO 8528-3 or BS EN 60034-22.
  - Automatic voltage regulator: To BS 4999-140.
  - Control panel: To BS ISO 8528-4.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

340 INTERNAL COMBUSTION ENGINES GENERALLY.

- Standards: To BS ISO 8528-2.
- Type: Compression engine.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Number of cylinders: Submit proposals.
  - Total displacement: Board's choice.
- Rated speed: 1500 rpm.
- Overspeed protection: To BS 5514-6.
- Air/ fuel intake: Turbo-charged.
- Air filters: Replaceable dry element type.
- Fuel filters:
  - Type: Replaceable paper type.
  - Filtration: To remove contaminants larger than 10 µm.
- Oil filters: Replaceable full flow type.
- Crankcase oil heater: Thermostatically controlled.
- Oil reservoir tank: To maintain the required oil level in the sump.
  - Reservoir capacity: Submit proposals.
  - Oil level monitor: Required.
  - Drain valve: Locate to provide gravity oil removal and easy maintenance.
  - Used oil container: Provide.
- Cooling system: Closed-circuit pressurized water based.
  - Coolant heater: Required.
  - Radiator: Generator Base Frame Mounted.

  Protective guard: Required.
  - Drain valve: Locate to provide easy maintenance.
  - Fan: Electric motor driven or Engine driven.
- Engine starting method: Electric starter motor .
  - Starter lockout: After 3 unsuccessful start attempts.
- Accessories: submit proposals.

345 INTERNAL COMBUSTION ENGINE ELECTRICAL EQUIPMENT

- Engine start battery: High performance plant to BS 6290-2 or Free electrolyte nickel cadmium batteries to BS 6260.
  - Capacity: Sufficient to Crank the engines 5 times at operating temperatures.
  - Charger: Batteries charged from mains when available, and charge alternator on when engine when running.
  - Lockable isolator: Required.
  - Location: Remote stand.
- Battery and charger for control panel: Required.

Capacity: Sufficient to enable control panel to function for 48 hours following mains failure.

350 GOVERNOR

- Standard: To BS 5514-4.
- Type: Electronic.
- Manufacturer: System manufacturer.
  - Product reference: Submit proposals.
- Mode of operation: To enable engine to operate continuously at rated speed from no-load to the rated full electrical load.
- Adjustments:
  - Acceleration rate;
  - Load gain;
  - Maximum speed;
  - Speed droop; and
  - Stability.

370A ALTERNATORS GENERALLY .

- Standard: To BS 5000-3, and BS ISO 8528-3 or BS EN 60034-22.
- Type: Synchronous.
- Manufacturer: Submit proposals.
- Product reference: Submit proposals.
- Excitation: Submit proposals.
- Overspeed withstand: 120% rated speed.
- Underspeed withstand: 95% rated speed.
- Short-circuit withstand capability (minimum): 2.5 times full-load short-circuit current for 10 s.
- Thermal classification to BS EN 60085: H.
- Ingress protection to BS EN 60034-5: IP32.
- Anti-condensation heater: Required.
- Protection:
  MV Circuit breaker with over current and earth fault inverse definite minimum time lag relay.
  Stator earth fault and rotor earth fault.
  General fault protection
- Output cable terminal boxes: Removable lid and side covers.
  - Outgoing cable entry: Top - Submit proposals.

380 AUTOMATIC VOLTAGE REGULATORS

- Standard: To BS 4999-140.
- Manufacturer: System manufacturer.
  - Product reference: Board's choice.
- Grade: 2.

450 CONTROL PANEL Individual controllers for Units G1 to G12.

- Standard: To BS ISO 8528-4.
- Manufacturer: System manufacturer.
  - Product reference: Submit proposals.
- Configuration: Group controls, alarms and indicators in common control panel.
- Controls:
  - Alarm reset;
  - Automatic/ manual switch;
  - Emergency stop;
  - Frequency adjust;
  - Key operated start/ stop switch;
  - Lamp test;
  - Load bank test;
  - Mains failure simulation; and
  - Maintenance bypass.
- Indicators:
  - Electrical:
  - Ammeter with phase selector switch;
  - Battery voltage;
  - Frequency meter;
  - Generator synchronized;
  - kW·h meter;
  - Power factor meter with phase selector switch; and
  - Voltmeter with phase selector switch.
  - Prime mover:
  - Coolant temperature gauge;
  - Fuel gauge;
  - Oil pressure gauge; and
  - Tachometer.
  - Status:
  - Coolant heater on;
  - Emergency stop activated;
  - Generator in use;
  - Generator ready;
  - Generator off-load indication ;
  - Generator on-load indication ;
  - Hours run meter;
  - Mains available indicator; and
  - Mains failure indicator.
- Alarms:
  - Visual:
  - Battery charge failure;
  - Battery low voltage;
  - Cooling fan failure;
  - Engine overspeed;
  - Engine start failure;
  - Engine underspeed;
  - High oil temperature;
  - Low fuel; and
  - Low oil pressure
  - Audible: Common alarm with mute button.
  - Remote generator system alarm: to ENMS and BMS.

450A CONTROL PANEL System controller - One per engine hall and one per Main MV intake room.

- used for Electrical network control and monitoring.
  Standard: To BS ISO 8528-4.
- Manufacturer: System manufacturer.
  - Product reference: Submit proposals.
- Configuration: Group controls, alarms and indicators in common control panel.
- Controls: Electrical Network control.
- Indicators:
  - Electrical: status of all devices connected (Open, Closed, withdrawn, tripped earthed etc) Primary power failure to any control panel. .
  - Prime movers: status of all generators .
  - Status: of incoming supplies.

  Alarms:
  - Visual: common alarm on the panel and common alarm xenon beacon externally on the wall of the Energy Centre.
  - Audible: Common alarm with mute button.
  - Remote generator system alarm: bms.

470 DAY TANKS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Capacity: 3200 Litre for each set.
- Location: Adjacent to generators.
- Fuel transfer: Gravity fed.
- Low level indicator and alarm: Required.
- Fittings:
  - Drain valve;
  - Fill pipe and cap;
  - Isolating valve;
  - Tank level indicator; and
  - Vent pipe.

480 DRIP TRAYS

- Type: Removable.
- Overflow outlet pipe: Run to a location where a container can be fitted below the pipe outlet.
- Capacity: 1.5 times the oil capacity of the prime mover sump.

485 EMERGENCY STOP BUTTONS

- Type: Red 40 mm mushroom head, hand operated.
  - Key to reset: Required.
- Manufacturer: Board's choice.
  - Production reference: Board's choice.
- Operation: To shut down the generator system immediately on activation.
- Mounting: Pedestal mounted.

490A LOAD BANKS for installation testing

- Type: 11KV inductive load (LV load banks and step down transformers would be acceptable) Testing of the mechanical/thermal performance of the installation shall be carried by

Connecting the load banks to the spare switches on the Energy Centre MV switch boards.
Such tests shall be completed and then re-demonstrated during Hot summer weather conditions.

- Manufacturer: Board's choice.
- Product reference: Board's choice.
- Rating: 110% rated load.
- Enclosure:
  - Ingress protection to BS EN 60529: Boards Choice.
  - Anti-condensation heater: Boards choice.
- Arrangement: Switch in equal load steps controlled from the generator system control panel.
  - Number of load steps: to mimic ideal load application.
- Forced air cooling with run on timer: Required.
- Selective load control and load indicator: Required.
  - Load step size: to mimic ideal load application.

495 GENERATOR SET FACTORY INSPECTIONS AND TESTS

- Notice before inspections: 14 d.
- Test equipment calibration certificates: Submit.
- Witnessing: Arrange for factory testing to be witnessed by the contract administrator and 5 colleagues.
- Testing: To BS ISO 8528-6.
  - Type: Acceptance tests and Functional tests.

498 GENERATOR SET ACCEPTANCE TESTS

- Location: At manufacturer's works with electrical load and On site.
- Checks:
  - Unit 1
  - Unit 2
  - Unit 3
  - Parallel operation
- Measurements:
  - Unit 1
  - Unit 2
  - Unit 3
  - Parallel operation
- Acceptance test report: To BS ISO 8528-6.
- Results: Submit.

499 GENERATOR SET STANDARD FUNCTIONAL TESTS

- Standard: To BS ISO 8528-6.
- Location: At manufacturer's works under test-bed conditions.
- Results: Submit.

FABRICATION

550 CUSTOM EXHAUSTS

- Exhaust: In accordance with BS 5854.
- Type: Natural draught.
- Manufacturer: System manufacturer.
- Material: Stainless steel.
- Fittings:
  - Adaptors;
  - Bends;
  - Firestop plates;
  - Flexible coupling;
  - Flue collector boxes;
  - Ridge terminal and adaptors;
  - Storm collars and flashings; and
  - Wall brackets.
- Exhaust silencers
  - Type: Baffle.

560 FABRICATION PROPOSALS

- Design: Complete the design of the generator system.
- Prime mover and alternator size: Take into account connected loads including ancillaries, harmonics and transient operation.
- Proposals: Submit drawings, technical information, calculations and manufacturer's literature. Include:
  - General arrangement drawings.
  - Control diagrams.
  - Prime mover and alternator data.
  - Power output curves.
  - Generator system efficiency at 50%, 75% and 100% full load.
  - Start up temperature (minimum).
  - Fuel and lubricating oil characteristics and consumption, as outlined in BS ISO 3046-1.
  - Minimum run time without fuel and lubricating oil tank replenishment.
  - Calculations for performance of acoustic enclosures and silencers.
  - Maintenance access dimensions.
  - Details of plinths and anti-vibration mountings.

EXECUTION

620 INTERRUPTIONS TO EXISTING SUPPLIES

- Notice before interruption: 28.
- Connection to existing switchgear: Submit proposals.

630 INSTALLING GENERATOR SYSTEMS

- System: Install to provide access for maintenance without having to remove connections and accessories.
- Fuel pipelines: Flexible final connection to engine.
- Safety guards and stone guards: Install.

640 INSTALLING EXHAUSTS

- Location: generally As drawings.
- Arrangement:

- Position to minimize noise levels and prevent exhaust gases entering the building through doors, windows or ventilation systems.
- Slope exhaust away from engine. Terminate exhaust with rain cap.
- Seal fabric penetrations to provide same level of protection from transmission of sound and fire as original fabric.
- Apply minimum of 50 mm lagging to exhaust in plant rooms.

650 INSTALLING CONTROL PANELS
- Location: Remote free standing.

655 INSTALLING EMERGENCY STOP BUTTONS
- Location: adjacent to each generator and on exit to each generator room.

670 INSTALLING DRIP TRAYS
- Location: Under parts of the generator system where fuel or lubricant leakage may occur.

COMPLETION

910 TESTING AND COMMISSIONING GENERALLY
- Standard: To BS ISO 8528-6.
- Operation of control panel: Verify.
- Cold start-up test: Record start-up time with generator idle for 24 h before.
- Results: Submit.
- Notice before commencing tests (minimum): 2 weeks.

940 TESTING GENERATORS OPERATING IN PARALLEL
- Synchronization controls: Verify.
- Load sharing: Verify.
- Operation of controls: Verify.
- Start-up and shutdown: Verify.
- Results: Submit.

950 PADLOCKS AND KEYS
- Locking mechanism: Five lever.
- Material: Brass.
- Quantity: Submit proposals.
- Padlock keys: Two for each padlock.
- Padlock identification: Stamp padlock describing its function.

960 DOCUMENTATION
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

970 SPARES AND CONSUMABLES
- Indicator lamps: Supply 2 of each type used.
- Filter elements: Supply one set.

980 LABELLING
- Rating plate: To BS ISO 8528-5.

V20 High voltage distribution systems

To be read with Preliminaries/ General conditions

GENERAL

110 HIGH VOLTAGE DISTRIBUTION SYSTEM whole.

- High voltage connection: New incoming supply, as section V10.
- Switchgear:
  - Existing;
  - Ring main units, as section V21;
  - Switchboards, as section V21; and
  - Switchgear assemblies, as section V21.
- Transformers: Fluid immersed, as section V22 and Dry type as section V23.
- Cabling: Low smoke thermosetting insulated, as section V24.
  - Accessories: High voltage cable terminations, as section V24 and Underground concrete cable protection covers, and protection tapes for underground cables, as section V24 and underground earthenware cable ducts.
- Containment:
  - Buried conduit, as section Y63;
  - Cable ladders, as section Y60; and
  - Cable trays, as section Y60.
  - Accessories: Cable cleats, as section Y60 and Protective covers, as section Y60.
- Building works:
  - Trenches, pipeways and pits, as section P30;
  - Holes, chases, covers and supports, as section P31; and
  - Plinth and bund systems, as section P33.

SYSTEM PERFORMANCE

210 DESIGN

- Design: Complete the design of the high voltage distribution system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

220 GRADING STUDY

- Scope: Complete (including existing, if any) high voltage distribution system.
- Fault calculations: Include fault impedance, and short circuit, asymmetric and symmetrical fault current analysis.
- Protective devices: Coordinate the selection and adjustment of protective device settings to achieve discrimination throughout the fault level range. Grade so that a fault on any outgoing branch circuit is cleared by the switching device installed in the faulted branch circuit without affecting the other outgoing branch circuits. Demonstrate discrimination using time-current coordination curves with single line diagrams, in the study report.
- Manufacturers' details and recommended settings: Include in study report.
- Study report: Submit.

EXECUTION

620 INSTALLING HIGH VOLTAGE DISTRIBUTION SYSTEMS

- Layout: Position cabling and equipment to provide safe and easy access for operation and maintenance.

COMPLETION

910 TESTING AND INSPECTION

- Testing and inspection results: Submit.

940 DOCUMENTATION

- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

V21 High voltage switchgear

To be read with Preliminaries/ General conditions

PRODUCTS

310 HIGH VOLTAGE SWITCHGEAR GENERALLY

- Standards: To BS EN 62711-200, BS EN 60694 and IEC 60466.

320 HIGH VOLTAGE SWITCHBOARDS GENERALLY

- Type: Cubicle .
- Manufacturer: FKI Switchgear, Schneider or equal.
  - Product reference: Board's choice.
- Access: Rear.
- Switchgear arrangement: Submit proposals.
- Voltage rating: 12 kV.
- Prospective rated short circuit current (1 s): 25kA
- Terminals: Suitable for the dry connection of copper and aluminium conductors.
- Enclosure: Manufacturer's standard.
  - Accessories: Anti-condensation heater and thermostat and Padlocks and keys.
- Service conditions: Normal indoor.
- Functional units: As drawings.
- High voltage busbars: Required.
- Transportation or installation restrictions: As drawings.
- Accessories:
  - Manufacturer's standard;
  - Ammeters;
  - Voltmeters ;
  - Frequency meters;
  - Phase meters;
  - Power factor meters;
  - Wattmeters; and
  - Current transformers.

330 RING MAIN UNITS GENERALLY

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Ring switches: High voltage switch-disconnectors.
- Outgoing feeder device: High voltage circuit breaker
  - Protection relay: Required
- Transportation or installation restrictions: None.

340 HIGH VOLTAGE EARTHING SWITCHES

- Standard: To BS EN 62271-102.
- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Circuit interrupting medium: Vacuum.
- Number of poles: 3.
- Rated voltage: 12 kV.
- Rated insulation levels:

- Short time power frequency: 12 kV.
- Lightning impulse: 23 kV.
- Rated frequency: 50 Hz.

- Rated current: 630 A.
- Rated short time withstand current: 50 kA for 1 s .
- Short circuit making current: Manufacturer's standard.
- Switch class: E2.
- Operating mechanism: Independent power

350A HIGH VOLTAGE CIRCUIT BREAKERS GENERALLY

- Standard: To BS EN 62271-100.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Circuit interrupting medium: Vacuum.
- Number of poles: 3.
- Surge arrestors: Required.
- Rated voltage: 12 kV.
- Rated insulation level:
  - Short time power frequency: 32 kV.
  - Lightning impulse: 23 kV.
- Rated frequency: 50 Hz.
- Rated current: 630 A.
- Rated short time withstand current: 25 kA for 1 s.
- Short circuit making current: Manufacturer's standard.
- Rated operating sequence: CO-5-CO.
- Rated break time: Manufacturer's standard.
- Circuit breaker class: E2
- Operating mechanism: Stored energy.
- Type of operation: Remote.
- Method of installation: Withdrawable
- Integral earthing switch: Board's choice.
- Minimum degree of ingress protection to BS EN 60529: IP31
- Mechanical interlocking: Captive key exchange type with square faced key and alphabetical or numerical coded operating face.
- Intertripping: Required wher.
- Protection:
  - as drawings
- Remote control and monitoring unit: Required.
  - Functions: Remote control and circuit-breaker position indicators.

370 HIGH VOLTAGE SWITCHES GENERALLY

- Standard: To BS EN 60265-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Circuit interrupting medium: Vacuum.
- Number of poles: 3.
- Rated voltage: 12 kV.
- Rated insulation levels:
  - Short time power frequency: 23 kV.
  - Lightning impulse: 23 kV.
  - Rated frequency: 50 Hz

- Rated current: 630 A.
- Rated short time withstand current (1 s): 25 kA.
- Short circuit making current: Manufacturer's standard.
- Switch class: M2.
- Operating mechanism: Independent manual.
- Integral earthing switch: Submit proposals.

380 HIGH VOLTAGE SWITCH-DISCONNECTORS GENERALLY

- Standard: To BS EN 60265-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Circuit interrupting medium: Vacuum.
- Number of poles: 3.
- Rated voltage: 12 kV.
- Rated insulation levels:
  - Short time power frequency: 23 kV.
  - Lightning impulse: 23 kV.
- Rated current: 630 A.
- Rated short time withstand current (1 s): 25 kA.
- Short circuit making current: Manufacturer's standard.
- Switch class: E3.
- Operating mechanism: Stored energy.
- Integral earthing switch: Submit proposals.

410 HIGH VOLTAGE BUSBARS GENERALLY

- Standard: To BS 159.
  - Approval: ASTA certified.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Material: Copper.
- Insulation medium: Manufacturer's standard.
- Number of poles: 3.
- Extendable: Required
- Rated voltage: 12 kV.
- Rated insulation levels:
  - Short time power frequency: 32 kV.
  - Lightning impulse: 23 kV.
- Rated frequency: 50 Hz.
- Rated current: 630 A.

420 AMMETERS AND VOLTMETERS

- Standard: To BS 89-2.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

421 FREQUENCY METERS

- Standard: To BS 89-4.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

422 PHASE METERS AND POWER FACTOR METERS

- Standard: To BS 89-5.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

423 WATTMETERS

- Standard: To BS 89-3.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

430 CURRENT TRANSFORMERS

- Standard: To BS EN 60044-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Type: Submit proposals
- Accuracy classification:
  - For use with protective equipment: 5P or 10P to suit relays and discrimination.
  - For use with measuring equipment: Boards proposals to suit meters used.
- Primary rating: Submit proposals
- Secondary rating: 1 A
- Rated short time current: Match the circuit in which the current transformer is installed.
- Test links: Provide for connection of calibration instruments and meters.

440 DIGITAL MULTIFUNCTION METERING EQUIPMENT

- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Display type: Submit proposals .
- Minimum degree of ingress protection to BS EN 60529: Match high voltage switchgear.
- Metering functions:
  - Active energy (kW·h);
  - Active power (kW);
  - Apparent power (kV·A);
  - Frequency (Hz);
  - Maximum active power demand (kW);
  - Phase currents (A);
  - Power factor;
  - Pulsed output (kW h); and
  - Reactive power (kV·A(r))
- Mounting: Recessed into switchgear

460 INDICATOR LAMPS

- Manufacturer: Submit proposals
  - Product reference: Submit proposals
- Lamp type: Cluster LED with bezel. Standardize.
- Lens colour: To BS EN 60073.
- Lamp mounting: Recessed.
- Common lamp test facility: Required.
- Access for lamp replacement: Externally from front.

480A HIGH VOLTAGE SWITCHGEAR TRIPPING AND CLOSING UNITS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Battery capacity: Adequate to supply the standing load for 24 h on loss of a.c. supply. After 24 h, capable of tripping and closing the circuit breakers 10 consecutive times.
- Enclosure: To BS EN 62208.
  - Material: Steel.
  - Minimum degree of ingress protection to BS EN 60529: IP31
  - Lockable hinged door: Required.
  - Mounting: Floor
  - Finish to enclosure and supporting framework: Corrosion resistant paint
  - Colour: Match high voltage switchgear
- Incoming supply protection: Miniature circuit breaker to BS EN 60898.
- Charger type: Constant voltage current limiting.
- Battery type: Sealed nickel cadmium to BS EN 60622
- Output:
  - Type: Direct current (d.c.).
  - Voltage: 48 V
- Digital voltmeter: Required.
- Indicator lamps:
  - Mains supply healthy.
  - Mains supply failed.
  - Charger failed.
  - Float charge.
  - Boost charge.
  - Low voltage.
  - High voltage.
  - Positive and negative earth fault alarms.
  - Low electrolyte (vented cells only).
- Common fault relay contact: Required.
  - Type: Volt free.
- Vented battery labelling: Describe the treatment required following contact with the electrolyte and warn of the explosion risk caused by naked flames.
- Remote monitoring facility: ENMS and BMS

490 VOLTAGE TRANSFORMERS

- Standard: To BS EN 60044-2 and/or BS EN 60044-5 to sit application.
- Manufacturer: Switchboard manufacturer.
  - Product reference: Board's choice.
- Type: Cast resin encapsulated.
- Accuracy classification: To suit protection, metering and control systems.
- Primary voltage: 12 kV
- Secondary voltage: 110 V.

495 PADLOCKS AND KEYS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Locking mechanism: Five lever.
- Material: Brass.

496 PADLOCK AND KEY CABINETS

- Type: Wall mounted metal.

- Finish: Match switchgear.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

FABRICATION

510 SWITCHGEAR GENERALLY

- Switchgear: Factory built.
- Free standing switchgear: Provide lifting bolts within reinforced top frame.
- Insect proofing: Cover assembly openings with non-combustible and non-corroding insect proof mesh.

515 PROPOSALS

- Content: Include the following:
  - Overall dimensions.
  - Degree of ingress protection.
  - Mounting and fixing details.
  - Builders work requirements including details of cast in rails.
  - Fault level and rated short circuit characteristics.
  - Functional unit details.
  - Details of paint systems and colour finishes.
  - Door swings.
  - Access panel details.
  - Schedule of labels.
  - Dimensioned general arrangement drawings, plans elevations and sections.
  - Shipping sections.
  - Cable gland plate details.
  - Routing of cables within assembly.
  - Arrangement of busbars, connections and supports.
  - Internal controls, instrument and meter diagrams.
- Proposals: Submit before fabrication.

590 FACTORY INSPECTIONS AND TESTS

- Notice before inspecting and testing: 28d
- Inspections:
  - Fabrication: Inspection not required
  - Assembly completed, busbars exposed and functional units assembled: Inspection not required.
- Testing: In accordance with BS EN 62271-100 and BS EN 60694.
  - Factory testing of completed assembly: Required
  - Routine tests: Required.
  - Special tests: Interlocks and interfaces.
- Test equipment calibration certificates: Submit.
- Witnessing: Arrange for factory testing to be witnessed by the contract administrator and 3 colleagues.
- Test and inspection reports: Submit.

EXECUTION

610 ALTERATIONS TO EXISTING SWITCHGEAR

- Standards: In accordance with manufacturers' or fabricator's instructions and type test certificates.
- Alterations: Submit records of alterations made to assemblies.

620 INSTALLATION GENERALLY

- Transportation, off-load and installation: Submit method statement.
- Fixing equipment: Fix in accordance with manufacturer's instructions.
  - Fasteners: Zinc electroplated.
- Assembly: Line and level panels in accordance with manufacturer's or fabricator's instructions.
  - Interconnect busbars.
  - Connect earthing conductor to system main earth terminal.
  - Replace fittings removed for transport.
  - Clearance (minimum): 1000 mm front and rear.

640 CONNECTIONS

- Incoming high voltage cables: Connect to switchgear.

650 INSTALLING METERING EQUIPMENT

- Digital metering equipment: Connect to building management system.

COMPLETION

910 CLEANING AND GENERAL INSPECTION

- Dust and debris: Remove.
- Completed installation: Inspect in accordance with BS EN 60694 and switchgear manufacturer's or fabricator's instructions.
- Labelling: Verify.
- Fuse ratings: Check and confirm.
- Enclosure earthing: Verify.
- Cables terminations: Inspect.
- Reports: Submit.

915 LABELLING

- Name plates in accordance with BS EN 60694: Provide.
- Equipment identification labels: . . . . .
- Anti-condensation heaters: Provide caution notices advising against accidental switching off.
- Standby power: Provide danger warning notices stating that assemblies may be energized from more than one source.
- Indicator lamps: Label each lamp describing its function.
- Fuses, terminal blocks and other assembly components: Label describing their purpose.
- Spare fuses: Label, describe their rating.
- Cabinets for padlocks and spare keys: Label.

920 TESTING AND COMMISSIONING

- Notice before testing and commissioning: 28d
- Testing generally: In accordance with BS EN 60694 and BS EN 62271-200
- Method statement: Submit.
- Earthing: Check and verify.
- Protective device settings: Configure to match the grading study.
- Voltage test: In accordance with BS EN 62271-100.
- Insulation resistance tests: Carry out for:
  - Ancillary trip and alarm wiring with any fuses and remote connections removed (500 V d.c.).
  - Anti-condensation heaters (500 V d.c.).
- Operation of alarm and trip devices: Check and verify.
- Indicators: Verify correct operation.
- Intertripping: Verify correct operation.
- Anti-condensation heaters: Check and confirm correct operation.
- Enclosure access interlocks: Check and confirm correct operation.
- Gas tightness of gas filled compartments: Verify.
- Condition of gas in gas filled compartments: Determine in accordance with BS EN 60480.
- Inspection and test results: Submit.

930 SPARE TOOLS

- Tools: Supply the tools necessary for maintaining the equipment, including racking handles and a torque spanner.
- Tool cabinet: Include name plate, labelled shelves and non-lockable door.
  - Dimensions: Size for storing racking handles, special tools, spare lamps, spare fuse links and other equipment necessary for satisfactory assembly and operation.
  - Location: Separate wall mounted, with finish to match switchgear

940 PADLOCKS AND KEYS

- Quantity: 6.
- Padlock keys: Two for each padlock.
- Padlock identification: Stamp padlock describing its function.

950 CALIBRATION CERTIFICATES

- Certificates of calibration for meters and instruments: Submit.

960 SPARES AND CONSUMABLES

- Manufacturer's recommended spares: Supply two sets.
- Spare fuses: Two of each type and rating used.
- Operating handles for circuit breakers and switches: One per device.

V22 Fluid immersed transformers

To be read with Preliminaries/ General conditions

PRODUCTS

310 TRANSFORMER Energy centre - step down generally

- Standards: To BS EN 60076-1, BS EN 50464-1 and BS 6436.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Transformer operation: Perform as specified for at least two years under the service conditions.
- Compliance with specified performance: Submit evidence.
- Transformer type: Low loss.
  - Losses: Submit details.
- Service conditions:
  - Application: Network distribution.
  - Generator connection: Not applicable.
  - Suitable for operation in parallel with other transformers: Required.
  - Altitude: Less than 1000 m above sea level
  - Ambient temperature:
    Minimum: -25°C .
    Maximum: 40°C .
- Voltage waveform:
  - Supply:
    Total harmonic distortion: Less than 5%.
    Even harmonic distortion: Less than 1%.
  - Load: Symmetrical three phase supply .
  - Frequency: 50 Hz .
  - Phases: Three .
- Duty: Approximately balanced and sinusoidal continuous three phase loading .
- Environmental conditions: Normal, with ordinary pollution rates and Outdoor .
- Transportation or installation restrictions: Craned onto and off roof. .

312 MANUFACTURER'S INFORMATION

- General arrangement drawings: Submit fully dimensioned and detailed general arrangement drawings including:
  - Weight of core and winding assembly.
  - Weight of tank and fittings.
  - Total weight including oil.
  - Quantity of oil.
  - Base details.
  - Cable box details.
  - Rating and connection plate details.
  - Arrangement and connection drawings for ancillary equipment.
- Transformer ancillary equipment: Submit manufacturer's literature.
- Type test certificates: Submit. Include:
  - Temperature rise.
  - Lightning impulse.
  - Partial discharge.
  - Sound level.

315 TRANSFORMER COOLING

- Type:
  - Internal dielectric cooling medium: Insulating liquid with a fire point > 300°C (K). Circulation method: Natural thermosyphon cooling in windings (N) .
  - External cooling medium: Air (A) . Circulation method: Natural convection (N) .
- Forced cooling controls: Not applicable.

320 FLUID PRESERVATION EQUIPMENT

- Conservator: Dehydrating (silica-gel) breather.

325 RATED POWER

- Rated apparent power: 2000 kV·A.
- Enhanced rating with additional cooling: Not applicable.

330 EARTHING

- High voltage system earthing: as drawings.
- Low voltage system earthing: TNC-S.

335 VOLTAGE RATIO AT PRINCIPLE TAPPING

- Primary winding to secondary winding: 11000:400. (No load)

350 CONNECTION AND PHASE DISPLACEMENT

- Vector group to BS EN 60076-1: Dyn11.

355 PRIMARY VOLTAGE TAPPINGS

- Sizes: Variations upto _8% and down to -10% in 8 steps.
- Tap change facility: On-load.
  - Type: Manual.

358 MANUAL TAP CHANGE FACILITY

- Position indicator: Required.
- Controls: External mounted.
- Controls: Lockable. Supply padlock and two keys.

365 TANK CONSTRUCTION

- Material and construction: Welded mild steel fabricated to prevent distortion when the complete transformer is lifted, jacked or transported.
  - Finish: Manufacturer's standard.
- Accessories:
  - Earthing boss tapped M12;
  - Filter valves;
  - Flanged fluid drain valve with closed position padlocking facility. Fitted with a gasketted cover plate;
  - Fluid drain valve with facility for padlocking in the closed position with padlock and two keys. Fitted with a female tapped outlet and a plug;
  - Fluid filler with filter and plug/ cap;
  - Jacking lugs;
  - Lifting lugs;
  - Marshalling box;

- Pulling eyes; and
- Sight glass type fluid level indicator.

367 INDICATORS AND ALARMS

- Buchholz relay: With adjustable alarm and trip contacts.
- Dial type oil level indicator: With adjustable alarm and trip contacts.
- Dial type oil temperature indicator: With adjustable alarm and trip contacts.
- Dial type winding temperature indicator: RequiredWith adjustable alarm and trip contacts.
- Pressure relief device: With adjustable alarm and trip contacts.
- Local audible alarm systems: Not required.

370 NOISE EMISSION CONTROL

- Sound pressure level (maximum): 50 dBA at 1 m.
- Anti-vibration mountings: Required.

375 HIGH VOLTAGE AND LOW VOLTAGE CABLE TERMINATIONS

- Position: On opposite sides.
- Cable terminations: High voltage required and Low voltage required.
  - Cables: High voltage as section V24 and Low voltage as section V32.

380 HIGH VOLTAGE CONNECTION ARRANGEMENT

- Cable entry: Bottom.
- Type of enclosure: Flange and terminations suitable for direct connection to ring main unit.

390 LOW VOLTAGE CONNECTION ARRANGEMENT

- Cable entry: Bottom.
- Type of enclosure: Flange and connections suitable for direct connection to low voltage switchboard.

400 FACTORY INSPECTIONS

- Notice before inspections: 14 days.
- Testing: In accordance with BS EN 60076-1.
  - Routine tests: Undertake
  - Type tests: Not required.
  - Special tests: NONE.
- Test equipment calibration certificates: Submit.
- Witnessing: Arrange for factory testing to be witnessed by the contract administrator and 3 colleagues.
- Test report: Submit

EXECUTION

610 INSTALLATION GENERALLY

- Transportation, off-load and installation: Submit method statement.
- Assembly: Replace fittings removed for transport.

620 INSTALLING CONTROLS, INDICATORS AND ALARMS

- Controls, indicators and alarms: Connect to marshalling box.
- Marshalling box location: Tank mounted.

COMPLETION

910 CLEANING AND GENERAL INSPECTION

- Dust and fluid: Remove.
- Tank and fittings: Inspect.
- Fluid leaks: Check.
- Breather: Verify fitment and confirm silica-gel crystals are blue.
- Operation of tap changer over the operating range: Verify.
- Transformer earthing: Verify.
- Cable terminations: Inspect.
- Fluid levels: Check and confirm correct.
- Reports: Submit.

915 LABELLING

- Rating plate in accordance with BS EN 60076-1: Provide.
- Identification label: Reference Number.

920 TESTING AND COMMISSIONING

- Method statement: Submit.
- Insulation resistance tests: Carry out for:
  - High voltage winding to earth (1000 V d.c.).
  - Low voltage winding to earth (500 V d.c.).
  - High voltage winding to low voltage winding (1000 V d.c.).
  - Ancillary trip and alarm wiring with fuses and remote connections removed (500 V d.c).
  - Cooling fan motors (500 V d.c.).
- Operation of level, alarm, and trip devices: Check and verify. Test Buchholz relays using nitrogen injection.
- Dielectric strength: Sample the fluid and test in accordance with BS 5263. Confirm the breakdown strength is acceptable.
- Cooling fan motors thermal overloads: Check and confirm correct operation.
- Forced cooling temperature controls: Check and confirm correct operation.
- Tap changer: Set on the principle setting and padlock in position.

925 OIL TESTS

- Tests: In accordance with BS 5263.
  - Sample interval: 3 months and 12 months after Practical Completion.

930 PADLOCKS AND KEYS

- Locking mechanism: Five lever.
- Material: Brass.
- Quantity: 4.
- Padlock keys: Two for each padlock.
- Padlock identification: Stamp padlock describing its function.

940 DOCUMENTATION

- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

V23 Dry-type transformers

To be read with Preliminaries/General conditions

PRODUCTS

310 TRANSFORMER Energy Centre, step up

- Standards: To BS EN 60076-11 and To BS 7844-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Transformer operation: Perform as specified for at least two years under the service conditions.
- Compliance with specified performance: Submit evidence.
- Transformer type: Low loss.
  - Losses: Submit details.
- Transformer configuration: Encapsulated
- Service conditions:
  - Application: Generator.
  - Generator connection: Through switchgear.
  - Suitable for operation in parallel with other transformers: Not required.
  - Altitude: Less than 1000 m above sea level
  - Ambient temperature:
  - Minimum: -25°C.
  - Maximum: 40°C.
- Voltage waveform:
  - Supply:
  - Total harmonic distortion: Less than 5%.
  - Even harmonic distortion: Less than 1%.
  - Load: Symmetrical three phase supply.
  - Frequency: 50 Hz.
  - Phases: Three.
- Duty: Approximately balanced and sinusoidal continuous three phase loading.
- Environmental conditions: Class E1.
- Fire resistance: Class F0.
- Transportation or installation restrictions: Submit proposals.

310A TRANSFORMER - step down

- Standards: To BS EN 60076-11 and To BS 7844-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Transformer operation: Perform as specified for at least two years under the service conditions.
- Compliance with specified performance: Submit evidence.
- Transformer type: Low loss.
  - Losses: Submit details.
- Transformer configuration: Encapsulated
- Service conditions:
  - Application: Network distribution.
  - Generator connection: Not applicable.
  - Suitable for operation in parallel with other transformers: Not required.

- Altitude: Less than 1000 m above sea level
- Ambient temperature:
- Minimum: -25°C.
- Maximum: 40°C.

- Voltage waveform:
  - Supply:
  - Total harmonic distortion: Less than 5%.
  - Even harmonic distortion: Less than 1%.
  - Load: Symmetrical three phase supply.
  - Frequency: 50 Hz.
  - Phases: Three.
- Duty: Approximately balanced and sinusoidal continuous three phase loading.
- Environmental conditions: Class E1.
- Fire resistance: Class F1.
- Transportation or installation restrictions: Submit proposals.

315 MANUFACTURER'S INFORMATION

- General arrangement drawings: Submit fully dimensioned and detailed general arrangement drawings including:
  - Weight of core and winding assembly.
  - Weight of enclosure.
  - Total weight.
  - Base details.
  - Cable box details.
  - Rating and connection plate details.
  - Arrangement and connection drawings for ancillary equipment.
- Transformer ancillary equipment: Submit manufacturer's literature.
- Type test certificates: Submit. Include:
  - Temperature rise.
  - Lightning impulse.
  - Partial discharge.
  - Sound level.

320 TRANSFORMER COOLING

- Cooling medium: Air (A)
  - Circulation method: Natural (N)

325 RATED POWER

- Rated apparent power: as drawings.
- Enhanced rating with additional cooling: not required.

2900 -EXT, EC Specification

330A EARTHING step-up

- High voltage system earthing: star point - Via NER panel.
- Low voltage system earthing: LV Delta winding - casing to LV systems earth Bar.

330B EARTHING Step Down

- High voltage system earthing: MV Delta winding - Casing to MV earth Bar.
- Low voltage system earthing: Star Point

335A VOLTAGE RATIO AT PRINCIPLE TAPPING Step-up
- Primary winding/ secondary winding: 400/11000.

335B VOLTAGE RATIO AT PRINCIPLE TAPPING step-down
- Primary winding/ secondary winding: 11000:400.

350A CONNECTION AND PHASE DISPLACEMENT step-up
- Vector group to BS EN 60076-1: Ynd11.

350B CONNECTION AND PHASE DISPLACEMENT step-down
- Vector group to BS EN 60076-1: Dyn11.

355 PRIMARY VOLTAGE TAPPINGS
- Sizes: ±2.5%

363 TRANSFORMER ACCESSORIES
- Accessories:
  - Bi-directional rollers;
  - Earthing boss tapped M12;
  - Lifting lugs;
  - Lockable auxiliary marshalling box fully cabled from each transformer auxiliary device to fixed & labelled terminals; and
  - Pulling eyes.

365A ENCLOSURE step-up
- Ingress protection to BS 60529: IP44
- Material and construction: Welded mild steel fabricated to prevent distortion when the transformer and enclosure is lifted or transported.
  - Finish: Manufacturer's standard
- Accessible interior and feeder circuit breaker: Not required.
  - Door interlocks: Prevent enclosure doors being opened while circuit breakers are closed.
    Interlocking: Captive key exchange type with square faced key and alphabetical or numerical coded operating face.
- Cable gland plates: High voltage
  - Type: Manufacturer's standard
- Anti-condensation heaters with thermostatic control: Required .
  - Type: Manufacturer's standard
- Forced ventilation fans: Not required
  - Type: Manufacturer's standard .
  - Controls: Manufacturer's standard .

365B ENCLOSURE step down
- Ingress protection to BS 60529: IP44
- Material and construction: Welded mild steel fabricated to prevent distortion when the transformer and enclosure is lifted or transported.
  - Finish: Manufacturer's standard
- Accessible interior and feeder circuit breaker: Not required.
  - Door interlocks: Prevent enclosure doors being opened while circuit breakers are closed.
    Interlocking: Captive key exchange type with square faced key and alphabetical or numerical coded operating face.
- Cable gland plates: High voltage and Low voltage

- Type: Manufacturer's standard
- Anti-condensation heaters with thermostatic control: Required .
  - Type: Manufacturer's standard
- Forced ventilation fans: Not required
  - Type: Manufacturer's standard .
  - Controls: Manufacturer's standard .

367 INDICATORS AND ALARMS

- Thermal protection: Required.
  - Type: Manufacturer's standard.
- Dial type winding temperature indicator: Required.
- Digital type winding temperature indicator: Required.
- Local audible alarm systems: Minimum 65 dBA sounder with xenon flashing beacon

370 NOISE EMISSION CONTROL

- Sound pressure level (maximum): 50 dB(A) at 1m
- Anti-vibration mountings: Required

375 HIGH VOLTAGE AND LOW VOLTAGE CABLE TERMINATIONS

- Position: to suit installations
- Cable terminations: High voltage required and Low voltage required.
  - Cables: High voltage as section V24 and Low voltage as section V32.

380 HIGH VOLTAGE CONNECTION ARRANGEMENT

- Cable entry: to suit installation.
- Type of enclosure: to suit installation

390 LOW VOLTAGE CONNECTION ARRANGEMENT

- Cable entry: to suit installation.
- Type of enclosure: to suit installation.

400 FACTORY INSPECTIONS

- Notice before inspections: 14 days .
- Testing: In accordance with BS EN 60076-11.
  - Routine Tests: Undertake.
  - Type Tests: Required
  - Special Tests: none
- Test equipment calibration certificates: Submit.
- Witnessing: Arrange for factory testing to be witnessed by the contract administrator and 3 colleagues.
- Test report: Submit.

EXECUTION

610 INSTALLATION GENERALLY

- Transportation, off-load and installation: Submit method statement.
- Assembly: Replace fittings removed for transport.

620 INSTALLING CONTROLS, INDICATORS AND ALARMS

- Controls indicators and alarms: Connect to marshalling box.
- Marshalling box location: Mounted on enclosure

COMPLETION

910 CLEANING AND GENERAL INSPECTION

- Dust and debris: Remove.
- Enclosure: Inspect.
- Windings: Inspect.
- Temperature sensor probes: Inspect.
- Forced cooling system: Inspect.
- Anti-condensation heating system: Inspect.
- Labelling: Verify.
- Transformer and enclosure earthing: Verify.
- Cables terminations: Inspect.
- Reports: Submit.

915 LABELLING

- Rating plate: In accordance with BS EN 60076-11.
- Identification label:: reference No

920 TESTING AND COMMISSIONING

- Method statement: Submit.
- Insulation resistance tests: Carry out for:
  - High voltage winding to earth (1000 V d.c.).
  - Low voltage winding to earth (500 V d.c.).
  - High voltage winding to low voltage winding (1000 V d.c.).
  - Ancillary trip and alarm wiring with any fuses and remote connections removed (500 V d.c.).
  - Cooling fan motors (500 V d.c.).
  - Anti-condensation heaters (500 V d.c.).
- Operation of alarm and trip devices: Check and verify.
- Cooling fan motors thermal overloads: Check and confirm correct operation.
- Forced cooling temperature controls: Check and confirm correct operation.
- Anti-condensation heaters: Check and confirm correct operation.
- Tap change links: Set on the principle setting.
- Enclosure access interlocks: Check and confirm correct operation.

930 PADLOCKS AND KEYS

- Locking mechanism: Five lever.
- Material: Brass.
- Quantity: Submit proposals.
- Padlock keys: Two for each padlock.
- Padlock identification: Stamp padlock describing its function.

940 DOCUMENTATION

- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

945 SPARES AND CONSUMABLES

- Filters for cooling system: Two sets

V24 High voltage cabling

To be read with Preliminaries/ General conditions

PRODUCTS

310A HIGH VOLTAGE CABLES GENERALLY

- Materials:
  - Underground cable networks for housing developments: In accordance with ENA ER G81-2.
  - 11 kV, underground industrial and commercial connections: In accordance with ENA ER G81-5.
- Bonds electrical power cable terminations: To BS 7197.
- Proposed high voltage cables: Submit drawings, technical information, calculations and manufacturer's literature.
- Spare capacity (percentage of current carrying capacity): 25%.

330 THERMOSETTING INSULATION CABLES

- Standard: To BS 6622.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Voltage designation: 11 kV.
- System category: A.
- Number of cores: 3.
- Conductor: Stranded copper.
- Insulation: Cross linked polyethylene (XLPE).
- Screen: Not required.
- Armour material: Galvanized steel.
- Oversheath: Polyvinyl chloride (PVC).
  - Thickness: Submit proposals.
  - Colour: Red.
- Semi-conducting layer on oversheath: Not required .

340 LOW SMOKE THERMOSETTING INSULATION CABLES

- Standard: To BS 7835.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Voltage designation: 11 kV.
- System category: A.
- Number of cores: 3.
- Conductor:
  - Material: Copper.
  - Type: Stranded.
- Insulation: Cross linked polyethylene (XLPE).
- Protection: Armoured.

360 HIGH VOLTAGE CABLE TERMINATIONS

- Impregnated paper insulation cables: To BS 7888-4.2.
  - Type: Submit proposals.
- Extruded insulation cables: To BS 7888-4.1.
  - Indoor: Submit proposals.
  - Outdoor: Submit proposals.

370 UNDERGROUND PLASTICS CABLE PROTECTION COVERS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Polyethylene.
- Size:
  - Length: Submit proposals.
  - Width: 150 mm.
  - Thickness: 18 mm.
- Jointing method: Peg.
- Identification: Laminate underground cable marker tape to top face.

390A EARTHENWARE DUCTS FOR UNDERGROUND CABLES .

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Accessories: Proprietary duct plugs.

400 PROTECTION TAPES FOR BURIED ELECTRICITY SUPPLY CABLE

- Standard: To ENA TS 12-23.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

410 MANHOLES

- Access chambers: Submit proposals.
- Inspection chambers: Submit proposals.

EXECUTION

610 INSTALLING HIGH VOLTAGE CABLES

- Underground cable networks for housing developments: In accordance with ENA ER G81-3.
- 11 kV underground industrial and commercial connections: In accordance with ENA ER G81-6.
- Execution: Controlled by authorized persons and undertaken by competent persons.
  - Evidence of authorization: Submit.
  - Evidence of competence: Submit.
  - Permit to work procedure and method statements: Submit.
- Preparation: Store cables above 5°C for 24 h before installation.
- Installation temperature (minimum): 5°C.
- Cables: Install in one length.
- Cable pulling: Do not overstress. Prevent kinks and twisting of the cable.
  - Installation method: Submit proposals.

620 EXCAVATIONS

- Excavations next to existing underground services: In accordance with HS(G) 47.
  - Method statement: Submit.
- Existing underground services: Expose and identify.

635 INSTALLING THERMOSETTING INSULATION CABLES

- Installation: In accordance with BS 6622 Appendix C.
- Stress relief: Slide semi-conducting sleeve over exposed insulation.

640 INSTALLING LOW SMOKE THERMOSETTING INSULATION CABLES

- Installation: In accordance with BS 7835 Appendix C.
- Stress relief: Slide semi-conducting sleeve over exposed insulation.

650A CABLES IN TRENCHES

- Base: Newly prepared bedding.
  - Material: Sand.
- Multiple cables in same trench: Set 250 mm apart.
  - Cable formation within trench: Flat.
- Manholes: Provide manholes, draw pits and jointing chambers.
- Cables below roads and hard standings: Duct and derate if longer than 10 m. Extend ducts 1 m beyond hard standing.
- Cable identification and protection: Underground Marker tape and flush cable plaques.

660A INSTALLING CABLE DUCTS.

- Location and colour coding: In accordance with NJUG Volume 1 'Guidelines on the positioning and colour coding of underground utilities' apparatus'.
- Duct formation within trench: flat at 300mm centres.
- Gradient (maximum): 1:20.
- Duct bends: Suitable for cable bending radii.
- Manholes: Provide manholes, draw pits and jointing chambers.
- Duct alignment: Check before installing cables.
- Duct cleaning: Clean duct run before installing cables.
- Draw ropes: Install draw ropes in ducts.
  - Type: Corrosion resistant, minimum breaking strength 550 N.
- Duct ends: Plug and seal with proprietary duct plugs.

670 CABLES IN DUCTS

- Cable installation from cable drums: Submit method statement.

680 PROTECTION TAPE FOR BURIED ELECTRICITY SUPPLY CABLE

- Installation: In accordance with ENA TS 12-23.

690A INSTALLING HIGH VOLTAGE CABLE JOINTS

cable joints shall be avoided wherever possible

- Straight cable length before and after joint (minimum): 1 m.
- Spacing between joints (minimum): 2 m.
- Joint identification: Label as follows:
  - Date installed.
  - Board's name.
  - Circuit reference.
  - Cable type and size.

COMPLETION

910 CABLE TESTING AND INSPECTION

- Cleating and bending radii of cables: Verify and confirm that they are in accordance with manufacturer's recommendations.
- Cable terminations: Verify and confirm that they are in accordance with manufacturer's recommendations.
- Continuity and polarity: Verify.
- Insulation test: Submit results.
- Sheath test: Submit results.
- Pressure test:
  - Paper insulated cables: To BS 6480.
  - Thermosetting insulation cables: To BS 6622.
  - Results: Submit.

920 DOCUMENTATION

- Record drawings: Submit, showing cable types, sizes, routes and depths, duct sizes and lengths, joint locations, joint and service phasing.

RHSC and DCN EDINBURGH
UNINTERRUPTIBLE POWER SUPPLIES SPECIFICATION

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Uninterruptible Power Supply Systems supporting the main core server room.
- Uninterruptible Power Supply Systems supporting clinical areas with isolated power supply (IPS) systems.
- Switchboards on the output side of the UPS, complete with interlocking arrangements.

3.0 INTERFACES AND DEMARCATIONS

The UPS systems shall be integrated with a host Internet Protocol network which will support communication, interaction, data transfer and data retrieval from and between the various engineering systems in the building. The UPS systems shall be connected to the host network via gateways. The Building Management System (BMS) will be provided with a Graphical User Interface which will permit the interrogation of the UPS systems down to component level. It is not intended that the BMS will control the system but rather will monitor component status and provide fault alarm indication at the Graphical User Interface.

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the Materials & Workmanship clauses.

5.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

6.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the UPS systems.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Board teams concerned with the planning and administration of UPS systems.

7.0 UNINTERRUPTIBLE POWER SUPPLIES (UPS)

7.1 General

UPS shall be provided to serve the loads as follows:-

- Main core server room
- Isolated Power Supplies (IPS) serving theatres
- IPS serving areas other than theatres

The battery autonomy for each of the above areas is described in section V44, clauses 350A, 350B and 350C below.

The kW or kVA ratings of the batteries shall be indicated on schematic drawings. ’s attention is drawn to the need to size UPS systems not on kVA but on kW (to cater for a power factor range).

7.2 Available Space and Intended Cooling

Accommodation for the UPS equipment and batteries is limited, and it is imperative that the UPS Installer checks that the offered apparatus/enclosures will fit into the rooms and spaces allowed for them, with ample space for access, operations and maintenance. The UPS equipment will be located in dedicated rooms within plantroom spaces, and it must be assumed that significant volumes of mechanical equipment and associated access space will prevent the allocation of additional space to UPS equipment.

Project Co. shall request guaranteed limits for the heat losses which may be expected from the offered UPS equipment, against which the intended mechanical cooling duty for each UPS Room can be checked. For each UPS unit, losses shall be declared for load conditions of 25%, 30%, 40%, 50%, 60%, 70%, 80%, 90% & 100% of the full rating, and the declared figures shall be inclusive of transformer losses (if transformers are included in the UPS scheme design).

The following graph details the minimum design efficiencies for the UPS system (including transformer). Note that the UPS system efficiencies are shown on the y-axis and the % load on the x-axis.

7.3 Configuration

7.3.1 General

The UPS shall provide a no-break supply during loss of normal mains power supply and subsequent emergency generator power supply. The UPS System shall be of modular parallel design and will have N+1 redundancy.

Uninterruptible Power Supplies (UPS) shall be provided to serve life-support equipment within area and rooms listed in the table below in accordance with SHTM 06-01 Electrical Services.

UPS Required Table

Level	**Area**	**Rooms**
Basement		
Ground Floor	Emergency Department Co-Joined Radiology	Resuscitation Room(s) 4 Major Treatment Rooms MRI Rooms CT Rooms Gamma Camera Rooms Control Rooms
First Floor	Co-Joined Theatres Critical Care DCN Acute Care	9 Theatres and anaesthetic rooms MRI Room Angiogram Interventional Room Recovery Spaces 24 Cubicle Spaces Receiving / Resuscitation Room
Second Floor	Ehealth	Ehealth Server Room's ventilation/cooling
Third Floor	Medical In-Patients	Transitional Care Rooms
Fourth Floor/Roof	Helipad	Helipad RFFS Accommodation Helipad Fire Suppression System

7.3.2 Battery/Autonomy

Batteries shall be to BS EN 60896 Parts 21 & 22, and shall be selected to provide a design life no less than 10 years.

It is intended that the temperature of the UPS room/battery room be normally between 21ºC+/-2ºC and the required battery performance/autonomy shall be offered against this parameter.

The three UPS units shall be compiled in N+1 configuration, each UPS battery shall be selected to provide an autonomy of 40 minutes which shall allow a full load autonomy at design load of 60 minutes when all three units are in operation.

The individual UPS battery autonomies shall be indicated in Section V44, clauses 350A, 350B & 350C, or on the issued drawings.

7.3.3 Output Neutral reference

The UPS output neutral point shall remain referenced to earth potential under all service scenarios.

7.3.4 Static Switch

A solid-state bypass switch (static switch) shall be incorporated in the UPS design to allow rapid transition to an internal bypass line in the event that an overload or fault condition arises which might damage the UPS inverter.

7.3.5 UPS Switching & Related Control

Each UPS shall include switches to facilitate the complete isolation of each individual UPS, for testing and maintenance. Thus moulded case circuit breakers or isolation switches shall be provided on the input, output and static switch supply of each UPS, and a further switch shall be installed to serve as an internal bypass.

Notwithstanding anything described elsewhere, the UPS shall be fitted with control & interlock features to safeguard the UPS during all conditions of current sharing whilst in parallel and against incorrectly sequenced operation of static switch and bypass switch.

- all inverters within a UPS combination will have a control link to facilitate synchronization, master/slave assignment, and current sharing when in parallel,
- The group will have on its internal bypass switch an early-make late-break auxiliary contact to force closure of the static switch in case a bypass operation was being attempted on the switch without having first activated the static switch.
- The group will additionally have on its internal bypass switch a solenoid release mechanism arranged to release a key (Castell, Ronis or other equal and approved type) which may be used in conjunction with interlocking arrangements on the external (‘wrap-around’) bypass switch, to ensure that the external bypass can be applied only after the internal bypass switch is closed. Other means of achieving the same function may be proposed.

7.3.6 Other Features

Each UPS shall include in the battery charging circuits a facility for temperature compensation of the charging current against temperature measured at the batteries themselves, such temperature measurement envisaged as being obtained from thermocouples fitted to the battery casings.

Each UPS shall include all facilities to allow remote monitoring by means of a telephone or data line connection. The UPS units shall incorporate communication circuits, data encoder, auto-dialler/modem etc. to permit transmission of fault reports to a remote location and allow periodic or on-demand interrogation of the UPS for information on operating status, load readings, alarm and operator logs, and to permit the initiation of diagnostic tests and transmission of results. It shall be possible to assign hierarchical passwords to such remote access and to the running of diagnostics. No settings need be adjusted remotely.

The UPS system shall be supplied and installed complete with remote alarm indicators for the benefit of User Department staff. In all cases, local controls shall permit silencing of an alarm buzzer and selecting/scrolling through the displayed information, but the UPS units shall not be operated in any way from the remote panels.

- In the case of clinical area (theatre), the remote indication shall be provided straight into (and shall be interfaced to suit) the Surgeon's Panel in all operating theatre(s). The output data shall be configurable to display status/alarms as the surgeons may require, but is envisaged as providing :

  - Indications of
    - UPS system healthy and running on three UPS units
    - UPS system operational but running on two UPS units only,
  - Alarm signals for
    - UPS bypassed – output on mains supply
    - Mains fail – UPS output derived from battery,
    - UPS alarm – general,
    - UPS alarm – battery low,
    - UPS alarm – shutdown imminent.

- In the case of clinical area (non-theatre) areas, the remote indication shall be provided at a number of simple remote alarm/indication panels located in the respective User Areas. No objection will be taken to the UPS remote alarms and the Isolated Power Supply (IPS) remote alarms [specified elsewhere, for other specialist] being combined into one alarm/indicator panel in each User Area. The signals will be confirmed later, but are expected to comprise :

  - Indications of
    - UPS system healthy and running on three UPS units
    - UPS system operational but running on two UPS units only,
  - Alarm signals for
    - UPS bypassed – output on mains supply
    - UPS alarm/fault.

- The UPS shall interface with the BMS and provide the following:
  - o Indications of
    - UPS system healthy and running on three UPS units
    - UPS system operational but running on two UPS units only,
  - o Alarm signals for
    - Mains fail – UPS output derived from battery,
    - UPS alarm – general,

- Although not a function of the UPS equipment itself, information about the incoming supply conditions (switch status) shall be communicated from the main LV switchboards to the Electrical Network Management System (ENMS). See Appendix B.

7.4 Switchboards

7.4.1 General

Power cabling is covered under the distribution specification.

7.4.2 Input & Output Switchboards

Switchboards shall be constructed to the standards set out in Low Voltage Distribution specification WW.A.P.1.2.20. They shall unless otherwise stipulated be Form 4 Type 2.

The Input and Output Switchboard requirements are indicated schematically on the issued drawings.

On the Input and Output Switchboards, each incomer circuit shall be equipped with a voltmeter and selector switch (to permit local indication of the 3 phase-to-neutral voltages and the 3 line-to-line voltages).

The Output switchboards shall include an interlocking scheme arranged to prevent damage to the UPS equipment when being switched by an Operator into or out of bypass condition or parallel condition. Electrical or mechanical interlocking may be offered, but mechanical interlocking is preferred.

Note that interlocking is not provided to prevent the load being switched off, it is provided to safeguard the equipment and provide some assurance to the operator that he will be prevented from doing damage to the UPS units whilst permitting him to use bypass conditions and paralleling/breaking parallel to keep the loads energised. may modify these as appropriate for the selected equipment.

- During normal operation, and all reasonable switching sequences, it should be possible to keep the load energized (accepting that the load may receive raw mains during switching operations if these involve bypassing the UPS). Reasonable switching sequences are those intended to take a UPS out of service for maintenance or restore it to service after maintenance, or to configure the UPS units for parallel or solo operation (if applicable),
- An internal bypass of a UPS is assumed to require activating the static bypass switch and then operating the internal maintenance bypass switch,

- Putting a UPS system into 'wrap-around Bypass' condition is assumed to require operating first the static switch, then the internal bypass switch, which will force the remaining two UPS units into by-pass and then operating the external bypass switch(es).
- It should not be possible to switch a UPS onto a busbar unless
  - o that busbar is initially de-energised, or
  - o if the busbar is live, unless
    - the UPS is selected for internal bypass and the busbar is already energised via that UPS's wrap-around bypass, or
    - the UPS is selected for internal bypass and the bar is already energised via the other UPS which is itself selected for internal bypass
- There should be no interlocking constraint as to order of switching (or on which switch parallel is made or broken) providing all other conditions are met.

No interlocks need be provided on the Input Switchboard, as the Operator can be expected to follow switching instructions for bypass & paralleling on only the downstream side of the UPS, and he may be expected to check the voltmeter readings for assurance that all incoming supplies are available before he switches.

7.4.3 "Wrap Around" Bypass

The UPS System shall be provided with an external wrap-around maintenance bypass facility which shall render the UPS entirely safe for maintenance and trouble shooting to the extent that a complete UPS unit can be 'swapped out' if necessary.

As described in the previous section, interlocking devices shall be provided to ensure that the load is transferred from UPS to mains, or vice versa, in a controlled manner. The supply shall not be interrupted during the transfer. The UPS shall not be damaged by back-feeding from maintenance bypass supply with the UPS output terminals.

7.5 Operation on System Healthy

The load shall be equally shared between each UPS of a paralleled group.

On reinstatement of power after a period of power failure the UPS units shall protect the load and the batteries shall be recharged. The UPS shall be capable of limiting the recharge current such that the value of the load plus the recharge current does not exceed the rating of the supply circuit breakers. As described under UPS features, section 7.3.6, the charging circuits shall include a temperature compensation feature which optimizes the charging current according to the measured temperature of the battery.

7.6 Operation on Failure of One UPS

The total load shall be transferred to the healthy UPS units. In the case of paralleled UPS units, the communication/control link shall permit the failed UPS to block its inverter output and the healthy UPS units to take over the whole of the load. (It will be permissible for all UPS units to enter static bypass condition for a short period, should this be necessary as part of the process).

The UPS system will provide the stated autonomy at full design load in its normal operative state. If a UPS unit fails or is being maintained and the supply to the healthy UPS unit fails then the UPS system will provide 66% of the autonomy at full design load. The design does not allow for two concurrent failures by design and this is considered to be a failure upon failure scenario. This is in accordance with SHTM 06-01 clause 10.7 which permits a reduced battery autonomy when one of the UPS units is not available.

7.7 Software

Open protocol industry standard software must be used. All software shall be 'backwards compatible'.

V44 Uninterruptible power supplies

To be read with Preliminaries/ General Conditions

PRODUCTS

310 UNINTERRUPTIBLE POWER SUPPLY (UPS) EQUIPMENT (THREE-PHASE)

- Standards: To BS EN 62040-1 and -3. Submit certification.
- Type: On-line.
- Manufacturer: Board's choice.
  - Product reference: Board's choice – subject to Technical Approval.
- Configuration: Parallel redundant (n+1) with bypass for UPS units.
  - External input and output isolators for each unit: Required.
- Service conditions: Site specific.
- Input power supply: 400V ac.
- Maintenance bypass: External fully interlocked
- Galvanic separation between input and output: Not specifically required, but output side neutral shall remain referenced to / connected to earth for all operating conditions (Board to submit proposals).
- Rated output apparent power (batteries): As detailed on UPS schematic.
- Overload capability: 125% for 10 minutes, 150% for 1 minute and 200% for 100milliseconds.
- Voltage: Three phase and neutral 400 V a.c. ±2%.
  - Voltage waveform: Sinusoidal.
    Total harmonic distortion: Less than 5%.
    Even harmonic distortion: Less than 1%.
- Frequency: 50 Hz ±2%.
- Output power factor: 0.9.
- Batteries: Required, and with 10 year life assuming 20°C environment.
  - Arrangement: Within UPS equipment enclosure or on separate free-standing multi-tiered racking (no more than 4 tiers high).
  - Recharge time:
    To 80% capacity: Manufacturer's standard.
    To 100% capacity: Manufacturer's standard
  - Battery monitors: Required.
- Re-charging regimes: Manufacturer's recommended charging method, but including temperature compensation for variation in battery temperature.
- Generated harmonic distortion at point of incoming supply: In accordance with ENA
- Engineering Recommendation G5/4-1.
  - Evidence of compliance: Submit evidence for 25%, 50%, 75%, and 100% load, with declarations for harmonic current for all harmonics to 25^{th}, and odd harmonics from 27^{th} to 49^{th}.
- Controls, indicators and alarms: Manufacturer's standard.
- Enclosure: Manufacturer's standard.
- Factory tests: Required.

320 SITE SPECIFIC SERVICE CONDITIONS

- Altitude: Less than 1000 m above sea level
- Environmental conditions: Normal indoor.

340 MANUFACTURER'S INFORMATION

- General arrangement drawings: Submit fully dimensioned and detailed general arrangement drawings including:
  - Confirmation that equipment fits in available (allocated) UPS Rooms.
  - Weight of each UPS unit.
  - Total weight of complete UPS assembly (with batteries if integrated).
  - Weight of separate battery (including enclosure or racks).
  - Rating and connection plate details.
  - Enclosure base details.
  - Arrangement and connection drawings for ancillary equipment.
- Batteries:
  - Submit design life details to confirm no less than 10 years for a 20°C environment.
  - Submit service life details assuming battery environment is controlled to 25 +/-1°C.
- Type test certificates: Submit details including:
  - Temperature rise.
  - Sound level in normal mode.
  - Sound level in battery mode.
  - Rated input current.
  - Maximum continuous input current (curve of current against time).
  - Inrush current expressed as a percentage of normal rated current.
  - Harmonics: Full details of input current harmonic distortion at 25%, 50%, 75% and 100% load.
  - Overall efficiency: Submit details at 25%, 50%, 75% and 100% load
  - Heat losses: Submit maximum loss details at 25%, 30%, 40%, 50%, 60%, 70%, 80%, 90% and 100% of rated capacity.
- Mean time between failures: Submit details.

350 BATTERIES FOR UPS

- Type: Lead-acid valve regulated (VRLA) to BS 6290-4, BS EN 60896-21 and BS EN 61056-1
- Voltage: Board's choice
- Battery autonomy (stored energy time at rated power): UPS SHALL BE CONFIGURED AS INDEPENDENT BUT SYNCHRONISED UNITS. EACH INDIVIDUAL UPS SHALL HAVE A BATTERY WITH AUTONOMY OF 40 minutes (giving a total system autonomy of 60 minutes).
- Fused parallel battery strings: Two (minimum).
  - Automatic disconnection of a faulty string: Required
- Impact resistant plastic shields to intercell terminal and output terminals: Required.
- Battery supply d.c. circuit breaker with overload and short circuit protection: Required.
- Ripple free battery charger with automatic temperature and float voltage compensation: Required.
- Battery recharge time: As manufacturer's recommendations

360 BATTERY MONITORS

- Type: Microprocessor based.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

- Features:
  - Automatic battery discharge test at adjustable time intervals;
  - Battery voltage;
  - Detection of faulty battery;
  - Detection of excessive temperature;
  - Estimated remaining battery service life; and
  - Standby time remaining

365 BATTERY SHELVING RACKS

- Type: Free standing.
- Complete with cladding to form cabinets
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

370 CONTROLS, INDICATORS AND ALARMS

- Indicator type: LCD display.
- Controls:
  - Automatic/ manual;
  - Display select button; and
  - On/ off/ bypass.
- Display:
  - Readings:
  - Battery voltage;
  - Input voltage;
  - Output voltage;
  - Input frequency;
  - Output frequency;
  - Input current;
  - Output current;
  - Output load kW; and
  - Output power factor.
  - Status indicators:
  - Battery operation;
  - End of autonomy;
  - Load on bypass;
  - Mains healthy;
  - Mains failed;
  - Normal operation; and
  - Time of load on battery autonomy.
  - Faults: Supply voltage and frequency faults.
  - Alarms: Required.
- Local audible alarm systems: Minimum 65 dBA sounder with xenon flashing beacon

380 CUSTOM ENCLOSURES

- Minimum degree of protection to BS EN 60529: IP31
- Material and construction: Welded mild steel. Assemble to prevent distortion when the complete enclosure is lifted or transported.
- Finish: Manufacturer's standard
- Lockable access doors: Required.
- Cable entry with removable gland plates: For top entry cables
  - Type: Manufacturer's standard

- Duplicate forced ventilation fans: Required.
  - Type: Manufacturer's standard.
  - Controls: Manufacturer's standard.
  - Fan failure alarms: Local and Remote
- Noise emission:
  - Sound pressure level in normal mode (maximum): Refer to Acoustic Strategy for limits
  - Sound pressure level in battery mode (maximum): Refer to Acoustic Strategy for limits
  - Anti-vibration mountings: Integral.

COMPLETION

910 CLEANING AND GENERAL INSPECTION

- Dust and debris: Remove.
- Enclosures: Inspect.
- Earthing: Verify.
- Cable terminations: Inspect.
- Inspection report: Submit.

915 LABELLING

- Identification label: Required.

920 TESTING AND COMMISSIONING

- Method statement: Submit.
- Phase rotation: Verify.
- Emergency and safety circuits: Check.
- Correct operation of alarms and controls: Confirm.
- Insulation resistance tests: Test interconnecting cables and test forced cooling fan motors.
- Type Tests: Perform all tests in accordance with BS EN 62040-3 Table 3.
- Routine Tests: In accordance with BS EN 62040-3 Table 4, perform the following.
  - Operational tests:
  - a.c. input failure test;
  - a.c. input return test;
  - Rated stored energy time test;
  - Simulation of parallel redundant UPS fault test;
  - Synchronization test;
  - Transfer test;
  - UPS auxiliary devices test.
  - Output tests:
  - Harmonic components measurement;
  - Load tests:
  - Light load test;
  - Full load test.
  - Standby generator compatibility tests: Required

940 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with the proposed document management system
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.
  Test certificates: submit
  System certification: submit

RHSC and DCN EDINBURGH
EARTHING & BONDING

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Earthing system generally
- Earth electrode system & installation
- Earthing of MV Network, Energy Centre & Generators
- Earthing of Substations
- Main equipotential bonding conductors
- Supplementary bonding conductors
- Neutral to earth point(s)
- Circuit protective conductors

- Conduits and conduit fixings
- Switch and riser cupboard earthing and bonding
- Server and hub rooms earthing and bonding (functional earth for comms/data)
- Imaging equipment earthing
- Earthing within MEIGaN areas
- High integrity earthing
- Cabling and containment earthing and bonding
- Earthing for Isolated Power Supplies
- Generator star point
- Earth resistor earthing
- Measurements & tests on the installed earthing system

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Specification:-

- Earthing connections to specialist equipment.
- Earthing connections to lightning protection system.

4.0 INTERFACES AND DEMARCATIONS

Final connection of Earthing & Bonding systems to other systems (e.g. Imaging equipment, server racks, comms equipment, etc.) – schedule of responsibilities:-

- Imaging equipment final earthing connection to imaging Earth Reference Bar (ERB) provided by the Electrical Installer - by the Imaging Specialist.
- Server racks in server rooms and IT hub rooms connection to standard and separate (IT/instrument) earth bars provided by the Electrical Installer - by the IT System Specialist.
- Communication or other equipment requiring connection to a functional earth bar provided by the Electrical Installer – by the Specialist.

5.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the materials & workmanship clauses.

The Earthing & Bonding System shall be in accordance with;-

- The IET Wiring Regulations, BS7671 17th Edition;
- SHTM 06-01;
- The Medical Electrical Installation Guidance Notes (MEIGaN) v2.0 September 2007;
- Requirements of Scottish Power Energy Networks, should any arise;
- IEE Wiring Regulations Guidance Note 7;
- Electricity at Work Regulations;
- BS 7430 & BS EN 50310;
- ESI Engineering Recommendation S34

6.0 LIAISON

The Electrical Installer shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Electrical Installer shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialist. The Electrical Installer shall liaise with other specialist's as necessary to ensure that all interfaces between the Earthing & Bonding System and other systems are allowed for.

Any other member of the Project and Hospital teams concerned with the planning and administration of the earthing and bonding system and policies.

7.0 EARTHING & BONDING SYSTEM

This section shall be read in conjunction with NBS clause V81 – Earthing and Bonding.

Earthing system generally

The whole of the electrical installation RHSC-DCN Building shall be effectively earthed and bonded to fully comply with the requirements of BS 7671 (17th Ed.), BS 7430 and MEIGaN v2.0 September 2007.

The entire earthing & bonding installation including switchboards, distribution boards, trunking, tray, ladder, basket tray, conduits, circuit protective conductors together with the metallic sheathing of cables shall be electrically continuous throughout forming a completely bonded system.

Earth electrode system & installation

An earthing system shall be installed to achieve a resistance to earth of less than one ohm. It is anticipated that the system will include connections to the building foundations. Where reinforced concrete foundations or piles are to be used as supplementary earth electrodes, connection to the re-bars shall be via a dedicated supplementary re-bar (minimum 12mm diameter) brought out through a connection box set into the concrete and at which connections to copper conductors/ strips can be made. The dedicated conductor re-bar shall be continuous (welded section to section if necessary) and shall be bound onto the structural re-bars.

The earth electrodes shall be solid high conductivity copper rods of 15 mm diameter, not less than 1.2 m long, be driven into the ground to a minimum depth of 2.4 m and be set out to meet the earth site and soil conditions. In addition, and where soil conditions allow such benefit, the electrodes may be buried lengths of high conductivity copper tape of size not less than 100mm x 3mm unless otherwise stated.

The earth electrodes shall be connected to form the earth network via high conductivity tape by means of a purpose made clamp below ground level in a proprietary brand of concrete inspection pit with a removable cover. A label shall be affixed within the inspection pit indicating the driven length of the earth electrode and its measured resistance value at time of test.

The high conductivity tape shall be installed in square and symmetrical lines with links provided in the tape system so that periodic tests may be carried out.

The earthing tape shall be LSOH sheathed or LSOH wrapped where run externally, through walls and floors or in situations where it may be liable to corrosion. PVC insulation may be used where copper tape is buried in the ground external to the building and where the use of such insulation contributes to the control of touch voltages or is required for separation reasons. Sheaths and wrappings shall be green and yellow. All insulated earthing tape when installed above ground or in floor trenches shall be secured at intervals not exceeding one metre by means of suitable saddles.

All joints in exposed sections shall be protected against moisture and corrosion by the application of two coats of anti-corrosion paint.

Each substation earth electrode system shall be bonded to the adjacent substation earth electrode system.

Earthing of MV Network, Energy Centre & Generators

The Energy Centre is to be provided with a MESH or common bonding network (CBN) for earthing of its electrical systems and for protection against the effects of lightning strikes. These systems shall be arranged such that multiple paths are provided to earth for all fault currents and over voltages.

The MV earthing systems to be provided principally comprise the Earth Electrodes (foundations, pits or ring conductors), Cables, Earth Bars and neutral Earthing panels indicated on the Drawings all designed/connected to safely conduct earth fault currents to the origin of the supply while the MV circuit protection recognises and clears the earth fault.

The CSA of the cables and earth bars will be as shown on the drawings.

The Generator Neutral Earth Panels shall be controlled to ensure:-

- that only one Generator neutral-earth connection is provided for all paralleled generators;
- the generator neutral is not earthed while the generators are paralleled with the Mains;

The Neutral Earthing Panel shall be automatically controlled by the Electrical Network Management System (ENMS).

Earthing of Substations

Refer to the earthing schematic for diagrammatic detail.

At each substation (11kV step down substation within the Hospital) the Electrical Installer shall provide a main earth bar within each LV switchroom for the 'A' side and 'B' side which shall be connected in a loop thereby providing an earth connection to each MV substation in accordance with SHTM 06-01.

The main earth bar shall comprise a 50 mm x 6 mm (minimum) high conductivity copper earth bar mounted on top of the LV switchboard.

A main earthing conductor shall be connected to the earth electrode network for each substation which shall be not less than 185mm^2. The main earthing conductor shall terminate at the main earth bar within each LV switchroom via removable test links.

A 11kV switchgear & transformers shall be bonded to the main earth bar. In addition the armour of all sections of 3-core 11kV cable shall be connected to the respective casings and bonded to the main earth bar.

The circuit protective conductors for the outgoing LV sub-mains cables shall be connected to the main earth bar.

Supplementary bonding conductors shall be provided together with all necessary clamps and cable terminals from the main earth bar to any extraneous conductive parts of metallic items located within the substation to maintain an equipotential zone.

Main equipotential bonding conductors

All main equipotential bonding conductors shall be in accordance with BS 7671 (17th Ed.).

A main equipotential bonding conductor shall be installed from the main earth bar located in the LV switchroom of each substation to all incoming main metallic piped services except Telecommunication systems, main pipework at boilers & chillers and to the main ductwork at air handling units. Where these services enter the building at basement level the main equipotential bonding conductors shall be bonded to earth bars within the basement serving a group of services and each earth bar shall be bonded to the main earth bar located in the LV switchroom of each associated substation.

The extraneous conductive parts of all other separate metallic services particular to the building shall be connected including medical gases, compressed air and vacuum systems, lightning protection system and any exposed metallic parts of the building fabric.

Local earth bars may be installed in the plantrooms to reduce the cost of this installation and plantroom earth bars shall be connected to the main earth bar by means of main equipotential bonding conductors.

All main equipotential bonding conductors shall comprise individual single core copper conductors with a green/yellow LSOH sheath.

Main Equipotential Bonding Conductors shall have a cross-sectional area not less than half the cross-sectional area required for the earthing conductor serving that part of the installation.

Local equipotential bonding and protective earth continuity between equipment and the associated mains supply isolator(s) shall not depend solely upon the continuity of conduits, cable braiding, ducts or trunking; it shall be achieved by means of a dedicated copper earth cable connected with brass or copper fittings.

Supplementary bonding conductors

All supplementary bonding conductors shall be in accordance with BS 7671 (17th Ed.).

Supplementary bonding conductors shall be provided to extraneous metal work such as, but not limited to, metal sinks and work surfaces, air transfer grills, medical gas outlets, heating pipes and radiators, water pipes, drug cupboards, ceiling mounted hardware, conduits, trunking and cable trays, metalwork above the ceiling line, steel or wire basket cable trays, steel floor ducts (lids to be fly-lead tagged), steel floor plates (in or below floor line), metal support plates, metal cable outlet plates, metal suspended ceiling tiles (cross-bonded) and ‘computer’ flooring (cross-bonded).

Where practicable and so indicated, or in substations, switchrooms and sections of the Hospital and Energy Centre housing plantrooms or server rooms, the supplementary bonding shall be extended to the main metallic reinforcement in constructional reinforced concrete.

All supplementary bonding conductors shall comprise individual single core copper conductors with a green/yellow LSOH sheath.

A supplementary bonding conductor connecting two extraneous-conductive-parts shall have a cross-sectional area not less than 2.5 mm^2 if sheathed or otherwise provided with mechanical protection or 4 mm^2 if mechanical protection is not provided. All other supplementary bonding conductors shall have a cross sectional area not less than 4 mm^2.

Neutral to earth point

The neutral to earth connection point shall be derived at the substation as indicated on the earthing schematic.

Measurements & Testing

Project Co. shall at stages during, and upon completion of, the earthing installation perform & record measured results of tests to:-

- Check the integrity of the installed earth electrode & earthing system;
- Confirm the overall earthing resistance of the complete system and record test readings (which can be repeated in subsequent years by maintenance teams) to illustrate continued integrity, interconnections & performance.

Project Co. shall measure the overall resistance to earth of each part of the earth electrode network such as each zone of earth rods (i.e. earthing nests), contribution of buried services (e.g. water pipes) constructional foundations, pile caps and crane bases.

A number of readings shall be taken in order that averages can be derived and bands of uncertainty gauged. Tests shall be proposed & recorded for all parts of the earth electrode network.

Project Co. shall provide a group of fully documented tests intended to record the resistance of interconnections on key parts of the earthing installation. Tests should, without disconnection of earthing conductors, permit confirmation that bonds/ connections are in place and should record the connection resistance of at least:-

- Links between substation earth bars and metal work on switchboards, transformers, etc.
- Underground external links as may be used to connect any gates, barriers, etc to the earthing system.

Circuit protective conductors

A separate circuit protective conductor shall be installed together with the phase and neutral wiring for all circuits including sub mains cabling.

The earth terminal of all socket outlets shall be solidly earthed to the system.

Conduits and conduit fixings

Metal conduits crossing expansion joints shall be fitted with proprietary couplings with an earthing clip at each side of the coupling, connected by a 4 mm^2 copper stranded conductor and LSOH insulated.

Switch and riser cupboards earthing and bonding

In each riser cupboard at each floor, the Electrical Installer shall provide a high conductivity copper earth bar an earth bar linked to the main earth bar of the respective main low voltage panel within the LV switchroom.

This shall be used to connect all supplementary and equipotential earthing conductors for the area of the building served by that riser.

Server and hub rooms earthing and bonding

A local standard earthing bar shall be installed in the main core server room and hub rooms, and shall be connected by a green/yellow LSF insulated conductor back to the supply substation's main earth bar.

An additional earth bar (for earthing of IT/ hub equipment/ instruments only) shall be installed in the core server room and hub rooms, and shall be connected by green/yellow LSF conductor (separately from the standard earth bar connection above) back to the supply substation's main earth bar.

Functional earths generally

In the event that communications, imaging or other equipment requires a functional earth then, as for server & communications rooms above, a separate copper earth bar shall be installed and connected back to a designated earth bar using cream coloured LSF conductor.

Connection to anti-static floors/ conductive floors.

Where anti-static or conductive floor surfaces are to be installed, Project Co. shall provide (after liaison with the floor installer) one or more connection terminal(s) bonded to the local earth reference bar, and the floor installer shall be responsible for laying/ connecting all under floor tapes, tails, etc and for testing the finished floor parameters.

Imaging equipment earthing

Earthing in diagnostic imaging and radiotherapy rooms / suites such as dental X-ray equipment, ultrasound, nuclear medicine, bone density, MR, CT, PET as well as conventional radiotherapy, radiographic and fluoroscopic equipment, shall be compliant with MEIGaN V2.0 published by MHRA.

Sub-mains cables for imaging equipment shall be armoured, refer to Low Voltage Distribution specification (WW.A.P.1.2.20), however the steel wire armour (SWA) is intended to provide mechanical and electro-magnetic compatibility protection and shall not be used as the main earth conductor. Connection to earth shall be achieved by means of a copper conductor, having a cross sectional area (CSA) greater than or equal to that of the phase conductors. Where the medical device supplier specifies a greater cross sectional area, the supplier's instructions shall be followed. The copper earth conductor shall be connected to the source of the supply unless it can be shown that a more local distribution panel can provide a copper conductor of adequate CSA from the earth reference bar (ERB) to the earth distribution bar of the sub-station (verify by inspection). The cable supplying power to a three-phase installation shall be a five core cable, and the cable supplying power to a single-phase installation shall be a three core cable.

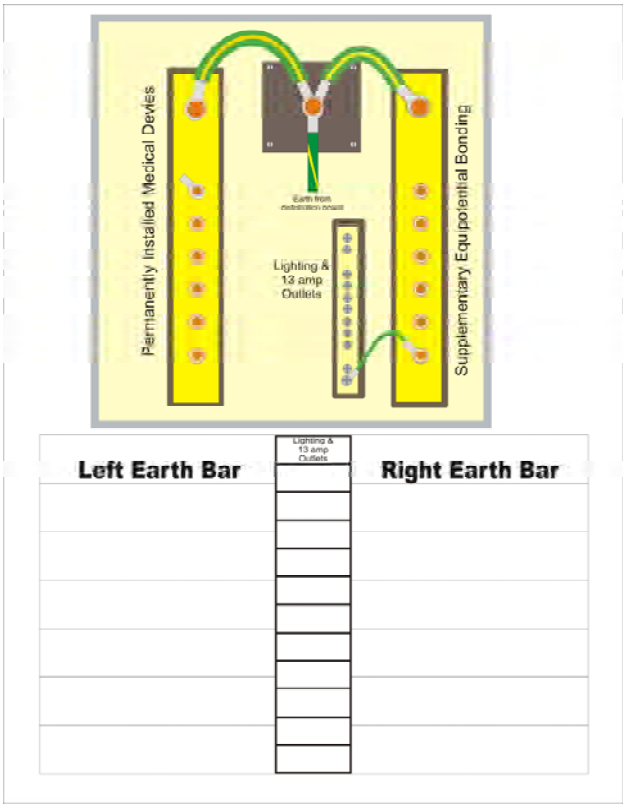
An earth reference bar (ERB) shall be provided in the following areas, subject to design development, within the RHSC-DCN Building:-

Floor	Department	Room Name	Room Number
*	*	*	*

(To be completed during detailed design stage)

The ERB shall be constructed as follow:

- 1st earth connection bar: serves all equipotential conductors for all permanently installed medical devices in the imaging room.
- 2nd earth connection bar: for supplementary bonding of all other extraneous metalwork within the imaging room. A small earth bar shall be connected to this bar for equipotential bonding of socket outlets and lighting.
- 3rd earth connection bar / stud: mains supply protective conductor. Bars 1 and 2 shall be bonded to bar 3.



The copper connection bars shall be insulated from the building. Each copper connection bar shall have a cross sectional area capable of carrying the maximum predicted short circuit current and shall have tapped holes able to take studs mechanically and electrically compatible with the peak current and cable size. The connection bars shall be connected to the incoming earth conductor by means of flexible removable links, which will facilitate the use of a current-measuring probe. The links shall have a cross sectional area sufficient to carry the maximum rated current. The additional smaller bar to accommodate the protective earth and equipotential bonding conductors from the socket outlets and lighting shall be rated to carry the maximum short-circuit current of the socket outlet supply.

Generally, each ERB shall be bonded back to the earth bar in the local electrical riser by means of a protective conductor of equal cross section as the phase conductor of the mains supply to the room however in imaging rooms served by IPS systems the imaging ERB shall also be bonded to the protective earth terminal (PET) within the IPS serving the sockets within the room.

The imaging ERB installation shall comply with the following requirements:

- The mains supply protective earth conductor entering the location shall be terminated at the imaging ERB.

- The imaging ERB shall be close to the mains supply isolator in an accessible position at a height of 1200mm AFFL.

- The imaging ERB shall be installed in an enclosure with a cover that requires a tool to open it and shall be marked ‘Earth Reference Bar’.

- Each protective earth and equipotential bonding conductor shall be separately terminated and connected to the relevant connection bar by means of crimped connections.

- All circuit protective earth and equipotential bonding conductors shall be identified and a list of connections made, a copy of which shall be available in the imaging ERB cabinet.

- All exposed conductive surfaces of installed equipment shall be earthed to the imaging ERB. This includes the enclosures of warning lights, injectors, water baths, contrast media warming equipment, viewing boxes, powered drug cabinets surgical lamps etc. All such items shall be returned to the imaging ERB by means of a cable having a cross sectional area sufficient to ensure that the bonding resistance between the imaging ERB and the earth connection on any installed device is less than 0.1 Ω (this includes the earth receptacle of all 13 A mains outlets) or as specified by the equipment manufacturer.

- All fixed non-powered equipment with metal surfaces (extraneous conductive surfaces) shall be similarly bonded to the imaging ERB. This includes protective screens (including wings), metal sinks and work surfaces, air transfer grills, medical gas outlets, heating pipes and radiators, water pipes, drug cupboards, ceiling mounted hardware, conduits, trunking and cable trays, steelwork above the ceiling line (Unistrut or Marstrut for example) (cross-bonded), steel or wire basket cable trays, steel floor ducts (lids to be fly-lead tagged), steel floor plates (in or below floor line), metal support plates, metal cable outlet plates, metal suspended ceiling tiles (cross-bonded), ‘computer’ flooring (cross-bonded). All such items shall be returned to the imaging ERB by means of a cable having a cross sectional area sufficient to ensure that the bonding resistance between any two conductive surface in the room is less than 0.2 Ω. Earthing by means of trunking, conduits or screening alone is not permitted, a copper conductor shall be provided.

- The installation of socket outlets shall ensure that the circuit protective conductors together with the equipotential conductor achieve an earth resistance value of less than 100 milliohms between any socket outlet and the imaging ERB.

The SWA of the mains supply cable for the medical device is intended to provide mechanical and electro-magnetic compatibility protection; it shall not be used as an earth path. Connection to earth shall be achieved by means of a copper conductor, having a cross sectional area greater than or equal to that of the phase conductors unless the medical device supplier specifies a greater requirement. If the medical device manufacturer stipulates an electromagnetic interference (EMI) screen for the mains supply cables, the SWA shall be terminated with a zoned earthing and neutral (ZEN) gland.

The SWA shall be earthed only at the distribution board unless that would conflict with the equipment manufacturer's instructions for earthing arrangements for electromagnetic compatibility (EMC).

The imaging ERB for the MRI suites shall be located on the equipment room side of the Faraday cage at the earth connection point specified by the manufacturer. The brass stud used to connect each side of the Faraday cage is deemed to be the incoming earth to the diagnostic room. This stud shall be securely connected to the Faraday cage. The imaging ERB enclosure shall be non-metallic, or at least non-ferrous, to prevent interaction with the high magnetic field. The supply-side conductor shall be one cable directly connected to the incoming supply equipotential conductor.

High integrity earthing

All power circuits and accessories shall be provided with high integrity earthing in accordance with Section 543.7 within Chapter 54 of BS 7671 (17th Ed.)

Small power circuits wired by means of 4mm^2 radial circuits in metal conduit will achieve high integrity earthing without the need for any further special measures.

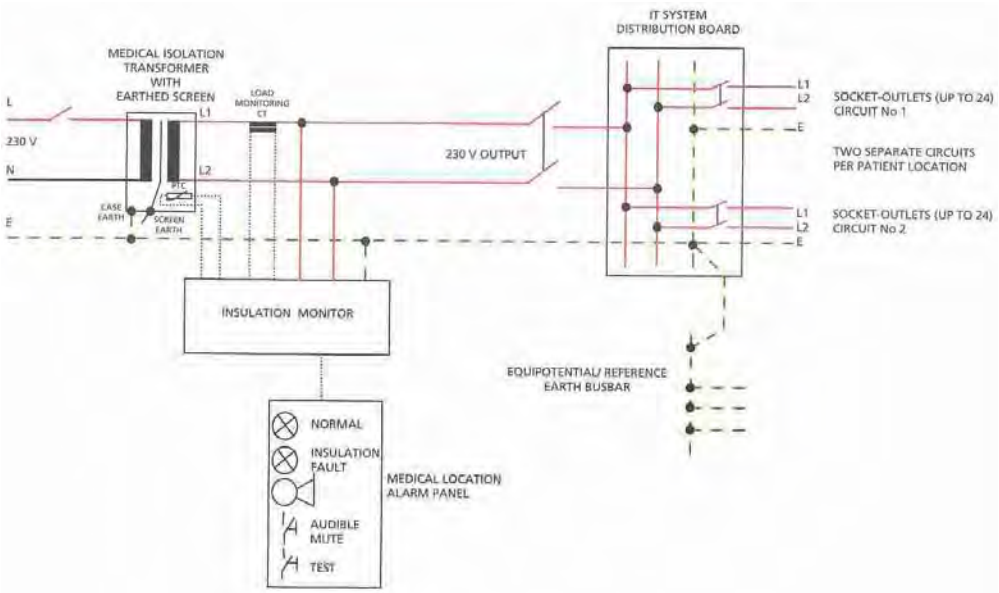
Cabling and containment earthing and bonding

Earth cabling shall be contained on the ladder rack and tray work distribution serving the LV cabling systems, as required. Tray work for the containment of vertical earthing cabling to and from points of termination shall be provided as necessary.

IT cabinet earthing shall be contained on the ladder rack and tray work distribution serving the LV cabling systems.

Earthing for Isolated Power Supplies

The PET integral to the IPS shall be earthed via the CPC of the Isolated Power Supply incoming sub-main cable, and shall act as an equipotential earth only, as far as the final circuits are concerned. These final circuit equipotential bonding conductors shall be sized as indicated on the distribution board schedules. Refer to the following diagram, figure 10.1B, taken from IEE Guidance Note 7 (Chapter 10) for typical arrangement of Isolated Power Supply earthing.



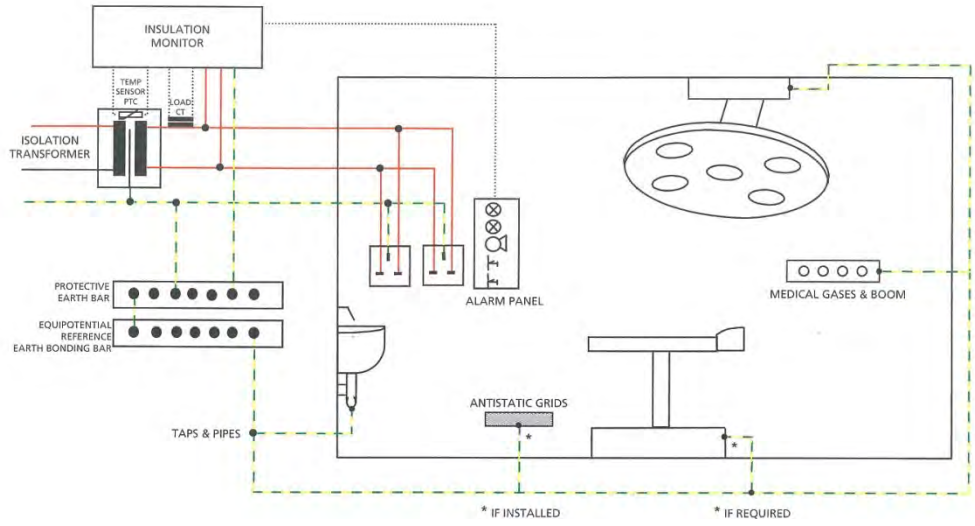
The earth terminals of socket outlets fed from the IPS shall be connected via equipotential bonding conductors to the protective earth bar within the isolated power supply unit.

Supplementary equipotential bonding conductors within the area served by the IPS shall be installed and connected to the PET integral to the IPS for the purpose of equalising potential differences between the following parts, located in the “patient environment”:

- Protective conductors;
- Extraneous-conductive-parts;
- Screening against electrical interference fields, if installed;
- Connection to conductive floor grids, if installed;
- Metal screen of the isolating transformer, if any.

The resistance of the conductors, including that of the connections, between the terminals for the protective conductor of socket-outlets and of fixed equipment or any extraneous-conductive-parts and the bonding busbar shall not exceed 0.2 Ω. The adequacy of the bonding shall be verified to ensure the touch voltages within the patient zone are not exceeded.

Note: The earthing and bonding in the operating theatres and similar medical locations shall comply with figure 10.1A of IEE Guidance Note 7 (Chapter 10), see below. The protective earth bar (or PET) shall be integral to the IPS and the required equipotential reference earth bonding bar shall be located adjacent to each Isolated Power Supply unit.



Earthing for Pendants in general

Pendants and all powered outlets within shall be earthed in accordance with the pertinent requirements for isolated power supplies, standard power outlets, equipotential bonding, etc as described above.

In addition, for Theatres and for any other areas so notified, if a Patient Earthing Terminal is incorporated in the pendant of other equipment design, it shall be connected to the relevant theatre earth reference bar by means of a dedicated copper (insulated) cable no less than 6mm^2.

V81 Earthing and bonding systems

To be read with Preliminaries/ General conditions.

GENERAL

110 EARTHING AND BONDING SYSTEMS GENERALLY

- Main incoming earth: Separate earth electrode network per MV substation.
- Size of main earthing conductor: To BS 7671 Regulation 543.1.3.
- Main earth electrode type: Earth rods.
- Main equipotential bonding
  - Connect the following to the main earthing terminal:
    All extraneous-conductive parts of an installation including, but not limited to:
    water service pipes,
    gas installation pipes,
    other service pipes and ducting,
    central heating and air conditioning systems,
    exposed metallic structural parts of the building,
    the lightning protective system.
  - Cable type: LSZH singles, as section V32.
  - Size: To BS 7671 Regulation 544.1.1.
- Supplementary equipotential bonding: Bond the following:
  exposed conductive parts,
  extraneous conductive parts.
  Refer to particular section.
  - Cable type: LSZH singles, as section V32.
  - Size: Minimum of 2.5 mm² if sheathed or where mechanical protection is provided, otherwise minimum 4 mm², and in areas with IPS units subject also to constraints imposed by interconnection impedance limits.
- Circuit protective conductors
  - Type: Refer to cable and distribution board schedules .
  - Size: Refer to cable and distribution board schedules.
- Earth terminal: main earth bar mounted on LV switchboard in each main LV switchroom. Separate wall mounted earth bar in each riser cupboard at each floor. Separate functional and general earth bar in each server and hub room. Separate reference earth bar installed in each diagnostic imaging and radiotherapy room/suite.
- Earthing of metal fencing around substations: Required.
- Accessories:
  - Earth bar;
  - Earth clamps; and
  - Soil conditioning agent

SYSTEM PERFORMANCE

210 DESIGN

- Standards: To BS 7671 and in accordance with BS 7430.
- Design: Complete the design of the earthing and bonding systems.
- Proposals: Submit drawings, technical information, calculations and manufacturer's literature.

220 ELECTRICITY DISTRIBUTOR'S REQUIREMENTS

- Electricity distributor: Comply with the requirements of the Electricity Distributor.
  - Evidence of compliance: Submit.

230 EQUIPOTENTIAL BONDING IN BUILDINGS WITH INFORMATION TECHNOLOGY EQUIPMENT

- Standard: To BS EN 50310.
- Objectives: Serving the two main server rooms.

250 GENERATOR EARTHING DESIGN

- Standard: To BS 7430 and in accordance with the Electricity Distributor's requirements.
- Independent earth electrode network: Provide.
  - Individual earth electrode resistance (maximum): 20 ohm.
  - Overall resistance to earth of earth electrodes in combination (maximum): 1 ohm.
- Generator operation: Short term parallel with mains electricity supply.
- Earth connection to generator: Provide.

255 MOBILE GENERATOR EARTHING

- Mobile generator earthing: Provide an earthing system with ‘user terminal’ capable of being connected to a mobile generator.
  - Mobile generator position At energy centre.

260 HIGH INTEGRITY EARTHING DESIGN

- Scope: Applies to all small power circuits, and accessories, serving socket outlets.

270 DESIGN FOR HAZARDOUS AREAS

- Standard: To BS EN 60079-14.

280 DESIGN FOR THE SAFE USE AND HANDLING OF FLAMMABLE LIQUIDS

- Design: In accordance with HS(G) 140 from UK Government Health & Safety Executive.

PRODUCTS

310 PRODUCTS GENERALLY

- Standards: To BS 7671 and in accordance with BS 7430.

320 EARTHING AND BONDING CONDUCTORS general

- Type: Bare, tinned, LSZH-covered and lead-covered copper tape to BS EN 13601.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

360 EARTH RODS

- Standards: In accordance with BS 7430 and Energy Networks Association Technical Specification 43-94.
- Type: Solid copper rods.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Size (diameter): As per particular specification, schematics and drawings.

370 COPPER EARTH PLATES

- Standard: To BS EN 13601.
- Type: Board's choice.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Size: Board's choice.
  - Thickness: Board's choice.

380 EARTH ELECTRODE INSPECTION PITS

- Type: Concrete.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Load rating (minimum): 5000 kg.
- Identification: Permanently identify with the wording 'SAFETY EARTH'.

390 MAIN EARTH BARS GENERALLY

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Hard drawn copper to BS EN 13601.
- Location: As per particular specification, schematics and drawings.
- Size:
  - Profile: As per particular specification, schematics and drawings.
  - Length: Board's choice but minimum 1000mm MV for and 450mm for earth bars associated with LV installation elsewhere within the Hospital & Energy Centre.
- Predrilled connections: Board's choice.
- Disconnecting links: 2.

440 EARTHING AND BONDING CLAMPS

- Standard: To BS 951.

460 SOIL CONDITIONING AGENTS

- Type: Submit proposals.

EXECUTION

610 GENERAL INSTALLATION

- Standards: To BS 7671 and in accordance with BS 7430.

660A INSTALLING EARTH RODS

- Position: In undisturbed ground.
  - Location: At least 2 m from building and metal fencing, avoiding communications cabling.

- Rod separation:
  - General earth installations: Space the rods apart by at least 1.25 times the depth of the longest rod.
- Rod alignment: Vertical.
- Rod length (minimum): 2.4 m.
- Couplings: Apply corrosion inhibiting paste to the threads and enclose so that rods meet at centre of coupling.
- Earth rod heads: Enclose and position within 100 mm of ground level.
  - Enclosure: Concrete inspection pit.
- Earth rods: Interconnect with PVC insulated copper tape.
  - Tape size: 25 mm x 6 mm.
  - Tape depth: 750 mm below ground.
  - Jointing method: Exothermic.
- Internal earth rods: Provide seals.

670 INSTALLING SURFACE BARRIERS AROUND EARTH RODS

- Non-conducting barriers: Install to prevent personnel or livestock contact with the ground within 2 m of earth rods.
  - Location and design: Submit proposals.

680 INSTALLING EARTH PLATES

- Earth plates: Install vertically. Backfill immediately following installation.
  - Depth of plate top (minimum): 1000 mm below finished ground level.
  - Location: Board's choice .

700 INSTALLING EARTH BARS

- Main earth bar location: Next to the main switchboard.
- Multiple earth bars: Connect with a conductor ring.
- Mounting: Insulated supports.
  - Support spacing: 300 mm for 25 mm bar and 450 mm for 50 mm bar.
  - Clearance between wall and earth bar (minimum): 30 mm.

710 INSTALLING MAIN EARTHING CONDUCTOR

- Conductor location: Install between the main incoming earth and the main earthing terminal in one continuous length.
- Connection: Make with compression lugs and phosphor bronze nuts and bolts and spring washers.
- Earthing conductor route: Board's choice.
- Connection to earth electrodes: Heavy duty copper alloy mechanical clamps.
- Protection to main earthing conductor: Not required.

720 INSTALLING MAIN EQUIPOTENTIAL BONDING CONDUCTORS

- Separate and continuous connections: Install between each service and the main earth terminal.
- Bonding conductor routes: Board's choice.
- Bonding connections at main earth terminal: Connect with compression lugs and phosphor bronze nuts and bolts and spring washers.

730 INSTALLING SUPPLEMENTARY BONDING CONDUCTORS
- Earth connections: Connect with compression lugs.

740 INSTALLING EARTH ELECTRODE PITS
- Locations: Submit proposals.
- Inspection pit lid: Install flush with the finished ground surface.

750 DISSIMILAR METALS
- Connecting dissimilar metals: Prevent electrolytic action.

760 EARTHING AND BONDING OF STREET FURNITURE
- Standards: To BS 7671 and in accordance with the Electricity Distributor's requirements.
- Supplies to street furniture: Use cables with separate phase, neutral and protective conductors.

770 EARTHING OF METAL FENCING AROUND SUBSTATIONS
- Type: Connected to substation earthing system.

COMPLETION

910 INSPECTION AND TESTING
- Standards:
  To BS 7671 and in accordance with BS 7430.
  To guidance/ procedures described in MEIGaN V2.0
- Notice before commencing tests (minimum): 24 h.
- Continuity of protective conductors:
  - Parallel earth paths: Isolate before testing.
  - Equipment: Continuity tester with short circuit current not less than 200 mA, and a no load d.c. or a.c. voltage between 4 V and 24 V.
- External earth fault loop impedance: Direct measurement.
- Earth fault loop impedance:
  - Method: Direct measurement.
  - Measurement locations: Origin, switchgear, fixed equipment and outlets, and circuit extremities.

920 NOTICES AND LABELS
- Standard: To BS 7671.
- Material: Face engraved rigid plastics laminate.
- Colour:
  - Background: White.
  - Lettering: Red.
- Typography:
  - Font: Helvetica medium.
  - Size: Submit proposals.
- Earth bars: Describe each connection and label with _SAFETY ELECTRICAL CONNECTION – DO NOT REMOVE_.
- Main earthing and bonding connections: Describe each connection and label with _SAFETY ELECTRICAL CONNECTION - DO NOT REMOVE_.
- Telecommunications functional earth connections: Label with "TELECOMMS EARTH - DO NOT REMOVE".

930 IDENTIFICATION OF FUNCTIONAL EARTHING

- Labelling: Identify the purpose of functional earth cables along their length using clip-on cable markers.
  - Spacing (maximum): 3 m.

940 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with the proposed document management system
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

RHSC and DCN EDINBURGH
WATER DETECTION SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Specification shall include, but not be limited to the following:-

- Sensing cable type water detection systems
- Sensing probe type water detection systems

Drawings

Project Co. shall prepare general arrangement drawings of the Water Detection Systems based on the Architect's base drawings and co-ordinated with other services and building elements.

The drawings shall indicate as a minimum:-

- Areas protected
- Sensing cables/probes
- Alarm panels

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this element of the Specification:-

- Power wiring
- Main cable containment (other than final run outs of conduits)
- Major leak detection (i.e. by differential pressure detection to pipework)

4.0 INTERFACES AND DEMARCATIONS

The Water Detection Systems shall be integrated with a host Internet Protocol network which will support communication, interaction, data transfer and data retrieval from and between the various engineering systems in the building. The Water Detection Systems shall be connected to the host network via gateways. The Building Management System (BMS) will be provided with a Graphical User Interface which will permit the interrogation of the Water Detection Systems down to component level. It is not intended that the BMS will control the system but rather will monitor component status and provide fault alarm indication at the Graphical User Interface.

5.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the materials & workmanship clauses.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Water Detection Systems.

8.0 SYSTEMS

Water detection shall be provided at:-

- Perimeter of core server room (sensor cable);
- Perimeter of all Hub rooms (sensor cable);
- Plant room bunds above or immediately adjacent to Theatre Department and Radiology departments.

Sensor probes shall be provided within the basement sumps to indicate high level warning.

Panels

Wall mounted water detection panels shall be located on the fully loaded drawings.

The panels specified herein shall be self-rebooting following mains failure and generator test conditions.

Sensor Cables

Water sensing cables shall be provided in core server room shall be laid around the perimeter of the room and in parallel strips 2m apart on the floor.

Water sensing cables shall be provided in Hub rooms shall be laid around the perimeter of the room and in parallel strips 2m apart on the floor.

Sensor probes

Sensor probes shall be provided in the sumps within the Basement and shall be floor mounted.

Sensors shall be suitable for plantroom environments and provided with a robust protective housing.

Cables linking the sensors and local panels shall be run in robust containment systems.

Alarms

In the event of local leakage, local audible and visual alarms shall be raised and repeated at the BMS front end.

W58 Water detection and alarm systems

To be read with Preliminaries/ General conditions

GENERAL

110 WATER PRESENCE DETECTION AND ALARM SYSTEMGENERALLY

- System manufacturer: Board's choice.
- Areas to be protected: Refer to Particular Specification.
- Zones: Refer to Particular Specification.
- Sensor types: Cable and Probe.
- Control panels: Required.
- Connection cable to sensors: Required.
  - Cable type: System manufacturer's standard.
  - Containment: Rigid metallic conduit, as section Y63.
  - Rewireable installation: Required.
  - Concealed installation: Required.
- Alarm indication:
  - Internal: Submit design and cost proposals.
  - External: Submit design and cost proposals.
- Completion: Submit design and cost proposals.

SYSTEM PERFORMANCE

210 DESIGN

- Design: Complete the design of: The water leak detection and alarm system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
- Zone diagram: Submit for water presence detection and alarm system.

220 ZONING AND IDENTIFICATION FOR WATER PRESENCE AND ALARM SYSTEM

- Zoning: Divide the installation into separately controlled and identifiable zones.
- Sensor identification: Individual address.

230 INTEGRATION WITH OTHER ALARM AND SECURITY SYSTEMS

- Objectives: Integration with BMS.
- Systems to be integrated: Building monitoring and management systems, as section Y41.

PRODUCTS

310 CABLE SENSORSFOR SERVER ROOMS, HUB ROOMS AND PLANTROOM BUNDS.

- Type: Four wire with LSZH sheath.
- Manufacturer: System manufacturer.
  - Product reference: Board's choice.
- Cable length: Submit proposals.
- Accessories: Hold down clips and Identification tags.

330 PROBE SENSORSFOR BASEMENT AND TUNNEL SUMPS.

- Type: Floor mounted.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals .
- Accessories: Protective housing.

350 CONTROL PANELS GENERALLY

- Manufacturer: System manufacturer.
  - Product reference: Board's choice.
- Features:
  - Individual zone alarm indicators;
  - Individual zone fault indicators;
  - Individual zone healthy indicators; and
  - BMS interface.
- Integral battery back up: Not required.
  - Low battery alarm: Required.

  Alarms:
  - Audible;
  - BMS connection;
  - Remote; and
  - Visual.
- Accessories: 50 event log.

370 VISUAL ALARM SIGNAL DEVICESGENERALLY

- Manufacturer: System manufacturer.
  - Product reference: System manufacturer.
- Type: LED.
- Flash rate
  - (Minimum): 30 per minute
  - (Maximum): 130 per minute
- Lens:
  - Material: Polycarbonate.
  - Colour: Clear.
- Enclosure ingress protection to BS EN 60529: IP44.

EXECUTION

630 INSTALLING CABLE AND TAPE SENSORS

- Fasteners:
  - Floors and ceilings: Self adhesive clips.
  - Pipework: Reusable wrap around bands.
- Contact between sensor and item being monitored: Required.
- Coverage: Lay in loops or wave pattern.
- Spacing between cables and between tapes (maximum): Submit proposals.

640 INSTALLING POWER SUPPLIES

- Equipment to be connected: Control panels.
- Power supplies: As Circuit schedule.
  - Final connection accessory type: Unswitched fused connection unit.

660 INSTALLING PROBE SENSORS

- Fixing: Screw fix.
- Spacing between probes (maximum): 2 m.

670 INSTALLING CONTROL PANELS

- Location: As SPA1046 on Architect's fully loaded layouts and WW electrical services plantroom layouts.
- Connection to sensors: Required.

COMPLETION

910 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificate to be compatible with Zutec system
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

930 SENSOR IDENTIFICATION AND TESTING

- Sensor identification: Label devices with a unique identity.
- Sensor testing: Verify the operation of each sensor. Submit a schedule of sensors, including the device test methods and results.

940 BATTERY BACK UP TESTING

- Mains power supply: Isolate.
- Quiescent mode: Measure current supplied by standby source when water presence detection and alarm system is operating in the quiescent mode. Submit results.

950 TESTING ACTUATION, INTEGRATION AND INTERFACING WITH ALARM AND SECURITY SYSTEMS

- Connections with other systems and equipment: Verify and demonstrate operation of the systems and equipment under leak and fault conditions.

RHSC and DCN EDINBURGH
LIGHTNING PROTECTION SYSTEM

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre to the South of the hospital houses heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Performance Specification shall include the following:-

- Design and installation of concealed Lightning Protection system
- Risk assessment, in accordance with BS 62305, on the requirements for additional transient overvoltage surge suppression devices (SPD) in addition to the surge suppression devices installed in the main LV switch boards, refer to WW Low Voltage Distribution specification WW.A.P.1.2.20
- Attendance on site at various stages of construction
- Testing and commissioning

3.0 PERFORMANCE SPECIFIED SYSTEMS

The Lightning Protection system is a performance specified system and this specification outlines the requirements to be met by the system.

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the Materials & Workmanship clauses.

5.0 DESIGN CRITERIA

General

The Lightning protection systems shall be designed to reduce the risk of lightning causing injury to occupants, failure of crucial electrical, data/telecommunications and M&E systems, or damage to the building fabric or structure.

The Engineering services in the RHSC-DCN are vital for the correct and safe continued operation of the hospital and the well-being of staff and patients. Accordingly, great care shall be taken to ensure that the lightning protection systems provide an appropriate level of protection against the effects of lightning strikes to:

- the building
- the services entering the building
- other buildings with services connections to the building.

As an initial guide for information only, a preliminary review has been carried out of the lightning protection requirements for the RHSC-DCN, to provide an estimate of the Lightning Protection System Classification based upon the recommendations of BS EN 62305.

The resulting estimate indicates that a Class I lightning protection system is required for its structure. The Specialist shall, as part of the detailed design, carry out a detailed assessment in accordance with BS EN 62305, to verify the precise Classification of the required system.

In accordance with BS EN 62305, the Specialist shall perform a risk assessment on the requirements for additional transient overvoltage surge suppression devices on cables entering/exiting the building, local to equipment such as IT racks and for any other electrical systems on the roof, in addition to the surge suppression devices installed within the main LV switch boards, refer to the Low Voltage Distribution specification, WW AP.1.2.20, for further details.

Earthing of the electrical distribution systems and bonding of extraneous metalwork is specified under a separate package (refer specification WW AP.1.2.25). Inasmuch as there may be connection between the lightning protection systems and the electrical system earthing, the Specialist shall take heed of relevant design standards for earthing generally (such as SHTM 06-01, BS 7430 Code of Practice for Protective Earthing of electrical installations, BS7671 (17th Ed) BS EN 50310 Application of equipotential bonding & earthing in buildings with IT equipment) and shall co-ordinate the earthing connections.

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Drawings

As part of the development of the design the Specialist shall prepare general arrangement drawings of the Lightning Protection System based on the Architect's base drawings and coordinated with other services and building elements.

The drawings shall indicate as a minimum:-

- Lightning Protection Systems roof plans
- Lightning Protection Systems elevations
- Connection details for Air Termination Network to steel frame, perimeter tapes and down conductors
- Connection details for down conductors
- Earth termination provisions and electrode/pile layouts
- Details of down conductor to earth termination network connection
- Details of test points and access provisions
- Details of bonding to services
- Details of bonding to curtain walling/cladding
- Details of integration with concrete frame
- Details of integration with building fabric
- Details of additional transient overvoltage surge suppression devices and installations

The Specialist is reminded of the requirement for Record Drawings (as-built), to be submitted prior to completion, (refer to section W60)

Liaison

The Specialist shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of Parts A, B and C of this specification, the Specialist shall include for close liaison with Health and Safety professionals including the Trust's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. The Specialist shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Lightning Protection System.

The Project Teams. Any other member of the Project and Board concerned with the planning and administration of Lightning Protection Systems.

6.0 LIGHTNING PROTECTION SYSTEM

General

The Specialist shall design and install a Lightning Protection System for the new RHSC-DCN building. The Specialist shall carry out an assessment and develop the detailed design requirements for the lightning protection system based on building details and detailed construction information.

The Specialist shall be responsible for the final selection of all equipment, tape and cabling and detailing of bonding and interconnection of any structural steel and reinforcing bars used in the Lightning Protection System.

The Specialist shall provide advice during the design phase on the most cost effective approach.

The systems to be provided shall principally comprise roof mounted air terminations connected to down- conductors with these in turn connected to the general mass of Earth.

The Specialist shall, for equipotential bonding purposes, bond together all metallic current paths available as part of the building construction and the lightning protection system. These shall include:

- Tape down conductors
- Reinforcement bars in the floor slabs
- Reinforcement bars in the pile caps
- Metallic roof coverings where suitable
- Roof edge tapes and air termination system

The completed systems shall accord with the recommendations of BS EN 62305.

The Specialist shall develop the concept into a design fully compliant with BS EN 62305 and provide a fully compliant installation. Where requested, the specialist shall provide copies of his calculations to prove the compliance of the design.

The completed system shall be provided with facilities that allow the system to be regularly tested.

The system shall be designed to provide the minimum necessary mesh width to reduce circulating currents throughout the building.

Finials

Finials shall be provided as appropriate at positions of around the building to reduce the risk of direct strikes to structure. These shall be connected to the linear air terminations and/or down conductors.

Air Terminations

The installation shall, where practicable and as far as possible, make use of the metal construction of the roofs as part of the air termination network.

Perforation of the metallic skin of the roof due to lightning strikes is not permissible.

Where necessary, supplementary conductor tape shall be installed to ensure a continuous roof termination network. Where required, e.g parapets, the conductor tape shall be PVC insulated and colour coordinated with the building.

The air termination network shall be bonded to the metallic roof coverings.

All antennae and other roof mounted exposed extraneous metalwork components of the building such as, but not limited to, the Helipad and its access ramp, handrails, plant housings, TV aerials, satellite dishes, radio masts, flag posts, CCTV brackets and towers, etc shall be bonded to the air termination network and protected by finials where necessary.

The Specialist shall note that use of “green roofs” and shall allow for these to be suitably incorporated into the system.

Down Conductors

Where down conductors, other than natural down conductors, are required they shall be copper tape or rods.

Down conductors shall be concealed behind the building cladding system. The Employer’s Requirements prohibit down-conductor tapes being installed exposed on the surface of the cladding system.

The Specialist shall liaise with the curtain walling and cladding specialists and include for adequate bonding to the metal supporting frames of these cladding systems.

Earth Terminations

The Specialist shall consider all appropriate methods of earthing the Lightning Protection System, to ensure an effective earth termination network taking into account the construction of the foundations. The earthing shall be achieved by using a combination of:

- the structural foundations
- earth rods
- a ring conductor

Earth electrodes shall be provided within purpose-made inspection pits with a lockable, hinged lid. Where these are located under hard surfaces they shall be suitable for pedestrian or vehicular traffic as appropriate.

Connections between the down conductors and the earth electrodes shall be contained in suitably sized earthing pits with removable covers.

The Specialist shall provide an effective means of decoupling the Lightning Protection System from the earth termination network for test purposes in accordance with BS EN 62305.

The Specialist shall carry out earth resistivity tests to determine the earthing properties of the ground on site.

Helipad

A helipad will be constructed above the DCN. This will have a steel structural frame and an access ramp also of steel framework construction. The structure of the helipad and ramp shall be bonded to the lightning protection system, and may be incorporated as part of the air termination system if the construction details are suitable.

Bonding of Building Fabric and Structure

Project Co. shall advise on the detailed requirements for bonding the building fabric and structure to the lightning protection system, and for the mutual bonding of the various components of the fabric and structure. This shall include the reinforcement bars and concrete frame and floors of the structure, the cladding system sub-frames, the Helipad and any ancillary metalwork such as the maintenance hoist rails, and the mutual bonding between separate sections of any floor slab across construction, expansion and movement joints etc.

Transient Overvoltage Surge Suppression Systems

In accordance with BS EN 62305, the Specialist shall perform a risk assessment of the requirements for additional transient overvoltage surge suppression devices in addition to the surge suppression devices installed within the main LV switch boards, refer to the Low Voltage Distribution specification, WW AP.1.2.20, for further details. Such systems which may require additional surge suppression, dependent on the outcomes of the risk assessment are listed below:-

- Helipad
- Roof mounted warning lights
- PV installation, consider surge suppression at coupling point with electrical distribution network
- Aerials/satellite dishes and associated system electronics
- Roof level perimeter tracks and their associated cleaning system
- Power & data cables entering/exiting the building including external lighting cables and copper telephone cables
- Equipment such as IT racks/servers
- etc

Should additional surge suppression devices be required, the Specialist shall design co-ordinated systems of transient overvoltage surge protection for the incoming electrical and data/telecommunications services and their distribution systems.

The Specialist shall review the transient overvoltage surge suppression requirements for the LV installation to provide complete transient overvoltage protection to the whole LV system, using the minimum necessary number of levels of protection. If further levels of protection are required, in addition to those located at the main LV switchboards, these shall be included at the sub LV panel boards, and at local distribution boards. The Specialist shall be responsible for defining the types of surge protection device at each level (Types I, II or III SPDs) as part of the design process.

The transient overvoltage surge suppression system for the data and telecommunications systems shall be designed based on the withstand properties of the data and telecommunications equipment being installed by the Data/Telecommunications Specialist.

Project Co. shall liaise closely with the Board, the and Data/Telecommunications Specialist to review and confirm the necessary details of the LV distribution system and the data/telecommunications installations, and shall carry out the detailed design of the transient overvoltage surge suppression (SPD) installations accordingly.

Attendance

Attend site at various stages of construction to:-

- Test the conductivity of the ground and to determine the most appropriate means of achieving the earth termination network
- Test the air termination network to ensure continuity
- Test the connection between the lightning protection system components to ensure complete continuity from the air termination network through the down conductor system to the ground termination network

Testing

Upon completion of the whole system, tests shall be conducted and the results included within the project record documentation.

MATERIALS AND WORKMANSHIP CLAUSES

W60 Lightning protection systems

To be read with Preliminaries/General conditions

GENERAL

110 BUILDING CONSTRUCTION FOR INFORMATION GENERALLY

- Substructure: In-situ concrete piles.
- Superstructure: Pre-cast sectional concrete columns, In-situ concrete floor slabs, partial in-situ concrete core structures.
- Roof structure: Steel framed; and/or - concrete in-situ roof with pre-cast sectional concrete columns
- Roof coverings: Sheet aluminium; and/ or in-situ concrete slab with special "Green" roof; in-situ concrete with membrane and paving slab; various other details; Refer to Architect's roof drawings.

120 LIGHTNING PROTECTION SYSTEM GENERALLY.

- System manufacturer: Submit proposals.
  - Registration: A member of the Association of Technical Lightning and Access Specialists (ATLAS).
- External LPS type: Submit design and cost proposals.
- Internal LPS: Submit design and cost proposals.
- Protection against explosive or highly flammable contents: Not required.
- Protection of electrical and electronic systems: Required.
- Air termination system:
  - Air terminals;
  - Copper tape;
  - Use roof covering; and
  - Submit design and cost proposals.
- Down conductors:
  - Copper tape concealed behind cladding;
  - Use superstructure; and
  - Submit design and cost proposals.
  - Lateral connections: Submit proposals.
- Earth termination system:
  - Earth rods;
  - Ring earth electrode;
  - Use substructure; and
  - Submit design and cost proposals.
- Accessories:
  - Earth rod inspection pits;
  - Notices and labels;
  - Soil conditioning agents;
  - Surge protective devices as section Y67; and
  - Submit design and cost proposals.
- Completion:
  - Electrical identification: As section V80.

SYSTEM PERFORMANCE

210 DESIGN

- Standards: To BS EN 62305-2, BS EN 62305-3 and BS EN 62305-4.
- Design: Complete the design of the lightning protection system.
- Class of LPS to BS EN 62305-2: I.
- Coverage of LPS: External and Internal.
- Internal equipment to be protected: Incoming services; all electrical systems; all electronic equipment; fire alarm system; tv and radio distribution; access control, CCTV and security systems; intruder alarm systems; public address systems; nurse call systems; data and telephone systems .
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

PRODUCTS

310 AIR TERMINALS GENERALLY.

- Standard: To BS EN 50164-2.
- Manufacturer: System manufacturer .
  - Product reference: Board's choice.
- Material: Copper.
- Type: Board's choice.
- Size: Board's choice.

340 COPPER TAPE GENERALLY.

- Standards: To BS EN 13601 and BS EN 50164-2.
- Manufacturer: System manufacturer .
  - Product reference: Board's choice.
- Size: Board's choice.
- Cover: PVC where exposed to view (e.g. roof).
  - Colour: Board to submit proposals for agreement with Architect.

370 EARTH RODS GENERALLY

- Standards: To BS EN 50164-2 and ENA Technical Specification 43-94 and in accordance with BS 7430.
- Type: Threaded copperbond rods.
- Manufacturer: System manufacturer .
  - Product reference: Board's choice.
- Size:
  - Diameter: Board's choice.
  - Length: Board's choice.

390 RING EARTH ELECTRODES GENERALLY.

- Standards: To BS EN 13601 and BS EN 50164-2.
- Material: Bare copper tape.
- Manufacturer: System manufacturer.
  - Product reference: Board's choice.
- Tape size: Board's choice.

410 CONNECTION COMPONENTS

- Standard: To BS EN 50164-1.
- Manufacturer: System manufacturer.
  - Product reference: Board's choice.

- Lightning current withstand classification: Class H.
- Material: Match conductor material.

415 EARTH ROD INSPECTION PITS
- Type: Concrete.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Load rating (minimum): Board's choice.
- Identification: Permanently identify with the wording "EARTH ROD".

420 METALLIC DIRECT CONTACT CLIPS
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Copper and aluminium alloy.

430 NON-METALLIC DIRECT CONTACT CLIPS
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: Non-brittle, UV stabilized high grade polypropylene.
  - Colour: Match tape.

440 NOTICES AND LABELS
- Material: Screen printed plastics.
- Colour:
  - Background: Board's choice.
  - Lettering: Board's choice.
- Typography:
  - Font: Board's choice.
- Size: Submit proposals.
- System notice wording: "THIS STRUCTURE IS PROVIDED WITH A LIGHTNING PROTECTION SYSTEM THAT IS IN ACCORDANCE WITH BS EN 62305-3 AND THE BONDING TO OTHER SERVICES AND MAIN EQUIPOTENTIAL BONDING SHOULD BE MAINTAINED ACCORDINGLY."

445 SOIL CONDITIONING AGENTS
- Type: Board's choice.

EXECUTION

630 INSTALLING LIGHTNING PROTECTION SYSTEMS
- Installation: In accordance with BS 62305-3.
- Substructure: When used as the earth terminal network measure its resistance to earth during the construction period.
- Results: Submit.

640 INSTALLING AIR TERMINALS
- Location: Board's choice.

650 INSTALLING TAPES

- Location: Down-conductors - concealed within wall cavity; Roof - exposed.
- Number of joints: Minimize.
- Contact surfaces: Clean. Coat with corrosion inhibitor.
- Bimetallic joints: Do not cross-contaminate.
- Conductors passing through roofs: Provide puddle flanges.

660 INSTALLING EARTH RODS

- Location: Board's choice.
- Rod separation: Space the rods apart by at least 1.25 times the depth of the longest rod.
- Rod alignment: Vertical.
- Couplings: Apply corrosion inhibiting paste to the threads and enclose so that rods meet at centre of coupling.
- Earth rod heads: Position below ground within 100 mm of ground level.
- Internal earth rods: Provide waterproof seals.

690 INSTALLING EARTH ROD INSPECTION PITS

- Inspection pit lid: Install flush with the finished ground surface.

700 INSTALLING RING EARTH ELECTRODES

- Earth rods: Interconnect with ring earth electrode.
- Depth: Pass below incoming services.
- Jointing method: Exothermic.

710 INSTALLING TEST JOINTS

- Location: Within earth rod inspection pit.
- Labelling: Provide a plate indicating the position, number and type of earth electrodes above each test point.

715 BONDING

- Standards: To BS EN 62305-3 and BS EN 62305-4.
- Bond the following to the lightning protection system:
  - Antennae;
  - Base of a down conductor to the main switchgear earthing terminal;
  - Base of down conductor to base of vertical steelwork in lift shaft;
  - Metal fire escape;
  - Metal flue pipe;
  - Shields of incoming services; and
  - Vertical steelwork in lift shaft to structural steelwork of building at eaves and ground levels
  - Helipad access ramp
  - Building Maintenance Access Hoist steelwork
  - Metal cladding support work.
- Bonding conductor sizes: To BS EN 62305-4.
- Locations of bonds: Board's choice.

720 DISSIMILAR METALS

- Connecting dissimilar metals: Prevent electrolytic action.

730 INSTALLING SOIL CONDITIONING AGENTS

- Location: Board's choice.

750 INSTALLING NOTICES AND LABELS

- Location: Within main switchrooms.

COMPLETION

910 INSPECTION AND TESTING

- Inspection and test: In accordance with BS EN 62305-3 and BS EN 62305-4.
- Results: Submit.
- Log book: Required.

940 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.

Y67 Transient overvoltage surge suppression devices

To be read with Preliminaries/ General conditions

PRODUCTS

310 TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIES WHERE REQUIRED FOR LOW VOLTAGE DISTRIBUTION SYSTEM - MAIN LV BOARDS

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Standard: BS EN 61643-11 and IEEE C 62.41.
- Operating voltage and frequency (nominal): 400 V at 50 Hz.
- Operating voltage (maximum): 500 V .
- Phase arrangement: Three.
- Surge current (minimum) between any two conductors: 10 kA.
- Let-through voltage (maximum): Must not exceed the equipment transient design level (ETDL) supplied by the equipment manufacturer. Submit proposals..
- Current rating: Submit proposals.
- Thermal overload protection: Submit proposals.
- Mode of protection: Lines to earth, lines to neutral, neutral to earth.
- Protection status indicators: Full protection status
- Remote indication of status (including loss of phase/ supply): Required.
- Effect on mains power supplies during normal operation:
  - No corruption to normal mains supply.
  - No break or shutdown of mains supply.
  - No excessive earth leakage current.
- Enclosure: Within LV switchboard, or in separate enclosure adjacent. Submit proposals.

310A TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIES WHERE REQUIRED FOR LOW VOLTAGE DISTRIBUTION SYSTEM - SECONDARY LV PANEL BOARDS

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Standard: BS EN 61643-11 and IEEE C 62.41.
- Operating voltage and frequency (nominal): 400 V at 50 Hz.
- Operating voltage (maximum): 500 V .
- Phase arrangement: Three.
- Surge current (minimum) between any two conductors: 10 kA.
- Let-through voltage (maximum): Must not exceed the equipment transient design level (ETDL) supplied by the equipment manufacturer. Submit proposals..
- Current rating: Submit proposals.
- Thermal overload protection: Submit proposals.
- Mode of protection: Lines to earth, lines to neutral, neutral to earth.
- Protection status indicators: Full protection status
- Remote indication of status (including loss of phase/ supply): Required.
- Effect on mains power supplies during normal operation:
  - No corruption to normal mains supply.
  - No break or shutdown of mains supply.
  - No excessive earth leakage current.

- Enclosure: Within secondary panelboard, or in separate enclosure adjacent. Submit proposals.

310B TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIES FOR LOW VOLTAGE DISTRIBUTION SYSTEM - DISTRIBUTION BOARDS (WHERE REQUIRED)

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Standard: BS EN 61643-11 and IEEE C 62.41.
- Operating voltage and frequency (nominal): 400 V at 50 Hz.
- Operating voltage (maximum): 500 V .
- Phase arrangement: Three.
- Surge current (minimum) between any two conductors: 10 kA.
- Let-through voltage (maximum): Must not exceed the equipment transient design level (ETDL) supplied by the equipment manufacturer. Submit proposals..
- Current rating: Submit proposals.
- Thermal overload protection: Submit proposals.
- Mode of protection: Lines to earth, lines to neutral, neutral to earth.
- Protection status indicators: Full protection status
- Remote indication of status (including loss of phase/ supply): Required.
- Effect on mains power supplies during normal operation:
  - No corruption to normal mains supply.
  - No break or shutdown of mains supply.
  - No excessive earth leakage current.
- Enclosure: Within distribution board.

330A TRANSIENT OVERVOLTAGE SURGE SUPPRESSION FOR DATA AND TELECOM SUPPLIES - ALL DATA, COMMUNICATIONS, CCTV AND OTHER ELV CABLES ENTERING OR LEAVING THE BUILDING

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Standard: To BS EN 61643-21, ITU-T K20 and ITU-T K21.
- Operating voltage (nominal): To be compatible with system protected.
- Bandwidth: To be compatible with system protected.
- Operating voltage (maximum): To be compatible with system protected.
- Surge current (minimum) per signal wire: To be compatible with system protected.
- Let-through voltage (maximum): To be compatible with system protected.
- Current rating (signal): To be compatible with system protected.
- Thermal overload protection: Submit proposals.
- Mode of protection: Lines to earth, lines to lines.
- Enclosure: Submit proposals.

340 ENCLOSURES.FOR SEPARATELY MOUNTED DEVICES

- Manufacturer: Board's choice.
  - Product reference: Submit proposals.
- Ingress protection (minimum): Submit proposals.
- Material: Manufacturer's standard.
- Finish: Manufacturer's standard.
- Colour: Manufacturer's standard.

EXECUTION

620 INSTALLATION GENERALLY

- Standards:
  - To BS 7671;
  - DD CLC/TS 61643-12; and
  - DD CLC/TS 61643-22.
- Equipment: Provide electrical supplies to equipment requiring power.
- Fixings: Non-corroding and compatible with the environment where they are installed.

630 INSTALLING TRANSIENT OVERVOLTAGE SURGE SUPPRESSION DEVICES FOR MAINS POWER SUPPLIES AND DATA AND TELECOM SUPPLIES

- Point of installation: secondary panelboards and distribution boards if necessary, submit proposals.
- Transient overvoltage suppression devices: Interconnect.
- Control cables between transient overvoltage suppression devices and BMS: Interconnect.
- Interconnecting cable:
  - Cable type: Submit proposals.
  - Cable size: submit proposals.
  - Cable length (maximum): 250 mm.
  - Cable installation: Tightly bind connecting leads together.
- Fuse protection: Provide fuse protection to transient overvoltage surge suppression devices.
- Isolation: Not required.

650 LABELLING

- Electrical equipment: Labels indicating the purpose of the equipment.
- Safety signs: Install where voltages above ELV exist.
- Voltage warning notices: Label equipment where voltage exceeds 230V.
- Format: To BS 5499-5. Include warnings of the voltage present.

RHSC and DCN EDINBURGH
PHOTOVOLTAIC SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central energy centre to the South of the hospital houses heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

- Photovoltaic systems
- AC/DC switchgear and associated cabling.
- Roof mounted cable containment.
- Connection to LV system in accordance with G59/2.
- Metering
- Roof mounting and fixing system including ballast.

3.0 PERFORMANCE SPECIFIED SYSTEMS

The Photovoltaic System is performance specified and this specification outlines the requirements to be met by the system.

4.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this element of the performance specification:

- Main cable containment within the building from roof level to the basement LV switchboard.
- Final connection to the LV switchboard.

5.0 INTERFACES AND DEMARCATIONS

The Project Co. specialist shall liaise with the services engineer, structural engineer and architect to ensure that his design co-ordinates with the building fabric, roof make up, electrical and mechanical services in the plant room, roof drainage outlets and gullies, lightning protection, ventilation turrets, structural elements and all other elements of the building and the installations therein. The specialist shall liaise with all relevant and interested parties regarding the design of the PV system, specification of components, the method of fixing to the roof, any impact on roof drainage outlets, penetrations through the roof for cables, point of connection to the electrical installation.

6.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and industry standards unless otherwise stated.

7.0 DESIGN CRITERIA

Drawings

Project Co. shall prepare general arrangement drawings of the Photovoltaic System coordinated with other services and building elements.

The drawings shall indicate as a minimum:

- Locations of components
- Wiring routes
- Wiring diagrams
- Cable containment provision
- Interfaces with the building and with the electrical infrastructure
- Roof mounting details
- Switchboard locations and sizes
- Any drawings necessary to satisfy the requirements of this specification as regardstechnical submittals

8.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Photovoltaic System.

9.0 SYSTEMS

9.1 Photovoltaic System

General

For the avoidance of doubt, this is a Performance Specification. The specialist shall as a minimum:

- Proactively produce the design
- Agree and record key design decisions
- Produce installation drawings and specifications
- Submit proposals for review
- Advise on necessary liaisons with supply authorities
- Submit design proposals where required in the Materials and Workmanship clauses
- Procure, install and commission the PV systems

Array

The system shall be designed for a net area of 80m2, achieved from an array of PV panels horizontally mounted mounted onto the building roof.

The solar photovoltaic system shall consist of a number of individual panels connected in series, mounted on a proprietary fixing system. Each panel shall be made of Polycrystalline cells and shall be provided with a framework support system coordinated with the roof system. The panels shall have an efficiency no less than 14.5% understand test conditions.

The panels shall then be connected as a single or multiple string, complete with all meters and isolators, to an appropriate number of inverters, which shall be located within a dedicated GRP style enclosure at roof level within the external plant enclosures. The direct current (DC) electricity generated fed into the inverter will be converted into a standard 230V / 400V alternative current (AC), which shall be feed into a dedicated LV distribution board, located within the LV switchroom at ground level. Depending on the load generated the specialist will be responsible to provide sufficient number of inverters to be able to handle the maximum generated capacity of the particular array.

The DC wiring shall be provided as high quality solar cable resistant to UV light and high temperatures. The DC strings shall be provided with all plugs and sockets required to ensure a complete and operational system. The DC cable size shall be designed by the PV specialist to suit each array.

A DC isolator shall be provided on the DC side of the inverters, located immediately adjacent to the invertors and labelled appropriately. On the AC side there shall be an AC isolator with the facility to lock off, also labelled appropriately. Each incoming DC string to each inverter will require a DC isolator and an AC isolator.

XLPE/LSF armoured cable/s shall be provided from the inverter, run on containment within the GRP enclosure, and terminated at the MCB/MCCB in the distribution board.

The array shall have a low reflectance so as not to create glare that may impact on the use of the tower roof level helipad.

Electrical equipment

The PV specialist shall provide all panelboards, distribution board, c/w incoming and outgoing MCB/MCCB circuit protection, to be located within the plantroom for the incoming AC supplies from the PV systems and the connection of the grid via an import/export meter and the utility connection.

Switchboards shall be form 4 type 2.

The system shall be installed by the specialist Board c/w all meters, isolators and G59 synchronization relays as necessary.

All metering shall be provided at the ground level within the LV switchroom, as a FIT meter for measuring the generated electricity. The metering shall be linked on a site wide BUS network for central monitoring of the side wide PV system electricity generation at the management suite.

There shall be provided a structural support system by the PV specialist together with additional framing systems required to integrate the PV system with the structural and architectural building elements. The PV Specialist shall liaise with the roof Boards, the Structural Engineer and Architect to determine the appropriate mounting and fixing type.

The PV specialist shall advise the structural engineer of loadings and wind pressure, and shall incorporate suitable fixings to ensure a structurally sound integrated installation.

All systems, inclusive of any framing, shall be earthed and bonded to the lightning protections systems at roof level and surge protection devices shall be provided at each distribution board.

All PV panels shall be fully accessible for maintenance purposes.

Refer to specification WW-532-201 Low Voltage Distribution.

Refer to specification WW-532-247 Common Electrical Materials and Workmanship Clauses for clauses relating to Low Voltage Cabling, Electrical Identification, Conduit, Trunking and Ducting, Cable Supports and Electrical Accessories.

V14 Photovoltaic systems

GENERAL

110 GRID CONNECTED PHOTOVOLTAIC SYSTEM

- Located on the roof.

- System manufacturer: Microgeneration Certification Scheme accredited.
- PV modules: Required.
  - Mounting: Proposals to be submitted including earthing as required.
- By-pass diodes: Required.
- String fuses: Required.
- Blocking diodes: Required.
- d.c. switchboard: Submit design proposals.
- d.c. isolation switches: Submit design proposals.
- Junction boxes to connect parallel arrays: Required.
- Power conditioning units (PCUs): Required.
- a.c. switchboards: Submit design proposals.
- a.c. isolation switches: Submit design proposals.
- Energy meters: Required.
- Cable type: Submit design proposals. LSF insulation required. - Sizes: Submit design proposals.
- Rewireable installation: Required.
- Concealed installation: Required.
- Cable containment: Submit design proposals. Containment shall be galvanised steel.
- Ensure cables are protected from the heating and UV effects of direct sunlight.
- Lightning protection: Submit design proposals, make provision for bonding to lightning protection system.
- Transient over-voltage surge suppression devices: Submit design proposals.
- Accessories: Submit design proposals.

SYSTEM PERFORMANCE

210 DESIGN

- Design: Complete the design of the photovoltaic system.
- Standards: To IEC 60364-7-712, to BS 7671, to BS EN 62124 and in accordance with BS 6399-2, ER G59/2-1 and ER G83/1-1.
- Testing and commissioning: Incorporate adequate measures to allow full testing and commissioning of the completed system.
- Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
- Approvals: Obtain written approval of the Electricity Distributor and Obtain planning approval from the relevant authorities.

230 ELECTRICAL ARRANGEMENT

- Arrangement: Submit proposals. Submit wiring diagrams. Submit proof of compliance with BS7671.

240 PHOTOVOLTAIC ARRAYS

- PV array: Inter-connect modules to form an array.
  - Nominal output:
    Power: nominal output of total array.
    Voltage: Submit proposals.
    Current: Submit proposals.

PRODUCTS

310 PHOTOVOLTAIC MODULES

- Standard: Submit proposals.
- Manufacturer: Microgeneration Certification Scheme accredited.
  - Product reference: Submit proposals.
- Type: Framed modules.
- Colour: Submit proposals – liaise with architect.
- Module interconnections: Submit proposals.
  - Module connectors: Suitably rated for the applicable d.c. voltage and current.
  - Protection to BS EN 61140: Class II.
  - Degree of ingress protection to BS EN 60529: Submit proposals.
  - Safety labelling: "Danger, do not disconnect under load. Isolate a.c. supply at inverter first".
- Module rating: submit proposals.
- Nominal output of module:
  - Power : submit proposals.
  - Voltage: Submit proposals
  - Current: Submit proposals
- Output warranty: 80% power output after 25 years.
- Framework material: Submit proposals.

315 MOUNTING FRAMEWORK

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.

320 BY-PASS DIODES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Submit proposals.
- Minimum rating: 1.25 x string short circuit current, and 1.15 x string open circuit voltage.

330 STRING FUSES

- Standard: To BS EN 60269-1.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Submit proposals.
- Minimum rating: Submit proposals.

340 BLOCKING DIODES

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Type: Submit proposals.
- Minimum rating: 1.25 x string short circuit current, and 2 x string open circuit voltage.

350A D.C. JUNCTION BOXES

- Standard: Submit proposals.
- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Material: Non-conductive.
- Degree of protection to BS EN 61140: Class II.
- Degree of ingress protection to BS EN 60529: Submit proposals.
- Separate positive and negative junction boxes: Required.
- Bus bar rating: submit proposals.
- Removable string fuses: Submit proposals.
  - Fuse rating: Submit proposals.
- String isolators: Submit proposals.
  - Type: Double pole switch-disconnector.
  - Rating: Submit proposals.
- Test points: Incorporate.
- Labelling:
  - Identification labels: "PV array junction box".
  - Safety labels: "Danger, contains live parts during daylight".

380 D.C. BATTERY CHARGE CONTROLLERS

- Standards: To pr EN 50314-1, pr EN 50314-2 and pr EN 50314-3.
- Manufacturer: System manufacturer.
  - Product reference: Submit proposals.
- Type: Pulse width modulation (PWM).
- Rating: Submit proposals.
- Degree of ingress protection to BS EN 60529: submit proposals.
- Accessories:
  - Battery temperature compensation;
  - Discharge control;
  - Overcurrent protection;
  - Reverse polarity protection;
  - State of charge display; and
  - Surge protection.

385 ENERGY METERS

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Standard: To BS EN 62052-11.
- Ofgem accreditation: Required.

410 POWER CONDITIONING UNITS

- Standards:
  - To BS EN 61000-3-2;
  - To BS EN 61727;
  - In accordance with ER G59/2-1; and
  - In accordance with ER G83/1-1.

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Degree of ingress protection to BS EN 60529: submit proposals.
- Degree of protection to BS EN 61140: Class II.
- Number required: Submit proposals.
- Arrangement: String inverters.
- Ratings (kW): Submit proposals.
- Input voltage: Submit proposals.
- Output: Three phase and neutral 400/230 V.
- Isolating transformer to BS EN 61558-1: Incorporate in PCU.
- Maximum power point tracker (MPPT): Incorporate in PCU.
- Electricity grid utility interface: Incorporate in PCU.

EXECUTION

620 INSTALLATION GENERALLY

- Installer: Microgeneration Certification Scheme accredited.
- Installation: Submit method statement.
- Standards:
  - To BS 7671.
  - In accordance with ER G59/2-1;
  - In accordance with ER G83/1-1; and
  - To IEC 60364-7-712.
- Materials: Separate dissimilar metallic materials to prevent bi-metallic corrosion.
- Fixing equipment: Fix independently of any other systems installation with zinc electroplated fasteners indoors and stainless steel fasteners outdoors.
- Location of equipment: Conveniently accessible for operation inspection and maintenance.

630 INSTALLING PV ARRAYS

- Standards:
  - To AAMA 501.2-03
  - To BS 5534
  - To BS 7671
  - To BS 8200
  - To BS EN 12154
  - To BS EN 60900
  - To BS EN 60903
  - To BS EN 61140
  - HSE HSG33; and
  - IEC 60364-7-712
- Safety: Use insulated tools, gloves and insulated matting. Only undertake external work in dry weather.
- Location: As drawings.
- Fixings: Suitable for wind loading.
- PV modules: Interconnect.
- Ventilation of PV array: Submit proposals.
- Interconnecting string cable routes: Submit proposals.

640 FRAMEWORK FOR MOUNTING MULTIBOX ASSEMBLIES
- Arrangement and fixings: Submit proposals.
- Treatment to cut metalwork, fasteners and fixings: Zinc-rich paint to BS 4652.
- Paint thickness: At least that of original layer.

650 INSTALLING COMPONENTS
- Location: Submit proposals.

670 INSTALLING A.C. ISOLATION SWITCHES
- Location:
  - Next to power conditioning unit;
  - Next to point of connection to a.c grid; and
  - Submit proposals.

675 INSTALLING D.C. ISOLATION SWITCHES
- Location: Next to power conditioning unit.

680 INSTALLING A.C. SWITCHBOARDS
- Location: Submit proposals.

685 INSTALLING D.C. SWITCHBOARDS
- Location: Submit proposals.

730 INSTALLING POWER CONDITIONING UNITS
- Location: Submit proposals.
- Ventilation: Provide.

740 INSTALLING ENERGY METERS
- Location: Submit proposals.
- Meters to show:
  - a.c. output of complete PV system;
  - d.c. output of each string; and
  - d.c. output of total PV array.
- Digital metering equipment: Connect to building management system.

750 INSTALLATION OF TRANSIENT OVER-VOLTAGE SURGE SUPPRESSION DEVICES
- Location: Submit proposals.

760 CONNECTION TO ELECTRICITY DISTRIBUTION NETWORK
- Standards: In accordance with ER G59/2-1.
- Location: Submit proposals.

770 INSTALLING INTERCONNECTING CABLES
- Cable routes: Submit proposals.
- Point of connection to a.c. grid: Spare way in local distribution board.
- d.c. cabling: Complete before installing PV array.

780 EARTHING AND EQUIPOTENTIAL BONDING
- Standards: To BS 7671, BS 7430, BS EN 62305-3 and BS EN 62305-4.
- Earthing of d.c. section of the system: Not required.

790 CONNECTION TO LIGHTNING PROTECTION SYSTEM

- Standard: To BS 6651.

COMPLETION

910 GRID CONNECTION

- Standards: In accordance with ER G59/2-1.
- Electricity Distributor's approval to operate: Obtain.

920 LABELLING

- Dual supply warning notices (grid connected systems only): Provide danger warning notices stating that the system has a dual supply and is energized from more than one source.
  - Location: PV a.c. isolation switch.
  - Electricity Distributor's approval of text: Obtain.
- PV modules: Label with warning notices describing the presence of live terminals.
- a.c. isolation switches: Label with notices stating "PV system - Point of emergency switching".
- Circuit diagram: Provide at point of interconnection.
- Details of protective settings incorporated in the PCU: Provide at point of interconnection.
- Contact telephone number for the maintainer of the system: Provide at point of interconnection.
- Fuses, terminal blocks and other assembly components: Label describing their purpose.
- Spare fuses: Label, describe their rating and purpose.

930 CLEANING AND GENERAL INSPECTION

- Dust and debris: Remove.
- PV array: Inspect for damage.
- Enclosures: Inspect.
- Earthing: Verify.
- Cable terminations: Inspect.
- Inspection report: Submit.
- Installation checklist in accordance with Appendix C of the DTI report Photovoltaics in buildings -testing commissioning and monitoring guide: Submit.

940 TESTING AND COMMISSIONING GENERALLY

- Standards:
  - To AAMA 501.2-83;
  - To BS 7671;
  - In accordance with ER G59/2-1; and
  - In accordance with ER G83/1-1.
- Method statement: Submit.
- Approval: Obtain written approval of the Electricity Distributor.
- Specialist commissioning engineer: Employ.
- Test equipment calibration certificates: Submit.
- Inspection and testing of electrical system: To BS 7671 and In accordance with

- Electricity Distributor requirements.
- Test for water tightness (for facades and roofing): Not required.
- Pre-commissioning checks: Undertake.
- Witnessing of testing and commissioning: Required.
- Notice before testing and commissioning: 7 days.

950 PRE-GRID CONNECTION COMMISSIONING TESTS

- Inspection and testing of electrical system: To BS 7671 and In accordance with Electricity Distributor requirements.
- PV array performance test: Undertake.
- Test conditions: Minimum irradiation level 600 W/m².
- Controls: Check operation.

960 DOCUMENTATION

- Type test certificates: Submit.
- Factory test results: Submit.
- Site test results and system performance analysis: Submit.
- System commissioning completion certificate: Submit.
- Operation and maintenance instructions: Submit.
- Record drawings: Submit.
- Approval of Electricity Distributor (grid connected systems only): Submit.
- Warranty for system: Submit.
- Microgeneration Certification Scheme: Submit certificate.

970 SPARES AND CONSUMABLES

- Supply the following spares:
  - Deliberately operated devices: 2 of each type and Protective switches.

RHSC and DCN EDINBURGH
LIGHTING INSTALLATION

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

APPENDICES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to the following:-

- Lighting installation
- Emergency lighting installation
- Metal encased prefabricated wiring system
- Automatic lighting controls
- Emergency lighting automatic test system

3.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this elements of the specification:-

- Lighting calculations and luminaire selection, refer to Performance Specification WW-541-248
- Helipad lighting (by Project to Specialist)

4.0 INTERFACES AND DEMARCATIONS

The emergency lighting test system shall be integrated with a host Internet Protocol Network which shall support communication, interaction, data transfer and data retrieval from and between the various engineering systems in the building. The emergency lighting test shall be connected to the host network via gateways. The Building Management System (BMS) shall be provided with a Graphical User Interface which shall permit the interrogation of the emergency lighting test system down to component level. It is not intended that the BMS shall control the system but rather shall monitor component status and provide fault alarm indication at the Graphical User Interface.

5.0 APPLICABLE STANDARDS

All elements of the works shall comply with the requirements of current legislation, regulations and standards stated in materials and workmanship clauses.

The general lighting system shall comply with CIBSE Code for Interior Lighting BSEN12464-1, CIBSE Lighting Guide 2 ‘Hospitals and Health Care Buildings’, CIBSE LG3, LG7 & LG11, BS4533, SHTM06-01 and Table 1 (and it's accompanying notes) of the ILE Guidance notes for the reduction of obtrusive light - 2011,.

The emergency lighting system shall comply with BSEN 1838, BSEN 50171, BSEN 50172, BS 5266-1, BS 5266-8, relevant European Directives, BS 7671, CIBSE Lighting Guide for Lighting in Hospitals and Healthcare Premises (LG2) & LG 12, , CIBSE technical memorandum TM12, SHTM 06-01, BSEN 12464-1.

6.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

7.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital’s Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

8.0 LIGHTING INSTALLATION

8.1 Lighting

Wiring

The distribution board ways allocated to internal lighting shall be indicated on the distribution board schedules. Lighting circuitry and switching details shall be shown on the design drawings. Lighting circuits shall be wired by means of 2.5 mm^2 LSZH thermosetting insulated single core copper conductors with 2.5 mm^2 earth, protected by 10 A Type C mcbs. Circuit breakers shall be selected to withstand the fault levels indicated on LV schematic diagrams. The only exception to this rule is that examination lamps and circuits serving bath and shower room lighting shall be protected by means of 10A, 30mA RCBOs; affected circuits are clearly identified on the drawings.

The residual current characteristic these RCBOs shall be A type (not to be confused with type A, B, C, D overcurrent characteristic of MCBs and RCBOs).

Refer to Common Electrical Clauses WW AP.1.2.2 Clause V32 for cable specifications.

A and B side cables shall be run in separate containments.

The wiring system shall generally be a metal encased prefabricated wiring system. Armoured flexible conduits shall be laid on wire cable baskets. Refer to accompanying clause V50.

The electrical containment drawings indicate routes and sizes of wire cable baskets for metal encased prefabricated wiring. The Board's prefabricated wiring system provider shall inspect the drawings and confirm the adequacy of the wire cable baskets shown.

An exception to the above is lighting in areas with inaccessible ceilings, such as in Theatre suites, in which case the wiring and conduit system shall be by means of the 'loop-in' system where access to wiring shall be at accessories and luminaires only.

Through access luminaires which shall permit services access into the ceiling void through the body of the luminaire are to be installed in the following areas with Category 1 ceilings (ceiling categories as per the ADB Room Data Sheets)

i) Operating theatres
ii) Anaesthetic rooms

Installation Requirements

Final luminaire locations shall be indicated on the reflected ceiling plans.

Flush-mounted modular luminaires, which are to be installed in exposed grid suspended ceilings, shall generally be supported by the ceiling grid. Where a concealed suspended ceiling is used, support brackets shall be provided by the luminaire manufacturer to suit the specified ceiling grid construction.

Luminaires to be installed recessed in suspended non-modular plasterboard or similar ceilings shall generally be supported by the ceiling, with suitable fixings to suit the specified ceiling grid construction.

Recessed luminaires shall be tied back to the soffit to prevent fall.

Surface-mounted luminaires mounted on suspended ceilings shall be supported from the ceiling grid using methods appropriate for the type of ceiling and the particular luminaire.

Luminaires which are smaller than the ceiling grid module shall be mounted on the ceiling tiles using a suitable non-combustible backing board (provided and cut by ceiling Board).

Project Co. shall ensure that the ceiling installer is made aware of the weights and positions of luminaires so that adequate supports and trimmers can be provided. Heavy luminaires that exceed the maximum weight limits of the ceiling type used shall be supported from the soffit.

Lamps, Diffusers and Louvres

Luminaires shall be supplied complete with lamps, louvres and diffusers attachments, as specified in the Luminaire Schedule. All prismatic diffusers shall be of the TP(a) type.

Lamps shall be as specified in the Luminaire Schedule.

The luminaire schedule indicates luminaires which shall be fitted with lamps with a colour rendering index Ra ≥90. All other lamps shall have a colour rendering index Ra ≥ 85.

Illuminated Warning Signs

Refer to clauses 405A & 405B in Materials & Workmanship section V59.

Illuminated warning signs shall be provided as detailed in the equipment schedule.

Laser and x-ray warning lights shall be interfaced with the laser/x-ray machines.

The mounting heights/locations shall be installed in strict accordance with the drawings, wall elevations and manufacturer requirements.

The wording on the illuminated signs shall be as detailed on the Room Data Sheets unless advised otherwise by manufacturer.

Theatre Operating Table Luminaires

Refer to equipment schedule for details.

The mountings shall be supported off the structural soffit, which is reinforced concrete. In particular, the positional, height and levelling requirements of the mounting stem shall be fully complied with. The height and levelling (vertical and horizontal) are particularly important in order to allow proper operation. Project Co. shall either employ the operating light specialist to install the stems for all operating lights, or shall have the installation monitored and verified by the operating light specialist to ensure that all such requirements are complied with.

Power supply units for the luminaires shall be located in theatre plant room. The luminaires shall incorporate a no-break battery backup of 3-hour duration. Batteries shall be VRLA with a life expectancy of 10 years. Conduit wireways to each luminaire shall be provided for camera cabling.

Plantroom Lighting

Final mounting heights and layout shall suit final plantroom layouts.

Examination Lights

Refer to equipment schedule for details. The mountings shall be supported off the structural soffit, which is reinforced concrete. The mounting stems of ceiling-mounted lights shall be installed in strict accordance with the specialist supplier/manufacturer's instructions, especially concerning heights and levels (vertical and horizontal). The luminaire supplier shall confirm fixing details and structural loads for approval.

Automatic Lighting Control

A global automatic lighting control system shall be installed which through the means of automatic controls shall make use of available daylight where described elsewhere in this specification, regulate lighting levels, monitor luminaires for lamp failure and permit easy reconfiguration.

The automatic lighting control system shall be run over the KNX BMS system and all components used shall be KNX/DALI compatible.

The system shall include a head end in the security room which shall provide the ability to control, monitor and schedule lighting.

The following paragraphs the automatic lighting control philosophy within various areas, refer also to the lighting control schedule in Appendix B.

<u>Absence Detection where Indicated on the Drawings.</u>

Manual switching shall be provided to turn lighting "ON" and "OFF". In addition, automatic presence detectors shall be provided in these areas for switching "OFF" lighting when areas are unoccupied. Presence detectors shall not switch lighting on. Automatic presence detectors shall be provided with adjustable time delay and shall be set to 10 minutes.

In general absence detection will be required to:

- Offices
- Consulting rooms
- Interview rooms,

Further guidance is provided in Appendix B.

The sequence of operation shall be:-

i) Operation of manual switch at entrance to room shall turn lighting “ON”.

ii) Subsequent operation of manual switch whilst lighting is illuminated shall switch lighting OFF.

iii) After a predetermined unoccupied period (achieved by the adjustable time delay on automatic presence detector) the automatic presence detector shall switch lighting “OFF”.

The above shall require switching of the momentary retractive type.

Presence Detection where Indicated on the Drawings

Automatic presence detectors only shall be provided for switching lighting “ON” when areas are occupied and switching lighting “OFF” when areas are unoccupied. No light switches shall be provided in these rooms. Automatic presence detectors shall be provided with adjustable time delay which shall inhibit the extinguishing of luminaires for a predetermined period. The time delay shall be set to 20 minutes.

In general presence detection will be required to:

- Bedroom En-Suites
- Store rooms
- Linen cupboards
- Toilets
- Bathrooms
- Ward kitchens/pantries
- Plant rooms (see lighting control matrix)
- Services risers/cupboards
- Shower rooms
- Changing rooms
- Departmental corridors and hospital streets (but see below)

Further guidance is provided in Appendix B.

The sequence of operation shall be:-

i) Upon entrance to room and whilst the room is occupied the automatic presence detector shall turn lighting “ON”.

ii) Upon exit from the room and whilst the room is unoccupied after a predetermined unoccupied period (achieved by the adjustable time delay timer on automatic presence detector) the presence detector shall switch the lighting “OFF”.

The presence detection in the departmental corridors and hospital streets shall be configured such that after a predetermined unoccupied period the presence detection shall regulate the lighting to 50% on schematic of normal output rather than 0% (i.e. the space is always illuminated).

Atrium Lighting Control

The lighting within the atrium will be automatically controlled as detailed in the section above.

Ceiling mounted automatic presence detectors shall be located within the occupied areas and shall control the lighting in the detection areas.

The lighting control system within the Atria shall be configured to permit different lighting 'scenes' as detailed by the lighting designer and agreed with the Board.

Note that the luminaires delivering the lighting within the Atrium comprise a mix of different forms of control gear such as DALI, 1-10V, & HF ballasts therefore provision shall be made to ensure all luminaires can be switched by the same action.

Daylight Linking

In rooms provided with automatic absence detection and which benefit from natural daylight, luminaires near the windows shall be automatically dimmable, regulated by the amount of daylight available. Any deviation from this shall require prior agreement with the Board. Combined presence/daylight sensors shall be utilised to achieve this requirement and shall directly switch/regulate the luminaires. Manual override of automatic dimming is not required. This does not apply to departmental corridors or hospital streets.

The sequence of operation shall be as follows:-

i. Unoccupied room, lights "off".
ii. Person enters room – makes decision not to turn on lighting. Lights remain off, regardless of daylight availability.
iii. Person enters room- makes decision to turn on lighting. Press retractable light switch(es) – luminaires "on".
iv. Daylight sensor checks available light and regulates luminaires nearest window to achieve a preset lux level. Luminaires shall not be regulated to less than 10% of their normal output. (This is to reassure occupant that luminaires are not defective.)
v. As daylight fluctuates luminaire output shall be adjusted (after pre-set time delay).
vi. Person leaves room – manually extinguishes lighting. In the event that person does not manually extinguish lighting after a predetermined unoccupied period all lighting shall be switched off.

Note that the daylight linking system does not interface with the blinds. If the blinds are closed, no benefit can be had from natural daylight therefore the lights will not dim automatically.

Daylight Control of Bedroom Lighting

Bedrooms will not be provided with movement detectors, however the luminaire nearest the window shall be daylight controlled as follows:

An external light sensor shall be fitted to each face of the ward accommodation to control appropriate luminaires.

The mode of operation shall be as follows:

- It shall not be possible to switch on the controlled luminaire nearest the window if there is sufficient daylight.
- When there is insufficient daylight it shall be possible to switch on the controlled luminaire manually.
- The external light sensor shall not automatically switch on the luminaire.
- When there is sufficient daylight the light sensor shall automatically switch off the luminaire.
- A light switch shall be provided in the bedroom which shall allow the luminaire to be switched on ONLY when there is insufficient daylight available.

The above provision will be a relatively crude means of energy conservation and will require careful 'tuning' over a period of several days. The light sensors shall be adjusted so that the luminaire nearest the window in the lowest floor bedrooms cannot be switched on when the daylight available in the half of the room nearest the window reaches 100 lux average.

Further details to provide via a technical submission.

Daylight Control of Atria Lighting

The Atria lighting shall be daylight linked regulated by the amount of daylight available to achieve the illumination levels stated in the Environmental Matrix.

External light sensors shall be fitted externally to the Atria in appropriate locations. These sensors are independent of those required for the daylight control of bedroom lighting.

Ward Corridors

Ward corridors shall be provided with manual switches to permit staff to regulate light output to preset levels of 0%, 50% or 100% Refer to lighting layouts for switch locations.

Manual Switching

The lighting drawings shall indicate switching arrangements and nominal locations of lighting switches. The Architect's loaded 1:50 drawings shall be used for final locations of switches, and they shall be assessed in relation to Scottish Building Regulations.

Where several accessory plates are located together, these shall be mounted at the same height, in a horizontal row, as appropriate, unless indicated otherwise on Architects drawings.

All lighting outlet boxes shall be fitted with an earth screw terminal pillar. Accessory units shall be bonded to this terminal using green/yellow coloured LSF insulated cable in compliance with BS7671.

Light switch back boxes in imaging rooms shall be plastic.

Light switches shall be recessed within wall finishes.

Surface mounted switches shall be of the metal-clad pattern.

Plate and grid switches shall be rated at 20 A, rated for high frequency ballast / inductive load.

Pull cords shall be ceiling-mounted independently supported and provided where indicated on the lighting drawings.

Permanent labelling shall be provided on all multi-gang light switches, identifying each switch control. This shall be carried out using a proprietary labelling system.

Ward switches shall be labelled to indicate general lighting and night lighting.

Where reading lights for patient use are provided at bedheads they shall be controlled by a switch at the bedhead and at the patient handset.

Samples of the labelling system shall be provided prior to installation for approval.

Lighting switches shall be IP56 protected where indicated as splash-proof on the Room Data Sheets.

Manual Dimming

Manual dimming shall be provided in clinical areas where required for the operation of the room.

A schedule shall be provided to indicate the extent of dimmable rooms.

LED/Fluorescent luminaires, which are to be manually dimmed, shall have control gear suitable for dimming and shall be controlled by momentary retractive switches. The same switches shall provide the on/off control. All dimming shall be via digital control ranging from 1% to 100% of normal output. Luminaire dimmable control gear shall be fully compatible with the selected dimmer controllers. It shall be the responsibility of to ensure that selected dimmable high frequency control gear and dimmers shall be mutually compatible.

Consideration shall be made to the inrush current on the dimming controls when the luminaires are first switched on. Appropriate rating of the dimmer switch shall be made for this.

8.2 Emergency Lighting

General

Self-contained units shall be utilised throughout and shall be connected to an addressable emergency lighting test system to reduce the maintenance burden.

Addressable Emergency Lighting System

The system shall comprise:-

- Central control and reporting computer
- Local test panels
- Addressable emergency lighting luminaires fitted with test interface
- Hand held programmers (1 and spare)
- Networking Cabling

The central PC for the test system shall be located in the main control room in the FM department, exact location to be agreed.

Each self contained emergency lighting luminaire shall be fitted with a test interface which shall communicate with the central control PC via a control bus. Each test interface shall be allocated a unique address code.

The test system shall enable scheduling of testing so that tests are automatically carried out at a convenient time. The system shall enable groups of luminaires to be tested on a rolling schedule to minimise disruption. The system shall be configured so that no area is left without cover even immediately after a full discharge.

The system shall continuously monitor the health of all connected components and provide fault alarms within seconds.

The test system shall log failures.

The system shall provide pinpoint location of any items in need of attention.

Local test panels shall be networked and shall provide central control and reporting. Test panels shall be loaded to no more than 80% of full capacity. It is preferred that the central battery self-test system and the self-contained emergency test systems shall form an integrated networked whole.

The test system shall suit all lamp types specified.

Batteries shall be 5 year design life.

Control wiring shall be installed in accordance with the manufacturer's recommendations, with particular reference to voltage drop limitations.

The Board shall submit details of his proposed test system.

Manual Emergency Lighting System

Emergency luminaires within tenanted retail units will be tested manually by key switches. These luminaires will not be linked to the central addressable emergency lighting system. The tenant shall be responsible for the testing of their own luminaires.

External Lighting

Refer to WW-A.P.1.32 for further details.

V50 General lighting systems

To be read with Preliminaries/ General conditions.

GENERAL

110 HARD WIRED GENERAL LIGHTING SYSTEM GENERALLY

- Origin of supply: Low voltage distribution system, as section V30.
- Final circuit cabling:
  - Types: LSZH singles, as section V32.
  - Sizes: As Circuits schedule.
- Containment: Rigid conduit, as section Y60 or Trunking or ducting, as section Y60.
- Rewireable installation: Required.
- Concealed installation: Required.
- Partial installation: Not required.
- Connections to luminaires: Ceiling roses/connector.
- Luminaires and lamps:
  - Luminaire types: As section V59.
  - Lamp types:
  - Tungsten halogen lamps, as section V59;
  - Tubular fluorescent lamps, as section V59 ;
  - Two and four pin compact fluorescent lamps, as section V59;
  - Self ballasted compact fluorescent lamps, as section V59;
  - Metal halide lamps, as section V59;
  - High pressure sodium lamps, as section V59;
  - Low pressure sodium lamps, as section V59; and
  - High pressure mercury lamps, as section V59.
  - Operating voltage: Low voltage and Separated extra low voltage.
- Lighting controls:
  - Light switches, as section Y65;
  - Dimmer switches and controls, as section Y65; or
  - Separate combined daylight and occupancy detection, as section V51.
- Completion:
  - Electrical identification: As section V80.

120 GENERAL LIGHTING SYSTEM WITH PREFABRICATED WIRING GENERALLY.

- The Board shall ensure that there is at least one spare circuit available in each home run cable.

Origin of supply: Low voltage distribution system, as section V30.

- Standards
  System generally: BS 8488
  Connectors: BS EN 61535 and BS EN 61984 as appropriate

Final circuit cabling:

- Types: Prefabricated LSZH insulated singles metal encased in flexible conduit.
- Sizes: As Circuits schedule.
- Containment: Cable basket, as section Y63.
- Rewireable installation: Required.
- Concealed installation: Required.
- Partial installation: Not required.

- System components:
  - Home run cables;
  - Lighting circuit distribution boxes;
  - Lighting extender leads;
  - Luminaire connection cables;
  - Master distribution boxes;
  - Starter leads;
  - Switch connection leads;
  - Switch modules; and
  - T connector.
- Connections to luminaires: 'T' connector.
- Luminaires and lamps:
  - Luminaire types: As section V59.
  - Lamp types:
  - Tungsten halogen lamps, as section V59;
  - Tubular fluorescent lamps, as section V59 ;
  - Two and four pin compact fluorescent lamps, as section V59;
  - Self ballasted compact fluorescent lamps, as section V59;
  - Metal halide lamps, as section V59;
  - High pressure sodium lamps, as section V59;
  - Low pressure sodium lamps, as section V59; and
  - High pressure mercury lamps, as section V59.
  - Operating voltage: Low voltage and Separated extra low voltage.
- Lighting controls:
  - Light switches, as section Y65;
  - Dimmer switches and controls, as section Y65; and
  - Separate combined daylight and occupancy detection, as section V51.
- Completion:
  - Electrical identification: As section V80.

PRODUCTS

305 PREFABRICATED WIRING PRODUCTS GENERALLY

- Connectors:
  - Standard: To BS 61535 and BS EN 61984 as appropriate. Submit certification
  - Type: Board's choice.

310A CEILING ROSES/CONNECTORS

- Standard: To BS 67.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Rating: 6 A.
- Mounting type: Submit proposals.
- Connection type: Plug-in.
- Flex length (maximum): 3 m (unclipped to allow easy replacement).
- Colour: White.

315 HOME RUN CABLES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: 6 or 9 circuit.
  - Size: Board's choice.
- Length: Board's choice.
- Connector arrangement: One fully shrouded male connector and one free cable end.

320 LIGHTING CIRCUIT DISTRIBUTION BOXES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Distribution box: Galvanized sheet steel with recessed input and outgoing connections.
- Connectors:
  - Power input connection: Via prefabricated wiring and plug-in connectors .
  - Power output connector: Fully shrouded female connector.
- Outgoing connections:
  - Quantity: Board's choice.
  - Poles: Board choice.

330 LUMINAIRE SUPPORTING COUPLERS General.

- Standard: To BS 6972.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Rating: 6 A.
- General luminaires: White plug with white cover.
- Emergency luminaires: Red plug with red cover.
- Plug type: Rewireable, independent.
  - Pin configuration: To suit requirements for KNX/DALI system.
- Cable type: Manufacturer's standard.
  - Cable size: 0.75 mm².
- Flex length (maximum): 2 m.

335 PREFABRICATED LSZH INSULATED SINGLES IN FLEXIBLE CONDUIT

- Standards:
  - Cable: To BS 7211.
  - Flexible conduit: To BS EN 61386-23. Submit certification
- Approval: British Approvals Service for Cables (BASEC) certified.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Flexible thermosetting insulated single core cables (LSZH singles, H07Z-K):
  - Construction: To BS 7211, table 3b.

345 LIGHTING EXTENDER LEADS Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board's choice.

- Size: Board's choice.
- Length: Board's choice.
- Connectors:
  - Arrangement: One fully shrouded male connector and one fully shrouded female connector.
  - Poles: Board choice.

350 LUMINAIRE CONNECTION CABLES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board choice.
  - Size: Board's choice.
- Length: Board's choice.
- Connectors:
  - Arrangement: Board choice.
  - Poles: Board choice.

355 MASTER DISTRIBUTION BOXES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Distribution box: Galvanized sheet steel with recessed input and outgoing connections.
- Rating: 16 A.
- Connectors:
  - Power input connection: Hard wired via home run cable.
  - Power output connector type: Fully shrouded female connector.
- Outgoing connections:
  - Quantity: Board's choice.
  - Poles: Board choice.

360 SWITCH CONNECTION LEADS Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board choice.
  - Size: Board choice.
- Length: Board choice.
- Connectors:
  - Arrangement: One fully shrouded male connector and one free end.
  - Poles: Board choice.

365 STARTER LEADS Prefabricated wiring system.

- Manufacturer: Board choice.
  - Product reference: Board choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board choice.
  - Size: Board choice.
- Length: Board choice.

- Connectors:
  - Arrangement: Board choice.
  - Poles: Board choice.

370 SWITCH MODULES Prefabricated wiring system.

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Board choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board choice.
  - Size: Board choice.
- Rating: 16 A.
- Length: Board choice.
- Connectors:
  - Arrangement: One fully shrouded male connector and one fully shrouded female connector.
  - Poles: Board choice.

375 T CONNECTORS Prefabricated wiring system.

- Standard: To BS EN 61535. Submit certification
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Board's choice.
- Cable type: Prefabricated LSZH insulated singles metal encased in flexible conduit.
  - Number of cores: Board choice.
  - Size: Board choice.
- Length: Board choice.
- Connectors:
  - 'T' arrangement: One fully shrouded male connector and one fully shrouded female connector.
  - Connection to luminaire: Fully shrouded male connector.

EXECUTION

610 INSTALLING GENERAL LIGHTING SYSTEMS

- Standard: To BS 7671.

640 LIGHTING CIRCUITS

- Rooms smaller than 4 m²: Restrict lighting circuits to one electrical phase.

650 MANUAL CONTROLS

- Location: As drawings.
- Staircases: No switching except into plant areas.

660 INSTALLING PREFABRICATED WIRING

- Connection arrangement: Form circuits using a male connector working away from any master distribution boxes.
- Fixing master/ lighting distribution boxes: Suspended from drop rods.

- Fixing cabling:
  - Maximum distance between clips:
    Prefabricated LSZH insulated singles metal encased in flexible conduit: 1500 mm.
  - Clipped in accordance with manufacturers recommendations.
  - Bends: Not permitted within 150 mm of connectors.

COMPLETION

905 TESTING AND INSPECTION OF FIXED ELECTRICAL WIRING

- Testing and inspection: To BS 7671.
- Test results: Submit.
  - Number of copies: 2.

910 TESTING AND COMMISSIONING OF GENERAL LIGHTING SYSTEMS

- Commissioning: In accordance with CIBSE Commissioning code L
- Controls: Check operation.
- Lamps: Check operation.
- Test results: Submit.
  - Number of copies: 2.

920 PHOTOMETRIC SURVEY

- Standard: In accordance with CIBSE Code for lighting.
- Locations: One sample of each room type.
- Daylight control: Full blackout.
- Average illuminance measurement method: Full grid.
- Illuminance variation measurements:
  - Diversity.
  - Uniformity.
- Measured values: Submit.
- Maintained average illuminance: Submit based upon measured values.
- Illuminance variation:
  - Diversity: Submit based upon measured values.
  - Uniformity: Submit based upon measured values.
- Survey photographs: Submit for each location.

930 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Operation and maintenance instructions: Submit.
- Plug & play schedule of components: Submit.
- Record drawings: Submit.
  - Number of copies: 2.

V51 Automatic lighting controls

To be read with Preliminaries/ General conditions

PRODUCTS

340 PHOTOELECTRIC CONTROL UNITS External
- Standard: To BS 5972.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Equipment interconnectivity: Wired.
- Inductive switching capacity: 25 A.
- Minimum degree of ingress protection to BS 60529: IP56.
- Switching settings:
  - Adjustable switching time delay: Required
  - On lighting level: Adjustable.
  - Off lighting level: Adjustable.
  - Timed on: Programmable 7 day 24 h clock.
  - Timed off: Programmable 7 day 24 h clock.
- Remote setup/ override: By infrared controller
- Mounting: Outdoor.

350 INTERNAL DAYLIGHT SENSOR
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Equipment interconnectivity: Wired.
- Daylight sensitivity: Adjustable.
- Remote setup/ override: By infrared controller.
- Mounting: Ceiling .
- Minimum degree of ingress protection to BS 60529: Board's choice.

350A EXTERNAL LIGHT SENSOR
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Equipment interconnectivity: Wired.
- Daylight sensitivity: Adjustable.
- Remote setup/ override: Not required.
- Mounting: Outdoor and Wall .
- Minimum degree of ingress protection to BS 60529: IP44.

360 EXTRA-LOW AUTOMATIC PRESENCE DETECTORS
- Type: Microwave.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Equipment interconnectivity: Wired.
- Occupancy sensitivity: Adjustable.
- Remote setup/ override: By infrared controller.
- Mounting: Ceiling.
- Minimum degree of ingress protection to BS 60529: Board's choice.

370 MAINS VOLTAGE AUTOMATIC PRESENCE DETECTORS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Microwave.
- Inductive switching capacity: 10 A.
- Occupancy sensitivity: Adjustable.
- Switching delay: Adjustable.
- Remote setup/ override: By infrared controller.
- Mounting: Ceiling .
- Minimum degree of ingress protection to BS 60529: Board's choice.

380 COMBINED PRESENCE/ DAYLIGHT SENSORS

- Manufacturer: Boards choice.
  - Product reference: Boards choice.
- Daylight sensitivity: Adjustable.
- Equipment interconnectivity: Wired.
- Occupancy sensitivity: Adjustable.
- Remote setup/ override: By infrared controller.
- Mounting: Ceiling.
- Minimum degree of ingress protection to BS 60529: Board's choice.

390 REMOTE INFRARED CONTROLLERS

- Quantity: 4.

410 CENTRAL CONTROLLERS

- Type: Microprocessor controlled.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Equipment interconnectivity: Wired.
- Control protocol: Digital addressable lighting interface (DALI) to BS EN 60929 Annex E.
- Inputs:
  - Combined das;
  - Daylight sensors;
  - Extra-low voltage occupancy sensors;
  - Mains voltage occupancy sensors;
  - Photoelectric control units ;
  - Remote infrared controllers; and
  - Laptop computers.
- Outputs: To building monitoring and management system, as section Y41.
- Enclosure: M's standard.
  - Minimum degree of ingress protection to BS EN 60529: IP23.
  - Material and construction: Manufacturer's standard.
  - Finish: M's standard.
- Mounting: Board's choice.

EXECUTION

610 INSTALLATION GENERALLY

- Interconnection: Interconnect sensors, controllers and luminaires.
- Positions of sensors: As drawings.

620 CABLE INSTALLATION GENERALLY

- Standard: To BS 7671.
- Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
- Cables: Install in one uninterrupted run with jointing at equipment and terminal fittings only.
  - Installation method: Submit proposals.
- Cables routes generally:
  - Concealed cable runs to wall accessories: Run vertically from the accessory.
  - Exposed cable runs: Submit proposals.
  - Cables from other systems: Segregate and cross at right angles.
  - Terminations: Support cable within 150 mm of termination.
- Balanced twisted-pair cabling:
  - Maximum untwist at terminations: 12 mm.

630 INSTALLING PHOTOELECTRIC CONTROL UNITS

- Location: Not influenced by luminaires.
- Connection: To adjacent luminaire .

640 INSTALLING DAYLIGHT SENSORS

- Location: Representative of the daylight level in the area under control.
- Connection: To adjacent luminaire .

650 INSTALLING OCCUPANCY SENSORS

- Location: To suit the occupancy pattern of the area under control. Shield from erroneous influences.
- Connection: To adjacent luminaire .

COMPLETION

910 CLEANING AND CABLE INSPECTIONS

- Detector lenses: Clean using anti static cleaning fluid.
- Cable connections: Verify.

915 LABELLING

- Equipment and sensor identification labels: Provide.
- Central controller: Label describing its purpose.
  - Output circuits: Label.

920 TESTING AND COMMISSIONING

- Commissioning: In accordance with CIBSE Commissioning Code L.
- Notice before commissioning (minimum): 14 d .
- Witnessing: Arrange for site testing to be witnessed by the contract administrator.
- Pre-commissioning checks: Undertake.
- Pre-commissioning certificate: Submit.
- Sensor settings: Submit proposals. Calibrate and commission.
- Test equipment calibration certificates: Submit.
- Operation of sensors and control devices: Check and verify. Submit results.
- System commissioning certificate: Submit.

940 SPARES AND CONSUMABLES

- Manufacturer's recommended spares: Supply one set

V55 Self-contained emergency lighting and signage systems

To be read with Preliminaries/General conditions.

GENERAL

110A SELF-CONTAINED EMERGENCY LIGHTING AND SIGNAGE SYSTEMGENERALLY

- System manufacturer: Submit proposals.
- Origin of supply: Low voltage distribution system, as section V30.
- Final circuit cabling:
  - Cable type: LSZH singles, as section V32.
  - Sizes: As Circuits schedule.
- Containment: Rigid conduit, as section Y60 or Trunking or ducting, as section Y60.
- Rewireable installation: Required.
- Concealed installation: Required.
- Partial installation: Not required.
- Connections to luminaires: Ceiling roses, as section V50.
- Emergency luminaires and lamps
  - Luminaire types: As section V59.
  - Lamp types:
  - Tungsten halogen lamps, as section V59;
  - Tubular fluorescent lamps, as section V59 ;
  - Two and four pin compact fluorescent lamps, as section V59; and
  - Self ballasted compact fluorescent lamps, as section V59.

  Test facility: Automatic test facility.

SYSTEM PERFORMANCE

PRODUCTS

320 EMERGENCY LUMINAIRES GENERALLY

- Standard: To BS EN 60598-2-22.
- Third party product certification: ICEL 1001. Submit certification
- Housing: Locate components necessary for the operation of the luminaire (including batteries, charger, lamp, and control gear) within the luminaire body.
- Indicators:
  - Charging: Green light-emitting diodes.
  - Fault: Flashing red light emitting diodes.
  - Test in progress: Flashing green light emitting diodes.
  - Position within luminaire: Readily visible. Fix to luminaire body.
- Batteries:
  - Standard: To BS EN 61951.
  - Type: Sealed nickel-cadmium.
  - Life (minimum) when operating under normal conditions at 25°C and subject to complete charge and discharge every 6 months: 4 years.
  - Labelling: Indelibly mark with year of manufacture and installation.

330 GENERAL LUMINAIRES RE-ENGINEERED FOR EMERGENCY USE

- Standards: To BS EN 13032-1 and -3.
- Third party product certification: ICEL 1004: Submit completed model test record certificate.
- Photometric data: Submit for re-engineered luminaires.

395 AUTOMATIC TEST FACILITY
- Standard: To BS EN 62034.
  - Type: PRN.
- Manufacturer: Board's choice.
  - Product reference: Board's choice.

EXECUTION

630 INSTALLATION GENERALLY
- Standards: To BS 7671 and in accordance with BS 5266-1.
- Locations: As drawings.

675 INSTALLING AUTOMATIC TEST CONTROLLER
- Location: At BMS front end.
- Interconnections with emergency luminaires: Complete.
  - Cables: Manufacturer's standard.
- Remote data transmission: Required.

678 INSTALLING LUMINAIRE AUTOMATIC TEST MODULES
- Installation: In each emergency luminaire.
  - Position: As manufacturer's recommendation.

COMPLETION

910 INSPECTION AND TESTING
- Inspection and testing: In accordance with BS 5266-1.
- Controls: Check operation.
- Full discharge test: Required. Following restoration of the normal supply verify the operation of charge indicators.
- Results: Submit.

920 EMERGENCY LIGHTING PHOTOMETRIC SURVEY
- Locations: Throughout.
- Timing: During the hours of darkness.
- Extraneous light: Minimize.
- Measured values: Submit, stating levels of extraneous light.

930 DOCUMENTATION
- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Documentation: In accordance with BS 5266-1.
- Certificate of testing: Submit.
  - Standard: In accordance with BS 5266-1, Annex B.
  - Number of copies: 2.
- System log book: Required.

940 CERTIFICATION FOR RE-ENGINEERED LUMINAIRES
- Certification: Submit completed ICEL 1004 model test record certificate.

V59 Luminaires and lamps

To be read with Preliminaries/General conditions.

PRODUCTS

310 LAMPS GENERALLY
- Manufacturer: As recommended by luminaire manufacturer.
- Lamps of the same type and rating: Same manufacturer.
- Fluorescent ballasts: Separate for each lamp.

320 TUNGSTEN FILAMENT LAMPS
- Not permitted

325 TUNGSTEN HALOGEN LAMPS
- Not permitted

330 TUBULAR FLUORESCENT LAMPS
- Standards:
  - Double-capped lamps: To BS EN 60081 and BS EN 61195.
- Lamp diameter: 6 mm and 16 mm.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

335 TWO AND FOUR PIN COMPACT FLUORESCENT LAMPS
- Standards: To BS EN 60901 and BS EN 61199.
- Types: As Luminaire schedule.
- Control gear: As Luminaire schedule.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

339 SELF BALLASTED COMPACT FLUORESCENT LAMPS
- Standards: To BS EN 60968 and BS EN 60969.
- Type: As Luminaire schedule.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

340 METAL HALIDE LAMPS
- Standards: To BS EN 61167 and BS EN 62035.
- Type: As Luminaire schedule.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.
- Instant re-strike control gear: As Luminaire schedule.
- Integrated protective glass: As Luminaire schedule.

345 HIGH PRESSURE SODIUM LAMPS
- Standards: To BS EN 60662 and BS EN 62035.
- Type: As Luminaire schedule.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.
- Method of starting: Internal ignitor.

350 LOW PRESSURE SODIUM LAMPS

- Standards: To BS EN 60192 and BS EN 62035.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

355 HIGH PRESSURE MERCURY LAMPS

- Standards: To BS EN 60188 and BS EN 62035.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

357 INDUCTION LAMPS

- Standards: To BS EN 61347-2-3 and BS EN 60929.
- Colour temperature: As Luminaire schedule.
- Colour rendering index: As Luminaire schedule.

360 AUXILIARY LAMPS

- Function: To provide illumination during main lamp start-up and re-strike periods.
- Lamp type: Tungsten halogen.
- Position: Integral within luminaire.
- Luminaires with auxiliary lamps: As Luminaire schedule.

370 CONTROL GEAR GENERALLY.

- Standard: To BS EN 61347-1.
- Ballasts:
  - Fluorescent lamp ballasts:
  Switched start: To BS EN 60921 and BS EN 61347-2-8. High frequency (A.C supplied): To BS EN 60929 and BS EN 61347-2-3. High frequency (D.C supplied): To BS EN 60925 and BS EN 61347-2-4.
  - Discharge lamp ballasts: To BS EN 61347-2-9 and BS EN 60923.
  - Emergency lighting ballasts: BS EN 60925 and BS EN 61347-2-7.
- Lamp starters generally: To BS EN 61347-2-1 and BS EN 60927.

385 LAMP HOLDERS FOR TUNGSTEN HALOGEN LAMPS

- Lamps<100 W: Bayonet B22d, or Edison screw E27, or Edison screw E14.
- Lamps >100 W,<200 W: Edison screw E27.
- Lamps >200 W: Edison screw E40.

390 BAYONET LAMP HOLDERS GENERALLY

- Standard: To BS EN 61184.
- Type: As Luminaire schedule.
- Material: As Luminaire schedule .
- Protective skirt: Required.
- Mounting: Suspended from ceiling rose.

391 EDISON SCREW LAMP HOLDERS GENERALLY

- Standard: To BS EN 60238.
- Material: As Luminaire schedule.
- Protective skirt: Required.
- Mounting: Suspended from ceiling rose.

392 FLUORESCENT LAMP HOLDERS

- Standard: To BS EN 60400.

395 ENCLOSURES FOR CONTROL GEAR Generally

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Material: As Luminaire schedule.
  - Finish: Match luminaire.
  - Colour: As Luminaire schedule.
- Degree of ingress protection to BS EN 60529: Board's choice.
- Hardware: Cylinder lock and handle. Standardize key type.
- Labelling: Describe control gear purpose.

400 LUMINAIRES GENERALLY General

- Standards: To BS EN 60598-1.
- Approval: Kitemark certified.
- Photometric performance: To BS EN 13032-1.
- Supply circuit conductor connections: Screw terminals .
- Internal fuse: Required for incoming circuit phase connections.

405 LUMINAIRES general

- Manufacturer: As luminaire schedule.
  - Product reference: As luminaire schedule.
- Description: As luminaire schedule.
- Features: As luminaire schedule.
- Ballasts CELMA energy efficiency index (minimum): Manufacturer's standard.
- Control gear position: Integral within luminaire.
- Luminaire power factor: Correct to minimum 0.9 lagging.
- Lamps:
  - Number: As luminaire schedule.
  - Type to PD IEC TS 61231 to ILCOS L: As luminaire schedule.
  - Colour temperature: As luminaire schedule.
  - Colour rendering index: As luminaire schedule.
  - Rating: As luminaire schedule.

405A LUMINAIRES X-Ray, Laser, etc Illuminated Warning Signs

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Legend: As ADB code.
- Mounting: Flush mounted if wall depth permits otherwise surface mounted.
- Lamp: T5 or LED.
- Control gear position: Integral within luminaire.
- Manufactured to BS EN 60598-1.
- To be switched by equipment.

405B LUMINAIRES Do Not Enter, Room In Use, etc Illuminated Warning Signs

- Manufacturer: Submit proposals.
  - Product reference: Submit proposals.
- Legend: As ADB code.
- Mounting: Flush mounted if wall depth permits otherwise surface mounted.
- Lamp: T5 or LED.
- Control gear position: Integral within luminaire.
- Manufactured to BS EN 60598-1.
- To be manually switched within room, refer to Lighting Layouts.

420 AIR HANDLING LUMINAIRES
- Standard: To BS 4533-102.19.

430 SEPARATED EXTRA-LOW VOLTAGE LIGHTING
- Standard: To BS EN 60598-2-23.

440 SEPARATED EXTRA-LOW VOLTAGE LIGHTING TRANSFORMERSGENERALLY
- Standard: To BS EN 61558.
- Type: As luminaire schedule.
- Power rating: Submit proposals.
- Output:
  - Connections: As luminaire schedule.
  - Constant secondary voltage: Maintain irrespective of load.
- Luminaire connections: As luminaire schedule.

450 LIGHTING TRACKGENERALLY
- Standard: As luminaire schedule.
- Type: As Luminaire schedule.
- Class: As luminaire schedule.
- Conductor rating: As luminaire schedule.
- Neutral rating: As luminaire schedule.
- Mounting: As luminaire schedule.

460 LUMINAIRE SMOKE HOODS
- Standard: To BS 476-21.
- Refer to Architect's Fire Strategy drawings.
- Smoke hoods and blankets: Match fire performance of building fabric.

FABRICATION

510 CUSTOM-BUILT LUMINAIRES GENERALLY
- Design and fabrication: Complete the design and fabrication of custom-built luminaires.
- Prototypes: Submit.
- Photometric data: Submit.
  - Standard: To BS EN 13032-1.

520 CUSTOM-BUILT LUMINAIRE General.
- Circumstances of use to BS EN 60598-1: As luminaire schedule.
- Electric shock classification to BS EN 60598-1: As luminaire schedule.
- Degree of ingress protection to BS EN 60529: As luminaire schedule.
- Supporting surface classification to BS EN 60598-1: As luminaire schedule.
- Luminaire light output ratio (minimum): As luminaire schedule.
- Description: As luminaire schedule.
- Features: As luminaire schedule.
- Lamps:
  - Number: As luminaire schedule.
  - Type to PD IEC TS 61231 to LICOS L: As luminaire schedule.
  - Colour temperature: As luminaire schedule.
  - Colour rendering index: As luminaire schedule.
  - Rating: As luminaire schedule.

530 PROPOSALS FOR CUSTOM-BUILT LUMINAIRES

- Content: Submit the following:
  - Overall dimensions.
  - Dimensioned general arrangement drawings, plans, elevations and sections.
  - Degree of ingress protection.
  - Mounting and fixing details.
  - Materials and component details.
  - Details of internal and external paint systems and colour finishes.
  - Means of access to consumable parts.
  - Schedule of labels.
  - Routing of cabling within luminaire.
  - Internal wiring diagrams and location of components.

EXECUTION

610 SAMPLES

- Samples: Before ordering, supply samples of the following luminaires: It is anticipated that samples of each family type shall be provided, a marked up luminaire schedule which details the sample luminaires to be agreed with BM and the Board schedule.
- Submittals: Include manufacturer's technical information with each sample.
- Identification: Label samples with the luminaire references.

620 INSTALLING LUMINAIRES AND LAMPS GENERALLY

- Standard: To BS 7671.
- Location: As drawings.
- Orientation: Parallel with ceiling.
- Lamps and accessories: Provide.
- Supports: Adequate for weight of luminaire.

630 LUMINAIRE CABLE CONNECTIONS

- Cable connection size (minimum): 1.5 mm².
- Conduit mounted: Terminate directly within luminaire.
- Trunking mounted: Terminate directly within luminaire.
- Suspended trunking: From cable connection mounted on side of trunking.
  - Type: Plug and socket outlet to BS 546.
- Rod or chain suspended: Luminaire supporting coupler.
  - Cable type: HR PVC/ PVC cord, clipped to chain or rod. Do not pass cord through chain links.
- Cable entry: Grommet.
- Class 1 earth connections: Connect to luminaire circuit protective conductor.
- Wiring within luminaires: Minimize. Clip at 300 mm intervals.

640 LUMINAIRES MOUNTED AS PART OF A SUSPENDED CEILING

- Luminaire supports: Independent suspension rods.
- Luminaire final connection: Plug and socket outlet to BS 546.
  - Mounting: Surface mounted on side of trunking.
  - Length (maximum): 2 m.

650 INSTALLING LIGHTING TRACK

- Orientation: Level with ceiling.
- Track suspensions: Flexible.

660 INSTALLING EXTRA LOW VOLTAGE LUMINAIRES general.

- Transformer location: Accessible.
- Conductor size for cables connecting transformers and luminaires (minimum): As luminaire schedule.
- Multi-point transformers:
  - Cabling to luminaire: Equal size and length.
  - Lamps: Same power rating.
  - Fixing: Secure to non-flammable materials.

670 INSTALLING CONTROLGEAR

- Location: Adjacent to luminaire.
- Fixing: Secure to building fabric.

680 INSTALLING SUSPENDED LAMP HOLDERS

- Flex length: 0.3 m.

690 INSTALLING LUMINAIRE SUPPORTS

- Support and fixing arrangement: Board's choice
- Luminaire suspensions: Vertical.
  - Multiple suspensions: Provide as necessary.
- Levelling: Adjust the length of suspensions so that luminaires are level.
  - Levelling tolerance: ± 3 mm.
- Conduit supports:
  - Size (minimum): 20 mm.
  - Type: Match cable containment.
  - Conduit boxes: Provide for each luminaire suspension point.
- Rod supports: Continuously threaded rods.
- Chain supports: Steel chain with conduit box hook and cover.
- Ball and socket: Provide as top support and fix cover to circular conduit box. Route cable from conduit box through ball and socket.
- Number of supports for luminaires longer than 600 mm (minimum):
  - Luminaire width<300 mm: 2.
  - Luminaire width >300 mm: 4.

695 INSTALLING SMOKE HOODS

- Support and fixing arrangement: Submit proposals
- Location: Where recessed luminaires penetrate fire rated ceiling. Electrical Board to refer to Fire Strategy drawings to determine locations of Fire Rated ceilings if any.

COMPLETION

910 CLEANING

- Luminaires and lamps: Clean when building works are complete.

920 TESTING AND COMMISSIONING

- Luminaires and lamps: Check operation.

930 SPARE LAMPS

- Quantity to be supplied: 5 of each type installed.
- Labelling: Label the lamps with the corresponding luminaire reference.

V60 External lighting systems

To be read with Preliminaries/ General conditions

GENERAL THIS CLAUSE RELATES TO EXTERNAL LIGHTING IN THE IMMEDIATE VICINITY OF THE HOSPITAL AND ENERGY CENTRE. ie: BUILDING MOUNTED
LUMINAIRES AND TO FOOTPATHS AROUND THE PERIMETER OF THE BUILDING.

REFER TO SPECIFICATION WW-JB-SP-532-248 FOR DETAILS OF SITE WIDE
EXTERNAL LIGHTING

120 AMENITY LIGHTING SYSTEMS GENERALLY

- System manufacturer: as luminaire schedule.
  - Product reference: as luminaire schedule.
- Electrical supply: Low voltage connection, as section V11.
- Low voltage switchgear: Cable distribution cabinet, as section V31.
- Luminaire supports: Steel lighting pedestals.
  - Painting: Factory finish.
- Concrete bases to columns/pedestals: Required.
- Luminaires: As section V59.
  - Operating voltage to BS 7671: Low voltage.
- Controls:
  - Types: Photoelectric control units, as section V51.
  - Configuration: Group.
  - Accessories: Enclosures for control gear .
- System accessories: Electrical cut outs.

130 CABLING AND CONTAINMENT Buried cables

- Cable type: Thermosetting insulated and LSZH sheathed armoured cables, as section V32.
- Containment: Buried in soft, in plastic ducts below roadways..
- Trenches, pipeways and pits: As section P30.
- Accessories: Plastics ducts for underground cables, as section V32.

PRODUCTS

340 STEEL LIGHTING PEDESTALS FOR AMENITY LIGHTING SYSTEMS

- Manufacturer: as luminaire schedule.
  - Product reference: as luminaire schedule.
- Profile: as luminaire schedule.
- Cross section: as luminaire schedule.
- Height (nominal): as luminaire schedule.
- Base: as luminaire schedule.
- Root length: as luminaire schedule.
- Mounting diameter or width (nominal) : as luminaire schedule.
- Factory finish: as luminaire schedule
  - Colour: as luminaire schedule.
- Accessories: as luminaire schedule.

400 ENCLOSURES FOR CONTROL GEAR as luminaire schedule.
- Manufacturer: as luminaire schedule.
  - Product reference: as luminaire schedule.
- Enclosure:
  - Material: as luminaire schedule.
  - Finish: as luminaire schedule.
  - Ingress protection to BS EN 60529: as luminaire schedule.
  - Hardware: Cylinder lock and handle. Standardize key type.
  - Labelling: Describe control gear purpose.

EXECUTION

620 INSTALLING ROADWAY AND AMENITY LIGHTING SYSTEMS GENERALLY
- Standard: To BS 7671.

640 INSTALLING ELECTRICAL CUT OUTS
- Location: At base of pedestals.

650 INSTALLING PHOTOELECTRIC CONTROL UNIT
- Location: As far as practical on each luminaire.

690 SETTING COMPONENTS IN EARTH
- Foundation holes: Form as small as practicable to allow refilling.
- Locating components: Accurately position, plumb and provide secure temporary support.
- Cable ducts: Connect to column cable entry slot and protect against collapse during backfilling.
- Earth for backfilling: Selected material free from stones or lumps of clay exceeding 40 mm in any direction.
- Backfilling: Refill with earth. Fully compact in 50 mm layers as filling proceeds.

750 COLUMN AND PEDESTAL LABELLING:
- Height above ground level: 1.2 m.
- Type: Glued on laminated label.
- Size of numbers and letters: Submit proposals.
  - Background to numbers and letters: white.
- Size of background: Submit proposals.

COMPLETION

910 CLEANING
- Electrical equipment: Clean immediately before handover.

920 INSPECTION AND TESTING
- Standard: To BS 7671.
- Notice before commencing tests (minimum): 24 h.
- Certificates: Submit.
  - Number of copies: 2.

930 COMMISSIONING
- Setting for control devices: Submit proposals and commission.
- Operation of control devices: Verify.
- Orientation of adjustable luminaires: Adjust to give optimum performance.

940 PHOTOMETRIC SURVEY GENERALLY

- Standard: In accordance with CIBSE Lighting guide 6.
- Locations: Around perimeter of RHSC-DCN Building.
- Time of test: Night.
- Average illuminance measurement method: Full grid .
- Measured values: Submit.
- Maintained average illuminance: Submit based upon measured values.
- Illuminance variation: Submit details.
- Environmental conditions: Submit details.
- Extraneous light: Measure and submit results.
- Test equipment: Submit calibration details.

950 DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Timing: Submit at completion.
- Contents:
  - Full technical description of each system installed.
  - Manufacturers' operating and maintenance instructions for fittings and apparatus including relamping instructions for luminaire types. Identify hazardous lamps that require specialist disposal.
  - Recommended frequency of testing and inspection, both for electrical safety, and for matters such as the corrosion and security of lighting columns and luminaire fixings.
  - Manufacturers' guarantees and warranties.
  - Record drawings showing circuits and their ratings and locations of fittings and apparatus.
  - List of normal consumable items and their sources.

960 SPARE LAMPS

- Quantity of each type to be supplied: 2.
- Labelling: Label the lamps with the corresponding luminaire reference.

APPENDIX A

LIGHTING CONTROL SCHEDULE

The following schedule has been prepared to indicate the design intent.

RHSC – DCN EDINBURGH – LIGHTING CONTROL SCHEDULE							
ROOM TYPE	**A&B CIRCUIT REQUIRED ? (IF IN DUAL CIRCUIT AREA)**	**MANUAL SWITCHING**	**MANUAL DIMMABLE CONTROL**	**PRESENCE DETECTION**	**ABSENCE DETECTION**	**DAYLIGHT LINKING**	**NOTES**
ANAESTHETIC ROOM	Y	Y	N	N	N	N	LIGHTING TO BE MANUALLY SWITCHED FROM DOOR.
ASSESSMENT ROOM	Y	Y	N	N	N	N	LIGHTING TO BE MANUALLY SWITCHED FROM DOOR AND AT THE PENDANT (WHERE APPLICABLE).
ATRIUM	Y	N	N	(SEE NOTE)	N	Y	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING “ON” WHEN AREAS ARE OCCUPIED AND SWITCHING LIGHTING “OFF” WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY. DAYLIGHT LINKING TO BE DEVELOPED.
BED BAY/ROOM (CRITICAL CARE/CCU)	Y	Y	Y	N	N	N	LOCAL MANUAL DIMMING CONTROL OF LIGHTING WITHIN EACH BED BAY/BEDROOM. SWITCH LOCATED AT DOOR OR PARTITION OF BAY AND AT THE PENDANT (WHERE APPLICABLE).
BEDROOM (MULTI)	Y	Y	Y	N	N	Y	GENERAL & NIGHT LIGHTING TO BE MANUALLY SWITCHED FROM DOOR, READING & NURSE EXAM LIGHTING TO BE MANUALLY SWITCHED AT THE BEDHEAD TRUNKING. READING LIGHTING TO BE MANUALLY CONTROLLED VIA THE PATIENTS HANDSET. LUMINAIRE NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA DAYLIGHT SENSOR
BEDROOM (SINGLE)	Y	Y	Y	N	N	Y	GENERAL & NIGHT LIGHTING TO BE MANUALLY SWITCHED FROM DOOR, READING & NURSE EXAM LIGHTING TO BE MANUALLY SWITCHED AT THE BEDHEAD TRUNKING. READING LIGHTING TO BE MANUALLY CONTROLLED VIA THE PATIENTS HANDSET. LUMINAIRE NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA DAYLIGHT SENSOR
CHANGING ROOM	Y	N	N	Y	N	N	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING “ON” WHEN AREAS ARE OCCUPIED AND SWITCHING LIGHTING “OFF” WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.

RHSC – DCN EDINBURGH – LIGHTING CONTROL SCHEDULE							
ROOM TYPE	**DUAL CIRCUIT REQUIRED**	**MANUAL SWITCHING**	**MANUAL DIMMABLE CONTROL**	**PRESENCE DETECTION**	**ABSENCE DETECTION**	**DAYLIGHT LINKING**	**NOTES**
CLEAN /DIRTY UTILITY	Y	N	N	Y	N	N	LIGHTING TO BE CONTROLLED FROM AN AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY
CLEANERS ROOM	N	N	N	Y	N	N	LIGHTING TO BE CONTROLLED FROM AN AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY
CONSULTING ROOM	Y	Y	N	N	Y	Y	MANUAL SWITCHING TO TURN “ON” AND “OFF”. AUTOMATIC PRESENCE DETECTORS ALSO PROVIDED FOR SWITCHING “OFF” LIGHTING WHEN AREAS ARE UNOCCUPIED. SHOULD THE ROOM BENEFIT FROM NATURAL DAYLIGHT, LUMINAIRES NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA COMBINED PRESENCE/DAYLIGHT SENSORS.
CONSULTING/EXAMINATION ROOM	Y	Y	N	N	Y	Y	MANUAL SWITCHING TO TURN “ON” AND “OFF”. AUTOMATIC PRESENCE DETECTORS ALSO PROVIDED FOR SWITCHING “OFF” LIGHTING WHEN AREAS ARE UNOCCUPIED. SHOULD THE ROOM BENEFIT FROM NATURAL DAYLIGHT, LUMINAIRES NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA COMBINED PRESENCE/DAYLIGHT SENSORS.
CONTROL ROOM (IMAGING)	Y	Y	(SEE NOTE)	N	N	N	GENERAL LIGHTING WITHIN CONTROL ROOM TO BE MANUALLY SWITCHED FROM DOOR. WHERE APPLICABLE, LOCAL CONTROL OF LIGHTING (NORMAL/DIMMING) WITHIN IMAGING ROOM AS REQUIRED BY THE ROOM DATA SHEETS TO BE PROVIDED AT THE CONTROL DESK.
CORRIDOR (DEPARTMENTAL)	Y	N	(SEE NOTE)	Y	N	N	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING “ON” WHEN AREAS ARE OCCUPIED AND REGULATE THE LIGHTING TO 25% OF NORMAL OUTPUT WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.
CORRIDOR (HOSPITAL STREET)	Y	N	(SEE NOTES)	Y	N	Y	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING “ON” WHEN AREAS ARE OCCUPIED AND REGULATE THE LIGHTING TO 50% ON SCHEMATIC OF NORMAL OUTPUT WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.
CORRIDOR (WARD)	Y	Y	(SEE NOTES)	N	N	N	MANUAL SWITCHES PROVIDED TO PERMIT STAFF TO REGULATE LIGHT OUTPUT TO PRESET LEVELS OF 0%, 25% OR 100%.

RHSC – DCN EDINBURGH – LIGHTING CONTROL SCHEDULE							
ROOM TYPE	**DUAL CIRCUIT REQUIRED**	**MANUAL SWITCHING**	**MANUAL DIMMABLE CONTROL**	**PRESENCE DETECTION**	**ABSENCE DETECTION**	**DAYLIGHT LINKING**	**NOTES**
DINING ROOM	Y	Y	N	N	N	N	LIGHTING TO BE CONTROLLED FROM MANUALLY OPERATED WALL MOUNTED SWITCHES.
DISCHARGE LOUNGE	Y	Y	N	N	N	N	LIGHTING TO BE CONTROLLED FROM MANUALLY OPERATED WALL MOUNTED SWITCHES AT THE STAFF BASE.
DISPOSAL HOLD	Y	N	N	Y	N	N	LIGHTING TO BE CONTROLLED FROM AN AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY
ENSUITE	Y	N	N	Y	N	N	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING “ON” WHEN AREAS ARE OCCUPIED AND SWITCHING LIGHTING “OFF” WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.
EQUIPMENT PARKING BAY	N	(SEE NOTES)	N	(SEE NOTES)	N	N	WHERE EQUIPMENT BAY IS LOCATED OFF A CIRCULATION/CORRIDOR SPACE THEN LIGHTING WILL BE CONTROLLED AS PER THE REGIME EMPLYED WITHIN THAT SPACE. WHERE EQUIPMENT BAY IS independent OF ANOTHER SPACE LIGHTING TO BE CONTROLLED FROM AN AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.
EXAMINATION ROOM	Y	Y	N	N	Y	Y	MANUAL SWITCHING TO TURN “ON” AND “OFF”. AUTOMATIC PRESENCE DETECTORS ALSO PROVIDED FOR SWITCHING “OFF” LIGHTING WHEN AREAS ARE UNOCCUPIED. SHOULD THE ROOM BENEFIT FROM NATURAL DAYLIGHT, LUMINAIRES NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA COMBINED PRESENCE/DAYLIGHT SENSORS.
EXIT/PARKING BAY	Y	Y	N	Y	N	N	LIGHTING WILL BE CONTROLLED AS PER THE REGIME EMPLOYED WITHIN THE ADJACENT CIRCULATION/CORRIDORS VIA. AUTOMATIC PRESENCE DETECTORS WHICH WILL SWITC“ L”GHTING "ON" WHEN AREAS ARE OCCUPIED AND REGULATE THE LIGHTING TO 25% OF NORMAL OUTPUT WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.

RHSC – DCN EDINBURGH – LIGHTING CONTROL SCHEDULE							
ROOM TYPE	**DUAL CIRCUIT REQUIRED**	**MANUAL SWITCHING**	**MANUAL DIMMABLE CONTROL**	**PRESENCE DETECTION**	**ABSENCE DETECTION**	**DAYLIGHT LINKING**	**NOTES**
EXTERNAL LIGHTING (MAIN ENTRANCE CANOPY)	N	(SEE NOTES)	(SEE NOTES)	(SEE NOTES)	(SEE NOTES)	(SEE NOTES)	LIGHTING CONTROLLED BY EXTERNAL PHOTOCELL AND ADJUSTABLE TIME-CLOCK.
IMAGING ROOM	Y	Y	(SEE NOTES)	N	N	N	LIGHTING TO BE CONTROLLED FROM MANUALLY OPERATED ON/OFF WALL MOUNTED SWITCHES AT THE DOOR. WHERE APPLICABLE, LOCAL CONTROL OF LIGHTING (NORMAL/DIMMING) WITHIN IMAGING ROOM AS REQUIRED BY THE ROOM DATA SHEETS TO BE PROVIDED AT THE CONTROL DESK WITHIN THE ASSOCIATED CONTROL ROOM.
INTERVIEW ROOM	Y	Y	N	N	Y	Y	MANUAL SWITCHING TO TURN "ON" AND "OFF". AUTOMATIC PRESENCE DETECTORS ALSO PROVIDED FOR SWITCHING "OFF" LIGHTING WHEN AREAS ARE UNOCCUPIED. SHOULD THE ROOM BENEFIT FROM NATURAL DAYLIGHT, LUMINAIRES NEAR THE WINDOWS SHALL BE AUTOMATICALLY DIMMABLE, REGULATED BY THE AMOUNT OF DAYLIGHT AVAILABLE VIA COMBINED PRESENCE/DAYLIGHT SENSORS.
KITCHEN (INCLUDING REGEN KITCHENS)	Y	Y	N	N	N	N	LIGHTING TO BE MANUALLY SWITCHED FROM DOOR.
LABORATORY	Y	Y	N	N	N	Y	LIGHTING TO BE MANUALLY SWITCHED FROM DOOR.
LINEN CUPBOARD	N	N	N	Y	N	N	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING "ON" WHEN AREAS ARE OCCUPIED AND SWITCHING LIGHTING "OFF" WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.

RHSC – DCN EDINBURGH – LIGHTING CONTROL SCHEDULE							
ROOM TYPE	**DUAL CIRCUIT REQUIRED**	**MANUAL SWITCHING**	**MANUAL DIMMABLE CONTROL**	**PRESENCE DETECTION**	**ABSENCE DETECTION**	**DAYLIGHT LINKING**	**NOTES**
LOBBY	Y	N	N	Y	N	N	AUTOMATIC PRESENCE DETECTORS PROVIDED FOR SWITCHING LIGHTING "ON" WHEN AREAS ARE OCCUPIED AND SWITCHING LIGHTING "OFF" WHEN AREAS ARE UNOCCUPIED. AUTOMATIC PRESENCE DETECTOR PROVIDED WITH ADJUSTABLE TIME DELAY.

RHSC and DCN EDINBURGH
ELECTRICAL NETWORK MANAGEMENT SYSTEM

CONTENTS

APPENDICES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this specification shall include, but not be limited to, the Electrical Network Management Systems (ENMS). For the purpose of this document the ENMS shall be deemed to include the generator control systems.

The ENMS shall comprise two network based control systems with fibre control rings connecting via network interfaces and Input/output modules. The Individual input/output modules being both controllable from each of the A and B networks and displayable on each of the control panels for each of the A and B systems

Outline descriptions of the functional requirements of the ENMS are given in section 7.3.1 of this specification.

The ENMS shall be compatible with all relevant parts of the Building Services installation including the:-

- MV supply and distributions systems
- MV generators and their controls
- SPEN switchgear (Monitoring only)
- CHP systems and their controls
- LV distribution systems and switchgear
- BMS systems
- Power factor correction apparatus

The description given may include some functionality that may be provided by a separate generator control systems. If this is so, Project Co. shall ensure the separate ENMS and generator control systems are compatible and fulfill the whole of the requirements noted hereinafter or indicated on the associated drawings/schedules or noted in specifications and drawings for systems controlled by the ENMS and/or generator control systems.

3.0 SPECIFIC EXCLUSIONS

This specification relates to the Electrical Network Management Systems (ENMS) only. Other systems are detailed in other elements of the specification.

4.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of SHTM 06-01, IEE Wiring Regulations BS 7671 (17th Ed.), current legislation, regulations and industry standards unless otherwise stated.

5.0 DESIGN CRITERIA

5.1 Electricity Supply Characteristics

The site will be provided with two new 11000Volt 50Hz, three phase electrical supplies from Scottish Power Energy Network's (SPEN's) MV network. These individual electrical supplies are derived from two sub-stations and terminate in a SPEN switchboard located adjacent to main MV switch room.

5.2 Drawings and sub-missions

As part of the development of the design the Board shall prepare general arrangement drawings of the works to be provided. These shall be based on the Architect's base drawings and coordinated with other services and building elements. A proposed drawing list shall be submitted with the Tender.

5.3 ITPD Requirements

This specification shall be read in conjunction with the NHS Lothian documents.

6.0 LIAISON

The Board shall include for liaison with:-

SPEN. Project Co. shall include for liaison with SPEN for the design of the services in/for the 11kV sub-station building and for ensuring that he will be able to connect to and monitor the circuit breakers in the main MV panels that SPEN are providing as part of their works.

The Hospital. The Board shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the small power System.

Any other member of the Project and Hospital teams concerned with the planning and administration of small power installations.

7.0 SYSTEMS

7.1 Generally

This specification shall be read in conjunction with the MV and LV systems drawings and specifications

7.2 Incoming Electrical Supplies

SPEN are providing two incoming electrical supplies each with a rating of 3MVA. These are to be arranged such that if either fails the other is capable of taking the complete building load.

The incoming MV electrical supplies will be terminated into the circuit breaker switch board which is designed to supply the electrical needs of the new development and includes an auto change over arrangement and two feeder breakers for the project which all need be monitored by the Electrical Network Management Systems (ENMS).

SPEN shall make volt free contacts available for status monitoring of the 4 devices which shall be run to a wall mounted interface demarcation box.

Project Co. shall liaise with SPEN examining their design drawings and proposals to verify the equipment being provided by SPEN is compatible with both the MV cables and the ENMS monitoring he is providing.

The RHSC-DCN supplies shall be terminated into the RHSC-DCN circuit breaker board which shall be designed to integrate with the generator circuit breaker board and provide supplies to the RHSC-DCN ring mains.

7.3 Electrical Network Management Systems

7.3.1 Generally

The new MV electrical systems will principally comprise two incoming supplies feeding into a distribution network whose principle equipment includes 14 No MV circuit breakers, 4No transformers, 3No MV Generators, including as outputs for the connection of generator testing load bank modules and the CHP unit.

The Main LV systems will principally comprise approximately 4No main LV switch panels, 30No sub-main panels supplying the Life Safety, critical, essential, less-essential and non-essential electrical systems throughout the new development. The Sub-main LV distribution systems comprises sub-main panels, bus-bars, switches/circuit breakers etc as shown on the drawings WW-XX-XX-SC-530.

The Electrical Network Management System (ENMS) will be required to monitor and where necessary automatically control the electrical systems/network during normal and abnormal conditions.

The ENMS will be required to:-

- Work in conjunction with the protection devices provided throughout the MV and LV distribution systems and where necessary carry out alternative switching of the systems as a result of MV or LV devices switching or tripping.
- Provide ‘event’ alarms at each control panel and on each display panel.
- Have password controlled ‘event’ acknowledgement at each control panel and in the FM office.
- Record MV and LV system events and, when required, provide print-outs showing all events.
- Enable authorised persons to control and carry out selective switching of the systems (manual override of any controlled/monitored device). This facility is to be password protected at each control/interface point and shall be available only in the generator control rooms and in the control rooms associated with the main incoming MV switch panel.
- Have separate passwords (higher levels of authorisation) for control of the MV systems.
- Have separate passwords for each user of the system and be able to record which user carried out which operation, alarm acknowledgement etc.
- Provide indication of the condition of the electrical network (hierarchical schematics) including the status of each item connected/monitored. This shall be achieved by the displaying of systems schematics on each of the display panels and identifying which of the devices are Closed, open, tripped withdrawn etc.
- Under partial or total mains failure conditions match the available supplies to the load and where necessary match the connected load to the available supplies.
- Control the switching of loads to meet the load step limits of the mains and the generators under all conditions.
- Provide output enable signals to the BMS to enable the BMS to start and stop (By the absence of the signals) the mechanical plant including chillers, fans, pumps, boilers, humidifiers etc. In this connection it should be noted that the BMS will need to be specially designed to accept the connection or removal of these ENMS signals as ‘priorities’ which need to be acted upon at a speed to suit the switching requirements of the Electrical systems.
- Apply the loads to the generators in an expedient manner to an agreed priority schedule.
- Control the necessary synchronisation with the mains and switching of the systems for both generator testing and when the mains are re-established after mains failure.
- Provide agreed control of the neutral earthing resistors for the various mains/generator paralleling situations.

- Capture and relay switchgear status, energy consumption, harmonic content, operation counter and fault indication to each of the interface control units and display these on the indicated schematics
- Be modular in its nature and be able to be extended
- Have 25% spare capacity.

All power supplies to the ENMS shall be provided via secure battery backed power supply units with sufficient autonomy to maintain the systems for a period of 72 hours under mains failure conditions. Each of these power supply units shall be monitored and alarmed onto each of the BMS and ENMS systems.

The ENMS shall be robustly designed to incorporate 'hot-standby' capability and be installed to provide the highest level of resilience to minimise the possibility of failure affecting the control of the electrical systems.

The ENMS shall use dedicated cables that are not used for any other purpose.

Separate 'A' and 'B' ENMS system control units will be required and will be linked to provide the required hot standby and increased resilience. The linking between the two systems shall be as indicated in the concept schematic.

ENMS user display and control units will be required at the following locations:-

- The Energy Centre control room— control panel and systems display.
- Main MV Switchroom — control panel and systems display.
- Main LV Panel; A1 - systems display
- Main LV Panel; A2 - systems display
- Main LV Panel; B1 - systems display
- Main LV Panel; B2 - systems display
- the Estates Office – display unit and control unit with only facilities to accept alarms (i.e. it shall not be possible to control switching from this location)
- Security Control room – display unit and control unit with only facilities to accept alarms (i.e. it shall not be possible to control switching from this location)

Each systems display unit shall provide hierarchical schematics of the systems showing the status of the devices controlled and/or monitored. This including switchgear status, energy consumption, harmonic content, operation counter and fault indication

Power supplies to local ENMS panels shall be provided from local battery backed power supply units that have sufficient autonomy to maintain the local systems for a minimum period of 72 hours under mains failure conditions. Each of these power supply units shall be monitored such that alarms are raised in the event of a failure.

7.3.2 Systems Operation

General

The ENMS will be arranged/programmed to control the electrical systems to make the best use of the available sources of supply (be that mains and/or generators).

- Matching of the Generators to required load
  - When the load is less than the capacity of the sets available (including synchronised/paralleled units and available non-running units) then a minimum of 500kVA of spinning reserve shall normally be paralleled.

- Matching of the load to the available generators.
  - Low priority numbers (less essential) shall be disabled until sufficient generators are available.
  - Allocation of 'load priorities' to various load centres, energy users, load types etc. all to enable the highest priority loads to be connected first or disconnected last while maintaining the systems within design limits.

Although the exact load prioritisation schedule will need to be agreed with the Hospital Board it is expected to include various priority ratings such as those noted in the table below:-

Priority Rating	Outline description of Load
1	Statutory requirements – Evacuation lifts, smoke extract/pressurisation fans, sprinkler pumps, wet riser pumps etc. Generator auxiliary supplies
2.1	Riser 1 Category 4 and 5 area life safety lighting and small power.
2.2	Riser 2 Category 4 and 5 area life safety lighting and small power.
2.3	Riser 3 Category 4 and 5 area life safety lighting and small power.
2.4	Riser 4 Category 4 and 5 area life safety lighting and small power.
3.1	Riser 1 Category 3 area Heating and Vent systems
3.2	Riser 2 Category 3 area Heating and Vent systems
3.3	Riser 3 Category 3 area Heating and Vent systems
3.4	Riser 4 Category 3 area Heating and Vent systems
4	Essential heating and systems
5	Vertical transportation
6	Imaging equipment supplies
7.1	Less Essential Heating and Ventilation Systems
7.2	Less Essential Heating and Ventilation Systems
8	Imaging equipment supplies
9.1	Chillers and cooling – stage 1
9.2	Chillers and cooling – stage 2
9.3	Chillers and cooling - stage 3

It should be noted that some of these load priorities may, subject to actual loads, be either switched together or switched at different times or even be sub-divided further as the design is finalised.

Mains failure – When RHSC MV systems healthy

Under normal mains failure conditions (when the RHSC-DCN MV infrastructure is healthy) the standby generator systems will be required to start and synchronise sufficient generator sets to permit the following minimum RHSC-DCN loads to be re-connected:-

Elapsed Time from generator start signal	Outline description of loads to be connected	Load STEP to be connected (kVA)
15 seconds	RHSC-DCN and energy centre - Lighting, small power and statutory life safety	1000
25 seconds	RHSC-DCN and energy centre - General loads	1000
35+ Seconds	RHSC-DCN I and energy centre - Non essential loads	1000

Under extreme conditions when generators sets may not be available to start (due to maintenance of individual units or switchgear not being available etc) the 15 and 25 second loads to be applied shall also be as the above table with loads adjusted proportionally for the number of units available to start.

Under Mains failure conditions the initial load sequencing shall be as follows:-

- Start signal to transfer to alternative SPEN supply (Wait 1 second)
- Start Signal to Generator (Wait 2 second)
- Generator Synchronising Period (+12 seconds)
- Transfer to alternative SPEN supply (If available)
- Commence sequential load connection process
- If alternative SPEN supply not available
  - RHSC Main Breakers open
- Review available synchronised generators and commence sequential load connection process

After the initial load sequencing, the ENMS shall continue to match the connected load of the site to the available generators by:-

- Enabling greater loads by enabling further load priority signals and starting of available generators up to the capacity of the generators available
- Starting/synchronising/paralleling of further generators when the site load increases.
- Disabling loads priorities when the site load exceeds the available generator capacity

Mains failure – Elements of MV systems tripped or isolated.

If both the Incoming supplies fail while elements of the MV Systems are out of circuit then the ENMS shall automatically work to restore electrical supplies to the loads without supplies in accordance with the Truth Table (to be progressed at Preferred Bidder stage).

Where the above requires the generators to be started to supply the failed loads then the generator starting and load sequencing shall generally be similar to that noted for normal mains failures. It should however be noted that, unless specifically required by the Truth Table, healthy supplies to RHSC-DCN loads should not be isolated in the process.

Operating Scenarios

The systems will need to be programmed to ensure the best use is made of the available sources. This is expected to include:-

Condition	**Response**
Normal operation-	Electrical systems operates from preferred incoming supply
Single supply failure-	All loads transfer to the single healthy supply.
Twin supply failure- (with normal Generator start conditions)	After the pre-set monitoring period (adjustable 0 - 5 seconds) Generators start and synchronise as one common group. After 15 seconds from the generator start signal the maximum permissible load step is applied to the generators (1.5MVA) After 25 seconds from generator start signal a further maximum permissible load step is applied to the generators (1MVA) The remaining plant load is then introduced
Twin supply failure- (with abnormal Generator start conditions)	After the pre-set monitoring period (adjustable 0 - 5 seconds) Generators start and synchronise as one common group. After 15 second from the generator start signal maximum permissible loads are applied - Loads commensurate with the number of generators synchronised. After 25 seconds from the generator start signals maximum permissible additional loads are applied – Loads commensurate with the number of generators synchronised. At 10 second intervals additional maximum permissible loads are applied until all generators are fully loaded.
Normal running on generators	The number of generators synchronised and supplying load are optimised to ensure that the number of units running matches the load with 2000kW spare. (i.e. N+1 generators on line)

Condition	Response
All operating Generators fail in operation while mains healthy	Load is transferred back to mains in accordance with the agreed load transfer steps.
Partial Generator failure or generator switchgear failure while the generators are supplying the load and the mains is Healthy	Failed generators/switch gear isolated. Load shed to suit the available capacity of the generators synchronised then either:- • If the load shedding requires isolation of the most important load priorities then the Generators shall be taken off-line, the MV systems re-energised from the mains and the loads connected back to the mains in load priority order. Or • If the load shedding does not require isolation of the most important loads then additional generators (where available) shall be started and synchronised before additional loads are connected in load priority order. The load priority level at which the generators are isolated shall be selectable from the ENMS control panels and shall for the purpose of initial set-up shall be agreed with the Board during the detailed design. This to occur quick enough to prevent the remaining generators (or their switchgear) failing on overload.
Single generator fails in normal N+1 operation.	Additional generator starts to regain the N+1 Status of the system. No load shedding
Single generator fails when not in N+1 configuration	Failed generators/switch gear isolated. Load shed to suit the available capacity of the remaining generators. If available offline generator shall start and synchronise before additional loads added to suit the generator capacity
Partial Generator failure or generator switchgear failure while the mains is failed.	Failed generators/switch gear isolated then either:- • Load shed to suit the available capacity of the generators synchronised. (This to occur quick enough to prevent the remaining generators [or their switchgear] failing/tripping on Overload) Or • Generators switch boards isolated and load shedding LV breakers before the MV systems are re-energised and the loads re-applied in accordance with the priority schedule and the number of generators synchronised. If available offline generator shall start and synchronise before additional loads added to suit the generator capacity.

Condition	Response
Supply Restoration (single or both)	Requires manual intervention to transfer loads back to the mains. Load transfer back to the mains may include isolation of lower priority loads (i.e. certain cooling plant) and a generator to reduce the fault level during synchronisation with the mains and transfer of the load before opening the generator circuit breakers.
Failure of an LV supply to critical equipment	The low voltage supply changes-over to the remaining healthy supply

In all cases the ENMS shall note the position and conditions of all connected devices and instantly amend the stored diagrams to show the current condition of the systems on the display panels. It should be noted that under major failure conditions when multiple switching operations need to take place in a short time that these shall take precedence over updating and displaying of the stored diagrams – in which case the display screens shall simply

The final operating sequences for the electrical network will be detailed as the design progresses.

The Systems shall be arranged to permit the testing of generators as follows with each of these only being selectable by MV authorised persons:-

1. All generators by Simulation of mains failure to the main incoming panels. This facility shall have additional higher level access codes as it requires a break in the supplies to the RHSC-DCN.
2. All generators by synchronising with the mains before isolating the mains so the generators supply the RHSC-DCN.
3. Each of the A and B sides of the generators by separating the A and B systems and simulating mains failures to them. This facility shall have additional higher level access codes as it requires a break in the supplies to part of the RHSC-DCN.
4. Each of the A and B sides of the generators by separating the A and B systems and synchronising the A or B half of the generators with their corresponding incoming supply before isolating the incoming supply.
5. Individual generators against Individual load banks without affecting the remaining MV network or the ability of the other generators to act as mains-failure back-up to the site.
6. Each of the A and B sides of the generators against load banks for proving of the systems without the need to supply the RHSC-DCN.

Whenever the generators are tested against the RHSC-DCN load it shall be possible to effect a break-free transfer of the load from the generators after the test period.

Each time the systems require the generators to be synchronised with the incoming supply the systems shall require the input of a higher level security MV authorised access code and shall specifically ask if the synchronisation has been agreed with the SPEN.

RHSC and DCN EDINBURGH
LIGHTING CALCULATIONS AND LUMINAIRE SELECTION

CONTENTS

LIGHTING CALCULATIONS AND LUMINAIRE SELECTION

1.0 GENERAL

1.1 Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

1.2 Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

1.3 Scope

Provision of:

- Selection of suitable luminaires
- Execution of lighting calculations
- Production of CAD luminaire layout drawings
- Designation of luminaires for emergency lighting

1.4 Exclusions

Design of:

- Lighting controls
- Circuiting
- Switching
- Cabling systems
- Emergency lighting test equipment

1.5 Information

Project Co. shall collate the following:

- CAD files showing luminaires in every room and indicating luminaires to be designated as emergency lighting luminaires
- Computer generated point calculations with contribution from inter-reflected light
  - Luminaire layout drawings
  - Luminaire photometric data including flux fraction ratios, polar intensity curves and utilisation factors
  - Lamp technical information
  - Room surface reflectance values
  - Maintenance factor calculations
  - Isolux contour plots for working plane and room surfaces
  - Schedule of design and calculated maintained average illuminance values
  - Schedule of design and calculated uniformity values
  - Calculated glare index values where deemed necessary by CIBSE LG2

- Luminaire and lamp schedule
- 3D model of the Atria for use within design team
- Data sheet of each luminaire
- Calculation sheets shall indicate wall and ceiling to working plane illuminance ratios

2.0 SELECTION CRITERIA AND STANDARDS

2.1 General

The lighting system shall comply with CIBSE Code for Lighting, and all CIBSE Lighting Guides, BS 4533, BSEN 12464-1, BSEN 60598-2-25, SHTM06-01, BS 5266 (all parts), Table 1 (and it's accompanying notes) of the ILE Guidance notes for the reduction of obtrusive light - 2011, Building (Scotland) Regulations, SLL Lighting Handbook: 2009, SLL Code for Lighting 2012 and SHBNs. The design shall also take due cognisance of “Lighting and Colour for Hospital Design” by Duke (NHS Estates, 2004) and Secure by Design.

2.2 The Lit Appearance

The lighting design shall take into account a number of considerations including:

- provide illumination levels and select luminaires which are appropriate for the task being carried out,
- select and arrange luminaires which are sympathetic, co-ordinate with and compliment the overall interior design concept,
- minimize ongoing maintenance costs by selecting luminaires and lamps from a limited number of sources and types,
- available daylight,
- glare,
- the lit appearance,
- illuminance at task areas,
- lamp colour,
- colour rendering,
- energy efficiency.

The lighting shall aim to promote a sense of well being in the patients and an air of competence and quality throughout the building.

In public areas the emphasis shall be on creating a pleasing environment with gentle but deliberate contrasts. Consideration shall be given to the use of LED luminaires in public spaces.

Computer modelling shall be employed to illustrate the lit appearance of the Atrium. The lighting shall create interest and contrast and highlights architectural features.

Glare shall be controlled and luminaires positioned so as not to cause discomfort to patients who may be in a prone position.

The general lighting shall be used as part of the way-finding strategy to highlight landmarks, reception desks and enquiry desks.

Feature lighting for art components shall be developed in accordance with the art budget.

2.3 Lighting Levels

Maintained illuminance shall take into account “normal” cleaning of luminaires and surfaces and depreciation of lamp output. “Normal” being defined as:

(a) Lamp life
(b) Annual luminaire cleaning
(c) Bi-annual room surfaces clean
(d) Spot lamp replacement

The initial illuminance shall therefore be higher than the maintained illuminance. The maintained illuminance shall be the average illuminance over the reference surface at the time maintenance has to be carried out by replacing lamps and/or cleaning the equipment and room surfaces. The reference surface shall be the working plane at desktop, bench top, floor, bed, couch or other position, as stated in the Room Data Sheets and CIBSE Lighting Guide LG2.

Lighting levels shall be in accordance with the Room Data Sheets and CIBSE LG2: 2008, in that order of precedence.

2.4 Lighting Maintenance Factors

Shall be determined in accordance with SLL Lighting Handbook: 2009

The lighting scheme shall have an overall maintenance factor calculated for the selected lighting equipment, space environment and specified maintenance schedule.

The Specialist shall:

- State the maintenance factor assumed
- Specify lighting equipment suitable for the application environment

2.5 Lamp Temperature

Generally, lamps shall have a colour temperature of 4000 K unless specifically stated otherwise in Room Data Sheets or LG2. Notwithstanding, the Board is encouraged to explore alternative lamp colour temperatures but shall seek approval of the Client for any changes to this specification.

2.6 Lamp Type

Lamps shall generally be high frequency T5 type linear fluorescent. LED lamps shall be utilised where feasible in lieu of compact fluorescent. Display and feature lighting shall utilise LED lamps where feasible.

2.7 Colour Rendering Index

Generally, all lamps shall have a colour rendering index Ra ≥ 85.

In rooms where Ra≥90 is required this shall relate the task area only.

2.8 Control Gear

Normal and emergency luminaires being run over the DALI/KNX network shall be provided with DALI compatible control gear.

Fluorescent luminaires not being run over the DALI/KNX network shall be fitted with high frequency control gear.

2.9 Energy

A ‘DEER’ value of level A shall be achieved, i.e.: a minimum of 66 lamp lumens per circuit watt.

Tungsten and tungsten halogen lamps shall not be used.

2.10 Lighting Controls

Refer to Lighting Installation Specification WW.A.P.1.2.30 for full details.

3.0 LUMINAIRES

3.1 Preliminary Luminaire Schedule

The luminaires shall be of the following type:

Area	Type of luminaire	Lamp type
Staff bases, receptions	Circular downlighter	
Bathrooms, shower rooms and changing rooms	Circular downlighter with sealed IP44	LED
Bed rooms	Wall mounted at bed head, including night lighting	LED
Corridors, wait areas	Recessed or semi-recessed modular fitting with prismatic diffuser or wall mounted prismatic	LED
Offices, admin areas, interview rooms, meeting rooms, seminar rooms	Recessed modular direct/indirect luminaire.	T5 lamps
Treatment room, dirty utility, clean utility, examination room, pantry and kitchens	Recessed modular fitting with prismatic diffuser. Sealed IP44	T5 lamps
Stairwells	Circular surface luminaires, wall mounted	LED
Plant areas and stores	Enclosed with high impact protection	T5 lamps
Atrium and entrance	Decorative	Various including LED
Theatres	Recessed modular fitting with prismatic diffuser. Sealed IP54	T5 lamps
A&E Toilets	Anti vandal luminaire with hidden fixings as required by Secure By Design.	LED

Dimming controls to be provided were indicated in the room data sheets.

3.2 IP Rated Luminaires

In certain areas such as operating theatres, showers and any luminaires exposed to external conditions, luminaires with a suitable IP rating shall be selected.

Rooms with plasterboard ceilings for infection control purposes shall have luminaires of a minimum IP44 rating.

3.3 Ward Luminaires

Ward bed areas shall be provided with a horizontal bed head trunking system, which shall provide varying levels of lighting to allow general lighting, night lighting and reading lighting.

Each high dependency and recovery bed position shall have a wall or bed-head trunking mounted, examination lamp with integral switch.

3.4 Corridor Lighting

BSEN 12464-1:2011 implies that corridors should be lit to 200 lux during the day and 50 lux at night. This is taken to mean that night lighting will be provided to corridors in bedded areas only.

Luminaires to be wall mounted or recessed or semi-recessed LED lay-in luminaire with a shallow projection beyond line of ceiling this will throw light across the ceiling surface increase the perceived brightness of the corridor. Luminaire to be sealed with internal reflector and external prismatic diffuser.

Corridor lighting shall be clear, concise and economic, by means of semi-recessed linear fluorescent fitting running parallel to the line of the corridor and off centre to one side to spill light further horizontally minimising high-level shadow marks on the walls, as well as putting some light onto the ceiling which would otherwise be directly unlit. In specific single patient ward corridors the lighting shall respond to the architectural layout of the rooms and doorways similar to a hotel corridor. Major intersections or nodes along corridors can be marked through a change in lighting or the use of a different luminaire (size, shape, proportion) throughout the building.

3.5 Communal Spaces

Communal and social areas should benefit from interesting lighting, not just in the form of interesting luminaire selection, but also of differing lighting intensities within the space that add interest and life into it. Staff/nurse bases shall be made more visible though increased lighting onto counter surfaces and through wall-washing vertical surfaces behind them to increase their lit presence. Wall hung art work shall be illuminated.

3.6 Plantroom Lighting

Final mounting height and layout shall suit final plantroom layouts.

Accessible plant areas, roof void areas, ducts, lift motor rooms, shafts and similar utility areas shall be illuminated utilising suitably IP rated luminaires with impact resistant covers.

3.7 Food Preparation Areas

Sealed food factory type luminaires shall be provided in areas in which food is prepared, cooked and stored.

3.8 Explosion Hazard Area Lighting

Luminaires in explosion hazard areas shall be suitable for the classification of the area.

The assessment of where hazardous explosive atmospheres may occur is by others.

4.0 EMERGENCY LIGHTING

Emergency lighting shall be by means of self-contained battery/inverter conversion kits which shall be sealed and provide 5 years battery design life.

Emergency lighting shall be in accordance with BS5266, CIBSE Lighting Guide LG12.

External emergency lighting shall be provided to muster points and external escape routes.

5.0 EXTERNAL LIGHTING

General

Helipad lighting and aircraft warning lighting shall be selected by the Specialist in accordance with CAA requirements.

New external lighting systems will be provided to the whole of the area which forms part of the Board's site in accordance with table 2 of LG2.

BREEAM Compliance

ENE 4: External lighting

1. External light fittings for the building, access ways and pathways will be selected such that the average installed efficacy for the site exceeds 50 lamp lumens / circuit Watt when a lamp has a colour rendering index greater than or equal to 60. Or 60 lamp lumens / circuit Watt when a lamp has a colour rendering index less than 60.
2. External lighting for signs and uplighting will be selected such that the average installed efficacy for the site exceeds 60 lamp lumens / circuit Watt where the lamp wattage is greater than or equal to 25W or 50 lamp lumens / circuit Watt where the wattage is less than 25W.
3. External light fittings will be controlled by a combination of time switches and daylight sensors in order to prevent operation during daylight hours, this will take effect from 23:00.

POL 7: Reduction of night time light pollution

1. The external lighting strategy will be designed to comply with ILE Guidance notes for the reduction of obtrusive light.
2. Adjustable time switches will be provided such that external lighting (other than safety and security lighting) can be automatically switched off between selected hours, this will take effect from 23:00.
3. Safety and security lighting will be designed to comply with ILE's Guidance notes.
4. Illuminated advertisements, where specified, will be designed in compliance with ILE Technical Report 5.

Illumination Levels

As per CIBSE Lighting Guide 2 Hospitals and Healthcare buildings.

RHSC and DCN EDINBURGH
PERFORMANCE SPECIFICATION TELEVISION AND RADIO DISTRIBUTION SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

<u>TV and Radio System</u>

- TV and radio transmissions distribution cabling
- Provision of the equipment required to enable radio (including hospital radio) and both “freeview” TV services to be distributed.
- Integration of Hospital Radio with TV and radio system.
- Final run out conduits
- Conduits in or on walls

3.0 PERFORMANCE SPECIFIED SYSTEMS

The Television and Radio Distribution system is a performance specified system and this specification outlines the requirements to be met by the system.

4.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Performance Specification:-

- Power wiring
- Main cable containment (other than final run outs of conduits)
- Suitable Hospital Radio system (by Board)

5.0 INTERFACES AND DEMARCATIONS

The Television and Radio Distribution system shall be separate from NHS Lothian Internet Protocol network.

6.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the Materials & Workmanship clauses.

The Television and Radio Distribution system shall be designed in accordance with HTM 08-03 : Bedhead Services.

7.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Drawings

As part of the development of the design Project Co. shall prepare general arrangement drawings of the Television and Radio Distribution systems based on the base drawings and coordinated with other services and building elements.

8.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Specialist Installer shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. The Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Television and Radio Distribution systems.

9.0 SYSTEMS

Low Current Systems action following mains failure/generator test conditions

The low current systems specified herein to be self-rebooting following mains failure and generator test conditions.

9.1 TELEVISION AND RADIO DISTRIBUTION SYSTEMS

General

The television and radio systems as described below shall be made available as a bedhead service.

Television and radio reception and distribution infrastructure such as external aerials/ dishes, containment and cabling/ distribution to enable radio (including hospital radio) and Freeview TV services shall be provided.

Cabling and Cable Containment

The main cabling routes shall be supported by wire basket cable trays.

Cable drops in or on walls shall be run protected in plastic conduit which shall be provided and installed by the Specialist.

In areas of non demountable ceilings, such as in Theatre suites, wiring shall be run in conduit arranged in a ‘loop-in’ basis to allow wiring without access to the ceiling void.

W20 Television and radio distribution systems

GENERAL

110 PATIENT ENTERTAINMENT SYSTEM INFRASTRUCTURE FOR NHS LOTHIAN ENTERTAINMENT SYSTEM

The Board shall submit proposals to provide the infrastructure necessary to enable the future installation of a leased patient entertainment system which will meet the following specification:

- System manufacturer:
  - Member of the Society of Cable and Television Engineers (SCTE);
  - Member of Confederation of Aerial Industries Ltd (CAI);
  - Member of the Independent Digital Standards Commission (IDSC); or
  - Submit proposals.
- Type: Submit design and cost proposals.
- Input signals:
  - Analogue terrestrial television (UHF);
  - Frequency modulated (FM) radio (VHF);
  - Digital audio broadcasting (DAB);
  - Digital terrestrial television (DTT);
  - Pay TV (hotel services);
  - game and internet services
  - telephone
    and
  - Submit design and cost proposals.
- Aerials:
  - DAB;
  - FM;
  - UHF; and
  - Submit design and cost proposals.
- Distribution equipment:
  - Diplexers;
  - Equalizers;
  - Launch amplifiers;
  - Masthead amplifiers;
  - Multiswitches;
  - Splitters; and
  - Submit design and cost proposals.
- Outlets: Television outlets.
- Accessories: Submit design and cost proposals.
- Completion: Submit design and cost proposals.

110B TV & RADIO DISTRIBUTION SYSTEM

The Board shall submit proposals to provide the infrastructure necessary for radio (including hospital radio) and both digital satellite/terrestrial “freeview” TV services which will meet the following specification:

- System manufacturer:
  - Member of the Society of Cable and Television Engineers (SCTE);
  - Member of Confederation of Aerial Industries Ltd (CAI);
  - Member of the Independent Digital Standards Commission (IDSC); or
  - Submit proposals.
- Type: Submit design and cost proposals.

- Input signals:
  - Analogue terrestrial television (UHF);
  - Frequency modulated (FM) radio (VHF);
  - Digital audio broadcasting (DAB);
  - Digital terrestrial television (DTT);
  - Hospital Radio;
- Aerials:
  - DAB;
  - FM;
  - UHF; and
  - Submit design and cost proposals.
- Distribution equipment:
  - Diplexers;
  - Equalizers;
  - Launch amplifiers;
  - Masthead amplifiers;
  - Multiswitches;
  - Splitters; and
  - Submit design and cost proposals.
- Outlets: Data outlets as identified by ADB codes such as, but not limited to OUT121, OUT131, OUT133 & OUT135.
- Accessories: Submit design and cost proposals.
- Completion: Submit design and cost proposals.

120 CABLING AND CONTAINMENT FOR PATIENT ENTERTAINMENT SYSTEM

- Cable: CAT 6A.
- Containment: Cable basket, as section Y63 and plastic conduit for final run outs.
- Rewireable installation: Required.
- Concealed installation: Required.
- Completion: Submit design and cost proposals.

SYSTEM PERFORMANCE

210 DESIGN

- Equipment provided by NHS Lothian.

220 PERFORMANCE

- ITU impairment grade: Submit proposals.

230 WIND RESISTANCE OF ANTENNAE

- An antennae array should be capable of withstanding winds of 100 km/h and gusting of 160 km/h without excessive movement or permanent deformation.

PRODUCTS

310 UHF ANTENNAE

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Approval: CAI Benchmark.
- Forward gain: Board's choice.
- Front/ back ratio: Board's choice.
- Channel group: submit proposals.

320 FM ANTENNAE

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Approval: CAI Benchmark
- Forward gain dB(i): Board's choice.
- Front/ back ratio dB(i): Board's choice.

330 DAB ANTENNAE

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Forward gain: Board's choice.
- Front/ back ratio: Board's choice.

350 MASTHEAD AMPLIFIERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Board's choice.
- Channel group: submit proposals.
- Frequency:
  - DAB 217.5 - 230 MHz;
  - FM 87.5 -108 MHz; or
  - UHF 470-862 MHz.
- Noise (maximum): <3 dB.
- Gain: Board's choice.
- Impedance:
  - Input and output terminals: 75 ohm.
- Mains 230 V connection: Required.

360 EQUALIZERS general

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Submit proposals.
- Transmitter source: Board choice .
- Signal loss: Board's choice.

370 LAUNCH AMPLIFIERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Board choice.
- Output power (dB µV) Board's choice.
- Frequency: submit proposals.
- Gain: Board's choice.
- Impedance:
  - Input and output terminals: 75 ohm.

380 MULTISWITCHES general

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Frequency:
  - Satellite bandwidth: 950-2150 MHz.
  - Terrestrial bandwidth: 47-862 MHz.

- Inputs:
  - IF: Board choice.
  - Wideband UHF-VHF: Board choice.
- Outputs Board choice.
- Satellite signal loss Board's choice.
- Terrestrial signal loss Board's choice.
- Switching: 13 V, 18 V, 13 V/ 22 kHz, 18 V/ 22 kHz.

390 DIPLEXERS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: Board choice.
- Signal loss: Board choice.

400 SPLITTERS general.

- Manufacturer Board's choice.
  - Product reference: Board's choice.
- Outgoing connection: Board's choice.
- Frequency range: Board's choice.
- Signal loss: Board's choice.

410A PATIENT ENTERTAINMENT OUTLETS

- Manufacturer: Board's choice.
  - Product reference: Board's choice.
- Type: CAT6A.
- Colour: Match electrical accessories.

EXECUTION

620 INSTALLING ANTENNAE AND DISHES

- Installation: In accordance with the CAI Code of practice for the Installation of terrestrial and satellite TV reception systems.
- Locations: Board's choice.
- Position: Board's choice.
- Mounting: Roof.
  - Concrete base: Required.
- Planning permission: Required.

640 INSTALLING CABLING

- Standard: To BS 7671.
- Installation: In accordance with the CAI Code of practice for the installation of terrestrial and satellite TV reception systems.
- Route: Boards choice and Submit proposals.
- Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
- Cables: Install in one length.
- Cable pulling: Submit proposals. Do not overstress. Prevent kinks and twisting of the cable.
- Bending radius (minimum): 10 times outside diameter of cable.
- Cable fixing: Do not staple.
- Cables passing through walls: Sleeve with conduit or pipe duct. Bush at both ends.
- Jointing: At equipment and terminal fittings only.

650 INSTALLING AMPLIFIERS

- Location: Board's choice and Submit proposals.

660 INSTALLING OUTLET PLATES

- Mounting: Recessed.
  - Height (finished floor level to underside of equipment): as loaded 1:50 drawings.
- Minimum depth of backboxes: 35 mm.

670 CONNECTION TO LIGHTNING PROTECTION SYSTEM

- Connection: In accordance with the CAI Code of practice for the installation of terrestrial and satellite TV reception systems.

COMPLETION

910 TESTING AND INSPECTION

- Method statement: Submit.
- Tests:
  - At receivers: In accordance with CAI Code of Practice for the Installation of terrestrial and satellite TV reception systems. Signal output level at each head end and amplifier: Measure.
  - Carrier to noise ratio at outlets: Measure.
  - Outlets to be tested: All.
- Results: Submit.

920A DOCUMENTATION

- Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
- Operation and maintenance instructions: Submit.
- TV Aerial Certificates: Submit
- Record drawings: Submit.
  - Number of copies 3.

RHSC and DCN EDINBURGH
NURSE CALL SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 3,

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

2.0 SCOPE

The scope of work covered by this Performance Specification shall include the following:-

Nurse call systems

Controlled drugs cupboard alarms

Final run out conduits

Conduits in or on walls

3.0 PERFORMANCE SPECIFIED SYSTEMS

The Nurse Call Systems are performance specified systems and this specification outlines the requirements to be met by the systems.

4.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Performance Specification:-

Power wiring

Main cable containment (other than final run outs of conduits)

5.0 INTERFACES AND DEMARCATIONS

The Nurse Call Systems shall include a display panel at the main nurse bases with provision for Fire Alarm and Medical Gas Signals.

6.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the Materials & Workmanship clauses.

The Nurse Call System shall be in accordance with SHTM 08-03.

7.0 DESIGN CRITERIA

Drawings

Project Co. shall prepare general arrangement drawings of the Nurse Call Systems.

The drawings shall indicate as a minimum:-

Nurse call panels including integration with other system alarms and indication
Power supply units
Call points
Hand sets
Reset points
Indicator lamps
Audible alarms
Cable containment requirements
Power requirements
Single line schematic diagram for each department
Single line schematic diagram for overall system
Interface arrangements with pneumatic tube transport system.
Interface arrangements with fire alarm indication.
Interface arrangements with Isolated Power Supply and UPS alarms.

8.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, the Specialist Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

The Hospital. Project Co. shall include for liaison in conjunction with the Board with members of the Hospital's team with an interest in the planning and administration of the Nurse Call Systems.

9.0 SYSTEMS

9.1 Nurse Call Systems

System Type

The system shall be of the hard-wired, fully multiplexed type.

All nurse call panels and accessories shall be sealed and wipe clean and capable of being disinfected or sterilized between patient use to protect against the spread of infection.

Nurse Call Indicator Panels

The indicator panels at each staff base or other control stations shall be flush mounted in the staff base desk or local wall as indicated on the loaded 1:50 drawings and the room data sheets.

In addition to the facilities listed in W55, Clause 380A, the following facilities shall be provided on the staff base nurse call indicator panels:-

The nurse call panel shall interface with the pneumatic tube transport system to indicate arrival of a package at the local station.
The nurse call panel shall interface with the fire alarm system to display the information specified in Specification WW.A.P1.2.36.
The nurse call panel shall also integrate the remote Isolated Power Supply alarms (IPS) and UPS alarms as required by Specification WW.A.P.1.2.24
Medical gas alarm.
Door access control.

Staff bases shall be provided with touch screen LCD panels, these panels shall provide audible and visual indication of the calls being made. Porject Co. shall submit, via the Board, a pro forma for completion a minimum of 6 months prior to the final commissioning of the system, and shall allow for at least 2 No. complete iterations of this information.

Power Supplies and Control Units

Space is available in the Low Current section of the departmental electrical cupboards to accommodate power and control equipment. Such equipment shall not be installed in ceiling voids for reasons of fire risk mitigation.

A power supply unit shall be provided for each nurse call indicator panel.

Each power supply unit shall be dedicated to the nurse call system for the area it serves.

Power supply units shall be provided with spare capacity to drive 25% additional points.

Power supply units shall incorporate standby batteries. Batteries shall be valve regulated lead acid, 10 year life, type, and shall provide 5 minutes autonomy.

Action following mains failure/generator test conditions

The nurse call systems specified herein to be self-rebooting following mains failure and generator test conditions.

Outlets

Project Co. shall supply and install the nurse call outlets as indicated on the loaded 1:50 drawings and on the Room Data Sheets. Follow me indicator lights shall be developed by

All areas shall have flush nurse call services installed.

Equipment in wet areas shall be complete with a waterproof membrane.

Where the loaded drawings indicate multiple co-located nurse call outlets these may be incorporated onto the same outlet plate or unit. For example reassurance lamps might be indicated on the loaded drawings separately from pull cord units, or a push button call point and the associated reset might be indicated as separate units; in both of these, and similar, cases it will be acceptable to utilise outlets which incorporate both functions

Patient Call Handsets

Handsets, shall have an electrostatic discharge immunity sufficient to withstand, without damage, the effects of electrostatic discharge that can occur within the environment in which the equipment is expected to operate. They shall meet the ± 4 kV contact discharge and ± 8 kV air discharge electrostatic discharge tests specified in BS EN 61000-4-2:1995, IEC 61000-4-2:1995.

Handsets shall be of maintenance free, sealed for life design.

Where reading lights for patient use are provided at bedheads they shall be controlled by a switch at the door and at the bedhead and shall also be controlled by a switch on the nurse call handset.

Medical Services Trunking and Pendants

Project Co. shall allow for liaison time as necessary with the medical services trunking and pendant specialists so that the medical services trunking and pendants can be procured complete pre-wired with nurse call cabling and accessories.

For wards and similar areas where medical services trunking units are specified they shall incorporate the features required by the loaded 1:50 drawings, union drawings and the Room Data Sheets.

System Wiring

The main arterial runs of cable containment will be installed by outside the scope of this Performance Specification.

Final run outs of cables from the main arterial containment shall be run protected in plastic LSOH conduit.

In areas of non demountable ceilings, such as in Theatre suites, wiring shall be run in conduit arranged in a ‘loop-in’ basis to allow wiring without access to the ceiling void.

System Operation

Project Co. shall provide a “follow me” lamp system which shall indicate to staff the direction that they need to travel in, to locate the call.

Where there is a possibility of two directions of travel, 2 No. “follow me” lamps systems shall be installed, 1 No. indicating each direction.

The “follow me” lamps shall be ceiling mounted and shall be complete with amber lenses.

Nurse call sounders shall be provided.

The system shall permit the reconfiguration of the “follow me” lamps following the transferral of control of the nurse call system from one staff location to the next.

Dummy Plugs

Where hand held units are pulled out of the socket they shall immediately trigger a patient to staff call.

Fifty dummy plugs are to be provided free issue to the Board, when inserted within the socket removes this call trigger (when reset).

Crash Call

The crash call shall not form part of the nurse call system. Crash calls will be made via the phone system.

Software

Project Co. shall provide 2 N° copies of the software used on this project. Open protocol industry standard software must be used. All software shall be ‘backwards compatible’.

Modifications and Upgrades to the System

The system shall be specifically designed to easily accommodate upgrades and modifications to the system in line with changes in ward usage and nursing practice.

It shall be possible to carry out modifications to the system of operation, update location labels, and adjust tone output levels and flash patterns on-site.

Any future addition of new call and indicating units shall be accommodated by connecting equipment into the Nurse Call Network and running a Windows-based installation program. Upon completion of installation, the system shall automatically register the new devices and store their identity to assist with the future maintenance requirements of the system.

Equipment front-plates shall, in the main, be interchangeable and shall accommodate snap-in escutcheons accessible from the reverse of the plate.

Disability

The entire system must also be compliant with any additional requirements of BS 8300 (needs of disabled people).

W55 Nurse call systems

GENERAL

110 NURSE CALL SYSTEM General
System manufacturer: Board's choice.
Call initiation devices:
- Patient handsets: Refer to loaded drawings and Room Data Sheets.
- Patient pull cords: Refer to loaded drawings and Room Data Sheets.
- Nurse emergency pull-switches: Refer to loaded drawings and Room Data Sheets.

Visual signals:
- Ward entrance indicators: Required.
- Direction “Follow me” indicators: Required.
- Reassurance indicators: Integral within patient handsets.

Operating voltage to BS 7671: Extra low voltage.
Equipment interconnection: Wired.
Power supply units: Required.
Call indicator panels: Required.

120 CABLING AND CONTAINMENT Nurse call
Cable type: Submit design and cost proposals.
Containment: main routes on wire basket tray and rigid plastic conduit final run outs.
Rewireable installation: Required.
Concealed installation: Required.

SYSTEM PERFORMANCE

210 DESIGN
Design: Complete the design of the nurse call system in accordance with HTM 08-03.
Spare capacity: 25% of installed call initiation devices. Circuits, power supply units, nurse call panels shall have capacity for 25% growth.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
Equipment electrical power: Provide electrical supplies to equipment requiring power.

220 MODE OF OPERATION
Patient to nurse:
- Sequence of lamps: Operates in a steady mode until cancelled at the associated reset unit.

Nurse emergency pull-switches:
- Sequence of lamps: Operates in a flashing mode until the emergency switch is returned to normal.
- Operation: Must not affect patient or emergency calls from other points on the system.

PRODUCTS

310 PRODUCTS GENERALLY
Products: In accordance with HTM 08-03.

320 PATIENT HANDSETS General
Manufacturer: Board's choice.
Product reference: Submit proposals.
Housing:
Material: High impact white plastics.
Ingress protection: To BS EN 60529, IP 67.
Permanently illuminated nurse call push: Coloured orange with tactile feel and marked with the nurse symbol.
Actuation: Electrical.
Reassurance lamp: Manufacturer's standard.
Reset: Refer to loaded drawings and Room Data Sheets.
Television control: Channel selection and volume control.
Programme controls: Submit proposals.
Bedlight control switch: On and off, marked with lamp symbol.
Attachment clip: Submit proposals.
Cable: White cord with strain relief.
Length: Submit proposals.
Plug: Able to disengage from the socket when strain is applied to the cable.
Mounting type: Submit proposals.
Monitored call circuit: Initiated by a break in the cable or withdrawal of the plug.
Parking bracket: Required.

330 PATIENT PULL CORDS General
Manufacturer: Board's choice.
Product reference: Submit proposals.
Cord colour: Orange.
Acorn: Orange coloured with nurse symbol.
Switch action: Momentary.
Accessories: Integral reassurance lamp with amber lens.

340 NURSE EMERGENCY PULL-SWITCHES General
Type: Pull-on/ push-off action.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Colour: Red.
Labelling on switch: 'Emergency Pull'.
Mounting: Refer to loaded drawings and Room Data Sheets.

350 VISUAL SIGNALS General
Manufacturer: Board's choice.
Product reference: Submit proposals.
Lamp: Manufacturer's standard.
Colour: Red.
Labelling: Unique call device identification code.
Mounting plate material: Zinc plated steel.
Finish: Match electrical accessories.
Mounting type: Ceiling.
Accessories: Integral sounder.

370 POWER SUPPLY UNITS General
Standard: To BS EN 60950-1.
Manufacturer: System manufacturer.
Product reference: Submit proposals.
Output power supply: Stabilized and overload protected.
Integral standby power supply: Required.

380A CALL INDICATOR PANELS General
Manufacturer: System manufacturer.
Product reference: Submit proposals.
Display: LCD.
Lamps: LED.
Number: Refer to loaded drawings and Room Data Sheets.
Day/ night volume control switch: Required.
Patient to nurse call tone: Fixed frequency. 1 s on, 9 s off, until all calls are cancelled.
Nurse to nurse call tone: Manufacturer standard, shall not sound similar to any other alarm tones eg: fire alarms.
Mute switch: Required.
Call transfer: facility required to transfer calls from any indicator panel to any other indicator panel Speech facility: Not required.

EXECUTION

620 EXECUTION GENERALLY
Execution: In accordance with HTM 08-03.

630 INSTALLATION OF PATIENT HANDSETS
Attachment: Flexible lightweight cable, and plug.

640 INSTALLATION OF PATIENT PULL CORDS
Location: Ceiling mounted.
Position within room: Refer to loaded drawings and Room Data Sheets.

650 INSTALLATION OF NURSE EMERGENCY PULL-SWITCHES
Location: Refer to loaded drawings and Room Data Sheets.

660 INSTALLATION OF VISUAL SIGNALS
Location:
Refer to loaded drawings and Room Data Sheets
Kitchen;
Nurses' station;
Overdoor;
Sister's office;
Utility room; and
Submit proposals.
Position: Refer to loaded drawings and Room Data Sheets.

670 INSTALLATION OF POWER SUPPLY UNITS
Location: Centrally within the ward area.
Position: Electrical cupboard.

680 INSTALLATION OF CALL INDICATOR PANELS
Location: Refer to loaded drawings and Room Data Sheets.

COMPLETION

910 TESTING AND COMMISSIONING
Testing and commissioning: In accordance with HTM 08-03.
Controls: Verify operation.
Alarm signalling: Verify operation.
Audible signal sound level output: Measure.
Results: Submit.

920 DOCUMENTATION
Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
Operation and maintenance instructions: Submit.
Record drawings: Submit.

930 SPARES AND CONSUMABLES
Supply the following spares:
Patient handsets: 2 of each type.
Patient pull cords: 2 of each type.
Lamps: 2 of each type.
Dummy call device plugs: 1 for every 10 patient beds.

RHSC and DCN EDINBURGH
SECURITY SYSTEMS

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

2.0 DESCRIPTION OF PROJECT

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central Energy Centre shall be provided to the South of the hospital housing heating, CHP, standby generation, fuel storage and utility incomers.

3.0 SCOPE

The scope of work covered by this Performance Specification shall include but not be limited to the following:-

Access Control System
Intruder Detection and Alarms System
Video door entry intercom
Intercom
Door interlocks
CCTV system
Panic Alarms

Final run outs of conduits
Conduits in or on walls
Interface with nurse call/panic alarms

4.0 PERFORMANCE SPECIFIED SYSTEMS

The Security System is a performance specified system and this specification outlines the requirements to be met by the system.

5.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this Performance Specification:-

Power wiring
Main cable containment (other than final run outs of conduits)
Programming of access control cards
Photographic equipment which the Board may require to process access control cards

6.0 INTERFACES AND DEMARCATIONS

The Security system shall be integrated with a host Internet Protocol network which will support communication, interaction, data transfer and data retrieval from and between the various engineering systems in the building. The Security system shall be connected to the host network via gateways. The Building Management System (BMS) will be provided with a Graphical User Interface which will permit the interrogation of the Security system down to component level. It is not intended that the BMS will control the Security system but rather will monitor component status and provide fault alarm indication at the Graphical User Interface.

The access control system shall be linked to the fire alarm system.

The CCTV system shall be linked to the intruder alarm and access control systems to provide specific viewing functions, such as presenting a picture on a monitor when an access card is presented to a reader, or when a movement detector activates.

Camera presets are required to respond to particular intruder alarms or access violation events, switching from low to high frame rate.

The external PA system shall be linked to cameras so the operator can ‘speak’ to persons in external spaces in an emergency or to reprimand/warn.

The design shall also take cognisance of the Board’s security requirements as detailed in the Board’s operational requirements.

Cabling

The main arterial runs of cable containment will be installed by the outside the scope of this Performance Specification.

Final run outs of cables from the main arterial containment shall be run protected in plastic LSOH conduit.

Cables shall be of the low smoke, zero halogen type (commonly referred to as LSOH, low smoke zero halogen).

In areas of non demountable ceilings, such as in Theatre suites, wiring shall be run in conduit arranged in a 'loop-in' basis to allow wiring without access to the ceiling void.

Power Supply

Final connection of system to power supplies:

7.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations, standards stated in the Materials & Workmanship clauses and Secured by Design.

8.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Drawings

As part of the development of the design the Project Co. shall prepare general arrangement drawings of the Security System based on the base drawings and coordinated with other services and building elements.

Drawings shall include as a minimum:-

Cable containment
Power supplies
Monitors
Cameras
Camera controls
Image storage
Schematics
System integration
Control and indication equipment
Entry phones
Card readers
System interfaces
Door contacts
Magnetic locks
Intercom stations
Door access controllers
Central p.c.
Break glasses
Request to exit buttons
Door interlocks
Panic Alarms

9.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the Project and Hospital teams concerned with the planning and administration of security systems and policies.

10.0 SYSTEMS

The final selection of all equipment and cabling shall be carried out by Specialist.

The design for all security systems shall be in line with the general principals of the approach recommended by Secured by Design.

Power Supplies and Control Units

Space is available in the Low Current section of the departmental electrical cupboards to accommodate power and control equipment. Such equipment shall not be installed in ceiling voids for reasons of fire risk mitigation.

Software

Project Co. shall provide 2 N° copies of the software used on this project. Open protocol industry standard software must be used. All software shall be 'backwards compatible'.

Low Current Systems action following mains failure/generator test conditions

The low current systems specified herein to be self-rebooting following mains failure and generator test conditions.

Low Current Systems with battery back-up

All battery systems shall be easy to test and change, it should be possible to replace the batteries without powering down or interrupting the operation of the system.

Warning shall be provided to the BMS when battery systems are failing and require maintenance replacement.

10.1 ACCESS CONTROL

General

Refer to security drawings for the locations of access controlled doors and video intercom units serving access controlled doors which represent the Boards requirements.

All entrance/exit doors will require door control systems with video entry systems and shall be operated internally by high level push to open buttons. Where video entry systems are being provided the position and quantity of cameras shall be such to enable the operator to view standing adults, children and persons in wheelchairs.

As a general rule of thumb, the following doors shall incorporate a controlled access system.

All external access doors
IT node room doors
Doors to wards
Main entrance doors to departments
FM & patient bed lifts
Additional restricted areas to be defined by NHS Lothian

The system shall be programmable to grant different patterns of access to staff and visitors.

Each ward, department and service area shall be capable of being locked down separately.

Proximity card readers shall be fitted to external personnel access doors into the Energy Centres.

The access control system should not inhibit emergency escape or access by the staff at any time.

The door access control system shall be integrated within the Nurse Call system, refer to PMI-069 and the Nurse Call performance specification WW AP.1.2.34 JB G1547.

Interfaces

The access control system shall also interface with the lifts and automatic doors.

Controlled doors along escape routes shall be capable of manual or automatic release in the event of the fire alarm system activating. Where escape runs from the public to the secure side of an access controlled door, the system shall operate such that the door is automatically released. Where escape runs from the secure to the public side of an access controlled door, the door shall be capable of manual release.

External Video Door Entry

The video door entry systems shall interface with the access control system and where indicated on the drawings, video door entry units shall be provided in order to communicate with personnel requesting entry. They also shall be provided with appropriate door release buttons.

The video camera shall be suitable for viewing of visitors in wheel chairs.

The external video door entry systems serving the main entrances shall be standalone systems and may utilise the external CCTV cameras if the location of the cameras is such to provide facial recognition of the persons, including wheel chair users, seeking entry to the security staff providing entry. The entry systems shall be provided with local control and facility to transfer to the main security room centre.

The external video door entry systems serving all other external entrance locations shall be standalone systems linked to the local staff base as indicated on the security layouts. The video door entry systems shall interface with the access control system and where indicated on the drawings, video door entry units shall be provided in order to communicate with personnel requesting entry.

They also shall be provided with appropriate door release buttons. The video camera shall be suitable for viewing of visitors in wheel chairs.

Internal Video Door Entry

The internal video door entry systems shall be standalone systems linked between the controlled door and the local staff base as identified on the security layouts.

The video door entry systems shall interface with the access control system and where indicated on the drawings, video door entry units shall be provided in order to communicate with personnel requesting entry. They also shall be provided with appropriate door release buttons.

The video camera shall be suitable for viewing of visitors in wheel chairs.

Proximity Cards

Proximity cards shall be incorporated within staff I.D. Badges with a facility to enable alterations to cards.

The access control system cards shall be compatible with the electric access control system in the RIE so that a single card can be used throughout.

Up to 15 templates shall be provided to allow the Board to programme and issue their access control card.

1No. PC and 1No. printer shall be provided to facilitate the above. No consumables to be provided.

Card Readers

These shall have anti-vandal fastenings and protective casings. External readers must be waterproofed to IP54 and a rain shield provided where the reader type requires further protection.

Break Glass Units

Break glass override units shall be provided on the secure side of all access control doors to locally interrupt the power circuit to the mag locks (for emergency use). This break glass unit shall be coloured green.

Request To Exit Units (RTEs)

RTEs shall generally be provided on the secure side of the access controlled door to allow normal egress from the secure area where indicated on drawings.

Door Locks

Magnetic locks shall be of the face-to-face type. Mag locks shall not be of the recessed Shearlock type.

10.2 INTRUDER DETECTION AND ALARM SYSTEMS

An Intruder Detection System shall be provided for out of hours security cover. PIR detectors shall be located in the following areas:-

Corridors

Ground floor rooms with windows

Internal rooms adjacent to any roof access points

Alarms shall link to the Security Control Centre. Local security systems alarm annunciation shall be provided with wards.

The details of the Intruder Alarms system shall be developed by the specialist.

Door Contacts

Door contacts shall be provided at each access controlled door to report to the access control system whether a door has been left ajar or a door has been forced open without the use of a RTE, card reader or fire alarm interface unit.

10.3 CCTV

The system shall adhere to the guidance given under Article 1 of Protocol 1 of the Human Rights Act 1998. Dynamic privacy control units shall be incorporated into the system whereby they can only be modified by means of an authorised password.

The systems shall present a secure and reassuring environment for staff, patients and visitors by providing appropriate security measures within the particular restraints imposed by clinical demand and personal freedom.

The CCTV system shall be installed, and provided with appropriate signage, in accordance with the requirements of the Data Protection Act and architect's details.

Video Signal Management

All cameras shall be linked back to the Control Centre with local supplementary monitors in accordance with the Clinical Requirements.

The main receptions & A&E receptions shall also incorporate a CCTV monitor position each with a flexible control facility to allow a combination of monitoring arrangements over two 20" flat LCD screens.

Local security systems alarm annunciation shall be provided within wards at the staff bases and at the central security room with facility for remote monitoring and control off site.

The scheduler shall be available for recording day, night and weekends so that different settings can be changed such as:-

Number of cameras to be recorded
Change record rates
Select activity on individual cameras (for example turn on camera during night periods only)
The stored video information shall be easily retrievable by entering the date and time.
The hard drives shall have the facility to be networked so that the system (live or stored data) may be viewed via a remote PC.
All cameras shall be provided with movement sensors so that movement detection can automatically set the CCTV cameras to a higher recording rate.
The system shall have the capability to increase camera record rates upon operation of intruder alarm detection or by operation of access controlled doors and/or external periphery doors

CCTV, Cameras, Servers and Image Storage

All CCTV cameras shall be IP-based. They shall be linked back to local hubs by fibre or Cat.6A cabling. Local data hubs shall be connected back to CCTV servers which shall in turn be linked to the main server room via a looped optical fibre network. CCTV cameras to be of the domed type.

CCTV cameras shall be programmed to 'tour' the viewable areas.

CCTV servers shall include input modules, processors and RAID storage providing 100% back-up. The system shall record at 25FPS per camera and provide 31 days storage; images shall be compressed, with the exception of a one hour period before and after alarm incidents, and be overwritten after 31 days of storage. Each CCTV server shall also be provided with an independent broadband connection to provide connectivity in the event of a network failure.

The system shall comprise a multi-channel digital recorder with a recording frame per second for each camera which is in accordance with a detailed engineering specification to be agreed with Lothian and Borders Police. The digital recorder shall also control playback of images onto a CCTV monitor.

The system shall be provided with a dedicated UPS of 30 minutes autonomy, in accordance with SHTM 06-01 recommendations, to protect against loss of data

Trigger Functions

The CCTV system shall be linked to the intruder alarm and access control systems to provide specific viewing functions, such as presenting a picture on a monitor when an access card is presented to a reader, or when a movement detector activates.

Internal CCTV

Project Co. shall provide a comprehensive colour CCTV system integrated within the BMS covering all corridors, reception, lift lobbies and other areas where members of the public gather or areas where access is to be restricted i.e. wards.

CCTV cameras shall be installed at the main entrances, waiting and circulation areas where the security and safety of hospital staff and patients is a concern but where free access for the visiting public is allowed. The CCTV systems are also to cover:-

All exits and entrances (including the Energy Centre entrance)
Ambulance parking
Vehicle bays
Fill points
Ward entrances
Children's play areas
Ambulance entry points
A&E departments
Car parks, estates yards, public spaces
Generator plant rooms
Main heating plant rooms
Corridors
Receptions
Lift lobbies
Other areas where members of the public gather or areas where access is to be restricted

All camera positions shall be provided with a local power supply unit with battery back-up provided to the server racks.

External CCTV

Project Co. shall provide a comprehensive colour CCTV system covering all external access points, car parking and external pedestrian/cycle circulation routes around the full site including FM, service yards, car parks, walkways, therapy gardens, boundary of/entrances to Site, boulevard, service tunnel etc, and the general road network.

External cameras shall be mounted on dedicated CCTV poles provided with a duct for power cabling and a second for comms cables.

External cameras to be capable of operating in reduced light conditions, cameras to be of the “low light” type.

External cameras shall be fully functional, set up with stops to avoid over viewing of adjacent properties.

External cameras covering the car parking areas shall be provided with number plate recognition capability.

The external CCTV system shall be testing using the Rotakin test in accordance with BS EN 50132-7. Human recognition (50% Rotakin) shall be provided in all areas.

10.4 INTERCOM SYSTEM

General

The intercom system fitted as part of the door entry system is described in the access control section.

This section relates to standalone intercom systems as indicated on the drawings.

The final positions of the Intercom Master Stations, Sub-Stations and Power Supplies shall be determined during the detailed design.

System Operation

The system shall be local standalone systems and shall provide total hands free open voice communication operation after the initiation of a call, with full duplex speech. The Master Station handset will allow communication privately or press-to-talk.

In the event of a user attempting to make a call to a station already in operation an engaged signal will be received.

10.5 PANIC ALARMS

General

The system shall satisfy the following requirements.

Panic alarms shall be integrated with the security system and BMS to allow:-

The unlocking of doors, initiated by the Fire Alarm system, along all escape routes to assist evacuation in an emergency.
Automatic locking of doors within the Accident & Emergency Departments if a panic button is pressed.
Activation of a security camera in a particular position when a door is opened to provide a picture of the person entering.

All panic alarms fixed and mobile shall be monitored centrally by the on-site Security Control Centre and shall provide a description of the alarm activation and the precise location of staff members in distress.

Fixed Panic Alarms

Locations as identified in the architects ADB drawings shall be fitted with panic alarms in the form of a discrete push button fixed to the underneath of the desks and hardwired to the security system.

At these locations a loud alarm shall be raised at the scene of the incident on activation of a panic alarm button.

Staff Mobile Panic Alarms/Personal Attack Alarms

Staff mobile panic alarms shall be provided for:

Emergency Department
Imaging Department
Emergency Decontamination
Out of Hours Service Areas

Staff mobile panic alarms shall be linked to reception desks of the relevant department.

An NHS Wi-Fi network shall be installed throughout the Hospital to facilitate the use of personal attack alarms.

The Wi-Fi/radio-frequency network infrastructure shall be compatible with the personal security device to provide lone-worker protection.

W40 Access control systems

GENERAL

110 ACCESS CONTROL SYSTEM GENERALLY
Standards: To BS EN 50133-1 and in accordance with BS EN 50133-7.
Manufacturer: Submit proposals.
Registration:
A member of BSIA;
A Gold member of NSI;
A Silver member of NSI; or
A member of SSAIB.
Operation in the event of mains failure: Access point remain secure.
Tokens: Proximity cards and Submit design and cost proposals.
Readers: Proximity readers.
Standby battery supply: 24 h (VRLA with 10 year life).
Locking mechanisms: Magnetic locks (face-to-face type) and strike plates. Magnetic locks shall not be of the recessed Shearlock type.
Controls: Board's choice.
Accessories:
Access control point status monitoring devices;
Card printer;
Digital camera;
Emergency break glass units; and
Request to exit buttons.

120 AUDIO INTERCOM SYSTEM
Entrance panel: Required.
Remote handsets: as drawings.
Manufacturer: Submit proposals.
Product reference: Submit design and cost proposals.
Audio communication: Two way.
Remote door opening via handset: Required.
Calling method: Push button.

130 VIDEO INTERCOM SYSTEM
Entrance panel: Required.
Remote handsets: as drawings.
Manufacturer: Submit proposals.
Product reference: Submit design and cost proposals.
Audio communication: Two way.
Video communication: One way.
Video image: Colour.
Camera type: Wide angle.
Remote door opening via handset: Required.
Calling method: Push button.
Mounting Height: 1200mm to centre of lens unless specified otherwise on architect's elevation drawings.

140 CABLING AND CONTAINMENT general
Cable type: Board's choice.
Containment: Cable basket as section Y63.
Rewireable installation: Required.
Concealed installation: Required.

SYSTEM PERFORMANCE

210 DESIGN
Design: Complete the design of the access control system.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

220 ACCESS CONTROL POINTS GENERALLY
Recognition classification to BS EN 50133-1: Class 2.
Access classification to BS EN 50133-1: Class B.
Environmental classification to BS EN 50133-1: Submit proposals.
Number of transactions (minimum): Submit proposals.

230 CONNECTION TO FIRE DETECTION AND ALARM SYSTEMS
Operation in the event of a fire signal: Access points open if escape needs to pass through secure area.

240 INTEGRATION WITH OTHER ALARM AND SECURITY SYSTEMS
Objectives: Fully integrated security system operating on engineering IT network via Internet Protocol. Refer to Particular Specification..
Systems to be integrated:
Closed circuit television systems as section W44;
Intruder detection and alarm systems as section W41;
Fire detection and alarm systems as section W50;
Central controls and building management systems as section Y40; and
Submit proposals.

PRODUCTS

310 MULTIPLE TECHNOLOGY CARDS
Type: Proximity card.

320 PROXIMITY CARDS
Standard: To BS ISO/IEC 10373-6.
Type: Non-contact 125 kHz proximity multi-chip and antenna without battery.
Physical characteristics: To BS ISO/IEC 14443-1.
Code: Unique, pre-programmed to BS 7227.
Unique, visible identification number: Required.
Manufacturer's guarantee against electronic failure (minimum): 25 years.
Accessories: Slot and neck strap.

360 PROXIMITY READERS
Manufacturer: Board's choice.
Product reference: Submit proposals.
Operating frequency: 125 kHz.
Proximity read range: Submit proposals.
Visual indication: LED displaying red when access point status secure, green when unlocked.
Audio status indication: Multiple tone sequences.
Tamper detection: Required.
Colour: Submit proposals.

390 INTERCOM ENTRANCE PANELS
Entrance panel call buttons: To suit.
Microphone: Integral.
Speaker: Integral.
Camera: Integral within video intercom entrance panels.
Finish: White.
Backlight: Required.
Audio tone when button pressed: Required.

400 ACCESS CONTROL CABLES
Standard: To BS 4737-3.30.
Conductor:
Nominal diameter: Board's choice.
Stranding: Board's choice.
Sheath: LSZH.
Cores (minimum): Board's choice.

420 MAGNETIC LOCKS AND STRIKE PLATES
General: Magnetic locks shall not be of the recessed Shearlock type.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Operating voltage: Board's choice.
Operation: Fail unlocked.
Holding force (minimum): 8 kN.
Material and finish: Submit proposals.
Instant release circuit: Required.
LED status indication: Not required.

440 INTERCOM REMOTE HANDSETS/ WALL MOUNTED DEVICE
Buzzer: Integral – Activates when door open and shall have facility for user override.
Monitor: Integral within video remote handsets/ wall mounted device.
Door release button: Required.
Mounting: Wall.
Finish: White.

450 ACCESS CONTROL SYSTEM CONTROLLERS
Manufacturer: Board's choice.
Product reference: Submit proposals.
Type: Microprocessor based.
Administration access: Password protected.
Synchronise date and time: Once a day.
ODBC compatible database:
Users (minimum): 12000.
Information fields per user:
Access period.
Access points.
Department.
Email address.
First name.
Holiday schedule.
Last name.
Photograph.

Telephone.
Token expiry.
Token number.
Visitor status.
Spare information fields per user (minimum): Submit proposals.
Import and export of database in ASCII format: Required.
Monitor and record the following transactions and events:
Forced access.
Pass back attempt.
Tamper.
Transaction invalid.
Transaction timed out.
Transaction valid.
Events and transactions: Data and time stamp.
Customised event alarms: Display.
Control features:
Access point status monitoring.
Anti pass back control: Global.
Auto unlock at predefined times.
Configure access groups, grids and levels.
Configure access point unlock time.
Configure time grids, zones and slots.
Daylight time saving.
Display access point status on site and layout plans.
Reports: Provide searchable information.
Transaction and event reports:
By access point.
By area.
By department.
By time and date period.
By transaction type.
By user.
Other reports:
Occupancy reports.
Time and attendance reports.
Publishing: Export to pdf and Print.

455 DOOR CONTROLLERS
Number of doors per controller: Board's choice.
Door lock battery backup: Within system controller (VRLA with 10 year life).
Time between token presentation and door unlock (maximum): 0.3 s.
Enclosure:
Material: Steel.
Finish: Board's choice.
Tamper alarm: Required.

460 PERSONAL COMPUTERS
Manufacturer: Board's choice.
Product reference: Board's choice.
Processor: Board's choice.
Read only memory (RAM): Board's choice.
Hard disk:

Capacity: Submit proposals.
Speed: Submit proposals.
Video card: Submit proposals.
Sound card: Board's choice.
DVD/ CD rewriter: Required.
Network card: 10/100 base T Ethernet.
Modem: V.92 56 kbits/s data, fax and voice..
Monitor: 20 inch LCD
Keyboard and mouse: Wireless.
Operating system: Windows XP.

465 ACCESS CONTROL POINT STATUS MONITORING DEVICES
Type: Magnetic reed switch.
Material: Aluminium.
Mounting: Recessed.

470 CARD PRINTERS
Type: Dual sided.
Print:
Method: Colour dye sublimation.
Resolution: 300 dpi.
Operation: Double sided.
Speed (minimum): 90 cards/ h.
Laminate: Hologram.
Card feeder capacity: 200.

480 EMERGENCY BREAK GLASS UNITS: Generally
Manufacturer: Board's choice.
Product reference: Board's choice.
Frangible element: Non-resettable.
Colour: Green.
Labelling: "EMERGENCY DOOR RELEASE".
Mounting: Semi-recessed.

480 EMERGENCY BREAK GLASS UNITS: DCFP department
Type: Vandal resistant.
Manufacturer: Board's choice.
Product reference: Board's choice.
Frangible element: Non-resettable.
Colour: Green.
Labelling: "EMERGENCY DOOR RELEASE".
Mounting: Semi-recessed.

490 REQUEST TO EXIT BUTTONS
Manufacturer: Board's choice.
Product reference: Board's choice.
Material: Plastics.
Finish: White.
Engraving: "PUSH TO EXIT".
Operation: Momentary.
Illuminated button: Not required.

EXECUTION

620 INSTALLING ACCESS CONTROL SYSTEMS
Standard: To BS EN 50133-1 and in accordance with BS EN 50133-7.
Location of the access controller: Submit proposals.
Token reader: Install next to system controller.

630 INSTALLING CABLING Generally.
Standard: To BS 7671.
Route: Submit proposals.
Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
Cables: Install in one length.
Cable pulling: Submit proposals. Do not overstress. Prevent kinks and twisting of the cable.
Cables passing through walls: Sleeve with conduit or pipeduct. Bush at both ends.
Jointing: At equipment and terminal fittings only.

650 INSTALLING READERS generally
Mounting:
Type: Wall.
Height (finished floor level to underside of equipment): 900 mm.

690 INSTALLING INTERCOM SYSTEMS generally
Entrance panel:
Mounting: Recessed.
Location: Submit proposals.
Height (finished floor level to underside of equipment): 1300 mm.
Handset locations: as drawings.
Labelling: Identify call buttons.

COMPLETION

910 TESTING AND COMMISSIONING GENERALLY
Standard: To BS EN 50133-1.
System commissioning agent: Board's choice.
Notice before commencing tests (minimum): Board's choice.
System programming:
Configure user database and tokens.
Number of users: 12000.
Configure access permissions.
Configure time grids, zones and slots.
Cable testing:
Insulation resistance: Submit results.
Earth continuity: Submit results.
Access points: Verify the correct operation of reader and lock mechanism. Configure unlock times.
Standby supply: Verify operation in the event of a mains failure. Check capacity and submit results.
Charger: Verify operation.
Equipment tamper detection: Verify operation.

920 EQUIPMENT LABELLING AND SYSTEM DIAGRAMS
Access points and door controllers: Label with a unique identification code.
System diagram: Provide showing the location and identity of all system equipment.
Location: Next to the access system controller.

930 AUDIO INTERCOM SYSTEM TESTING AND COMMISSIONING
Call button: Verify the operation of call buttons.
Audio communication: Verify 2 way audio communication.
Remote release: Verify the operation of remote door release facilities.

940 VIDEO INTERCOM TESTING AND COMMISSIONING
Call button: Verify the operation of call buttons.
Audio communication: Verify 2 way audio communication.
Video image: Verify the operation of the video camera and remote display.
Remote release: Verify the operation of remote door release facilities.

950 DOCUMENTATION
Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
Operation and maintenance instructions: Submit.
Record drawings: Submit.
Commissioning Certificate: Submit.
Test Certificate: Submit.

960 SPARES AND CONSUMABLES
Tokens to be supplied: none.

W41 Intruder detection and alarm systems

110 INTRUDER DETECTION AND ALARM SYSTEMGENERALLY
Standard: To BS EN 50131-1.
System manufacturer: Submit proposals.
Registration: Submit proposals.
Grade: Grade 2.
Power supply: Type A.
Environmental classification: Class I.
Areas to be protected: Refer to Particular.
Perimeter protection: Submit design and cost proposals.
Detectors: Submit proposals.
Equipment interconnectivity: Wired.
Cabling and containment:
Cable type: Submit design and cost proposals.
Containment: Rigid conduit, as section Y60.
Rewireable installation: Required.
Concealed installation: Required.
Warning devices:
Internal: Submit design and cost proposals.
External: Submit design and cost proposals.
Signalling method: Submit design and cost proposals.
Control and indicating equipment (CIE): Submit design and cost proposals.
Accessories: Submit design and cost proposals.
Completion: Submit design and cost proposals.

SYSTEM PERFORMANCE

210 DESIGN
Design: Complete the design of the intruder detection and alarm system.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

225 ZONING AND DEVICE IDENTIFICATION
Zoning: Divide the installation into separately controlled and identifiable zones.
Device identification: Individual address.

230 SPARE CAPACITY
Spare capacity (minimum): 25%.

235 CONNECTION TO FIRE DETECTION AND ALARM SYSTEMS
Fire and fault signal: Accept and relay to the alarm receiving centre.

246 INTEGRATION WITH CCTV SYSTEMS
Integration: In accordance with BS 8418.

250 DIGITAL COMMUNICATORS
Standards: To BS EN 50136-1-3 and BS EN 50136-2-3.

252 DIRECT LINE SIGNALLING
Standards: To BS EN 50136-1-2 and BS EN 50136-2-2.

255 PREVENTION OF SETTING FOR GRADE 2 SYSTEMS
Conditions preventing system setting: Submit proposals.

261 SUPPLEMENTARY PROCESSING OF SIGNALS FOR GRADE 2 SYSTEMS
System status, set:
Response to hold-up signal/ message: Submit proposals.
Response to fault signal/ message: Submit proposals.
ATS message type in response to tamper signal/ message: Submit proposals.
System status, unset:
Response to hold-up signal/ message: Submit proposals.
Response to tamper signal/ message: Submit proposals.
ATS message type in response to hold-up signal/ message: Submit proposals.
ATS message type in response to tamper signal/ message: Submit proposals.
ATS message type in response to fault signal/ message: Submit proposals.

265 SUPPLEMENTARY INDICATIONS FOR GRADE 1 AND 2 SYSTEMS
System set: Submit proposals.
During setting: Submit proposals.
During unsetting: Submit proposals.

272 NOTIFICATION REQUIREMENTS FOR GRADE 2 SYSTEMS
Means of notification: Submit proposals.

280 SUPPLEMENTARY TAMPER DETECTION FOR GRADE 2 SYSTEMS
Tamper detection of junction boxes: Submit proposals.
Additional forms of tamper detection: Submit proposals.

286 MONITORING SUBSTITUTION OF GRADE 1, 2 AND 3 SYSTEM COMPONENTS
Substitution of system components: Submit proposals.
Substitution of signals/ messages: Submit proposals.
Timing:
Substitution of system components: Submit proposals.
Substitution of signals/ messages: Submit proposals.

290 EVENT RECORDING FOR GRADE 2 SYSTEMS
Memory capacity (minimum): Submit proposals.
Endurance of memory after system power failure (minimum): 30 days.
Event recording functions: Submit proposals.

PRODUCTS

310 ACOUSTIC DETECTORSGENERALLY.
Standard: To BS 4737-3.6.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

312 BEAM INTERRUPTION DEVICESGENERALLY.
Standard: To BS 4737-3.12.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

314 CAPACITIVE PROXIMITY DETECTORSGENERALLY.
Standard: To BS 4737-3.13.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

316 COMBINED PASSIVE INFRARED AND MICROWAVE DETECTORSGENERALLY.
Standard: To BS EN 50131-2-4.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

317 COMBINED PASSIVE INFRARED AND ULTRASONIC DETECTORSGENERALLY
Standard: To BS EN 50131-2-5.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

318 DELIBERATELY OPERATED DEVICESGENERALLY
Standard: To BS 4737-3.14.
Type: Submit proposals.
Manufacturer: Submit proposals.
Submit proposals: Submit proposals.
Operating mechanism: Submit proposals.
Key reset: Required.
Operating method: Submit proposals.
Sound level during operation: Submit proposals.

319 MICROWAVE DETECTORSGENERALLY
Standard: To BS EN 50131-2-3.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

320 PASSIVE INFRARED DETECTORSGENERALLY.
Standard: To BS EN 50131-2-2.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

322 PROTECTIVE SWITCHESGENERALLY.
Standard: To BS 4737-3.3.
Type: Magnetic reed switch.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Circuit configuration: Submit proposals.
Material: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

326 ULTRASONIC DETECTORSGENERALLY
Standard: To BS 4737-3.5.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

328 VIBRATION DETECTORSGENERALLY
Standard: To BS 4737-3.10.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

330 VOLUMETRIC CAPACITIVE DETECTORSGENERALLY.
Standard: To BS 4737-3.8.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Mounting: Submit proposals.
Features: Submit proposals.

340 ELECTRONIC SOUNDERS
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Colour: Submit proposals.

345 LED CLUSTERS
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Colour: submit proposals.

350 VIBRATING PAGERS
Manufacturer: Submit proposals.
Product reference: Submit proposals.

355 XENON BEACONS
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Colour: submit proposals.

360 EXTERNAL SOUNDERS
Type: Self activating bell, foam proof.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Stand by power supply: Integral.
Colour: Submit proposals.
Strobe: Integral.
Visual indication: LED.
Ingress protection to BS EN 60529: IP65.

400 CONTROL AND INDICATING EQUIPMENT (CIE)GENERALLY
Standard: To BS EN 50131-1.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Controller: Microprocessor based.
Features:
Event time recording.
Alarm and fault indication.

450 REMOTE KEYPADS
Backlight: Required.
Individual zone identification: Required.
Individual device identification: Required.
Deliberately operated button: Integral.

480 MULTI-CORE INTRUDER ALARM CABLES
Standard: To BS 4737-3.30.
Conductor: 0.22 m², 7 x 0.2 mm stranding.
Sheath: LSZH.
Cores (minimum): Submit proposals.

EXECUTION

620 INSTALLING INTRUDER ALARM CONTROL AND INDICATING EQUIPMENT
Standards: To BS 7671 and BS EN 50131-1.
Location: Submit proposals.
Main power supply: From an unswitched fused connection unit. Permanently wire with a dedicated circuit from the building's main low voltage switchboard.
Dummy external sounder: Required.
Location: Submit proposals.

630 INSTALLING CABLES
Route: Submit proposals.
Device wiring: Individual radial circuit from control panel.
Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
Cables: Install in one length.
Cable pulling: Submit proposals. Do not overstress. Prevent kinks and twisting of the cable.
Cables passing through walls: Sleeve with conduit or pipeduct. Bush at both ends.
Jointing: At equipment and terminal fittings only.

635 INSTALLING ACOUSTIC DETECTORS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): 3000 mm.

640 INSTALLING BEAM INTERRUPTION DEVICES Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

645 INSTALLING CAPACITIVE PROXIMITY DEVICES Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

650 INSTALLING COMBINED PASSIVE INFRARED AND MICROWAVE DETECTORS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

651 INSTALLING COMBINED PASSIVE INFRARED AND ULTRASONIC DETECTORS Generally
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

655 INSTALLING DELIBERATELY OPERATED DEVICES Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

660 INSTALLING MICROWAVE DETECTORS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

665 INSTALLING PASSIVE INFRARED DETECTORS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

670 INSTALLING PROTECTIVE SWITCHES Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

675 INSTALLING ULTRASONIC DETECTORS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

680 INSTALLING VIBRATION DETECTORS Generally.
Mounting: Surface mounted.
Height (finished floor level to underside of equipment): Submit proposals.

685 INSTALLING VOLUMETRIC CAPACITIVE DETECTORS Generally.
- Mounting: Recessed.

Height (finished floor level to underside of equipment): Submit proposals.

690 INSTALLING ELECTRONIC SOUNDERS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

695 INSTALLING LED CLUSTERS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

700 INSTALLING XENON BEACONS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): Submit proposals.

710 INSTALLING REMOTE KEYPADS Generally.
Mounting: Recessed.
Height (finished floor level to underside of equipment): 1300 mm.

COMPLETION

905 TESTING AND COMMISSIONING GENERALLY
Standard: To BS EN 50131-1.
System commissioning agent: Submit proposals.
Notice before commencing tests (minimum): 2 weeks.
Cable testing
Insulation resistance: Submit results.
Earth continuity: Submit results.
Charger: Verify operation.
Detection devices: Verify the operation, and adjust to provide maximum coverage.
Device voltage: Submit details of the voltage at powered devices.
Local warning devices: Verify operation.
Remote signalling: Verify operation.
Standby supply: Verify operation in the event of a mains failure. Check capacity and submit results.
Tamper detection: Verify operation.
Timers: Set up and adjust entry and exit timers.
User codes: Set up and commission.

910 DEVICE IDENTIFICATION AND TESTING
Device list: Before commissioning submit proposals, including proposed device, zone and group names.
Zone diagram: Before commissioning submit proposals.
Device identification: Label devices with a unique address corresponding to that used by the CIE.
Device testing: Verify the operation of each device. Submit a schedule of devices, including the device test methods and results.

915 SYSTEM SOAK TESTING
Soak test: Undertake when construction works are complete, but before handover and before connection to a remote alarm receiving centre.
Period: 14 days.
Re-test after remedial works.

920 STANDBY BATTERY TESTING

Mains power supply: Isolate.

Quiescent mode: Measure current supplied by standby source when intruder detection and alarm system is operating in the quiescent mode. Submit results.

Alarm mode: Measure current supplied by standby source when intruder detection and alarm system is operating in the alarm mode. Submit results.

925 TESTING ACTUATION, INTEGRATION AND INTERFACING WITH ALARM AND SECURITY SYSTEMS

Connections with other systems and equipment: Verify and demonstrate operation of the systems and equipment under fire and fault conditions. Submit results.

935 DOCUMENTATION

Standard: To BS EN 50131-1.

Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system

Operation and maintenance manual: Submit.

Record drawings: Submit.

Commissioning Certificate: Submit.

Test Certificate: Submit.

940 LOG BOOK

Type: Hard back cover embossed "INTRUDER DETECTION AND ALARM SYSTEM LOG BOOK" with A4 lined paper, minimum 100 pages.

Number of copies: 3.

945 SPARES AND CONSUMABLES

Supply the following spares:

Deliberately operated devices: 2 of each type.

Detectors: 2 of each type.

Protective switches: 2 of each type

W44 Closed circuit television systems

GENERAL

110 CCTV SYSTEM Internal areas
System: In accordance with BS EN 50132-7 and Home Office Scientific Development Branch CCTV operational requirements manual.
Manufacturer: Board's choice.
Registration: Submit design and cost proposals.
Format: Consultative Committee for International Radio (CCIR) PAL colour, 1080 scan
lines/frame, 25 frames/second, 16:9 aspect ratio.
Purpose: To provide a secure and reassuring environment for staff, patients and visitors.
Type: Digital.
Surveillance equipment: Cameras.
Controller: Control matrix.
Telemetry transmitter and receivers: Submit design and cost proposals.
Number of monitors: Camera: monitor ratio (maximum)10:1.
Data collection: Submit design and cost proposals.
Accessories:
Camera brackets;
CCTV signage;
Internal camera housings; and
Submit design and cost proposals.

110A CCTV SYSTEM External areas
System: In accordance with BS EN 50132-7 and Home Office Scientific Development Branch CCTV operational requirements manual.
Manufacturer: Board's choice.
Registration: Submit design and cost proposals.
Format: Consultative Committee for International Radio (CCIR) PAL colour, 1080 scan lines/frame, 25 frames/second, 16:9 aspect ratio.
Purpose: To provide a secure and reassuring environment for staff, patients and visitors..
Type: Digital.
Surveillance equipment: Cameras.
Controller: Control matrix.
Telemetry transmitter and receivers: Submit design and cost proposals.
Number of monitors: Camera: monitor ratio (maximum)10:1.
Data collection: Submit design and cost proposals.
Accessories:
Camera brackets;
CCTV signage;
External camera housings;
Towers; and
Submit design and cost proposals.

120 CABLING AND CONTAINMENT Internal areas
Cable type: Board's choice.
Containment: Cable basket.
Rewireable installation: Required.
Concealed installation: Required.

120A CABLING AND CONTAINMENT External areas
Cable type: Board's choice.
Containment: Submit design and cost proposals.
Rewireable installation: Required.
Concealed installation: Required.

SYSTEM PERFORMANCE

210 DESIGN
Design: Complete the design of the CCTV system.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

240 DIGITAL STORAGE
Rate per camera (minimum) : 25 frames/s.
Compression of images : Yes, with the exception of a one hour period before and after an alarm incident.
Data over-writing period : 31 days.
Back-up storage: 100% back-up required.

250 INTEGRATION WITH OTHER ALARM AND SECURITY SYSTEMS
Objectives: To integrate CCTV system with other systems.
Systems to be integrated:
Intruder detection and alarm system
BMS
Access control
External PA system
Laboratory CCTV installation.

PRODUCTS

310 CAMERAS: INTERNAL
Camera Type: Domed.
Manufacturer: Board's choice.
Product reference: Submit proposals.
CCD sensor format: Submit proposals.
Resolution (minimum): 1080 lines/frame.
Power supply: Extra low voltage.
Camera synchronising: Submit proposals
Signal to noise ratio (minimum): Submit proposals.
Image strength with 75 ohm terminations: 1 V peak to peak.
Automatic gain control: Required.
White balance control: Automatic.
Backlight compensation: Required.
Present gamma settings: 1 and 0.45.
Iris: Automatic.
Shutter speed adjustment: Automatic.
Infrared sensitive: Not-required.
Colour to monochrome switching: Automatic at pre-determined threshold (25 lx)
Lens mounts: Submit proposals.
Lens:
Type: Variable focal length.
Filter: Submit proposals.

Mounting points: Submit proposals.
Accessories: Submit proposals.

310A CAMERAS: EXTERNAL

Camera Type: “Low Light”, domed.
Manufacturer: Board's choice.
Product reference: Submit proposals.
CCD sensor format: Submit proposals.
Resolution (minimum): 1080 lines/frame.
Power supply: Extra low voltage.
Camera synchronising: Submit proposals
Signal to noise ratio (minimum): Submit proposals.
Image strength with 75 ohm terminations: 1 V peak to peak.
Automatic gain control: Required.
White balance control: Automatic.
Backlight compensation: Required.
Present gamma settings: 1 and 0.45.
Iris: Automatic.
Shutter speed adjustment: Automatic.
Infrared sensitive: Not required, to be “low light” type.
Colour to monochrome switching: Automatic at pre-determined threshold (25 lx)
Lens mounts: Submit proposals.
Lens:
Type: Variable focal length.
Filter: Submit proposals.
Mounting points: Submit proposals.
Accessories: Submit proposals.

330 PAN AND TILT UNITS: Internal

Camera Type: Dome.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Pan angle: 5°-350°.
Tilt angle: -20°-90°.
Speed control: Submit proposals.
Pan speed: Submit proposals.
Tilt speed: Submit proposals.

330A PAN AND TILT UNITS: External

Camera Type: “Low Light”, domed.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Pan angle: 5°-350°.
Tilt angle: -20°-90°.
Speed control: Submit proposals.
Pan speed: Submit proposals.
Tilt speed: Submit proposals.

340 CONTROL MATRIX

Manufacturer: Board's choice.
Product reference: Submit proposals.
Video inputs: Submit proposals.
Video outputs: Submit proposals

Adjustable dwell time per camera image: Submit proposals
Interval: Submit proposals.
Video inputs:
Unused: Automatic skip.
Lost: Alarm displayed on monitor.
Spot monitor output: Submit proposals.
Control keyboard: Tactile push buttons with individual LED indication.
Manual selection of camera images: Submit proposals.
Screen mode: Sequential switching and split screen.
Titling: Time, date, and camera identification.
Video motion detection: Required.
Alarm outputs: Submit proposals.

350 TELEMETRY TRANSMITTERS
Manufacturer: Board's choice.
Product reference: Submit proposals.
Control functions:
Autopan;
Auxiliary latching function;
Auxiliary momentary action function;
Focus;
Iris;
Lamps;
Pan;
Power; and
Tilt.
Alarm inputs: Submit proposals.
Control keyboard: Tactile push buttons with individual LED indication.
Control via coaxial cabling: Synchronised frequency shift keyed (FSK) signalling.
Control over twisted pair cabling: 4-20 mA current loop.
Multiple camera control: Required.
Guard tour set up: Required.
Mounting: 19 inch rack.
System configuration: Password protection.

360 TELEMETRY RECEIVERS
Type: Submit proposals.
Control signal type: Submit proposals.
Inputs: Submit proposals.
Pre-set pan, tilt, zoom and focus positions: Submit proposals.
Movement control modes: Submit proposals.
Enclosure with integral power supply unit:
Material: Submit proposals.
Degree of ingress protection to BS EN 60529: IP65.
Colour: Submit proposals.

380 DIGITAL VIDEO RECORDERS
Manufacturer: Board's choice.
Product reference: System manufacturer.
Resolution:
Horizontal: 720 pixels.
Vertical: 576 pixels.
Storage media: Submit proposals.
Capacity: 31 recording days.

Inputs: Submit proposals.
Recording speed: 0.1-50 frames/s.
Event recording mode: Required.
Pre-event buffer: Submit proposals.
Camera inputs: Submit proposals.
Monitor outputs: Submit proposals.
IEEE 1394 connections:
Input: Submit proposals.
Output: Submit proposals.
Integral CD recorder: Required.
Video motion detection: Required.

390 MONITORSGENERALLY
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Approval: BEAB.
Type: Liquid crystal display (LCD).
Size (nominal diagonal): 21 inch.
SVHS input: Submit proposals.
Audio input and output: Not required.
Mounting: Wall.

400 CAMERA BRACKETS general
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Type: submit proposals.
Material: Submit proposals.
Finish: Submit proposals.
Camera mount adjustment: Single bolt release.
Pan: ±360°.
Tilt: ±70°.

410 CCTV SIGNAGE: To architects details
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Format: Yellow background with black text and images.
Size: Submit proposals.
Content:
Warn individuals that they are entering premises or an area with CCTV surveillance.
CCTV camera symbol.
Describe the purpose of the CCTV system.
Identify the organisation responsible for operating the system.

420 EXTERNAL CAMERA HOUSINGSGENERALLY
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Shape: Submit proposals.
Material: Submit proposals.
Finish: Board's choice.
Vandal resistant fasteners: Required.
Ingress protection to BS EN 60529: IP65.

Integral heater: Required.
Sun shield: Required.
Wiper and washer assembly: Required.

430 INTERNAL CAMERA HOUSINGSgeneral
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Shape: Submit proposals.
Material: Submit proposals.
Finish: Board's choice.
Vandal resistant fasteners: Required.
Ingress protection to BS EN 60529: Submit proposals.

440 INFRARED ILLUMINATORS
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Lamp type: Submit proposals.
Infrared wavelength: Submit proposals.
Effective infrared distance (minimum): Submit proposals.
Infrared cut off angle: Submit proposals.

450 TOWERS general
Manufacturer: System manufacturer.
Product reference: System manufacturer.
Type: Tubular section.
Height above ground level: Submit proposals.
Tilt over facility: Required.
Anti climb guards: Required.
Finish: Galvanized.

620 INSTALLING CLOSED CIRCUIT TELEVISION SYSTEMS
Standard: To BS EN 50132-7.
Site survey: Assess the site conditions and available artificial light.
Access: Locate system to provide safe access for maintenance and testing.
Camera connections: Conceal where practical, otherwise contain within PVC covered metal flexible conduit.
Mounting heights: Submit proposals.

630 INSTALLING CABLES
Route: Submit proposals.
Timing: Do not start internal cabling until building enclosure provides permanently dry conditions.
Cables: Install in one length.
Cable pulling: Submit proposals. Do not overstress. Prevent kinks and twisting of the cable.
Cables passing through walls: Sleeve with conduit or pipeduct. Bush at both ends.
Jointing: At equipment and terminal fittings only.

640 INSTALLING SIGNAGE
Location: Submit proposals.

910 CLOSED CIRCUIT TELEVISION SYSTEM TESTING AND COMMISSIONING
Standard: To BS EN 50132-7.
Evaluation of system performance: Rotakin test.
Commissioning video: Display image quality and camera coverage, using Rotakin test target.
Camera coverage: Adjust to obtain optimal performance.

920 DOCUMENTATION
Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system
Operation and maintenance instructions: Submit.
Record drawings: Submit.
Commissioning Certificate: Submit.
Test Certificate: Submit.

RHSC and DCN EDINBURGH
FIRE DETECTION AND ALARMS SYSTEM & GASEOUS FIRE-EXTINGUISHING SYSTEM

CONTENTS

MATERIALS AND WORKMANSHIP CLAUSES

1.0 GENERAL INTRODUCTION

Purpose of Document

The manufacture, supply, installation, wiring, connecting, setting to work and commissioning of the works described in this document.

This specification relates to the Low Voltage Distribution system serving the RHSC-DCN Building and the associated Energy Centre.

This specification shall be read in conjunction with all other mechanical and electrical engineering services specifications and the Architectural drawings.

Description of Project

The new facility shall re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit.

The building is generally constructed from reinforced concrete.

The basement houses FM support facilities and the main building services heat distribution centres and electrical plant rooms.

Ventilation plantrooms are generally located at roof level and level 2.

A central energy centre to the South of the hospital houses heating, CHP, standby generation, fuel storage and utility incomers.

2.0 EXISTING SITE AND SERVICES

There will be a fire command centre in the control room.

During a fire incident control of ventilation and smoke will be from the command point and alternative repeater panels will be located at various positions around the building as shown on the fire alarm schematic.

The fire command centre shall provide command and control for the life safety systems including PC graphics for:

Fire Alarm Detection and annunciation;
Sprinklers (monitoring);
Ventilation system smoke dampers (monitoring and control at each fireman's entry/ main fire alarm panel location via BMS interface)
Fire fighting systems (monitoring and control);
Helipad systems (monitoring);
All other systems provided in accordance with the agreed fire strategy.

3.0 SCOPE

The scope of work covered by this Performance Specification shall include, but not be limited to the following:-

Fire detection and alarm system
Gaseous fire-extinguishing systems to the main core server room
Final run out conduits
Conduits in or on walls

4.0 PERFORMANCE SPECIFIED SYSTEMS

The Fire Detection and Alarm System is a performance specified system and this specification outlines the requirements to be met by the system.

5.0 SPECIFIC EXCLUSIONS

The following is specifically excluded from the scope of this element of the Performance Specification:-

Power wiring
Main cable containment (other than final run outs of conduits)
Sprinkler System

6.0 INTERFACES AND DEMARCATIONS

The fire detection and alarm system & gaseous fire-extinguishing system shall be integrated with a host Internet Protocol network. The fire detection and alarm system shall be connected to the host network via gateways. The System will be provided with a Graphical User Interface which will permit the interrogation of the fire detection and alarm system down to component level. It is not intended that the BMS will control the system but rather will monitor component status and provide fault alarm indication at the Graphical User Interface.

The system shall be integrated with the RIE as indicated on drawing WW-XX-XX-SC-572-001.

The new system shall be fully tested and bedded in prior to be connected through so that no false fire alarm signals are exchanged between the two facilities during system commissioning.

7.0 APPLICABLE STANDARDS

All elements of the works shall be designed in accordance with the requirements of current legislation, regulations and standards stated in the Materials & Workmanship clauses.

The fire detection and alarm system & gaseous fire-extinguishing system shall accord with all appropriate Scottish Hospital Technical Memoranda 81 and 82, HTM 05, Codes of Practice and relevant British & European Standards, the Scottish Non-Domestic Handbook, Fire, Annex 2b, Hospitals, 2006., BS 5839-1 and the agreed Fire Strategy.

8.0 DESIGN CRITERIA

Electricity Supply Characteristics

LV power characteristics: 400/230 V, 3-phase, 50 Hz, 230 V, 1-phase, 50 Hz.

Drawings

Project Co. shall prepare general arrangement drawings of the Fire Detection and Alarm System & Gaseous Fire-Extinguishing System.

9.0 LIAISON

Project Co. shall include for liaison with:-

Health and Safety Professionals. As well as the Health and Safety requirements of this specification, Project Co. shall include for close liaison with Health and Safety professionals including the Hospital's Health and Safety Advisors and the CDM Co-ordinator and shall comply with the CDM Regulations and all Health and Safety regulations.

Other Specialists Project Co. shall liaise with other specialists as necessary to ensure that all interfaces between the Fire Detection and Alarm System and other systems are allowed for. This shall include but not be limited to:-

NHS Lothian Fire Officer
City of Edinburgh Council
Scottish Fire & Rescue Service
Building Management System specialist
Lifts consultant
Security systems specialist
Sprinkler systems specialist
Smoke damper controls panel specialist
Pneumatic tube system specialist
Catering equipment specialist
Roof/Window specialists (with regards smoke relief)

Building Control. Project Co. shall liaise, with and adhere to, the requirements of the Building Control Officer.

Any other member of the and Board teams concerned with the planning and administration of fire precautions.

10.0 SYSTEMS

10.1 FIRE DETECTION AND ALARM SYSTEM

System Type

The Fire Detection and Alarm System shall be of the analogue addressable type providing category L1 coverage as defined by BS 5839:1:2013.

Cabling and Cable Containment

The Fire Detection and Alarm System wiring shall comply with the requirements of BS5839-1, SHTM 81 & 82 and Scottish Non-Domestic Handbook, Fire, Annex 2b, Hospitals, 2006.

Cables shall be the types as specified in BS5839 and be of red outer sheath and of the low smoke, zero halogen type (commonly referred to as LSF). All cables, including power cables and network cables, associated with the Fire Detection and Alarm System shall be of the enhanced type, meeting the PH120 classification when tested in accordance with BSEN 50200 and the 120 minute survival time when tested in accordance with BS 8434-2.

The main cabling routes shall be supported by wire basket cable trays. Runs of wiring comprising 1, 2 or 3 cables may be installed directly upon the soffit.

Methods of cable support shall be non combustible and shall withstand a similar temperature and duration to that of the cable whilst maintaining adequate support.

In areas of non demountable ceilings, such as in Theatre suites, wiring shall be run in conduit arranged in a ‘loop-in’ basis to allow wiring without access to the ceiling void.

Fire Alarm Zones

Project Co. shall determine fire alarm zone boundaries in accordance with the guidance in (S)HTM82 and BS5839. Reference shall be made to the fire strategy drawings for fire compartment boundaries.

In the event of fire The Works shall be capable of individual zone evacuation with all other zones receiving awareness signalling in accordance with the cause & effect matrix developed from the Fire Strategy.

Trigger Devices

The following trigger devices shall be provided:-

Multi sensor fire detectors shall be of the multi-criteria type operating via an algorithm to minimise unwanted fire signals as much as is practically possible
Manual call points (flush mounted in occupied spaces)
Heat detectors (temperature activation settings to be below that of sprinkler heads)
Smoke detectors in supply ductwork at all air handling units
Beam detectors
Canopy Extinguisant systems

Manual Call Points

Manual call points must be provided at every exit and staircase with no point in the building being more than 30m travel from a call device. (Any deviation for Clinical requirements shall be agreed with the Board).

Fire Alarm Evacuation facilities shall be provided at each main node, these shall require a double action e.g. break frangible lid and then activation of call point.

Ceiling Void Detection

The requirement for void detection will be risk assessed within each void in accordance with the Fire Strategy. The Fire Strategy provides an explanation for the methodology to be adopted for the risk assessment of the void content and an overview of the types of items considered to be acceptable.

The risk assessment, in matrix form, shall be agreed with the Board to identify where void detection is necessary.

Gaseous Extinguishing Systems

Gaseous Extinguishing Systems shall be provided in the following areas:

Main core server room

The room will be provided with gaseous extinguishing system which shall include a local control panel. The gaseous extinguishing system control panel shall be connected to smoke detectors within the server room and shall, in a preset sequence, shut down the room ventilation, close any air dampers, and ultimately trigger gas release.

The gaseous extinguishing system control panel shall be connected to the ‘house’ fire alarm system.

Refer to section S70 of this specification for Materials & Workmanship clauses pertinent to the gaseous extinguishing system.

Project Co. shall advise on any specific requirement relating to room construction, airtightness, pressure relief, gas extraction, interfaces with mechanical services/ power supplies/ fire alarm system.

Project Co. shall produce working drawings indicating locations of bottles, control panels, human interfaces, detection, pipework, nozzles, valves, power supplies, etc.

The design shall be co-ordinated with the cooling systems and IT equipment layouts.

The following matrix describes in general the actions required in the event of fire in the server room.

MAIN CORE SERVER ROOM FIRE DETECTION CAUSE AND EFFECT SCHEDULE

	'HOUSE' PANEL				COMPUTER ROOM						
	Flashing zone light	Text display	Zone sounders	Audible alert on panel	Shut down room ventilation	Close dampers	Trigger gas release	Flashing zone light	Text display	Sounders in server room	Audible alert on panel
Computer suite											
Gaseous Ext. Panel											
Smoke Detector 1	X	X	X	X	X			X	X	X	X
Smoke Detector 2	X	X	X	X	X	X	X	X	X	X	X

Omission of Detection

Detection need not be provided in:

Bathrooms
Shower rooms
Staff toilets
Cupboards of less than 1m²

Detection shall be provided in all other areas unless a risk assessment has been produced and agreed. .

Warning Devices

Fire alarm audibility levels shall be as required by HTM 05, SHTM82 and BS5839-1.

Audible alarm devices shall provide a constant tone when in "alarm" and be a light pulse & intermittent tone when in "alert".

Audible alarm devices shall generally be positioned to warn staff without undue disturbance to patients.

Noise sensitive areas exist within the Hospital within departments such as Theatres, Recovery, etc. the Board shall indicate which areas shall have a normal level of sound and which shall have a reduced level.

Voice evacuation announcements shall be provided in the atrium as required by the fire strategy with pre-programmed announcement text being agreed with the Board. These announcements shall be made via voice alarm sounders.

In areas where patients can escape unaided, and in non-patient areas, the audibility of the alarm shall be in accordance with BS 5839-1. Such areas would be:

Out patients
Public spaces
Main hospital streets

Fire alarm sounders shall be of the addressable type that are low power consumption and are wired directly upon the local fire alarm loop cable. Combined detector/sounder units are acceptable. All sounders must be provided with the facility to adjust sound levels.

Audio/Visual alarm devices shall be provided in:-

Plantrooms
UPS rooms
WCs in public areas
Noisy areas
Over each external door which gives access to fire alarm panels

In occupied spaces Audio/Visual alarm devices shall incorporate a sounder of 50dB(A) at 1m of similar sound to the main audible alarms.

Visual only alarms shall be provided in:

Operating theatres and post operative recovery
Intensive therapy units, critical care, and other similar high dependency units
Imaging rooms

The system shall be equipped with sufficient sounders to maintain sound outputs in different areas in accordance with SHTM 82, HTM 05, and incorporate visual strobe indicators for a fire condition in accordance with the requirements of the Disability Discrimination Act.

Control and Indicating Equipment

The Main Alarm Panel (MAP) shall be located in the Main Entrance. The MAP shall be wall mounted. The Fire Alarm PC Screen and HVAC screen shall be located in the Security Control room to provide the Fire Authorities with the facility to control the operation of the supply/exhaust air systems with assistance from FM personnel.

Local Fire Alarm Panels (FAP). FAPs shall be standalone local control and indication panels. On each floor, a local FAP shall be provided which shall enable each area to be separately and independently commissioned. The final quantity of local FAPs will depend upon the system supplier's technology. Every fire detection loop shall not be loaded to more than 80% of its capacity. The MAP shall be linked to all standalone local FAPs via a master bus network. Should this master bus network fail each local FAP shall be able to operate autonomously.

Graphic Repeat Panel (GRP). Adjacent to the MAP provide a GRP which shall clearly identify the location of a departmental area upon activation of a triggering device within that area.

Repeat Alarm Panels (RAP). RAPs shall identify the device and department in alarm via the LCD text display; the graphics shall assist the fire fighting team to clearly identify the location of the department in alarm. RAPs shall be located as indicated on the fire strategy drawings and in the Fire Control Room.

Framed coloured floor plans shall be provided at the MAP and RAP positions.

Local Repeat Indication Panels (LRIP) shall be provided at each staff base. LRIPs are to advise staff of where the location of the fire is so that they can plan their evacuation procedure whilst in the alert state. LRIPs shall have a minimum of a 40 character LCD display to identify to the nursing staff in the department in alarm and to evacuate as appropriate. These panels shall also have an audiovisual alarm unit so that upon activation of a fire signal the nursing staff will be immediately alerted.

The LRIPs at Staff Bases may be combined with local nurse call indicator panels (and Isolated Power Supply Unit annunciator panels where appropriate). Refer to the layout drawings for quantities and locations of Staff Bases.

Any other control panels which may be required due to the system proposed, shall be located in riser cupboards and/or plantrooms.

All fire alarm panels shall be capable of giving details of system status for fire, fault and alarm conditions including full text descriptions of location at all nodes and staff base positions. In addition, all panels shall be capable of data / event logging and report generation.

The control panels shall be fully networked with resilient connections to the site based PC front end with map facilities and remote graphics monitoring in Hillington via a dedicated link.

The control panels shall be sized to provide an additional 25% spare capacity for future growth within the Fire Detection & Alarm system.

Power Supply Units

A power supply unit shall be provided for each of the control panels. Each power supply unit shall be dedicated to the Fire Detection and Alarm System for the area it serves.

Power supply units shall be integral with batteries.

Power supply units shall be sized at 125% of its nominal use.

All batteries shall be, valve regulated lead acid (VRLA) with sufficient autonomy to drive the system (in quiescent mode) for 24 hours, followed by a 30-minute period where all alarm devices and communications are operated with the normal sound pressure level outputs. Batteries shall have a design life of 10 years.

Final connection of system to power supplies – schedule of responsibilities:-

Local means of electrical isolation (key operated fused connection unit) - by the Electrical Board installed outside the scope of this Performance Specification.
Power cable from local means of electrical isolation to power supply unit – by the Specialist Installer.
Termination of power cable at both ends- by the Specialist Installer.

Action following mains failure/generator test conditions

The fire alarm system specified herein to be self-rebooting following mains failure and generator test conditions.

Door Retaining Units

Door retaining units shall be of the electromagnetic type and shall operate as described in SHTM 82.

Doors shall be released upon fire alarm activation, their operation shall be as described in SHTM82. The system shall be fail safe door closed.

Door retaining units shall be configured to permit the doors to close at night.

Project Co. shall advise the Electrical Installer of local power supply requirements for door retaining units.

Door holder locations are indicated on the Architect's fire strategy drawings.

Smoke Damper Control

The details of the Smoke Damper control are to be finalised at a later stage.

Ancillary Devices

Interface units shall be provided to control/monitor security access control doors, mechanical plant, smoke damper control panels, sprinkler switches (including those in retail units), gaseous extinguishing systems, lift controllers, AGV controllers, atria smoke control, staircase smoke pressurisation/venting and basement smoke venting.

The extract hood in the kitchen will be fitted with 'fire trace' automatic extinguishing systems by the catering equipment specialist outside the scope of this contract.

The fire alarm system shall interface with the retail units' fire alarm panels.

An interface unit shall be installed at each BMS outstation.

Interface units shall be provided at each sprinkler flow detection valve to monitor valve position and flow.

Interface units shall be provided at each retail unit for sprinkler flow switches and pumps (monitoring).

Short circuit isolators shall be incorporated either within the base of each device or as standalone items. Should standalone devices be offered they shall be installed at intervals of no greater that 20 devices on a particular fire alarm loop and always between fire compartments.

Development and Management of Cause and Effect Schedule

The Cause and Effect Schedule shall encompass every fire alarm zone, every fire alarm control and indicating panel, interfaces with access control systems, door retaining units, gaseous extinguishing systems, paging system, audible and visual alarms, sprinklers, all mechanical services plant, smoke damper control panels, lift controllers etc.

The Cause and Effect Schedule shall form the basis of the demonstration and verification of correct system operation.

Progressive horizontal evacuation in patient areas is to be facilitated by each fire resisting sub-compartment being on a separate alarm zone, and by the use of two stage (evacuate/alert) alarms. Generally, upon detection of fire within a fire compartment it is anticipated that the following of events shall occur.

Fire Panel indicates an event.
Fire Alarm Control Panels and Repeat Panels indicate location of the fire event.
“fire” signal is sent to the Fire Command Centre.
Redcare connection to Alarm Receiving Centre (ARC)
“alarm” signal provided by audible and/or visual warning devices within the alarm zone.
“alert” signal provided by audible and/or visual warning devices within the adjacent sub-compartments (in horizontal plane).
“alert” signal provided by audible and/or visual warning devices within the adjacent sub-compartments immediately above and below (in vertical plane).
Recirculating ventilation systems serving areas in which the ‘alarm’ signal is given shall be set to discharge to the open air.

Ventilation plant serving the basement and atria shall shut down and be under the control of FM staff via the BMS interface adjacent to the main fire alarm panels and be under the direction of the fire brigade.
All other ventilation plant shall continue to operate and shall be under the control of FM staff via the BMS interface adjacent to the main fire alarm panels and be under the direction of the fire brigade.
Interface to extinguishing systems in kitchen extract hood.
Access controlled doors in “alarm” sub-compartment shall be automatically released to ‘free’ state.
Access controlled doors in adjacent sub-compartments shall be automatically released to ‘free’ state.
Doors detents in “alarm” sub-compartment shall be released.
Door detents in adjacent sub-compartments shall be released
Global release of all external final escape doors.
A signal shall be relayed to the local smoke damper control panel and the relevant dampers will be opened/closed as necessary.
Lifts serving the area in alarm shall receive an appropriate signal to operate as detailed within the Fire Strategy,
Interfaces with fixed gaseous extinguishing system.
Interfaces with fire shutters.
Interface is activated within retail units/ tenanted spaces.
The pneumatic tube transport system shall be shut down globally following the completion of any transaction in progress.

The sprinkler system operates in isolation of the Fire Detection & Alarm system and therefore does not form part of the cause & effect scenario.

Manual Operation of Sounders

A manual alert/evacuate control facility shall be provided for each alarm sounder zone. This shall be integrated within the main fire alarm control and indication panel. It shall provide the facility to manually activate any sounder zone in alert or evacuate mode, and to enable progressive evacuation of the Hospital under control of the Fire Brigade. The controls shall meet the requirements of SHTM 82.

Grace Times

The system shall be capable of accommodating the following strategy if required to reduce false alarms.

For any zone to cause an evacuation signal a double knock scenario must occur, i.e. two devices must detect fire within that zone. When the first device operates, a supervisory alert signal shall be sounded at the main fire panel. The signal must be acknowledged within a pre-defined period or the system shall go to fire mode. However, if the signal is acknowledged, a timer shall be initiated which shall allow inspection of the area, the duration of which is to be agreed with the Board and the local fire authority. Should a second device operate within the alerted area within this period, then the system shall go to fire and operate in accordance with the relevant matrix drawing.

However, in the event of the operation of any manual call point, a single knock scenario shall take place, which shall cause immediately an evacuation fire signal.

Should this strategy be adopted, this must be agreed with the Hospital and the local fire authority.

Testing & Commissioning

The complete system shall be fully tested and commissioned in accordance with BS5839.

A full audibility test shall be carried out in the presence of the Fire Officer and any other bodies who need to be present.

Following the testing and commissioning, Project Co. shall issue a Certificate of Installation and Commissioning which shall conform with BS5839-1.

Project Co. shall take into account the need for maintaining patient security during alarm testing i.e. the testing regime shall not allow for ordinarily secure doors to open as a result of routine testing.

Demonstration

Following testing and commissioning, Project Co. shall demonstrate the completed system.

Documentation

Project Co. shall provide necessary documentation to confirm that the system will have a documented history of compatibility by design for a minimum of 15 years. Future compatibility shall be supported for no less than 10 years. Compatibility shall be defined as the ability to upgrade existing systems to current level of technology, and extend new field panels on a previously installed network.

Project Co. shall provide prior to completion a Log Book which shall conform with BS5839-1.

Software

Project Co. shall provide 2 N° copies of the software used on this project, following issue of the Certificate of Installation and Commissioning. Open protocol industry standard software must be used. All software shall be 'backwards compatible'.

Requirements Specific to the Energy Centre

The energy centre will house:-

Dual fuel (oil and gas) boilers. MV switchgear, diesel fuelled standby generator plant, CHP plant, fuel storage and associated pumps.

The fire alarm system shall include interfaces with gas shut off valves, interfaces with fusible links in boiler rooms, CHP room and generator rooms, interfaces with BMS.

In rooms where fuel is stored, pumped and utilised, the selected fire alarm equipment shall be suitable for the hazardous environment.

Audio/Visual alarms shall be provided throughout the energy centre selected to take account of the background noise.

W50 Fire detection and alarm systems

110 FIRE DETECTION AND ALARM SYSTEM
System manufacturer: Submit proposals.
Manufacturer approval: LPCB LPS 1014 certified.
Type: Automatic analogue addressable.
Category to BS 5839-1: L1.
Variations: None.
Detection devices:
Atmosphere: Normal.
Types:
Manual call points;
Optical beam smoke detectors ;
Point heat detectors ;
Point smoke detectors ; and
Submit design proposals.
Equipment interconnectivity: Enhanced fire resisting cabling.
Cable containment: Cable basket, as section Y63.
Rewireable installation: Required.
Concealed installation: Required.
Internal alarms:
Primary: Sounders.
Secondary: Visual alarm signal devices.
External alarms: Refer to Particular specification 'Existing site and services'.
Controls: Main control and indicating equipment.
Accessories:
Automatic door release mechanisms ;
Actuation of fire protection systems ;
Mimic panels ;
Remote indicators ;
Short circuit isolators ; and
Zone diagrams.

130 ASPIRATING DETECTION SYSTEMS refer to Particular specification.
System manufacturer: Submit proposals.
System type: Secondary sampling.
Equipment interconnectivity: Enhanced fire resisting cabling.
Cable containment: Cable basket, as section Y63.
Rewireable installation: Required.
Concealed installation: Required.

210A DESIGN OF FIRE DETECTION AND ALARM SYSTEMS
System designer: Board.
Design: Complete the design of the fire detection and alarm system in accordance with BS 5839-1, SHTM81 and 82, Scottish Non Domestic handbook, Fire, Annex 2b, Hospitals.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.
System design certificate: Submit with design proposals.
Design drawings to be co ordinated with architect's reflected ceiling grid
Submit cable containment and power supply requirements
Submit Cause and Effect matrix

215 DESIGN OF ASPIRATING DETECTION SYSTEMS
System designer: Board.
Design: Complete the design of the aspirating detection system in accordance with BFPSA Code of practice for category 1 aspirating detection systems.
Proposals: Submit drawings, technical information, calculations and manufacturers 'literature.
System design certificate: Submit with design proposals.

220 PERFORMANCE OF FIRE DETECTION AND ALARM SYSTEMS
Areas to be protected: Refer to the particular section of this specification for details of where protection may be omitted.
System objectives: To provide type L1 protection. To warn staff without undue disturbance to patients.
Spare system capacity: 10% loop loading.
Number of devices per zone (maximum): Board's choice.

225 PERFORMANCE OF ASPIRATING DETECTION SYSTEMS
Areas to be protected: Refer to Particular Specification.
System objectives:
In server rooms: To provide pre fire warning, interfaced with house fire alarm system, as described in the particular section of this specification. System will be used in area with high air flow.
In theatres and MRI - in lieu of ceiling mounted detectors.
Maximum transport time: 120s.
Sampling: Continuous.
System sensitivity: Very high.

250 DETECTION ZONES
Zoning: Submit proposals. Follow guidance given in BS5839-1 and SHTM 81 and SHTM 82. Refer to Architect's Fire Strategy Plans for compartments and sub compartments.

255 ALARM ZONES
Alarm zoning: Submit proposals.
Mode of operation: To warn staff without undue disturbance to patients. To facilitate progressive horizontal evacuation in accordance with SHTM 82. Refer to Particular section of this Specification.
All zone evacuate control: Not required.

260 ACTUATION OF FIRE PROTECTION SYSTEMS
Standard: To BS 7273-1.
Objectives: gaseous extinguishing systems in 2 no. server rooms to be actuated as described in the Particular section of this specification and clause S70.

265 INTEGRATION WITH OTHER ALARM AND SECURITY SYSTEMS
Objectives: Refer to particular.
Systems to be integrated: Refer to Particular.

266 INTERFACES TO EQUIPMENT
Interfaces to equipment not forming part of the fire detection and alarm system: Design system to interact with the equipment in the event of a fire or fault signal.
Equipment and mode of operation: Refer to Particular.

270 INTERFACE ISOLATION FOR TESTING PURPOSES
Isolation of systems and equipment: Design system so that the actuation, integration and interfacing can be isolated during fire alarm testing.
Means of isolation: Via CIE.

285 EXTERNAL ALARM SIGNALLING
Objective: External alarms required at each fire exit. External sounders to be silenced after 30minutes.

310 DETECTION DEVICES
Device address setup: Automatic via CIE.
Removal of devices: Must require a special tool. Must not affect the operation of alarm equipment.
Device bases: Maintain circuit continuity when device is removed.

320 PRODUCTS FOR USE IN EXPLOSIVE GAS OR VAPOUR ATMOSPHERES
Standard: To BS EN 60079-14.

330 PRODUCTS FOR USE IN EXPLOSIVE DUST ATMOSPHERES
Standards: To BS EN 61241-14 and BS EN 61241-17.

370 MANUAL CALL POINTS
Standard: To BS EN 54-11.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Operation: Type A.
Frangible element: Non-resettable.
Integral red visual indicator: Required.
Environmental category: Indoors.
Mounting: Fully recessed.
Time delay between activation of manual call point and the alarm signal (maximum): 3 s.
Protective covers: Not required.

380 OPTICAL BEAM SMOKE DETECTORS
Standard: To BS EN 54-12.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Thermal turbulence detection: Required.
Contamination compensation: Required.
Power supply: Internal.

400 POINT HEAT DETECTORS
Standard: To BS EN 54-5.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Classification: A1.
Suffix: S.
Type: Point.
Temperature activation settings to be below that of sprinkler heads.

410 POINT SMOKE DETECTORS
Standard: To BS EN 54-7.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Detection method: Multi criteria type.

420A ENHANCED FIRE RESISTING CABLING
All fire alarm system wiring, including loop wiring, power supplies and network cabling shall be of the enhanced type.
Type: In accordance with BS 5839-1.
Sheath and accessory colour: Red.
Refer to V32 clauses 420 & 420A to 420L.

430A STANDARD FIRE RESISTING CABLING
NOT TO BE USED

435 SOUNDERS
Standard: To BS EN 54-3.
Manufacturer: Board's choice.
Product reference: Submit proposals.
Type: Electronic sounder.
Sounder cut off time (maximum): 30 minutes.
Ingress protection standard: Type A.
Colour: Red.
Directional output at 1 m (minimum): Adjustable so as to alert staff only in patient areas.
Elsewhere to achieve noise level required by BS5839-1.
Integral beacon: Not required.
Mounting: Semi-recessed.
Power supply: From loop.

445 VIBRATING RADIO PAGERS
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Number to be supplied: 50.
Type of licence: Manual frequency co-ordinated licence.
Response time following alarm condition (maximum): 5 s.
Response to fire alarm condition:
Unique vibrating and audible output on alarm condition.
Duration: Continuous for 60 s or until acknowledged at the vibrating radio pager.
Priority over all other signals.
Response to loss of transmission: Identified at the pager within 5 m by a visual and tactile signal.
Power source: Battery.
Low battery warning: Indicated by visual and tactile signal.
Display:
80 character (minimum) LCD.
Backlight: Required.
Password protection: Required.

447 TRANSMITTERS FOR VIBRATING RADIO PAGERS
Manufacturer: As vibrating radio pager.
Product reference: Submit proposals.
Type of licence: As vibrating radio pager.
Power supply: Integral.
Standard: To BS EN 54-4.
Standby source: Rechargeable battery.
Indications:
Output fault signal;
Total loss of power supply; and
Battery supply failure.
Alarm outputs: Output to vibrating radio pagers and Output to fault warning equipment.

450A AUDIBLE / VISUAL ALARM SIGNAL DEVICES:
For use in plantrooms, service yards etc as detailed in Particular section of this specification
Manufacturer: Board's choice.
Product reference: Submit proposals.
Type: Xenon beacon, also to incorporate sounder to achieve sound levels required by BS5839-1.
Flash rate per minute:
Minimum: 30.
Maximum: 130.
Lens:
Material: Polycarbonate.
Colour: Red.
Enclosure ingress protection to BS EN 60529: IP44.

450B VISUAL ALARM SIGNAL DEVICES
For use in Operating theatres, ITU, audiology, Imaging and other areas of high dependency as detailed in the particular section of this specification
Manufacturer: Board's choice.
Product reference: Submit proposals.
Type: Xenon beacon.
Flash rate per minute:
Minimum: 30.
Maximum: 130.
Lens:
Material: Polycarbonate.
Colour: Red.
Enclosure ingress protection to BS EN 60529: IP44.

455 FULLY FUNCTIONAL REPEAT PANELS
Standard: To BS EN 54-2.
Features: Match CIE.

460 MAIN CONTROL AND INDICATING EQUIPMENT (CIE)
Standard: To BS EN 54-2.
Main display: 32 character alphanumeric colour display.

Zone indication to BS 5839-1: Individual LED status indicators.
Installed capacity: Board's choice.
Monitored sounder circuits (minimum): Board's choice.
Printer: Output to separate printer.
Indications:
Fault signals from points;
Total loss of power supply; and
Alarm counter.
Controls:
Coincidence detection;
Delays to the activation of outputs;
Disablement of addressable points; and
Test condition facilities.
Outputs:
Output to fire alarm devices;
Output to fire alarm routing equipment;
Output to fire protection equipment;
Output to fault warning equipment; and
Standardized input and output interface.
Input device: Alphanumeric keypad.
Enclosure: System manufacturer's standard.
Ingress protection to BS EN 60529: System manufacturer's standard.
Finish: Submit proposals
Mounting: Recessed.

465 POWER SUPPLY EQUIPMENT
Standard: To BS EN 54-4.
Standby source: Rechargeable battery (VRLA with 10 year life).
Time after which sufficient capacity remains to power the fire alarms for at least 30 minutes: 24 h. Note that although the system will be supported by standby generator it will not be permitted to reduce this duration accordingly.
Housing: Within the CIE.
Monitoring of power supplies: By the CIE.

470 AUTOMATIC DOOR RELEASE MECHANISMS
Standard: To BS 5839-3.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Control type: Electromagnetic.
Mounting type: wall mounted but at sufficient height to prevent damage by trolleys.
Operation: Automatic via CIE.
Power: Derived from sounder circuit.
Integral manual release button: Required.

475A MIMIC PANELS
Standard: To BS EN 54-2.
Manufacturer: System manufacturer.
Product reference: Submit proposals.
Type: Submit proposals.
Material: Submit proposals.
Enclosure ingress protection to BS EN 60529: IP44.
Mounting: Recessed.

480 REMOTE INDICATORS
Lamp: High intensity LED.
Colour: Red.
Lens:
Material: Polycarbonate.
Colour: Clear.
Enclosure ingress protection rating to BS EN 60529: IP 44.

550 SHORT CIRCUIT ISOLATORS
Manufacturer: Board's choice.
Product reference: Submit proposals.
Power supply: Loop powered.
Integral LED status indicator: Required.

565 ASPIRATING SMOKE DETECTION EQUIPMENT
Equipment: In accordance with section 11 of FIA Code of Practice for Design, Installation, Commissioning & Maintenance of Aspirating Smoke Detector (ASD) Systems.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Pipework: Submit proposals.
Size: Submit proposals.
Sampling points: Submit proposals.

650 INSTALLING MAIN CONTROL AND INDICATING EQUIPMENT (CIE)
Location: Submit proposals.
Power supply: Derive from a dedicated circuit from the main switchboard and connect to CIE via unswitched fused connection units.

660 INSTALLING CABLING
Standard: To BS 7671.
Cable route: Segregate from other cabling. Where installed in trunking, locate in a dedicated fire cabling compartment.
Type: Loop or radial circuits without spurs pr tees
Mechanical protection: in areas where physical damage or rodent attack could occur.
Fastening cables:
To building fabric: Metal P-clips with red plastic coating.
To cable supports: Metal bands with red plastic coating.
Cables passing through the building fabric: Sleeve.
Jointing: At equipment terminals.
Cable terminals: Use ceramic terminal blocks.
Maximum circuit resistance: Measure before concealment. Submit results.

670 INSTALLING POINT DETECTORS
Protective cage: Not required.

680 INSTALLING MANUAL CALL POINTS
Location: Prominent position.
Mounting height generally (above finished floor level): 1.2 m.
Test key: Locate to allow easy test operation.

Labelling: Identify the manual call point address.
Type: Face engraved rigid plastic laminate.
Background: White.
Lettering: Red.

700 INSTALLING SOUNDERS
Circuit wiring: Distribute and interleave multiple sounder circuits around the building.
Protective cage: Not required.

705 INSTALLING VISUAL ALARM SIGNAL DEVICES
Location: Submit proposals
Mounting height generally (above finished floor level): 2.1 m.
Protective cage: Not required.

710 INSTALLING SHORT CIRCUIT ISOLATORS
Location: Submit proposals.
Labelling: Identify the associated zones.

720 INSTALLING END OF LINE DEVICES
Location: Submit proposals.
Labelling: Identify the presence of an end of line device, and describe its function.

725A INSTALLING REMOTE INDICATORS
Concealed detection devices: Install individual LED indicators.
The provision of an individual indicator will generally not be necessary provided that the location of the detection device is clearly indicated at the CIE, exceptions: lift shafts, mechanical and electrical risers, electrical cupboards, electrical switchrooms and transformer rooms, lift motor rooms.

730 INSTALLING TRANSMITTERS FOR VIBRATING RADIO PAGERS
Location: Submit proposals.
Connection to equipment: Install interconnecting wiring between transmitter and: Submit proposals.
Power supply: Derive from a dedicated circuit from the main switchboard and connect via unswitched fused connection units.

740 INSTALLING INTERFACES TO OTHER EQUIPMENT AND SYSTEMS
Connection to equipment: Install interconnecting wiring between interface unit and equipment controlled.
Interface units: Label, describing their function.

750 INSTALLING ALL ZONE EVACUATION CONTROLS
Location: Integral within CIE.

760 INSTALLING ASPIRATING SMOKE DETECTION SYSTEMS
Pipework:
Joints: Solvent welded.
Bends: Long radius.
Labelling: Along the pipework and at each sampling point.
Connection to sampling point: Rigid extended sampling pipe.

910 TESTING AND COMMISSIONING GENERALLY
Commissioning: In accordance with BS 5839-1.
System commissioning agent: Board.
System verification agent: Board.
Notice before commencing tests (minimum): 2 weeks.

911 SYSTEM INFORMATION
Device list: Before commissioning submit proposals, including proposed device and zone names.
Zone diagram: Before commissioning submit proposals.

915 TESTING AND COMMISSIONING OF ASPIRATING SMOKE DETECTION SYSTEMS
Standard: In accordance with FIA Code of Practice for Design, Installation, Commissioning & Maintenance of Aspirating Smoke Detector (ASD) Systems.

920 DEVICE IDENTIFICATION AND TESTING
Device identification: Label devices with a unique address corresponding to that used by the CIE.
Device testing: Verify the operation of each device. Submit a schedule of devices, including the device test methods and results.

925 CABLE TESTING
Insulation resistance: Submit results.
Earth continuity: Submit results.

930 SYSTEM SOAK TESTING
Soak test: Undertake when construction works are complete, but before handover.
Period: 14 days per construction zone.
Re-test after remedial works.

935 STANDBY BATTERY TESTING
Mains power supply: Isolate.
Quiescent mode: Measure current supplied by standby source when fire detection and alarm system is operating in the quiescent mode. Submit results.
Alarm mode: Measure current supplied by standby source when fire detection and alarm system is operating in the alarm mode. Submit results.

940 TESTING ACTUATION, INTEGRATION AND INTERFACING WITH ALARM AND SECURITY SYSTEMS
Connections with other systems and equipment: Verify and demonstrate operation of the systems and equipment under fire and fault conditions.

945 MEASUREMENT OF SOUND PRESSURE LEVELS
Sound pressure levels: Measure throughout the building.
Test instrument:
Standard: To BS EN 61672-1.
Setting: Slow response, weighting A.

Doors: Close before measuring sound pressure levels.
Results: Submit.
Format: Electronic layout drawing showing location of measurements with results

960 CERTIFICATION
Format: In accordance with BS 5839-1 Annex G.
Number of copies: Match operation and maintenance manuals.
Design certificate: Submit.
Installation certificate: Submit.
Commissioning certificate: Submit.
Verification certificate: Submit.
Test certificate: Submit.
Fire Alarm Sound Record Sheets: Submit.

965 DOCUMENTATION
Operation and maintenance instructions, record drawings & test/commissioning certificates to be compatible with Zutec system.
Operation and maintenance manual: Submit.
Record drawings: Submit.
Fire evacuation plan: Submit.
Format: Electronic colour CAD layout.

970 LOG BOOKS
Format: To BS 5839-1 Annex F.
Number of copies: 1.

980 ACCEPTANCE CERTIFICATE
Acceptance certificate: Prepare and submit.

990 SPARES AND CONSUMABLES
Supply the following spares:
Frangible elements for manual call points: 10.
Detectors: 2 of each type
Printer ink and paper roll: Replace immediately before handover.

S70 Gaseous fire-extinguishing systems

GENERAL

120 HALOCARBON GAS TOTAL FLOODING FIRE-EXTINGUISHING SYSTEM
System manufacturer: Submit proposals.
Extinguishant type: Submit proposals.
Source: High pressure storage cylinders.
Pipelines: Submit design and cost proposals.
Pipeline ancillaries:
Container valve assemblies and their actuators;
Check valves and non-return valves; and
Submit design and cost proposals.
Outlets: Nozzles.
Operation: Electrical actuation.
Controls:
Control panel;
Electrical automatic control and delay devices;
Non-electrical automatic control and delay devices;
Manual triggering and stop devices;
Pneumatic alarm devices; and
Submit design and cost proposals.
Accessories: Submit design and cost proposals.
Completion:
Plant and equipment identification: Submit design and cost proposals.

SYSTEM PERFORMANCE

210 DESIGN
Design: Complete the design of the gaseous fire-extinguishing system.
Proposals: Submit drawings, technical information, calculations and manufacturers' literature.

230 HALOCARBON GAS FIRE-EXTINGUISHING SYSTEM
Standards:
CEA 410 (FC-3-1-10) extinguishant: To BS ISO 14520-4.
FE-13 (HFC 23) extinguishant: To BS EN 15004-6.
FE-36 (HFC 236fa) extinguishant: To BS ISO 14520-11.
FM-200 (HFC 227) extinguishant: To BS EN 15004-5.

PRODUCTS

310 HIGH PRESSURE STORAGE CYLINDERSFOR HALOCARBON GAS TOTAL FLOODING FIRE-EXTINGUISHING SYSTEM
Standards: To BS EN ISO 9809-1 and BS EN ISO 9809-3.
Type: submit proposals.
Manufacturer: System manufacturer.
Product reference: Submit proposals.
Number: Submit proposals.
Capacity: Submit proposals.

325 CONTAINER VALVE ASSEMBLIES AND THEIR ACTUATORS
Standard: To BS EN 12094-4.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

326 HIGH AND LOW PRESSURE SELECTOR VALVES AND THEIR ACTUATORS
Standard: To BS EN 12094-5.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

328 CHECK VALVES AND NON-RETURN VALVES
Standard: To BS EN 12094-13.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

340A NOZZLES FOR HALOCARBON GAS FIRE-EXTINGUISHING SYSTEMS Server rooms x 2
Type: Overhead.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

350 ELECTRICAL ACTUATIONFOR HALOCARBON GAS TOTAL FLOODING FIRE-EXTINGUISHING SYSTEM
Actuator: In accordance with BS 7273-1.
Type: Point smoke detector.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

360 MECHANICAL ACTUATIONFOR HALOCARBON GAS TOTAL FLOODING FIRE-EXTINGUISHING SYSTEM
Actuator: In accordance with BS 7273-2.
Type: Manual release.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

370 CONTROL PANELSFOR HALOCARBON GAS TOTAL FLOODING FIRE-EXTINGUISHING SYSTEM
Type: Submit proposals.
Manufacturer: Submit proposals.
Product reference: Submit proposals.
Components on panel fascia:
Alarm silence lamp;
Buzzer silence;
Fire-extinguishing system automatic mode - lamp;
Fire-extinguishing system manual mode - lamp;
Hold gas release - switch and lamp;
Isolate gas release circuit - switch and lamp;
Isolate remote signal - switch and lamp;
Key operated security switch;
Lamp test switch;
Manual/ automatic mode - push switch;
Manual release unit ;
Power on lamp;

Silence alarm switch;
System general fault - lamp and buzzer;
Test evacuate alarm switch; and
Submit proposals.

380 ELECTRICAL AUTOMATIC CONTROL AND DELAY DEVICES
Standard: To BS EN 12094-1.
Controls:
Abort switch ;
Automatic and manual/ manual only switch;
Discharge prevention device;
Hold switch ;
Manual release switch;
Time delay facility; and
Submit proposals.

390 NON-ELECTRICAL AUTOMATIC CONTROL AND DELAY DEVICES
Standard: To BS EN 12094-2.
Controls:
Abort switch ;
Automatic and manual/ manual only switch;
Discharge prevention device;
Hold switch ;
Manual release switch;
Time delay facility; and
Submit proposals.

400 MANUAL TRIGGERING AND STOP DEVICES
Standard: To BS EN 12094-3.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

410 NON-ELECTRICAL DISABLE DEVICES
Standard: To BS EN 12094-6.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

420 PNEUMATIC ALARM DEVICES
Standard: To BS EN 12094-12.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

450 PRESSURE GAUGES AND PRESSURE SWITCHES
Standard: To BS EN 12094-10.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

460 ODORIZING DEVICES
Standard: To BS EN 12094-16.
Manufacturer: Submit proposals.
Product reference: Submit proposals.

EXECUTION

620 INSTALLING STORAGE CYLINDERS
Location: Close to the hazards they protect.
Protection for severe climatic or mechanical exposure: Provide guards or enclosures.
Sunlight: Protect from direct sunlight.

630 INSTALLING NOZZLES
Location: Free of obstructions, air currents and draughts.
Position: Install perpendicular to the hazard centred over the area protected by the nozzle, or between 45° and 90° from the plane of the hazard surface.

640 INSTALLING CONTROL PANELS
Location: Exit to the protected space.
Mounting: Semi-recessed with collar.

COMPLETION

910 TESTING
Notice (minimum): 3 days.
Static pressure test:
Open ended pipelines: Pneumatically test in a closed circuit for 10 minutes at 3 bar (300 kPa). The pressure drop must not exceed 20% of the test pressure.
Closed sections of pipelines: Hydrostatically test to 190 bar (19000 kPa) for high pressure systems and 36 bar (3600 kPa) for low pressure systems, for a period of 2 minutes. After this period check that there is no leakage.
Purging: On completion of testing, purge the systems. Remove moisture.

920 SETTING TO WORK
Operation: Using nitrogen, or a suitable alternative, test that flow through pipelines and nozzles is unobstructed.
Thermal links: Check that control cable lines are free.
Pneumatic heat actuation: Test using manometer. Capillary lines must be leak free.

930 DOCUMENTATION
Operation and maintenance instructions: Submit.
Record drawings: Submit.

940 OPERATING TOOLS
Tools: Supply tools for operation and maintenance purposes.
Quantity: 2 sets.

Add value.
Inspire trust.

Edinburgh RHSC-DCN

Critical Care Department Briefing Review

April 2022

Mechanical, Electrical and Public Health Consulting Engineers

Issue / Revision Record

Issue	Date	By	Checked	Comment
1	08.04.22	SMCK	BR	Initial Report

We aim to be the pre-eminent provider of quality building services solutions and the best to work with, in the view of our clients, partners and colleagues. We believe in a sustainability led approach to design for the benefit of our clients and the world we live in.

It is our ultimate goal to work closely with our fellow professionals and clients to minimise carbon emissions and to deliver a better environment for us all to live in.

Contents

1.0 Introduction

This Report examines the Client's briefing for the Critical Care Department at Edinburgh's RHSC-DCN Hospital, with particular regard to Ventilation and Pressurisation conditions. The documents being reviewed comprising the H&K Reference Design Briefing Environmental Matrix and accompanying Guidance notes.

These documents have been reviewed along with any referenced documentation and commentary provided against any additional Ventilation Performance guidance contained within.

2.0 Executive Summary

From our Review of all referenced documents, we have not found any guidance with regards to ventilation rates other than that provided for Neutropenic Patient Ward and Isolation Rooms the latter of which confirms the requirement for pressurised lobbies to +10 Pa and 10 A/C per hour.

We would also advise that the Client NHSL was given numerous opportunities to comment on the bedroom air change rates being provided within this Department and never advised that these should be treated any differently from sleeping accommodation throughout the Hospital at 4 A/C per hour mechanical Supply and notional balanced pressure with no defined or monitored value.

3.0 Briefing Information

3.1 Environmental Matrix Table

Within this Table the Client has briefed 4 A/C per hour Positive pressure but no defined value for PICU 4 Beds with the exception of Single Bed Isolation Cubicle, which is noted as HBN 04 Dependant, Neonatal HDU Single Bed Cubicle 4 A/C per hour.

Throughout this Table only Isolation Cubicles and associated Gowning Lobbies are quoted as HBN 04 dependant.

3.2 Guidance Notes

Within the Guidance Notes clauses Notes 1,15 and 21 make reference to HDU (High Dependency Unit) and PICU (Paediatric Intensive Care Unit) and advise as below:

Note 1. This workbook is prepared for the Reference Design Stage as an easier reference tool to replace ADB RDS M+E sheets for the Environmental Criteria elements as described on these sheets.

Note 15 (part) HDU Bed Areas - Design Criteria - HBN 57 gives specific guidance as well as SHTM 03-01 esp Appendix1 for air changes -10 A/C per hour Supply,18 to 25ºC control Range …….

Note 21 Note that Isolation Suite ventilation provisions for this project shall follow HBN 04 Supplement 1 Section 4 Item 4.8 Guidance ……..

4.0 Reference Documents

In carrying out this review we have examined the following referenced Documents, copies of which are attached within the Appendix:

- B1 Critical Care Clinical Output based Specification
- H&K Reference Design Briefing Environmental Matrix as per Contract briefing document with guidance notes
- HBN 04-02 Critical Care Units
- HBN 57 Critical Care (old doc))
- SHPN 04 Supplement Isolation suites
- HTM 2025 (old doc)
- SHTM 03-01 Appendix 1: Table A1
- HBN 04 Supplement 1
- Ward Layout Drawing
- HBN 23 Hospital Accommodation for children and young people (not referenced)

5.0 Commentary

We have noted our comments against each of the referenced Documents below.

Critical Care Clinical Output Specification SEPT 2014

This is the particular Client Department Specification within which the only reference to ventilation is on Page 14 of this document which refers to lobbied Single Bed Isolation Rooms and confirms positive pressure lobbies to be provided.

Reference Data is recorded in Section 1.9 and includes:

HBN 57 Facilities for Critical Care (See Below)
SHTM 2025 Ventilation (See Below)

H&K Reference Design Briefing Environmental Matrix as per Contract briefing document with guidance notes

As per the notes above only Isolation Suites Section 1.8 are refenced differently from other patient accommodation and on the notes we have extracted the references to various Guidance Documentation.

These are HBN 57 (see Below) SHTM 03-01 Table 1 (See Below) and HBN 04 Supplement 1 (see below).

HBN 04-02 Critical Care Units OCT 2014

Section 4 Page 7 Whole unit planning and Design considerations makes passing mention of ventilation but no defined standards.

Section 6 Clinical Spaces Notes 6.1 to 6.9 details Isolation Rooms and their ventilation. There does not appear to be any other reference to ventilation of patient areas with 4.4 repeating the 10 A/C per hour and +10 Pa guidance for the lobby. There does not appear to be any guidance on A/C per hour or pressure for other than the Isolation Rooms.

HBN 57 Critical Care (old doc) 2003

Section 8 Engineering Requirements includes for Ventilation sec 8.42 talks about a balanced Supply and Extract but also refers to each bedroom having a lobby which we would translate as Isolation Facilities see section 8.50.

SHPN 04 Supplement Isolation facilities in Acute Settings Sept 2008

Sec 2.5 defines two Isolation facilities.

Enhanced single room with en-suite facilities.
Enhanced single room with en -suite facilities and ventilated bed access lobby (isolation suite).

Neither of which are applicable as generally the rooms in Critical Care we are looking at don't have en-suite facilities. However, ignoring this,the document states that the Enhanced Single Room need only have extract ventilation.

Section 4 Page 15, describes Ventilation for an Isolation Suite.

HTM 2025 (old) 1994

Section 2 refers to Provision of Ventilation in Healthcare Buildings and gives a general description of various ventilation systems.

Section 6 Special Ventilation Systems does not appear to have specific guidance for Critical Care Areas.

SHTM 03-01 Table1

Refers to Critical Care Areas at 10A/C per hour with +10 Pa and has a specific note re Isolation Rooms. Where as Isolation Rooms also on the table are referred to HBN 04-01, see note above where HBN 04-01 refers specifically to Isolation Rooms with en-suites.

SHPN 04 Supplement 1 Isolation Facilities in Acute Settings Sept 2008

Again, this refers to rooms with en-suite facilities which isn't what we have, and A/C per hour and pressure are for lobbied Isolation Suites not Bedrooms.

Ward Layout Drawing

This drawing is provided for general guidance to the Department layout.

Health Building Note 23 Hospital Accommodation for Children and young people 2004

Whilst this document doesn't appear to be referenced in the H&K Reference Design Briefing Environmental Matrix and cross referencing notes we felt it appropriate to include within this review.

Section 5, page 51 refers to Engineering Services and cross references HBN 57 for Critical Care page 51 and 5.60 page 55 for Isolation rooms.

Again, no other reference appears to be given to bedrooms requiring 10 A/C per hour and +10 Pa pressure.

6.0 Conclusions

From our review of all of the referenced documents we can find no reference to providing 10 A/C per hour and +10 Pa positive pressure for any other area of patient accommodation other than those associated with Isolation Suites and Neutropenic Wards.

We would suggest that if higher Air Change Rates were a Client requirement they were never requested within the briefing documentation.

7.0 Appendices

- B1 Critical Care Clinical Output based Specification
- H&K Reference Design Briefing Environmental Matrix as per Contract briefing document with guidance notes
- HBN 04-02 Critical Care Units
- HBN 57 Critical Care (old doc))
- SHPN 04 Supplement Isolation suites
- HTM 2025 (old doc)
- SHTM 03-01 Appendix 1: Table A1
- HBN 04 Supplement 1
- Ward Layout Drawing
- HBN 23 Hospital Accommodation for children and young people (not referenced)

Re-provision of RHSC and DCN at Little France

ITPD: Volume 3 **(Part 6 Section 3 Sub-Sections A to E of the Schedule to the Project Agreement)** **The Board's Construction Requirements**	**Doc No:** **Title** **Revision:** **Date:**	**Volume 3** **Board's Construction Requirements** **Rev A** **March 2013**
Author: NHS Lothian (The Board).		

SCHEDULE TO THE PROJECT AGREEMENT

PART 6

Section 3: The Board's Construction Requirements

Sub-Section A: Introduction

Part 6 Section 3 of the Project Agreement encompasses the construction requirements of the Board and is divided into the following Sub-Sections and Appendices:

Sub-Section A Introduction

Sub-Section B Definitions and Abbreviations

Sub-Section C General Requirements

This Sub-Section contains overall philosophy and standards for the design, construction and finish and associated infrastructure, both internal and external for the Works and/or the Facilities.

Sub-Section D Specific Clinical Requirements

This Sub-Section contains design philosophy and specific requirements for each of the Clinical Services to be provided from the Facilities.

Sub-Section E Specific Non-Clinical Requirements

This Sub-Section contains Soft FM summary interface specifications and other Non-Clinical specifications related to the Works and/or the Facilities.

Appendix A Interface with Campus Site and/or Campus Facilities

Part 1 – Interface Construction Matters and Interface Proposals

Part 2 – Interface Proposals Procedure

Part 3 – General Matters

Annex 1 – Form of Notice

Appendix B Interface Output Specification

Appendix C Environmental Matrix

Appendix D Not Used

Appendix E Initial Drainage Proposal

Appendix F Access Strategy

Appendix G Connection Proposal

Appendix H Construction Access Proposal

Appendix I Oversail Strategy

Appendix J Service Proposal

Appendix K Substation Proposal

Appendix L Supplemental Drainage Proposal

Appendix M TMS

SCHEDULE TO THE PROJECT AGREEMENT

PART 6

Section 3: The Board's Construction Requirements

Sub-Section B: Definitions & Abbreviations

A. Terms used in this Schedule Part 6 Section 3 where defined in the Project Agreement shall have the meanings ascribed to them in the Project Agreement or otherwise shall have the meanings given to them as follows:-.The following abbreviations have been used in this Schedule Part 6 Section 3:

24/7	Twenty four hours a day seven days a week
ACS	ACS Accreditation (formerly CORGI Regulations)
AEDET	Achieving Excellence – Design Evaluation Toolkit
AFD	Action for Disability
AHU	Air Handling Unit
AGSS	Anaesthetic Gas Scavenging System
BCR	Board's Construction Requirements
BEAM	Building Environment Assessment Methodology
BMS	Building Management System
BREEAM	BRE Environmental Assessment Method
BS	British Standard
BSRIA	Building Services Research & Information Association
CAA	Civil Aviation Authority
CAMHS	Child and Adolescent Mental Health Service
CCTV	Closed-circuit television
CDM	CDM Regulations
CEL	Scottish Government Health Directorates Circulars
CEN	European Committee for Standardisation
CHP	Combined Heat & Power
CIBSE	Chartered Institution of Building Services Engineers
COSHH	Control of Substances Hazardous to Health

CP	Code of Practice
CYPH	Children and young peoples hospital which may otherwise be known as RHSC (Royal Hospital for Sick Children)
DCN	Department of Clinical Neurosciences which forms part of the Facilities
DDI	Direct Dial In
DGH	District General Hospital
DHW	Domestic Hot Water
DoE	Department of the Environment
ED	Emergency Department
EMS	Environmental Management System
EN	Euronorm Standards
EPC	Energy Performance Certificate
EU ETS	European Union Emission Trading System
HBN	Health Building Notes
HDL	Health Department Letters
HDU	High Dependency Unit
HFN	Health Facilities Notes
HFS	Health Facilities Scotland
HGN	Health Guidance Notes
HIS	Healthcare Improvement Scotland
HSE	Health & Safety Executive
HSDU	Hospital Sterilisation and Disinfection Unit
HTM	Health Technical Memoranda
HVAC	Heating Ventilation & Air Conditioning
HWS	Hot Water Supply
ICAO	International Civil Aviation Organisation
ICT	Information & Communication Technology

IDS	Intruder Detection System
IES	Illuminating Engineering Society
IEE	Institution of Electrical Engineers
IHT	Institute of Highways & Transportation
IP	Interpenetration Protection rating
IPS	Isolated Power Supply
IT	Information Technology
ITPD	Invitation to Participate in Dialogue
JAA	Joint Aviation Authority
LAN	Local Area Network
LEV	Local Exhaust Ventilation
LPS	Loss Prevention Standard
MAOT	Mobile Air Operations Team
MCA	Maritime and Coastguard Agency
MEL	Management Executive Letter (now known as Health Department Letters – HDL)
MRI	Magnetic Resonance Imaging
MTBF	Mean Time Before Fail
MOD	Ministry of Defence
NBS	National Building Specifications
NEAT	NHS Environmental Assessment Tool
NHBC	National House Building Council
NHS	National Health Service
NHSIA	National Health Service Information Authority
NHSL	NHS Lothian
PA	Public Address system
PBX	Private Branch Exchange
PCIU	Percutaneous Cardiac Investigation Unit

PCP	Project Co's Proposals
PICU	Paediatric Intensive Care Unit
PIR	Passive Infra-red
PoE	Power-over-Ethernet
PPE	Personal Protective Equipment
PPG	Planning Policy Guidance
RBD	Reliability Block Diagram
RDD	Reviewable Design Data
RFFS	Rescue and Fire Fighting Services
RHSC	Children and young peoples' hospital (which may be known as CYPH and/or Royal Hospital for Sick Children) which forms part of the Facilities
SAR	Search and Rescue
SCIEH	Scottish Centre for Infection and Environmental Health
SCIM	Scottish Government Capital Investment Manual
SEHD	Scottish Executive Health Department
SEPA	Scottish Environment Protection Agency
SFPN	Scottish Fire Practice Notes
SFT	Scottish Futures Trust
SGHSCD	Scottish Government Health and Social Care Directorates
SHFN	Scottish Health Facilities Notes
SHGN	Scottish Health Guidance Notes
SHPN	Scottish Health Planning Notes and Scottish Hospital Planning Notes
SHS	Scottish Healthcare Supplies
SHTM	Scottish Health Technical Memoranda
SHTN	Scottish Hospital Technical Notes
SI	International System of Units
SUDS	Sustainable Urban Drainage System

TPO	Tree Preservation Order
UPS	Un-interruptible Power Supplies
VIE	Vacuum Insulated Evaporator
VDU	Visual Display Unit
VoIP	Voice over Internet Protocol (or Voice Over IP)
WC	Water Closet
WRAP	Waste & Resources Action Programme

B. The following additional definitions have been used in this Schedule Part 6 Section 3:

Adaptability Strategy	Means the Adaptability Strategy, provided by Project Co to define their strategy for ensuring appropriate provision for adaptability and flexibility of the Facilities
Appendix A	Means Appendix A (Interface with Campus Site and/or Campus Facilities) annexed to this Sub-Section C of Section 3 *(Board's Construction Requirements)* of Schedule Part 6 *(Construction Matters)* as varied, amended or supplemented from time to time in accordance with the Project Agreement;
Benefit Realisation Plan	A benefits realisation plan acts as an overview of the main milestones detailed in each benefit profile. It serves as a management tool to monitor, track and manage the collective set of benefits associated with a project. The key activities (e.g. measurements, evaluations etc), from each benefit should be drawn together to form the consolidated plan. This will provide a centralised resource to help keep track of what needs to be done, when and by whom, to manage the successful realisation of benefits.
Blue Light	Ambulance, police and fire services
Car Park B	The car park which ceases to be used as a car park and is the Site
Certified Wood	Timber certified by Forest Stewardship Council
Corporate Greencode	Corporate GREENCODE® is a suite of software, templates and support materials developed by the NHS for the NHS. It is maintained by Health Facilities Scotland (HFS) to: • guide you through the development and implementation of a corporate Environmental Management System (EMS) and

	• provide tools to help you run and maintain your corporate EMS.
Council	The City of Edinburgh Council
Design Champion	Person in the Board who promotes the importance of achieving quality in capital developments and in ongoing initiatives to improve both the patient environment and the working lives of staff
Encode	HTM 07-02: EnCO2de – Making energy work in healthcare
Environmental Matrix	Means the Environmental Matrix, which details the room environmental condition requirements of the Board required within each department / unit / space / area. The title is Reference Design Envisaged Solution – RHSC / DCN Environmental Matrix version third issue as set out in Appendix C of this Section 3 *(Board's Construction Requirements)* of Schedule Part 6 *(Construction Matters)* (as varied, amended or supplemented from time to time in accordance with the Project Agreement);
Existing CAMHS	Child and Adolescent Mental Health Services currently at the Royal Edinburgh Hospital and Forteviot at the Existing RHSC
Existing DCN	Department of Clinical Neurosciences, Western General Hospital, Edinburgh
Existing RHSC	Royal Hospital for Sick Children, 9 Sciennes Road, Edinburgh
Family Council	Works collaboratively with partners, such as the Board, RHSC reprovision team and other forums, to ensure that the family perspective is integrated into current service provision, including redesign, for Children & Young People (C&YP) services
Firecode	Firecode consists of a number of Health Technical Memoranda (HTM) which consider policy, technical guidance and specialist aspects of fire precautions. Full list of HTM obtained from http://www.dh.gov.uk/en/Publicationsandstatistics/Lettersandcirculars/Firecode/DH_609
Good Practice Guidance for selecting materials	The edition of the publication entitled "Good practice in the selection of construction materials" (British Council for Offices (BCO): 2011) or any amended or updated version as at Financial Close.
Green Travel Plan	Means the NHS Lothian Sustainable Development Strategy Green Travel Plan.

HAI SCRIBE	Healthcare Associated Infection System for Controlling Risk In the Built Environment
HEAT	Means Health Improvement Efficiency and Governance, Access to Service, and Treatment Appropriate to Individuals
Hot Core	Direct vertical patient circulations route from Helipad to Emergency Department and from Emergency Department to Operating Theatres.
Identikit	Means NHS Scotland Identity Guidelines
Major Incident	As defined by the Board's Major Incident Strategy Response Plan Strategic Plan Number reference HPT E023 03
NHS Requirements	Means the requirements defined in paragraph 2.3 of this Sub-Section C as the same may be amended from time to time
Nursery	Means former Acorns nursery 51 Little France Crescent Edinburgh EH16 4SA
Project Sponsor	Person who is responsible within the Board for the success of the project
Safety Action Notices	Safety Action Notices were standard priority safety warnings issued in Scotland from 1995 to 2009 when they were superseded by Medical Device Alerts (from the MHRA – Medicine and Healthcare Products Regulatory Agency) and Estates & Facilities Alerts.
Secured by Design	Is the official UK Police flagship initiative supporting the principles of 'designing out crime'
Touch Down Base	A workstation space where staff can access a PC, Telephone, Printer ,radiological examinations, patient monitoring systems, emergency nurse/patient call system and other administrative tools to assist the clinical practitioner in executing their job.
Vistamatic	Glazed secure vision panel

SCHEDULE TO THE PROJECT AGREEMENT

PART 6

Section 3: The Board's Construction Requirements

Sub-Section C: General Requirements

1 Introduction

This document sets out the key design criteria and the core requirement to create a modern facility to re-provide services from the Existing RHSC, Existing CAMHS and the Existing DCN in a single building adjoining the RIE Facilities at the Campus Site. The design shall be enduring and take account of the history, culture and physical requirements of these internationally renowned centres of excellence.

Part 6 Schedule 3 Sub-Section C forms the general construction requirements included in the Board's Construction Requirements. Project Co shall satisfy all the requirements under this Sub-Section C.

This (and subsequent) sections of Sub-Section C of the Board's Construction Requirements outlines the overall aims of the Board with regard to the design quality of the Facilities. This Sub-Section C shall be read in conjunction with, but not limited to the following documents:

The Board's Policies; and

Project Specific Requirements defined in Sub-Sections D and E, and Appendices to this Schedule Part 6 Section 3.

Sub-Section C is divided into the following paragraphs.

Contents

2 Project Wide Requirements

The Board's vision is to provide high-quality, patient-centred services from modern Facilities. The new hospital is a single building supported by the separate energy centre but Project Co may provide other buildings on the Site to house plant and services. Where the term "building" is used, this refers to the RHSC and DCN hospital building. The energy centre and Project Co's other buildings shall meet the relevant requirements of Part 6 Schedule 3 Sub-Section C of the Board's Construction Requirements. The physical design and access to the Facilities shall promote and enhance the delivery of that full range of services, all to the benefit of patients, visitors, public and staff alike. Additionally the design strategy shall respond to the needs and aspirations of a variety of service providers including the NHS, local authorities and other community based services. The wish of the Board is to create a centre of excellence that may be an inspiration to others and set a benchmark of quality of sustainable design.

Project Co shall ensure the design complies with the general ethos detailed here, whilst also addressing the detailed requirements listed in the following clauses. It shall be noted that the requirements detailed are not exhaustive, and it is recognised that specific clinical needs will determine the nature and design of Facilities in some areas.

The Board requires the following matters to be addressed as part of its requirements:

a) The need for Project Co to maintain leadership throughout to the agreed final design stage and;

b) The Board's management team will be actively involved and will support both the project team and the clinicians.

Project Co shall support the Board's vision as stated above and develop a partnership with the Board to ensure that these aspirations are met and that Project Co co-operate fully in the evaluation of these criteria with the Board at key stages of the process.

Project Co shall ensure that the design of the Facilities draws upon and endeavours to further develop, improve and exceed current best practice (and Good Industry Practice) standards achieved in other similar schemes, and meets the requirements of the prospective patient groups, staff and the public. This philosophy of design and sustainability shall be extended across all parts of the Facilities including landscaped and external areas as well as the essential patient areas and these endeavours should extend to benefit the wider population of the community.

The Board is keen to actively participate in the design process. To facilitate this, Project Co shall engage the Board in the design and in particular the Reviewable Design Data.

2.1 Approach to Design

The Scottish Parliament has articulated the desire that Scotland becomes ***"the best small country in the world"*** and has further asserted that the quality of our built environment is a key factor in achieving this. The Scottish Government Health and Social Care Directorates (SGHSCD) believe that improving the quality of our caring environments is crucial to delivering the confident, compassionate Scotland that is aspired to.

The new building will follow the design aspirations and guidance laid out in the Policy on Design Quality for NHS Scotland (2010) to which the Board subscribes and implements through its Design Champion. The DCN will meet the objectives of the DCN stakeholders. Specifically for children and young people it will deliver the quality objectives laid down by the Family Council and other stakeholders in the project. The quality objectives of the children and young people's Family Council are:

a) The new hospital will be a beautiful place with Children and Young People at the centre of a nurturing, engaged and safe community.

b) The new hospital will provide systems and spaces that recognise the healing capacity of sustaining everyday lives and provide parallel pathways of care for patients, carers and families.

The DCN part of the Facilities will have a physical link with the existing RIE Facilities specifically with the critical care unit. Project Co should generally design and also satisfy themselves that the Facilities are capable of being so designed so that the construction and operation of the Facilities will all be within the Site subject to the rights granted to Project Co on the RIE Site and/or Bioquarter Site, as applicable, as detailed in Clause 9 (Nature of Land Interests) of the Project Agreement and subject to Appendix A. If any access or other rights are required for the construction and operation of Facilities outwith the Site and on any part of the Retained Site and/or Retained Estate and/or Bioquarter Site then Project Co will be required to notify the Board and seek agreement of the Board for the exercise of any such rights. If Project Co requires any access or other rights outwith the Campus Site and/or Bioquarter Site then Project Co recognises that consent to such rights will be required from the owner and/or operator and/or occupier of the affected property and Project Co will be responsible for obtaining any such consents.

The design will be evaluated against BREEAM 2011 New Construction (SD5073) (with BREEAM ENE1 target of 6 credits (excellent) in accordance with the BREEAM Scheme Document for New Construction (SD5073) Section 6.ENE1).

The design needs to realise the aspirations of the Benefit Realisation Plan.

The Design Champion for the project is the NHS Lothian's Project Sponsor, supported by the Director of Capital Planning and Projects, and the design process is managed by the reprovision project team.

Project Co shall take cognisance of all the architectural and building services implications of the requirements described in the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

2.2 General Requirements of the Board

Architectural and General Design

Project Co shall ensure the Facilities comply with the following general requirements of the Board:

a) Application of the principles contained within "A Policy on Architecture for Scotland, 2001"and "A Policy on Architecture for Scotland, Public Consultation, Review of Policy" 2006 both published by the Scottish Government;

b) Adherence to the requirements set out in CEL 19 (2010) “A Policy for Design Quality for NHSScotland, 2010 Revision published by the Scottish Government;

c) Application of the principles contained in “Improving Standards of Design in the Procurement of Public Buildings”, 2002 published by the Office of Government Commerce;

d) Application of the principles within the Scottish Government Health and Social Care Directorate's "A Policy on Sustainable Development for NHSScotland 2012". All NHS Scotland bodies engaged in the procurement of new healthcare buildings must carry out independent sustainability accreditation for projects;

e) Application of the principles contained in “Healthier Places” – Architecture & Design Scotland; and

f) Application of the principles contained in “A Vision of Health NHSScotland’s agenda for realising value in the developing healthcare estate” – Architecture & Design Scotland

Clinical Design Issues

a) In-patients and out-patients shall have an appropriate level of privacy and allow an adequate level of observation by staff;

b) The Facilities shall be designed to handle the projected workload;

c) The design shall provide and promote a calm, safe working environment and shall contribute to the development of this requirement through the choice of colours, soft furnishings and the visual integration of all safety and security systems;

d) Entrances and waiting areas shall have a light, spacious and welcoming atmosphere and the main entrances shall be immediately apparent;

General Design Issues

a) Whilst maintaining an integrated approach to the design of the Facilities, Project Co shall ensure that individual departmental design is age-appropriate and that patient orientation and recognition of location is achieved. Project Co shall consult the Board with respect to the interior design proposals and the Board’s preferences and opinions shall be taken into account in the final choices;

b) The Facilities shall incorporate the recommendations of "Effective Wayfinding and Signing Systems - Guidance for Healthcare Facilities" 2nd Edition 2005, NHSScotland Signage Guidelines, NHSScotland Identity Guidelines and BS8501:2002. “Graphic symbols and signs – Public information symbols” and have a co-ordinated décor and sign-posting scheme to create a safe and readily-understood patient environment;

c) The Facilities shall incorporate appropriate standards of security, and minimise the potential for exposure to crime and vandalism. Recognising that particularly vulnerable groups will use the Facilities, security will be designed to meet the needs of all patients, visitors and staff. Vulnerable individuals include, but are not exclusive to, young children, mental health patients, and the frail and elderly. The Facilities shall meet the requirements of Secured by Design. In this respect, as part of the planning process, discussions with the Lothian and Borders Police Architectural Liaison team and Special Branch shall take place, and any comments made reflected in the Facilities as appropriate (see paragraph 3.7 of this Sub-Section C for further guidance). The security arrangements shall require to have regard to, and be compatible with the security arrangements in place for the RIE Site; and

d) The Facilities shall be designed such that all maintenance and life cycle component replacement procedures can be carried out practically, efficiently and effectively and with minimal disruption to Clinical Services.

All standards, guidance, codes of practice and all other titled requirements that Project Co shall comply with are to be the current version of the requirement or its replacement requirement without the need for a Change. Refer also to paragraph 2.5 below.

2.3 NHS Requirements

In addition to the standards listed in paragraph 2.4 of this Sub-Section C, unless the Board has expressed elsewhere in the Board's Construction Requirements, a specific and different requirement, the Facilities shall comply with but not be limited to the provisions of the NHS Requirements as the same may be amended from time to time:

a) The themes, issues and recommendations in “Better by Design: Pursuit of Excellence in Healthcare Buildings” by the Department of Health;

b) New Policy on Design Quality for NHS Scotland published by SGHSCD;

c) Firecode;

d) HAI SCRIBE;

e) HBN;

f) HFN and SHFN;

g) HGN and SHGN;

h) HTM and SHTM;

i) SHTN;

j) SFPN;

k) HDL;

l) SHPN;

m) NHS publication 'Performance requirements for building elements used in healthcare facilities’;

n) NHS Scotland & NHS Policies;

o) Board Policies as scheduled and available in the Disclosed Data as such schedule and Board Policies may be amended from time to time;

p) Health Department Letters (or Management Executive Letters) as appropriate published by SEHD and SGHSCD;

q) Safety Action Notices published by NHS Scotland;

r) Healthcare Improvement Scotland (HIS);

s) NHS Model Engineering Specifications;

t) Department of Health publication “Better by Design”;

u) Corporate Greencode;

v) NHS Scotland Fire Safety Management, incorporating NHS Scotland Firecode;

w) Hazard Notices issued by NHS Scotland; and

x) HSC 1999/123;

i. Firecode

Project Co shall ensure the Facilities comply with the NHS Scotland Fire Safety Management - a suite of documents which explains the policy and technical guidance in fire precautions in hospitals and other healthcare premises, comprising the Health Facilities Scotland Fire Safety Policy, the Scottish Health Technical Memoranda (SHTM) and Scottish Fire Practice Notes (SFPN) which all comprise NHS Scotland Firecode, the Fire Safety Documentation Reference Guide and A Model Management Structure for Fire Safety.

Project Co shall prepare proposals in accordance with NHS Scotland Firecode to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement prior to the submission of the proposals for approval by the Relevant Authority including without limitation building control department.

In the event of a conflict between the requirements of the local building control officers and NHS Scotland Firecode the more onerous requirements shall take precedence. Project Co shall notify the Board as soon as such conflict is known or suspected and shall further advise the Board of Project Co's proposed relevant design solution as early as possible before formal submission for review by the Board. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

ii. Health Building Notes (HBN)

Project Co shall take fully into account the guidance and advice included within HBN. Project Co shall ensure the Facilities comply with the requirements of HBN and shall adopt as mandatory any recommendations.

iii. Health Facilities Notes & Scottish Health Facilities Notes (HFN & SHFN)

Project Co shall, in relation to all SHFN and all HFN (except HFN where an SHFN exists with the same number and covering the same subject matter): take fully into account the guidance and advice included within such SHFN and HFN; ensure that the Facilities comply with the requirements of such SHFN and HFN; and adopt as mandatory all recommendations and preferred solutions contained in such SHFN and HFN.

iv. Health Guidance Notes & Scottish Health Guidance Notes (HGN & SHGN)

Project Co shall, in relation to all SHGN and all HGN (except HGN where an SHGN exists with the same number and covering the same subject matter): take fully into account the guidance and advice included within SHGN and HGN. Project Co shall ensure the Facilities comply with the requirements of SHGN and HGN and shall adopt as mandatory any recommendations.

v. Health Technical Memoranda & Scottish Health Technical Memoranda (HTM & SHTM)

Project Co shall, in relation to all SHTM and all HTM (except HTM where an SHTM exists with the same number and covering the same subject matter): take fully into account the guidance and advice included within such SHTM and HTM; ensure that the Facilities comply with the requirements of such SHTM and HTM; and adopt as mandatory all recommendations and preferred solutions contained in such SHTM and HTM.

vi. Scottish Hospital Technical Notes (SHTN)

Project Co shall, in relation to all SHTN take fully into account the guidance and advice included within such SHTN; ensure that the Facilities comply with the requirements of such SHTN; and adopt as mandatory all recommendations and preferred solutions contained in such SHTN.

vii. Scottish Fire Practice Notes (SFPN)

Project Co shall, in relation to all SFPN take fully into account the guidance and advice included within SFPN. Project Co shall ensure the Facilities comply with the requirements of SFPN and shall adopt as mandatory any recommendations.

viii. Scottish Government Health Directorates Circulars (CEL and HDL)

Project Co shall, in relation to all CEL and HDL take fully into account the guidance and advice included within CEL and HDL. Project Co shall ensure the Facilities comply with the requirements of CEL and HDL and shall adopt as mandatory any recommendations.

ix. Scottish Health Planning Notes and Scottish Hospital Planning Notes (SHPN)

Project Co shall take fully into account the guidance and advice included within SHPN. Project Co shall ensure the Facilities comply with the requirements of SHPN and shall adopt as mandatory any recommendations.

x. Sustainability

Project Co shall comply with the requirements set out in "A Policy on Sustainable Development for NHSScotland 2012". This policy supersedes and incorporates NHS HDL (2006)21 "An Environmental Management Policy for NHSScotland".

Project Co shall comply with the requirements set out in HTM 07-02 EnCO2de – making energy work in healthcare.

Project Co's proposals shall facilitate the achievement of an effective Environment Management System; the exemplar tool is Corporate Greencode's objectives.

Project Co's proposals shall allow the Facilities to achieve as a minimum "very good" rating when subjected to a BREEAM 2011 New Construction (SD5073) and BREEAM ENE1 target of 6 credits (excellent) in accordance with the BREEAM Scheme Document for New Construction (SD5073) Section 6.ENE1

assessment.

Council requirements and NHS Policies including CEL 2 (2012), A Policy on Sustainable Development for NHSScotland 2012 to be read in conjunction with "A Sustainable Development Strategy for NHSScotland 2012", "Sustainable Development in the NHS", 2001 and, "NHS Estates, Sustainable Development: Environmental Strategy for the National Health Service," 2005.

xi. General

Project Co shall take fully into account all health building briefings and planning guidance relevant to the briefing, design and construction of an acute general hospital, particularly but not limited to the material published by SEHD and NHS Estates guidance formally promulgated for use in Scotland.

Project Co shall also take fully into account the guidance and advice included within the following publications as the same are amended from time to time:

a) Enhancing privacy and dignity-achieving single sex accommodation;
b) National standards of cleanliness for the NHS Scotland;
c) Quality Guidelines: Access for People with Disabilities (April 2000);
d) Infection Control in the Built Environment (SHFN 30 & HAI-SCRIBE);
e) National Standards of cleanliness for the NHS Implementation Guidance Toolkit;
f) Standards for Environmental Cleanliness in Hospitals; and
g) Scottish Infection Manual – "Managing the Risk of HAI in NHS Scotland".

Project Co shall ensure the design of the Facilities incorporates the following requirements;

a) Minimisation of the need for staff to be with patients in secluded or isolated parts of the building;
b) The layout of the inpatient units shall discourage patients from leaving the units except when authorised to do so. Project Co shall give due consideration to channelled exit routes that require the negotiation of staffed areas; and
c) Ease of patient observation by staff.

2.4 Minimum Design & Construction Standards

Project Co shall also ensure that the Facilities comply with Good Industry Practice, NHS Scotland requirements, relevant statutory requirements (including highways) and required consents including, but not limited to, the following as the same may be amended from time to time:

a) Construction (Design and Management) Regulations 2007;
b) Management and Safety at Work Regulations 1999;
c) Health & Safety legislation, including all UK and Scottish Statutory Instruments;
d) Recommendations of the Health and Safety Executive;

e) Control of Substances Hazardous to Health (COSHH) Regulations 2002 and amendments;

f) Manual Handling Operations Regulations 1992;

g) Health and Safety (Display Screen Equipment) Regulations 1992;

h) Workplace (Health, Safety and Welfare) Regulations 1992;

i) BS OHSAS 18000:2007~~;~~

j) Quality Assurance System to BS EN ISO 9000 and 9001~~;~~

k) The Equality Act 2010;

l) The Climate Change (Scotland) Act 2009;

m) “Better Public Building” by Department of Trade & Industry;

n) The Building (Scotland) Act 2003 and its most recent amendments;

o) The Fire (Scotland) Act 2005 and its most recent amendments;

p) The Fire Safety (Scotland) Regulations 2006;

q) The Building (Scotland) Regulations 2004 and its amendments;

r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments

s) Scottish Fire and Rescue Service and NHS Lothian Fire Officer’s requirements and fire safety requirements, including, but not limited to the Board’s Fire Strategy, Fire Safety for NHS Scotland 2011, CEL 11(2011), Practical Fire Safety Guide for Healthcare Premises by Scottish Government and NHS Scotland Firecode series;

t) Minimum requirements of the relevant utilities companies, and the Board;

u) Requirements of The City of Edinburgh Council’s Building Control Officer, Fire Officer and Environmental Health Officer;

v) Relevant British Standards, Codes of Practice, or equivalent European industry recognised standards;

w) Eurocodes;

x) Building Research Establishment Digest Recommendations;

y) Local Bye-Law and Regulations;

z) Scottish Centre for Infection and Environmental Health guidance / recommendations;

aa) Treasury Taskforce Private Finance Technical Note No. 7: How to Achieve Design Quality in PFI Projects;

bb) The requirements of the National Radiological Protection Board;

cc) Radiological Protection Act 1970;

dd) Radioactive Substances Act 1993;

ee) The Ionising Radiation Regulations 1999;

ff) The Ionising Radiation (Medical Exposure) Regulations 2000;

gg) All other bodies and authorities having jurisdiction;

Project Co shall as a minimum achieve the standards detailed in the Patient Rights (Scotland) Act 2011; and

For the avoidance of doubt, Project Co shall provide all fixed fire fighting equipment to comply with statutory requirements and the requirements and recommendations of NHS Scotland Firecode.

2.5 Hierarchy of Standards

If there is any inconsistency within the terms of this Section 3 of Schedule Part 6 *(Construction Matters)* and the Appendices then the provisions of Appendix A, Appendix B (Interface Output Specification), Appendix E (Initial Drainage Proposal), Appendix F (Access Strategy), Appendix G (Connection Proposal), Appendix H (Construction Access Proposal), Appendix I (Oversail Strategy), Appendix J (Service Proposal), Appendix K (Substation Proposal), Appendix L (Supplemental Drainage Proposal) and Appendix M (TMS) shall prevail.

Where contradictory standards / advice are apparent within the terms of this Section 3 of Schedule Part 6 *(Construction Matters)* and the Appendices then subject to the foregoing paragraph then (1) the most onerous standard / advice shall take precedence and (2) the most recent standard / advice shall take precedence. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.

Where there is a conflict of interest resulting from the use of the standards / advice Project Co shall involve the Board in the decision making process. The Board shall be entitled to make the final decision regarding the standards / advice to be used for the Facilities including any contradictions that may arise between items (1) and (2) above.

NHS Scotland standards shall take precedence over equivalent NHS England and Wales's standards.

In certain instances, NHS publications include a number of options or alternative solutions. Where the Board has defined their preference specifically, Project Co shall adopt these preferences as a mandatory requirement. Where no Board preference is stated, Project Co shall engage the Board in the design development process to seek and incorporate the Board's preference within the Facilities.

While the Board has placed a clear obligation on Project Co in relation to NHS publications, it also wishes to acknowledge that in certain cases the subject matter, guidance and advice included therein may have been further developed and improved since the date of publication. In this regard, the Board does not wish to limit the use of current best practice or innovation in relation to the adoption of design standards.

For the avoidance of doubt, the Board considers NHS publications reflect minimum standards and any alternatives proposed by Project Co shall provide a similar or enhanced level of service and quality.

2.6 Information Technology & Record Information

Computer aided design shall be applied but not limited to the following:

a) Calculations and principal energy flow analysis for plant simulation;

b) All drawn information layouts, schematics, etc.;

c) “As fitted” and record documentation and drawings;

d) Electrical, mechanical and communication services;

e) Landscaping and site planning and;

f) Traffic modelling and;

g) All other design or design information which Project Co is obliged to provide the Board in accordance with paragraph 4.5.17 (Completion Requirements) and/or Clause 17.18 and/or 18 of the Project Agreement.

The systems used for computer aided design, including Building Information Modelling, shall be available for use by the Board from the point of commencement of the design for the Facilities and all of the information listed above shall be made available on such systems and maintained fully up to date throughout the Works and as applicable during the Operational Term and made available at all times to the Board. This is required in order to assist with the transfer and integration of new and existing information between the Board and Project Co.

3 General Design Requirements

Project Co shall design the Facilities to address the following issues:

3.1 Character & Innovation

3.1.1 Vision

Cognisance shall be taken of the long and illustrious histories of the Royal Hospital for Sick Children and Department of Clinical Neurosciences in Edinburgh. The new building will effortlessly and efficiently support service delivery, both now and in the future, and the human needs of the people within the building; those on whom the service depends - the staff – and all those it is intended to serve. The design should be valued by the patients, staff, visitors, other users and the local community. It shall have an enduring quality that will outlive transient trends or architectural fashion and will provide a memorable landmark building of which future generations will be proud.

The design shall reinforce a strong positive image of the NHS and be identifiable with its function of care. It shall therefore represent the standards of excellence that the teams of staff at all levels are working to achieve.

The building design shall avoid being a purely utilitarian environment, neither bland nor monotonous and certainly not an “off the shelf shoe box”. Each part shall have a discrete visual identity. All vistas and focal points such as entrances should be instantly recognisable with distinctive visual interest.

It shall recognise the following human and healing aspects enshrined in NHSScotland’s vision for the healthcare estate:

a) Uplifting – a building that people of the local area are proud of; that is a symbol of the NHS service ethos and the staff: that conveys respect to the patients and which encourages respectful behaviour in return; which offers an “architecture of hope”.

b) Local – that one size does not fit all: that both the service configuration and the architectural expression should grow from, and support, the community needs and the unique characteristics of the place.

c) Natural – the importance of daylight and contact with the natural environment; of knowing the time of day and weather; of being able to escape into a garden; of being sustainable and using resources efficiently.

3.1.2 Excellence for Patients

The design of buildings, external and internal appearance as well as the design of the external works, and landscape can have a positive or a negative effect upon patient care, staff experience at the work place and the way NHS healthcare buildings are perceived. Project Co shall develop design solutions which by the use of materials, lighting, shape, scale, mass and form of the building elements make a positive contribution to engendering the well-being of patients, staff and visitors.

3.1.3 Healthcare Excellence

Project Co shall develop building design solutions that:

a) Reinforces the dependability and reassurance that the NHS means to the local community;

b) Respects their local environment and at the same time make a positive contribution to the urban context that they are in;

c) Clearly expresses their function in external and internal appearance;

d) Allow patient diagnostic and treatment areas to be differentiated in design concept and detail from inpatient areas; and

e) Reflect that design considerations such as the distribution, size and proportion of windows and the use of materials can reflect the clinical function.

These elements shall be expressed in the scale and mass of the buildings, as well as the disposition of functions, whilst sustaining its effectiveness and efficiency of its use.

3.1.4 Architectural Vision

Project Co shall develop building design solutions, which create an ordered composition of building elements in a stimulating form that successfully combines good standards of space, height, form, scale and use of materials and colours / images with associated functional requirements and the surroundings.

3.1.5 Stimulating Design

Project Co shall develop building design solutions which create a high quality, good working environment, both externally and internally, which shall provide a reassuring, enjoyable, convenient and safe hospital for all patients, their families, visitors and staff. This objective shall not be in conflict with the desire to produce a stimulating design. Project Co shall meet this objective and shall develop a design which will not date and which shall be adaptable in a way that does not destroy the original design vision / concept, whilst sustaining its effectiveness and efficiency of its use.

3.1.6 Design Innovation

The design shall reflect current and developing innovations in healthcare delivery and translate these into an innovative buildings solution including the incorporation of art integral to the architecture.

Innovation in design can range from whole concepts of hospital planning, distribution of functions etc to detail design of components, materials, spaces, use of technology etc.

3.1.7 Recognisable Quality

The Board expects high quality design to match the best national standards of healthcare provision it intends to implement.

Materials shall be substantive and of high quality. They shall be carefully detailed and constructed such that the quality is appreciated throughout the life of the Facilities. They shall retain their appearance within a compatible maintenance regime. For example, detailing of external materials shall be resistant to and shall not cause unsightly staining.

The life cycle plan and design detailing shall allow for replacement of elements of the buildings in a way that does not impair the design quality or adversely affect the service provision.

3.2 Internal Environment

3.2.1 Quality Environment

"You can't just heal a person with medicine; the environment has to work too."
Young People's Advisory Group

The design of the Facilities shall create a sustainable, high quality, good working environment, both externally and internally which will provide a reassuring, relaxing, convenient and safe hospital for all patients, their families, visitors and staff.

The Board anticipate that an interior designer will be included in the Project Co's design team to secure a clear co-ordination of the interior materials and wayfinding within the Facilities, matching the furniture, furnishings and equipment being procured by the Board.

Communal patient areas, which include spaces such as playrooms and quiet rooms, shall be domestic in design and ambience (whilst ensuring that measures to reduce the risk of transmission of infection and increase safety are not compromised). Public areas such as waiting and reception areas shall be restful, open and be well lit with natural light as far as is

practicable. They shall, as a rule, have views out to landscaped spaces that add quality and orientation.

The design shall allow for an open and friendly environment, but shall ensure privacy and dignity for patients, family members and visitors when required. To achieve this, the following features shall be incorporated:

a) The ability for patients to see staff working within each section;

b) The ability for staff to observe patients easily from the Touch Down Base;

c) Where appropriate, glazed panels to have privacy control;

d) Doors to all rooms inpatient single rooms shall have large viewing panels with privacy control;

e) Wards and Units shall function as dedicated patient care areas and must not be designed for use nor used as thoroughfares for access;

f) Facilities shall be sensitive to the cultural, religious and spiritual needs of patients, family members, visitors and staff;

g) All non-clinical areas shall be designed to limit incursion into the clinical areas; this may be achieved by separate service entrances;

h) Reception areas shall be easily accessible to visitors upon entry to the ward, department or unit;

i) Reception areas shall facilitate dialogue with visitors of varying heights e.g. children, wheelchair users, adults, whilst maintaining staff security and privacy across the reception desk;

Wards shall be designed to maximise the efficiency of working arrangements, ensuring minimal travelling distance whilst treatment is being carried out at bedside and in clinical treatment areas within the ward environment.

Washing and toilet facilities shall be located within bed areas, and sited to allow maximum visibility into the rooms. Visual and acoustic privacy must be positively addressed in the case of shared facilities within bed bays. All washing and shower areas shall be designed to minimise the spread of infection, and meet accessibility codes, for example large doors which open outwards.

A suitable and appropriate, continuous machine cleanable floor surface is required. Refer to paragraph 5.13.2 for flooring.

The use of curtains shall be minimized wherever possible to control infection by utilising screens/blinds within glass which can be operated without touching the blind.

The location of patient entertainment systems shall not be obtrusive.

It is anticipated that ward layouts will maximise views, particularly from bedrooms. Sight lines shall be optimised for all users to enable outward visibility with consideration being given to sill heights. Windows on the ground floor will require special attention in relation to privacy and security. Account shall be taken of external environmental conditions, such as stronger winds at higher levels and window designs shall manage and control these environmental effects. The Board welcomes innovative designs and diverse approaches such as wheelchair and baby-buggy height windows which are inherently safe. Window design and specification must meet the requirements of The Building (Scotland) Regulations 2004 and its amendments and adhere to all relevant minimum NHS Requirements.

Project Co shall provide covered areas, which can be used year-round, as amenity and play space. Project Co shall provide seating and furniture in these areas.

Parents/relatives/carers normally need to take time off work to be with their child/family member in hospital. Access for them to resume normal activities, while remaining close to their child/family member, must be demonstrated within the design, e.g. internet access in quiet internal and external areas for carers.

The internal finishes must be effectively and expertly designed and co-ordinated, and furnishings, furniture and equipment must be of high standard. User representatives, via the Board's Representative must be consulted at appropriate points throughout the design, construction and operational phases to ensure that the processes and solutions are responsive to specific needs, both operationally and aesthetically, as well as maintaining corporate requirements all in liaison with the Board's Project Team.

3.2.2 Light, Colour & Texture

Colour, decoration, works of art and motifs shall be used to facilitate identity of the Facilities; and its designated areas / zones and in addition improve wayfinding. It also shall be used to create an immediate and distinct 'image' of the Facilities to visitors, which is interesting and stimulating. The use of colour shall be co-ordinated with the lighting and be appropriate for the activities in each area; toned down in certain areas e.g., recovery, rehabilitation and quiet areas; but bright and stimulating in others, such as waiting and corridor areas.

Project Co shall propose the colour scheme and any choices available, details of which shall be submitted to the Board for review by the Board in accordance with paragraph 1.2.3 of Schedule Part 8 (Review Procedure), Table of Finishes and clause 12.6 of the Project Agreement.

The design shall provide quiet, comfortable areas with pleasing outlooks easily accessible from clinical areas where patients and their families / visitors can "escape" from the clinical environment. Such areas may facilitate informal discussions with health professionals in the future, and be equipped for play / recreation.

The effective use of light is an essential component of the hospital design. Light should be used both creatively within the building and also externally to light the building and create a sense of presence and beauty. The external lighting is to be designed to illuminate main entrances to the building, for wayfinding in the dark and to promote external design features. The use of external lighting to enhance security arrangements is essential.

The use of both natural daylight and artificial light should contribute towards a high quality environment and also be energy efficient. It shall be possible to adjust lighting for reading, close and clinical work, to suit mood and condition of patient, time of day etc. Emergency lighting is required throughout the Facilities.

Natural light should be provided in public spaces and in occupied private and staff spaces within the building as far as is practicable. Natural and artificial light sources shall be designed to avoid glare and thermal gain. Changes in level shall be well lit and abrupt changes in illumination should be avoided, unless specified as a clinical requirement. Glare on reception desks, signs and notice boards must be avoided. Artificial lighting layouts particularly, but not exclusively, along areas of circulation, shall be designed to avoid the creation of a stroboscopic lighting effect.

Deep plan spaces may prove necessary in certain circumstances. In such cases, the layout must be relieved by the penetration of daylight and sunlight from adjacent courtyards or roof and light shafts.

3.2.3 Internal Spaces

All internal spaces shall be planned in accordance with the requirements of the Specific Clinical Requirements at Sub-Section D with the appropriate adjacencies and layouts.

Some spaces shall be designed to encourage social interaction for patients, visitors and staff.

Public spaces shall be used to integrate the various parts of the building, and shall be designed to avoid being a space joined by long, narrow corridors.

3.2.4 Internal Wayfinding

Design solutions shall incorporate an integrated, comprehensive wayfinding strategy that enables patients, visitors and staff to self-navigate with ease and lack of stress throughout the buildings.

The integration of works of art into the wayfinding strategy is encouraged by the Board.

The wayfinding strategy shall be designed to meet the needs of staff, patients and visitors. Routes shall be clearly defined to ensure that parts of the buildings that are restricted to staff are not used as short cuts by patients and visitors. The use of enclosed internal courtyards as an integral part of a route shall be considered.

Internal signage shall be easily understood and consistent throughout the journey from the entrance to the department reception and on to rooms. It shall not create a clutter and the use of pictograms and graphic art is encouraged.

Proposals should be developed which acknowledge the multi-sensory process used in wayfinding and which address the needs of people with impairment in touch, smell, sight or sound.

The wayfinding strategy shall embrace the Identikit toolkit guidelines published by NHS Scotland and be able to interface with what is in use within the Campus Site and Bioquarter Site.

3.3 Urban & Social Integration

3.3.1 Sense of Place

The Facilities shall be designed to complement and enhance the quality of the design in the locality in which it is sited. It shall create a welcoming, inclusive and vibrant environment, and shall enable easy access by the communities and groups who will use it.

The Facilities shall be organised to establish a continuity of building frontage and a clear definition of public and private spaces. When approaching the building the viewing of service areas or more “industrial” looking parts of the Facilities shall be avoided.

3.3.2 Neighbourhood & Community

Project Co shall ensure they are considered a responsible 'good neighbour' throughout design, construction and operation periods. The Facilities shall add value to the neighbourhood and wider community, and not detract nor be a nuisance or a burden to the environment.

The design shall reflect the importance of the Project in healthcare terms and it shall be seen as a leading edge community resource reflecting the objectives of a modern NHS.

Project Co shall provide Facilities whose overall visual impact contributes to improving civic design, and is sensitive to their relationship with the surroundings.

Careful consideration shall be given to the height of the buildings in relation to adjacent developments.

3.3.3 Site Fit

New buildings, parking areas, other infrastructure and services shall be located with regard to the existing landscape and topography. Amenity space shall be planned around the buildings at appropriate places.

The design of the Facilities shall identify areas of the Site as possible expansion zones.

3.3.4 Hard & Soft Landscaping including Garden Spaces

Project Co shall design, as an integral part of the Facilities, a hard and soft landscaping scheme that will enhance the environment of the Facilities.

The landscaping scheme shall be of a high quality and shall assist in knitting the Facilities into their surroundings. It must also provide an interlinked network of attractive public spaces for amenity and circulation for use by patients, staff and visitors.

These will form an essential clinical part of the external environment, and must be integrated with the other aspects of the external environment, building entrance areas; car parking; access roads; pavements / footpaths; and service / delivery areas. The landscape design should support and enhance the separation of pathways of pedestrians, public vehicles and delivery vehicles.

The soft landscape design and choice of plants should assist in providing a therapeutic environment and be sympathetic to the character of the existing landscape.

External hard and soft landscaping (including courtyards) shall be designed for therapeutic use and provide patient's, staff and visitors access. The landscape scheme shall facilitate security of pedestrians and avoid 'No-Go' areas. A comprehensive and integrated landscape strategy shall be developed for appropriate formal and informal treatment of public and private areas.

Project Co shall provide all the external equipment required for the external areas. Details of the extent, type and location of such equipment shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement. Notwithstanding the foregoing, the Board reserves the right to fund specific equipment from Charitable Funds and

depending on the type of specific equipment thus funded such equipment shall be governed by Schedule Part 11 (Equipment Schedule).

3.4 Citizen Satisfaction

3.4.1 Design Concept

The visual forms shall enhance the sense of place and shall exploit to best advantage the environmental qualities of the Facilities and the Retained Site and the Retained Estate.

3.4.2 Scale & Proportion

Appropriate scale and proportions shall reflect the human scale, suitable for child and adult users of the hospital, adjoining urban surroundings and the existing buildings / structures at the Campus Site. Plant rooms, lift, stair towers and the helipad shall express form and function, but they shall not be perceived as dominating and oppressive.

3.4.3 Composition

The composition of the buildings shall be complete, cohesive and well balanced in massing. The visual form shall enhance the Site and sense of place.

The overall form of the buildings shall be designed to demonstrate the individual functional needs of each part of the Facilities. These parts shall harmonise with each other and the overall site, and the concept of facilities for different age and patient groups with distinct identities shall be fully explored by Project Co.

3.4.4 Aesthetics

The overall visual form of the buildings shall combine good standards of space, height, form and scale. The form of the building shall appeal to the aesthetic senses of patients, visitors and staff as follows:

a) The lines of the design shall clearly define forms and surfaces of the buildings;

b) The skyline shall reflect the mass of the buildings but not be out of scale and dominating;

c) The sky line shall not be monotonous.

d) The solid forms shall be in scale and have harmonious shapes; and

e) The interplay of light and shade shall add to the definition of the building form and the balance between solid and glazed elements needs to be incorporated into the design.

3.4.5 The Arts

The Board will be entitled to approve the whole art content in the Project and Project Co shall submit any artwork to the Board as Reviewable Design Data for review by the Board in

accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement before any art work is commissioned.

Project Co is required to demonstrate how art is an inherent element of the design and how it has been integrated into the building fabric such that there is differentiation between the identities of the RHSC, CAMHS and DCN areas.

The incorporation of art, its use for way finding and the enhancement of the overall therapeutic environment must be an essential requirement of the design. Work has been initiated by the Board to develop an arts strategy to support the design of a hospital, and its environs, that will promote health and wellbeing. In consultation with the Board, Project Co shall carefully consider the outputs from the 2010-2014 charitably funded Artists in Residence Programme within the RHSC and CAMHS. Documents relating to the Board's arts requirements are set out in the Disclosed Data. Project Co shall provide and install the art.

Project Co shall give careful consideration to the co-ordination and siting of artwork, so that it is multi-age appropriate, child-safe and interactive. Project Co shall ensure that all artwork conforms to the infection control standards appropriate to its location. Integration of artwork within the interior design should enhance identity at all levels – Facilities wide, departmental, main public spaces and circulation routes. To facilitate the utilisation of walls and other surfaces as art or for art, the design and positioning of engineering outlets, controls and sensors requires particular consideration. The internal wall construction and surface finishes within the Facilities shall allow for the flexible display of Artwork. Project Co's lighting design shall include for the use of illumination and spotlighting of the artwork features, or as art itself.

Project Co's design shall provide space for:

- Live arts performance and associated forms of presentation;
- The display of artwork created by children in RHSC and for the display of art competition work
- Health promotional events; and
- Public events, appeals and merchandising for fundraising / charity promotions.
- Artworks to be displayed on a rotational basis.
- Project Co shall ensure that the Facilities, where appropriate, incorporate innovative design and artworks as an integral part of the Facilities. Project Co shall:
    a) Create and designate spaces within the Facilities (both internal and external) which will be appropriate for the integration of artwork into the designs, and ensure that these locations incorporate suitable building services and the relevant parts of the Facilities are suitably designed and constructed in all respects for the provision for placing or fixing such items such that they are displayed to their best advantage;
    b) Liaise with the Board (or nominated representative) as ideas for arts are developed in conjunction with service users and staff, and, in conjunction with the Board, identify a shortlist of suitable artists that works may be commissioned through; and

c) Commission such artists whose artwork has been submitted to the Board as Reviewable Design Data and approved by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement, and take full responsibility for ensuring their works are integrated into the Facilities, also ensuring that the contractor and designers involved are integrated into this process from the outset such that the creative opportunities are maximised and that functional, cost and arts programme issues are anticipated and resolved.

Project Co shall take an active and supportive role in implementing an arts and environment programme for the Facilities.

Project Co's design shall integrate such artwork features as are being transferred from the Existing RHSC and Existing DCN into the overall design philosophy for the Facilities. A schedule of the large and heavy items to be transferred, including those items to be built into the new building fabric, is detailed in the Disclosed Data. A schedule detailing the more portable items to be transferred is included in Schedule Part 11 (Equipment Schedule).

The artworks proposals shall embrace (where applicable) the Identikit toolkit identity guidelines published by NHS Scotland.

3.5 Uses

3.5.1 Service Philosophy

The service philosophy is contained in Sub-Sections D and E of Section 3 of this Schedule Part 6.

The design shall deliver a solution, which fully reflects the special needs for each patient group whether they be attending hospital on a planned or on an unplanned basis. Clinical activity is considered further under these headings:

a) Unscheduled Care;

b) Scheduled Inpatient care;

c) Out-patient and Medical Day Care;

d) Critical Care Services;

e) Theatre and Day Surgery;

f) Clinical Support Services;

g) Child and Adolescent Mental Health Service.

These are detailed in the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

The Project shall promote integrated ways of working and delivering services for both primary and secondary care, and for the NHS, local authorities and other community based services.

3.5.2 Clinical & Non Clinical Functionality

The Facilities shall be designed to accommodate the Clinical, Non-Clinical and other functions ascribed to them in terms of space, environment and the efficient and safe operation of equipment, as defined in the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

The design of the Facilities shall:

a) Function efficiently, effectively and economically to achieve the optimum balance between capital cost of the Facilities and the Board's operating costs and to meet and satisfy all of the requirements and obligations set out in these Board's Construction Requirements to ensure that the Facilities are sustainable well into the future and as a minimum for the whole of the Operational Term or to meet the Handback Requirements, which ever is the longer period;

b) Demonstrate that the design fully reflects the special needs for each patient group in terms of access, functional relationships and planning;

c) Interface easily with other service providers in particular the wider services provided by the Board;

d) Foster the provision of patient-focussed acute services; and

e) Permit and encourage service integration across the care spectrum/community.

The design shall be able to do this in terms of environment, scale, comfort privacy, reassurance, style and security.

3.5.3 Design for Therapy

The Board places a high priority on how the design of the Facilities impacts, both mentally and physically, on the treatment experience for patients, families, visitors and staff. It is therefore essential that Project Co develops a clear strategy which is interpreted through the design of the Facilities and focuses on providing an environment that takes every opportunity to enhance the experience of every person who comes in to contact with it.

This paragraph 3 shall be read in conjunction with the requirements for infection control. Whilst it is expected that there is a balance to be drawn between design for therapy and infection control requirements, the requirements of one over the other shall not preclude the use of well thought out design and good quality solutions.

3.5.4 Patient Privacy and Dignity

To achieve appropriate levels of privacy, Project Co shall provide Facilities which allow adequate space around patients. This may include space for families, and other visitors to sit with patients, adequate space between chairs, and seating in rest bays along corridors to provide rest places along the route of the patient / visitor journey. The privacy afforded to patients, staff, families and visitors shall not be compromised by inappropriate or inadequate sound reduction measures in the design or in the build standard.

Sill heights for windows shall enable outward visibility, in particular for children, patients in wheelchairs and in beds. Special consideration shall be given to the needs of those with impaired mobility and those with poor sight. Some doors and internal glazed screens shall

require vision panels or other glazing systems, which may be obscured or controlled for privacy. The ability to use vision panels which allow objects / small children on the other side to be viewed are required in those areas as defined in the Room Data Sheets.

3.5.5 Age Appropriate Care

The age range of children routinely attending the RHSC paediatric facility will be 0 – 16 years, and a number of young people aged from 17 to 18 years of age also will attend. CAMHS patients routinely attend until they are 18 sometimes older therefore the building, particularly within the Inpatient areas, will offer a variety of facilities to meet the needs of infants, pre-school age, 5-10 year olds, 10-13 year olds and 13-16/18 year olds. Adolescents in RHSC have access to a social space designed specially for this age group, CAMHS inpatient areas are to accommodate 12-18 years olds. The DCN facility provides services to adults.

Age specific facilities will be provided within the appropriate areas.

3.5.6 Single Room Accommodation

DCN and CAMHS will have 100% of inpatient spaces in single rooms, and in the RHSC approximately 59% of inpatient spaces will be in single rooms, which will facilitate the management of the privacy and dignity of patients and families, and infection control.

Challenges for the design of single room accommodation, particularly within longer term inpatient facilities, includes many adolescents preferring to be in a single room for privacy, however consideration is to be given to provide additional space for social, educational and IT facilities.

3.5.7 Functional Relationships

The design shall offer all users of the Facilities the highest level of efficiency in their operations by way of relationships and adjacencies between functional units.

The general inter-relationship of wards and departments is fundamental to good design, ensuring patients and families can receive effective care and that staff can go about their business efficiently.

The grouping and disposition of departments shall take into account the importance of enabling easy flow of the three main groups of traffic:

a) Patient, family, visitor and staff traffic arriving at the hospital;
b) Patients' and staff traffic between clinical departments (in and out patient areas) and central diagnostic departments, particularly theatres and radiology.
c) Service traffic – good design will ensure that distances for service traffic are kept to a minimum with innovative use of vertical routes e.g. service lift;

3.5.8 Work Flows & Logistics

Workflows within and between departments shall be direct and the routes for patients and staff as short as possible. Internal traffic cross-flows which could be inefficient or conducive to the transmission of micro-organisms either through airborne or other means shall be minimised.

The movement of people and the distribution of supplies and waste shall be carefully considered. Circulation routes shall be clear and appropriately sized.

Patterns of movement within the hospital shall be clear, unambiguous and logical for patients, families, visitors and staff. The adjacency patterns will minimise travel time and distances for patients, families, visitors and staff, with clear and coherent signposting to support a natural flow of pedestrian traffic.

Use shall be made of art in creating focal points, and supporting wayfinding both for internal and external areas.

The route for patients to be taken to the RIE Facilities and RHSC Emergency Departments from the helipad is through the Hot Core. There is to be a controlled link to the RIE Facilities from the ground and first floors of the Facilities building.

All signposting and instructions must be readily accessible and capable of being understood by the community that the hospital serves.

Provision is to be made for deliveries being accommodated at a loading area / bay. These will arrive in a range of different vehicle types, and the deliveries will be off-loaded into an adjacent Goods Receipt Area. Provision is also to be made for mail to be delivered directly into a Mail Room, catering supplies delivered directly into a Catering Store, and linen will be delivered straight into a linen store.

3.5.9 Manual Handling

Project Co shall ensure that the working environment of staff shall be designed in such a way that where they are required to manually handle inanimate objects / patients and / or transport patients, due consideration shall be given to the obligations within the Manual Handling Operations Regulations 1992 (as amended). This shall extend to the provision of mechanical devices including fixed (i.e. ceiling mounted tracking hoist systems) or mobile hoists including appropriate allocation of space and structural capacity.

3.5.10 Adaptability & Expansion

Project Co shall ensure that the physical arrangement of the buildings allows for growth and change of Clinical Services in the future, as far as is practical. The provision for such are detailed in the Adaptability Strategy.

The design shall consider the means for departments to be used flexibly, adapted or expanded. National policy, clinical advancements and technological changes will impact on the way services are provided in the future, and the Facilities need to be sufficiently flexible to handle these advances. The design shall demonstrate that potential change or expansion has been considered by the provision of adequate space either at the external perimeter and / or between functions and departments.

The structural grid, construction technique, structure, service penetrations and engineering services strategy shall demonstrate that the design proposals for expansion, adaptation and flexibility are co-ordinated.

The provision of engineering, telecommunications and building services shall be appropriate for the provision of anticipated changes in medical equipment.

The architectural flexibility shall reflect the overall Adaptability Strategy.

Project Co shall ensure that the design of the internal enclosing walls, screens and ceilings and their relationship to the environmental servicing strategy present a co-ordinated and consistent approach throughout, capable of accepting change at a later date with the minimum of disruption to the building structure and main mechanical and electrical plant installations and associated services.

Project Co shall ensure that the Facilities' structure and envelope, services, partitioning, ceiling, and flooring systems are consistent with a co-ordinated methodology which facilitates future flexibility for re-planning and change in the layout of departments, rooms, services outlets and equipment.

The internal divisions and environmental servicing strategy shall provide a co-ordinated and consistent approach throughout and shall readily accept change with the minimum disruption to the building structure and main mechanical and electrical and plant installations. In particular, it shall be possible to install or relocate fittings, fixtures, equipment and service outlets with minimum disruption to the use of the Facilities.

Building structures shall be designed by Project Co to facilitate ease of alteration to the internal layout of the buildings, or to its plant, services or equipment, during the lifetime of the buildings. This shall be achieved by:

a) Selecting structural forms in which future builderworks holes for building services distribution, both vertically and horizontally (including ductwork), or equipment, may be cut simply and economically and maintaining the fire safety integrity without significant additional work;

b) Providing knock out panels to permit the formation of holes not exceeding 150x150mm through suspended floors, adjacent to 50% of the internal columns on all floors. These knock out panels shall be positioned close to columns distributed across all areas of each floor;

c) Designing the floors for imposed loadings that will permit the reallocation of space within the Facilities, so that each area of floor is structurally capable of supporting the imposed loads of offices, wards, corridors, general storage areas or waiting areas, together with their appropriate partition walls, finishes, ceilings, services and medical equipment;

d) Providing removable access panels within the structure, where these are required for the installation, maintenance, repair and removal of plant, services or equipment;

e) Constructing internal room walls such that they can be readily removed or altered i.e. the structure is not reliant on the walls for structural stability; and

f) Designing plant space and riser space so that future change can be accommodated.

Project Co shall ensure that the Facilities do not have perimeter upstand beams and all perimeter beams shall be designed to allow a clear 300mm services zone above the ceilings and below the perimeter beams, unless otherwise agreed with the Board.

3.6 Spaces

3.6.1 Floor Layouts

The design of departmental and unit layouts shall reflect the demand for space defined by occupancy and usage as described in the Board's Construction Requirements Part 6 Section 3 Sub-Section D (Specific Clinical Requirements), Sub-Section E (Specific Non Clinical Requirements). Where areas and shape of rooms results in undesirable spaces, Project Co shall discuss with the Board alternative solutions, which may or may not result in shared space providing a more appropriate environment as well as optimising the available use of space. These may include locker rooms, sitting areas, seminar rooms etc

3.6.2 Equipment Requirements

Project Co shall identify and provide all necessary connections and infrastructure (including supply, extraction and removal of waste) for all items of equipment identified in Schedule Part 11 (Equipment Schedule). For the avoidance of doubt, this obligation specifically includes specialist service requirements, including for example 3-phase electrical supply, surge protection, special water supply requirements and separation of contaminated waste.

Project Co shall provide a suitable environment for each item of equipment; this shall take into account lighting, temperature and ventilation requirements. Project Co shall design the Facilities to allow for the provision and safe use of the Group 1, Group 2A, Group 2B and Group 3 Equipment.

For reasons relating to standardisation, compatibility, staff familiarity and product quality the Board shall be entitled to choose items of equipment which shall be proposed and submitted by Project Co to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Irrespective of the party responsible for the supply, installation, maintenance and replacement of each item of equipment (as detailed in the Schedule Part 11 (Equipment Schedule)), Project Co shall provide Facilities that satisfy the following criteria:

Allow equipment and associated systems to be installed, commissioned, operated, maintained and replaced in accordance with;

a) Good Industry Practice;
b) Manufacturer's instructions;
c) The Board's specific supplementary requirements; and
d) The Board's, and statutory health and safety requirements;

In order to:

a) Allow equipment and associated systems to operate efficiently, effectively and in accordance with their intended function for the whole of its design life;
b) Take due account of the impact on the environmental conditions within the Facilities. For the avoidance of doubt, this obligation includes (but is not limited to) impact of heat gain and loss, and ventilation; and
c) Take due account of the potential impact of future equipment changes through either updating or replacement. In particular, allowance for equipment of different sizes, weights, service requirements or environmental impacts.

d) Allow the Board to provide their Clinical Services and Non Clinical Services with a minimum of disruption during installation, commissioning, operation, maintenance and replacement.

A number of specialist engineering systems will be required within the Facilities and each shall be fully integrated within the design proposals. Specialist systems shall be incorporated where appropriate to enhance the operation of the equipment and the Facilities.

The construction, structure, plant and services shall be designed to meet the Board's Construction Requirements and the specific requirements for special equipment and associated services. The design of the Facilities shall meet these requirements with regard to wall, ceiling and floor loads, structural movement and deflections, the need for special floors, wall and ceiling supports, ceiling grids and other such measures to allow for the installation of special equipment and associated services.

3.6.3 Room Data Sheets

Project Co shall provide Facilities that, as a minimum, meet all the requirements specified in the Room Data Sheets included in this Schedule Part 6 Section 6. Room Data Sheets not included in Schedule Part 6 Section 6 shall be provided through RDD.

Project Co shall provide fully developed Room Data Sheets submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

As part of the commissioning process, Project Co shall be responsible for demonstrating compliance with the requirements included within the Room Data Sheets.

For the avoidance of doubt, Project Co shall provide mechanical ventilation, comfort cooling and air conditioning to suit the functional requirements of each of the rooms in the Facilities. Irrespective of the ventilation requirements in Room Data Sheets, where rooms are clearly intended to be occupied and / or become internal spaces during design development and natural ventilation is not possible, mechanical ventilation and / or extract ventilation shall be provided as appropriate to suit the function of the space.

3.6.4 Interior Design

Project Co shall develop an interior design strategy to cover all areas of the Facilities and shall present this to the Board for its consideration. The integration of works of art is considered by the Board to be an essential element of any such interior design strategy.

Proposals shall be presented by Project Co in room-by-room schedules with samples of finishes, colours, lighting fittings, materials as appropriate, and signage, supplemented by colour sketches or coloured computer images submitted to the Board for review in accordance with paragraph 1.2.3 of Schedule Part 8 (Review Procedure), Table of Finishes and clause 12.6 of the Project Agreement. Project Co shall agree with the Board a programme for submission of this information allowing sufficient time for consultation with the users, and for incorporating feedback into the final scheme.

Where Project Co includes internal planting displays, these must comply with the Board's infection control requirements, and associated irrigation and atmospheric controls shall be provided.

3.6.5 Space Standards

"Many factors can contribute to engendering a sense of ease, for instance:- the degree of natural light, brightness and airiness, colour and texture, an easily understood layout with clearly defined focal points, uncluttered signage and a clear distinction between the realms of public and private space, maintaining patient dignity".

SEHD 2006

Project Co shall provide designs which are efficient, economical and flexible for immediate and future use, and which can be managed efficiently to cope with seasonal and strategic variations in activity.

The internal and external space provision shall be equal to or greater than that prescribed in codes of practice, regulations and guidance related to hospital buildings.

Appropriate space provision shall be made for circulation, waiting and sub-waiting space and for the movement of patients, pedestrians and the storage and transportation of goods.

Individual departments shall be designed to allow formal and informal discussion, therapy and interaction within each clinical environment - such as in consultation rooms, therapy and rehabilitation rooms, waiting areas and receptions. The design shall also support the creation of a learning environment for informal and formal teaching of staff, students, patients and their families.

Project Co shall provide space to allow informal discussion, therapy and interaction within open and reception areas in the clinical environment, such as areas of rehabilitation, consultation and main waiting / reception areas. Consideration shall also be given to making use of open areas such as courtyards and corridor recesses within clinical areas and main circulation routes for 'break-away' space.

Project Co shall recognise that the perception patients' and staff of the spaces created may assist with their feeling of belonging and of not being intimidated, and may help with their orientation, mobility, confidence, privacy and their ability to socialise.

3.6.6 Ward Configuration

Where required, wards shall be configured to meet the requirements of single sex wards providing privacy and dignity to patients.

The layout of the wards shall facilitate the separation and zoning of patients into clinical groups to respond to seasonal variations in activity, case mix, and practice and to deal with infectious conditions.

Space around beds shall comply with Department for Health Adult in-patient accommodation: Planning and design manual: Version 2.5: England and HBN 23 Hospital Accommodation for Children and Young People (2005) providing adequate space for health care professionals, teaching requirements, visitors and multi-pieces of equipment to be located near to the patient within the bed area. Additional space shall be allowed for engineering and building services zones. There shall be a minimum of 3.6m between bed centres.

The Touch Down Bases are sited throughout the clinical ward area to ensure optimum observation of patients and equipment in single and four bedded wards. The ratio of Touch Down Base should be 1:4 beds depending on design of ward.

3.7 Security & Control

Security of patient, staff, families and other visitors is of utmost priority. The design of the Facilities shall ensure maximum protection and minimise exposure to crime in internal and external areas.

Special care shall be given by the Project Co to the control and monitoring of access points used by the public and staff from public circulation spaces particularly those which may be quiet and sparsely populated during out-of-hours services.

Particular attention shall be given to the security of routes used during the hours of darkness by staff between pedestrian access points to the Site, car-parking areas and entrances to the Facilities.

Access control systems shall be provided to restrict access to certain areas of the hospital to relevant staff members, patients and visitors as appropriate in paragraph 9.19. Access controls shall be based around the following requirements:

a) Provision of high resolution CCTV or appropriate technology at all entry and exit points, reception areas, main entrance and such other areas as are defined in paragraph 9.19;

b) Systems to provide of out-of-hours security infrastructure to accommodate varying working hours, particularly evening and night-time working;

c) Security systems that are consistent with other Board facilities and policies, including main door or departmental access systems linked to staff identity badges;

Points of entry and reception points shall be minimised and allow for natural supervision and/or monitoring of movement and entry.

There shall be minimal isolated vistas and dead-end spaces to design out the potential for crime. The provision of security lighting must be effective and efficient but not overbearingly bright.

Design of roadways, paths and parking areas shall take into account the safety of staff, patients and the public. Landscaping will soften the hospital site, be attractive and calming but be designed with security and safety in mind.

External areas and courtyards must be safe, secure and capable of being used in varying weather conditions.

All external access routes and entrances to the Facilities shall prevent the risk of wind funnels.

3.7.1 Secured by Design

Project Co shall meet the requirements of “Secured by Design”, and in particular the recommendations of the Secured by Design - Hospitals guide.

Project Co shall endeavour to ensure that their approach to security and control of the Facilities will be structured in a way which will allow the Board the flexibility to seek compliance with the requirements of the Secured by Design initiative at a later date.

3.7.2 Safer Parking Scheme

Project Co shall where possible adhere to the principles of the British Parking Association's Safer Parking Scheme Documents and Guidelines.

Project Co shall endeavour to ensure that their approach to security and control of the parking facilities will be structured in a way which will allow the Board the flexibility to seek compliance with the requirements of the Safer Parking Scheme initiative at a later date, and achieve the "Park Mark Safer Parking Award". Safe routes for pedestrians should be incorporated.

3.8 Site Access & Circulation

A traffic assessment has been undertaken on behalf of the Board to ascertain and evaluate the impact of the development on transport patterns. Project Co shall validate the recommendations of this report and secure agreement with The City of Edinburgh Council for its proposals.

The Board requires to see, as far as reasonably practical, the clear separation of access for services, supplies, and waste removal vehicles from patients' and visitors' access points and entry points for the Facilities. In addition as RIE is an operating hospital adequate access to the RIE must be maintained at all times during construction and operation of the Facilities.

In the planning and design of the Facilities and of the Site layout, Project Co shall endeavour to ensure as far as is reasonably practical that routes used by pedestrians are segregated from routes used by moving road vehicles and any tug trains or similar deployed in the operation and maintenance of the Facilities. Project Co through the location of suitable external seating shall provide "rest areas" in safe positions along the main pedestrian routes.

External wayfinding shall be consistent with the principles currently adopted on the RIE Site, and Bioquarter Site or as modified at some future date, and be appropriate for the different age range of patients involved.

For the RHSC Paediatric facility there will be separate entrances required for the following departments:-

a) For the Emergency Department (ED);

b) Main hospital entrance for patients, staff and visitors;

c) Child and Adolescent Mental Health Service (CAMHS);

Clinical Neurosciences

a) Route for emergency patient transfers via RIE Facilities Emergency Department;

b) Main hospital entrance for patients, staff and visitors;

The defined routes for construction plant and construction access roadways shall comply with the provisions of paragraph 4 and Appendix A.

Project Co shall undertake all necessary works associated with the following specific requirements:

3.8.1 Design for Disability

The design shall comply with the requirements of the Equality Act 2010, and take full consideration of HBN 00-02 “Sanitary Spaces”, SHFN14 "Disability access", SHFN20 "Access audits for primary healthcare facilities", HFN 21 “Car Parking” and Standards of Care for Dementia in Scotland: Action to support the change programme, Scotland’s National Dementia Strategy. Further guidance is provided in BS 8300:2009 Design of buildings and their approaches to meet the needs of disabled people - Code of practice.

Doors and lifts are required to be of a width and length to allow wheelchair access (often with additional attached equipment) and patients being transferred on trolleys and beds with attached clinical equipment, and this is also essential for children being transported in prams and buggies. Automatic doors along patient pathways are essential to ensure that staff pushing patients and /or equipment on trolleys, wheelchair users and parents/carers with children in prams/buggies can move rapidly and smoothly. Automatic doors will improve access for wheelchair users, those with reduced mobility, impaired vision and other disabilities. Automatic doors will minimise damage caused to doors and walls by trolleys and cages.

Entrances to the Facilities shall be clearly identified to promote ease of wayfinding and distinctive ‘landmarks’ shall be incorporated into the design particularly for the main entrances.

The Facilities’ environment, both externally and internally, shall be designed to be accessible to everyone. The journey on to the Site, from pedestrian / vehicle routes, through the main receptions, into the Facilities and to the desired locations shall follow a safe, logical and clear system.

Attention shall be paid in the design to all aspects of the physical environment relating to the accessibility of the Facilities as follows:

a) Access to buildings, such as level or ramped entry;

b) Emergency evacuation arrangements, in particular for the visually impaired, the disabled and the frail, such as fire refuges or alternative escape routes for people with mobility impairments;

c) The accessibility of external paths and landscaping and the location of “rest areas” on all external routes;

d) Circulation within buildings, including their interior layout;

e) Effective lighting and signage and colour or tone contrast on doors to aid orientation;

f) Desks, laboratory benches, work surfaces and reception desks with varying or flexible heights;

g) Appropriate seating;

h) Accessible toilets; and

i) Convenient but controlled ‘free’ proximity parking.

Project Co shall ensure that the Project design draws upon and endeavours to further develop improve and exceed current best practice and standards achieved in other similar

projects, and incorporates full accessibility for the prospective patient groups, staff and public. This shall include aspects of both physical environment and visual and audio aids to enable full and unrestricted use of the Facilities for all groups. This philosophy of design shall be extended across all parts of the Facilities including access to the landscaped and external areas as well as the essential patient treatment and residential areas.

Project Co shall ensure the design complies with the general accessibility ethos detailed above, whilst also addressing the detailed requirements listed elsewhere. It shall be noted that the requirements detailed are not exhaustive, and it is also recognised that specific clinical needs will determine the nature and design of Facilities in some areas.

In particular it is highlighted that the Facilities will be used by a high proportion of wheelchair users. Project Co shall ensure that the fire strategy and design of the Facilities take full account of this.

In meeting the overarching obligations with respect to accessibility, Project Co shall comply with the following non-exhaustive list of standards:

a) BS8300:2009 Design of buildings and their approaches to meet the needs of disabled people – Code of practice;

b) SHFN 14 Disability Access;

c) SHFN 20 Access audits for primary healthcare Facilities; and

d) HFN 21 Car parking.

BS8300:2009 “Design of buildings and their approaches to meet the needs of disabled people – Code of practice”; is also the document most widely referred to by consultants advising on general building design in relation to the Equality Act 2010. Project Co shall therefore refer to this document and give full regard to its standards. It will, however, be necessary to match the standards of BS8300:2009 “Design of buildings and their approaches to meet the needs of disabled people – Code of practice” with others laid down in NHS guidance notes.

For the avoidance of doubt, specific accessibility requirements listed in this Schedule Part 6 Section 3 shall take precedence over the standards laid down in BS8300:2009 “Design of buildings and their approaches to meet the needs of disabled people – Code of practice”.

3.8.2 Vehicular Access

Road widths, turning circles, waiting bays and lay-bys shall be designed so that they are suitable for hospital and emergency traffic including service vehicles and are designed for the convenience of staff and the public. These routes shall link the main access points on Old Dalkeith Road/ Little France Crescent to the principal vehicle routes and entrance points to the Facilities. It shall be noted that some of these routes may be required to connect seamlessly into and be compatible with roads, turning circles, bays and lay-bys which are outside the Site boundary.

3.8.3 Pedestrian Access

Project Co shall provide routes to the Facilities and to adjacent parts of the Campus Site from Old Dalkeith Road and Little France Crescent which are safe and convenient for pedestrians and cyclists to use. These routes shall link the main access points on Old Dalkeith Road / Little France Crescent to the principal patient, visitor and staff entrance points to the Facilities. It shall be noted that some of these routes may be required to connect

seamlessly into and be compatible with and reflect pedestrian desire lines and pathways which are outside the Site, subject to the requirements of paragraph 4, Appendix A and Clause 9 (Nature of Land Interests) of the Project Agreement.

Pedestrian routes to the building shall be as direct as possible to reduce the temptation to use or create unauthorised entrances and exits. Project Co through the location of suitable external seating shall provide “rest areas” along the main pedestrian routes.

Pedestrian emergency exits from the buildings shall be used for that purpose only and appropriate measures shall be taken by the Project Co to ensure that they cannot be used for accessing the buildings.

3.8.4 Cycle Routes

Special attention shall be given to the maintenance and extension of existing safe cycle routes. Project Co shall carry out works to form a cycle path and reconfigure the landscaped areas within the Yellow Area (Cycle Path Works) subject to providing a method statement for these works which method statement will form part of the relevant Interface Proposal, and complying with the requirements of Section 2 (Operational Construction Issues) and paragraphs 1 to 4 and 8 of Section 5 (Access Areas, Drainage and Substation) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Access Strategy and/or where applicable any Access Strategy agreed and/or determined pursuant to Section 2 (Access Areas and Amended Drainage Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A.

The reconfigured cycle path shall terminate at Little France Crescent and to the access to the Site from Old Dalkeith Road Project Co shall provide appropriately located bicycle security and staff changing facilities. It shall be noted that some of these routes may be required to connect seamlessly into and be compatible with existing cycle routes which are outside the Site boundary but within the Campus Site.

3.8.5 Emergency Vehicle Access

Project Co shall provide clear and well defined routes for emergency vehicles such as ambulance, fire and police. The Emergency Department access will require 2 distinct entrances: one for emergency patients and one for ambulant patients.

Ambulances will most frequently use the Emergency Department entrance and the entrance to DCN. Waiting and queuing of ambulances at these locations will require to be considered by Project Co.

The design of the Facilities by Project Co shall take into account the unimpeded continued routing of “blue-light” emergency ambulance traffic into the ED in the Facilities and the RIE Facilities and around the Campus Site. Special provision shall be made for manoeuvring, unloading and waiting of ambulances and other emergency vehicles at the Emergency Department for the Facilities and the RIE Facilities.

3.8.6 Service Vehicle Access

Service traffic shall be separately routed to the loading bay area(s). Project Co shall provide a holding facility for three of the longest lorries to wait for access to the service ramp to the basement of the building. Access to the holding area, VIE compound, energy centre and basement of the building will be controlled as defined in paragraph 7.5 of this Sub-section C.

In such areas safe segregated routes for pedestrians will be clearly identifiable and these will not be in conflict with vehicular movements.

3.8.7 Road Markings & Signage

Project Co shall undertake all necessary road, footpath and car parking markings and signage works within the Site boundary.

3.9 Car Parking & Drop-off / Pick-up

3.9.1 Car Parking

Car parking to replace the car parking spaces in Car Park B have been provided elsewhere at the Campus Site. Car Park F will provide additional car parking to meet the essential needs of the Campus Facilities.

Project Co shall provide a strategy for parking which demonstrates control of access to onsite and close proximity parking.

From the Actual Completion Date, Patients and Visitors to the Facilities will have access to Car Park E.

3.9.2 Emergency Department Parking

Project Co shall provide as a minimum 24 free spaces for emergency visitors to the ED for the Facilities and the RIE Facilities. Of these spaces:

a) 50% must be of a size for disabled or parent and child parking, and marked as appropriate.

b) 50% must be non-disabled spaces for short term parking for emergency visitors to the ED facilities.

These will be provided in a way that is clear to users that they are for short term stay and they will be located so as not to cause access issues elsewhere.

Access controls will be provided as detailed in paragraph 7.5 of this Sub-section C.

3.9.3 Disabled and Parent and Child Parking

The design of the Facilities shall recognise the importance of providing sufficient disabled parking spaces and drop-off points as close to the entrances as possible.

In addition to the disabled and parent and child parking provision at the ED, Project Co shall provide as a minimum:

a) 40 free disabled parking spaces for RHSC indicating that they are for Disabled and Parent and Child Parking; and.,

b) 20 free disabled parking spaces for DCN marked accordingly.

Access controls will be provided as detailed in paragraph 7.5 of this Sub-section C.

The design of the Facilities shall recognise the importance of providing sufficient disabled parking spaces and drop-off points as close to the entrances as possible.

3.9.4 Drop-off / Pick-up Arrangements

Project Co shall provide designated, covered “drop-off / pick-up” area(s) directly adjacent to the principal entrances to the Facilities including the ED entrance. This shall allow direct access to the Facilities, for a wide range of vehicles including private cars, taxis, ambulances and patient transport vehicles. The design should discourage any other use other than drop-off in this area.

4 Site Specific Requirements

4.1 Site Boundary

The Site is currently in the ownership of the Scottish Ministers and is part of the Campus Site.

Refer to other site boundary issues detailed in other parts of this paragraph 4 and paragraph 7 of this Sub-Section C (in particular paragraph 7.3).

4.2 Travel Plan

In line with the Board’s obligations under Policy Statement 3 of SEHD’s “Environmental Management Policy for NHS Scotland”, the Board will prepare a Green Travel Plan for the Facilities, which aims to reduce the impact on the environment of travel by staff, patients and visitors to and from the Facilities, and travel by staff during work at the Facilities.

The scope of this Green Travel Plan is in line with the Integrated Transport White Paper ‘Travel Choices for Scotland’ and ‘Scotland’s Transport: Delivering Improvements’.

Project Co shall assist the Board in developing the integrated Green Travel Plan to take account of the impact of the Facilities.

Project Co shall ensure that the proposals for Site access and circulation, pathways and car / cycle parking are discussed and agreed with the Board in the context of the Green Travel Plan.

Guidance is available within the SEHD document, ’Travel Plans: An Overview, September 2002’.

For the avoidance of doubt, the Board is responsible for the development of the Green Travel Plan.

4.3 Existing Services

4.3.1 RIE Enabling Works

The Board has identified the following enabling works (the “RIE Enabling Works”) which will be required to be carried out on the Campus Site to meet planning requirements. These key

enabling works will be carried out by or on behalf of the Board by or on behalf of Consort. These works do not form part of the Project and it is intended they are completed or substantially completed prior to any part of the Project commencing on Site. The key enabling works are described here for information purposes only and form part of Disclosed Data so that Project Co is aware of them and takes them into account in planning for the Project.

a) Flood Protection Works: which means the enhancement of existing flood protection measures at the Campus Site;

b) Road Infrastructure Works: which means changes to the road and transport infrastructure at the Campus Site, including but not limited to the creation of a public transport terminus to the east of RIE Facilities, new bus stances and revision of existing car parking;

c) VIE Relocation Works: which means relocation of the existing VIE plant and gas governor serving the RIE Facilities to another location on the RIE Site. Separate VIE plant is required for the Facilities;

d) Link Building Works: which means the building which is to be part of the RIE Facilities to which the new Facilities will be connected at ground and first floor levels;

e) Service Diversion Works: which means the disconnection of certain services such as electricity, water, gas, that serve the RIE Facilities and are currently located on under or over the Site and such services which are disconnected will be relocated in positions outwith the Site to new positions within the RIE Site. However Project Co should note that not all redundant services are being removed and grubbing up of any disconnected and redundant services will be the responsibility of Project Co, as part of the Works. Project Co should have regard to the following services which are expected to continue to be present at the Site namely the County sewer (which it is believed runs from south to north in the western area of the Site) the storm water system (which serves Car Park B), the utilities services for the Nursery including water, gas, power, telecommunication and drainage, the Sewers referred to in paragraph 6.1.1 and gas pipe referred to in paragraph 6.1.2; further the following services are expected to be present and possibly connected namely bases for medical gases, equipment, apparatus, pipes, conduits and the like relating to disconnected, non functioning and/or redundant services under the Site, manholes and slabs for parking equipment. Project Co shall carry out any protection and diversion works associated with any further existing services located within the Site but this list is not exhaustive and Project Co must satisfy itself as to the conditions of the Site. This may include (but not be restricted to) electric cables; telecommunications cables and equipment; gas mains and apparatus; sewerage mains / drainage pipes; and water mains;

f) Sewer Diversion Works: which means the diversion of trunk sewers currently located in the Site to positions outwith the Site to new positions within the RIE Site save for a section of Sewer referred to in paragraph 6.1.1 which will continue to run under the Site; and

g) Clinical Facilities: Reconfiguration/alteration of a number of clinical facilities within RIE Facilities;

4.3.2 Flood Works

a) Off-Site Flood Protection Works – It is proposed to construct flood defence walls (approximately 1000mm high) to both sides of the Niddrie Burn in the Nether Craigour area upstream of the Old Dalkeith Road bridge to provide improved flood protection to dwellings at Little France Mills and to the Campus Site and Campus Facilities. These works will be procured under a separate contract and do not form part of the Project and are expected to be carried out in the areas shown on the indicative plan RHSC-DCN-FP-001 which forms part of the Disclosed Data.

4.4 Demolition and Site Clearance Requirements

Notwithstanding paragraph 4.3 above, Project Co shall be responsible for the all demolition and site clearance of the Site including without limitation all structures such as the Nursery, services and removal of disconnected services. The work that Project Co shall carry out will include but is not limited to the following:

a) The identification and removal of all structures, including the Nursery, hardstandings and the like occupying the Site.

b) The identification and protection of live (and/or used) services in, under, on, over the Yellow Area, the Orange Area, the Service Strip, the Foul Service Strip, the Substation Site, Substation Access Area and the Substation Cable Route.

c) The identification, decommissioning, removal and / or protection / relocation of live (and used), live (and redundant) or redundant (and disconnected) services in, under, on, over, crossing the Site; and

d) The identification and removal of underground services, old foundations, drainage runs, basement structures and other below ground obstructions present following demolition of previous structures occupying the Site.

The Board has provided Disclosed Data. Whilst the Board believes that the information presented here is representative of the position on Site, Project Co is required to draw its own conclusions with respect to overall allowances required and the accuracy of the Disclosed Data. Other obstructions, contamination and services not yet identified may be present at the Site.

Where in connection with the Project, Project Co requires to carry out any demolition, Project Co shall carry out all demolition in accordance with BS 6187:2000 “Code of Practice for Demolition” and the following:

a) Issue a method statement identifying the scope and methodology for undertaking the demolition works in Project Co's Proposals and to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement;

b) Break up and remove off-site all structures, foundations, temporary accommodation, and other below ground and surface obstructions in accordance with, but not limited to, BS5228, 2009 “Code of practice for noise and vibration control on construction and open sites.”;

c) Decommission and / or break up and remove all redundant underground structures, chambers and redundant surface water and foul water drains, telecommunications, electric cables, gas mains, water mains and ducts within the Site. For the avoidance of doubt, this obligations includes for making safe all redundant works left in-situ, and sealing of voids, where left, against vermin;

d) Protect remaining live services against damage or disruption; and

e) Minimise vibration and noise produced by the demolition works, and agree appropriate limits for such with the Board to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Project Co shall allow the Board to carry out independent monitoring that shall include but not be limited to air pollution, noise, and vibration.

4.5 Construction Phase Requirements

4.5.1 General

The permanent and temporary Works and all construction operations for the Project should, save where expressly provided otherwise, generally be designed and constructed so that they can be carried out and where appropriate replaced, repaired, renewed and maintained on and from within the Site.

The Site is part of the Campus Site and Project Co has to be aware of and plan and programme the Works and Operations having regard to the other activities and operations ongoing at the Retained Site and Retained Estate.

At some points it may be necessary temporarily for Project Co to enter or have access across other parts of the Retained Site and/or Retained Estate for construction activities in accordance with and subject to the requirements detailed in this Sub-Section 3 and Appendix A Appendix B (Interface Output Specification) and Appendix E (Initial Drainage Proposal) and the Interface Proposals and in accordance with Clause 9 (Nature of Land Interests) of the Project Agreement. Project Co shall be responsible for identifying and implementing all necessary working practices to satisfy statutory requirements in relation to their construction activities. The construction of the Facilities shall be registered with the Considerate Constructors Scheme. The Contractor shall be registered with the Considerate Constructors Scheme.

Project Co shall undertake the role of Client and appoint a Principal Contractor and CDM Co-ordinator under the Construction (Design & Management) Regulations 2007 and appropriate amendments for the duration of the Works.

Project Co shall also comply with the obligations of the “Contractor” as laid down in the Board’s “NHS Lothian Estates Operation Policy For Control of Contractors”.

Project Co shall at all times work within the hours permitted by The City of Edinburgh Council in granting planning permission for the Facilities.

Precautions shall be taken to avoid infestation of the Works by rats, mice and other vermin. When drains are being laid, precautions shall be taken to avoid the entry of rodents, including providing temporary stoppers to pipe ends and setting manhole covers in position

as the work proceeds. Pipes and cables passing through the foundation walls shall be properly built in.

Project Co shall take all necessary precautions to prevent the outbreak and spread of fire. Project Co shall provide and maintain suitable and adequate fire fighting equipment at points within and adjacent to the Works. Project Co shall comply with the requirements of the Fire Prevention on Construction Sites: The Joint Code of Practice on the Protection from Fire of Construction Sites and Buildings Undergoing Renovation. Bonfires on the Sites will not be permitted.

Project Co. shall not use the Site during the Works for any purpose other than carrying out the Works.

There are helicopter operations to and from the existing helipad facility currently operating from RIE Site. Project Co shall comply with CAA requirements on construction sites close to a helipad. In particular Project Co's tower cranes will require to have aviation lights to indicate the cranes location to the helicopters using the existing helipad.

Project Co shall provide, for the duration of the construction phase, Personal Protective Equipment for visiting Board staff (and other approved visitors), and use of Project Co facilities for meetings etc.

Project Co shall provide the Board with temporary site accommodation for Board staff and advisors for the duration of the Construction Phase.

Project Co shall provide, remove and pay for all associated consumption of the temporary utilities required to construct the Works.

4.5.1A Clean Roads and Footpaths

Project Co shall adequately maintain approaches to the Site and/or any other roads and/or footpaths within the Campus Site which it is using or accessing and keep such free from mud and debris or materials to the Board's satisfaction. All vehicles must be cleaned, with any mud or loose debris removed, prior to the vehicles leaving the Site. Project Co shall provide facilities for washing down vehicles before leaving the Site and/or the Campus Site, to avoid contamination of the surrounding roads. Any contamination of surrounding roads, pavements, cycle paths etc. by site traffic shall be removed.

4.5.2 Site Access

Construction Access over the Yellow Area

If Project Co requires to carry out works to form a construction access to the Site over the Yellow Area Project Co shall provide a method statement for these works which method statement will form part of the relevant Interface Proposal and shall construct the works and comply with the requirements of Paragraph 1 of Section 1 (Construction Access) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Construction Access Proposal.

Works and Access during the Operational Term

Project Co shall maintain, repair, replace and renew the Facilities. Where in connection with the carrying out of works of maintenance, repair, replacement and renewal to the Facilities

Project Co needs to access the RIE Site and/or RIE Facilities any such works and access shall be carried out in accordance with Section 2 (Operational Construction Issues) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A, and the Interface Proposals and where applicable Paragraph 1 (Access Strategy) of Section 2 (Access Areas, Amended Drainage Proposal and Amended Substation Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A. This is without prejudice to any other more onerous requirements detailed in the Board's Construction Requirements which may apply to other works being carried out in the RIE Site including without limitation:-

Where:-

a) the works are to repair, maintain, replace and renew service media serving the Facilities located within the Service Strip or the Foul Service Strip Project Co shall also comply with the provisions of Section 6 (Service Strip and Foul Service Strip) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Service Proposal and where applicable any Amended Service Proposal agreed or determined pursuant to Section 3 (Amended Service Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A; and/or

b) the works are to repair, maintain, replace and renew interface links between the fire alarm and security systems, PTS and ICT and the Joint, Project Co shall also comply with the provisions of Section 7 (Link Building) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A, the Interface Output Specification and the Connection Proposal; and

c) the works are to repair, maintain and (where necessary) replace and renew the electricity cable on the Substation Cable Route Project Co shall comply with the provisions of paragraph 3 of Section 2 (Operational Construction Issues) and paragraph 7 of Section 5 (Access Areas, Drainage and Substation) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Substation Proposal; and/or

d) otherwise comply with any other requirements in relation to Access Areas otherwise referred to in this Section 3 *(Board's Construction Requirements).*

4.5.3 Board Major Incident Support

Project Co shall support the Board in dealing with a Major Incident. Project Co's support will be as required by but not limited to the Board's Major Incident Strategy Response Plan Strategic Plan Number reference HPT E023 03.

4.5.4 Restrictions and Requirements for Storage of Waste on Site

Project Co is required to demonstrate a waste management programme for the Works to minimise all site waste disposal to landfill, and to maximise reuse/recycling of timber, metal, plastic, paper and other waste arising. Project Co will liaise with all suppliers to ensure the minimum of packaging is used for deliveries of goods and materials to site. Any unavoidable packaging waste is to be recycled through an authorised waste recycler. When surplus excavated material and building spoil and rubbish cannot be recycled Project Co is to dispose of it to a licensed tip and be transported by an approved waste transportation company, and shall fully comply with all Law governing the controlled disposal of waste material. No materials shall be disposed of on Site by any other means. All spoil and waste materials that arise from the construction of the Works shall only be stored on Site until disposed off site. Project Co shall take cognisance of the location of the air intakes for the Retained Estate when assessing the locations for spoil and waste material stockpiles and

comply with the requirements of paragraph 4.5.12 in selecting the location for spoil and waste material stockpiles. No burning of any materials is permitted on or near the Site.

Project Co shall meet all statutory waste management regulations and local byelaws in relation to the storage of waste on site including but not limited to the Environmental Protection Act, Environmental Protection (Duty of Care) Regulations 1991, Hazardous Waste Regulations 2005 and WEE Directive.

The storage of waste during construction works shall cause no harm to neighbours and/or other building users at the Retained Site and particular attention is required to the location of waste storage areas in relation to windows and ventilation air intakes in the surrounding buildings.

Waste storage areas must be secure and shall be constructed such that they limit the possibility of leakages and contamination.

4.5.5 Site boundary treatment requirements

Project Co shall provide a site boundary that is secure and prevents unauthorised access to the Site at all times.

Around the perimeter of the Site Project Co shall provide a solid painted hoarding which extends from ground level to a minimum of 2.4m and shall provide visual screening of the Site. Corporate signage shall be restricted to the entrances and exits of the Site and in every case there shall be an NHS Lothian sign located next to each of the contractor's corporate signs. There shall be no other advertising on the hoarding or on tower cranes / construction equipment. Artwork created by or on behalf of the Board may be displayed on such crane and/or construction equipment as appropriate as proposed by the Board to Project Co. and approved by Project Co such approval not to be unreasonably delayed or withheld. All NHS Lothian signage shall comply with the recommendations of "Effective Wayfinding and Signing Systems - Guidance for Healthcare Facilities" 2nd Edition 2005, NHS Scotland Signage Guidelines and NHSScotland Identity Guidelines.

Project Co shall provide two waterproof public information project boards for external display. Project Co shall discuss and propose to the Board the content, size and location of these signs for approval by the Board such approval not to be unreasonably delayed or withheld. .

4.5.6 Site signage restrictions and requirements

Project Co shall obtain approval of the content and layout of the main site signboard/s from the Board such approval of the Board not to be unreasonably delayed or withheld subject to complying with the aftermentioned requirements. That part of the signage which refers to the Board shall follow the recommendations of "Effective Wayfinding and Signing Systems - Guidance for Healthcare Facilities" 2nd Edition 2005, NHS Scotland Signage Guidelines and NHS Scotland Identity Guidelines. The signboard/s shall contain the project title, the names of the Board, Project Co and the Principal Contractor. No additional advertising will be permitted on these signs beyond the standard consultant signboards.

4.5.7 Signage outside the Site

Project Co shall provide signage, but not in the Yellow Area, to the Emergency Department of the Royal Infirmary of Edinburgh that requires to be clearly visible from Old Dalkeith Road. Project Co shall ensure that existing RIE Facilities signage is replicated or reinforced if

temporarily obscured by the construction of the Facilities. Project Co shall replicate or reinforce existing RIE Facilities signage that is obscured by the Works.

4.5.8 Site Accommodation and Compound

Project Co will be entitled to use Car Park E for a site compound during the Construction Phase for the Works, subject to complying with the provisions of Section 3 (Site Compound/Car Park E) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A.

Project Co shall provide a site compound that is secure and prevents unauthorised access at all times. The existing services that run under, on and over Car Park E are to be located by Project Co. A record drawing of the existing services shall be provided to the Board prior to the commencement of construction of the Works. Project Co shall provide and obtain all necessary consents for temporary services to the site accommodation and compound and pay for their use.

Project Co shall be permitted to erect a sign stating their name and the project title at the entrance to the compound. No additional advertising will be permitted.

4.5.9 Restrictions and requirements on vehicles accessing the Campus Site road network

Project Co shall comply with paragraph 4.5.2. Notwithstanding the foregoing and any other requirements applying to any works, where any works and/or activities are or require to be carried out in any part or parts of the Access Areas, Project Co shall comply with paragraphs 2 to 4 of Section 5 (Access Areas, Drainage and Substation) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Access Strategy and where applicable any Access Strategy agreed or determined pursuant to Section 2 (Access Areas, Amended Drainage proposal and Amended Substation Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A and also in accordance with Clause 9 (Nature of Land Interests of the Project Agreement.

Project Co shall ensure that all contractors attending the Site are made aware of the heightened level of care and consideration required when carrying out work in an operational hospital in order to mitigate any detrimental effect on patient care, Board staff and the general public.

Project Co shall propose, discuss and agree with the Board a strategy for providing unimpeded Blue Light access to the RIE Emergency Department and other appropriate departments / units during construction of the Works. Project Co shall ensure that at all times during the construction and commissioning of the Works that free and unimpeded access is maintained for Blue Light emergency traffic through the Orange Area to the adult Emergency Department of RIE and through the Orange Area to the Percutaneous Cardiac Investigation Unit (PCIU) within the RIE. This includes the ambulance access which will encroach upon the Site, the stretcher drop off entrance and the ambulant entrance at the adult Emergency Department of the RIE. Provisions will also have are also to be made on the Site and Campus Site as required, to provide a minimum of five ambulance drop off parking spaces. The spaces are to be such that a stretchered patient can be taken directly into the adult Emergency Department of the RIE from an ambulance parked at any of these five spaces. Ambulances must also be able to pull out from any of the five spaces without hindrance to any other parked ambulance. Project Co shall plan construction and commissioning of the Works so as to accommodate these requirements including without limitation the TMS and/or Access Strategy and/or the requirements of Section 2 (Access

Areas, Amended Drainage Proposal and Amended Substation Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A.

Project Co shall agree with the Board revisions to the Blue Light traffic access/egress routes during the construction period.

Where construction traffic is required to access the Orange Area and any other part of the Campus Site road network, Project Co shall be responsible for ensuring that drivers observe the 15mph speed limit, that all vehicles have a valid MOT (if required), have the appropriate comprehensive insurance and that all drivers hold a valid UK driving licence.

A vehicle “Civil Penalty Notice Scheme” operates on the Campus Site.

4.5.10 Construction works further information

A. Construction works on the Site but connecting to other parts of the RIE Facilities

Fire connection and the Joint

As set out in paragraph 4.5.1 the new Facilities shall be delivered as a standalone new build. However, the Facilities will be physically linked to the RIE Facilities at ground and first floor levels. The part of the RIE Facilities to which the Facilities will be linked is called the Link Building.

The Link Building is part of the RIE Facilities. Project Co will be responsible for designing and constructing the Facilities to physically link to the RIE Facilities at the Link Building interface point as more particularly detailed in the Interface Output Specification. Project Co shall carry out the works to connect the Facilities to the Link Building subject to and in accordance with:

a) Section 7 (Link Building) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A;

b) Interface Output Specification; and

c) the Connection Proposal.

Project Co shall design and construct the fire alarm in accordance with the provisions detailed in paragraph 3.7.

Project Co shall construct the Joint. The Joint shall form part of the Facilities.

B. Construction works outside the Site – Off Site Works

(a) Works outside the Site but within the Campus Site, and maintained by Project Co

There shall be building services links between the Facilities and the RIE Facilities in respect of building services and other connections in terms of: -

a) infrastructure associated with ICT;

b) a pneumatic tube system (PTS);

c) foul drainage connections.

The above matters form part of the RIE Works

a) Access road for the Substation Works in the Substation Access Area

(i) Project Co will design and build a new PTS system which will run from the Facilities to the pharmacy and laboratories within the RIE Facilities. Project Co will design and build an ICT Data Network system which will run from the Facilities to link to the Board's ICT equipment/systems within the RIE Facilities. The Board will advise Project Co of the route for the PTS and ICT within the RIE Facilities. Project Co will be responsible for replacing, repairing, renewing and maintaining the PTS and ICT. Project Co shall provide design, construction and other information which information will form part of Project Co's applicable Interface Proposal for approval by the Board and shall design build, construct, replace, renew and maintain in accordance with:

- Section 7 (Link Building) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A
- The Interface Output Specification; and
- The Connection Proposal.

(ii) Service Strip

There may also be connections into some existing infrastructure for foul water drainage. If Project Co requires to connect the foul water drainage systems for the Facilities into the existing foul water drainage systems for the RIE Site and/or RIE Facilities then foul water drainage systems must be designed and constructed by Project Co such that they may be connected to foul water drainage systems only at the agreed connection points in the Initial Drainage Proposal and/or within the Foul Service Strip. Project Co will be responsible for replacing, repairing, renewing and maintaining the foul water drainage systems serving the Facilities and the connections. Project Co shall provide design, construction and other information which shall be part of Project Co's applicable Interface Proposals to the Board for approval, about the foul water drainage systems serving the Facilities. Project Co shall comply with the requirements for installing, maintaining, repairing, renewing and replacing foul water drainage systems subject to and in accordance with:-

- Section 2 (Operational Construction Issues) and Section 6 (Service Strip and Foul Service Strip) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A; and
- The Access Strategy; and
- The Service Proposal; and
- The Supplemental Drainage Proposal; and where applicable
- any Access Strategy and/or Amended Drainage Proposal and/or Amended Service Proposal as applicable agreed or determined pursuant to Section 2 (Access Areas and Amended Drainage Proposal) and Section 3 (Amended Service Proposal) of Part 2 (Interface Proposals Procedure) of this Section 3 *(Board's Construction Requirements)* of Schedule Part 6 *(Construction Matters)* (as varied, amended or supplemented from time to time in accordance with the Project Agreement).

As regards design and construction, maintenance, repair, replacement, and renewal of any electrical, gas and water connections these must all be independent services serving the Facilities and shall not connect into any such services serving the Retained Site and/or Retained Estate. However wherever any such services have to be installed and cannot be installed on the Site they may be installed on the RIE Site, the locations for such services are however restricted to certain areas of the RIE Site namely the Service Strip. Project Co will be responsible for design and construction and replacing, repairing, renewing and maintaining such services serving the Facilities. Project Co shall provide such design,

construction and other information which shall be part of Project Co's applicable Interface Proposals for approval by the Board and Consort about the services and shall comply with:-

- Section 2 (Operational Construction Issues) and Section 6 (Service Strip and Foul Service Strip) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A; and
- The Access Strategy; and
- The Service Proposal; and where applicable
- any Access Strategy and/or Amended Service Proposal agreed or determined pursuant to Section 2 (Access Areas and Amended Drainage Proposal) and Section 3 (Amended Service Proposal) of Part 2 (Interface Proposals Procedure) of this Section 3 *(Board's Construction Requirements)* of Schedule Part 6 *(Construction Matters)* (as varied, amended or supplemented from time to time in accordance with the Project Agreement).

(iii) Access road for Substation Works in the Substation Access Area: if Project Co chooses to construct a substation on the land outlined in blue on Plan 4 in accordance with Paragraph D below then Project Co shall design and construct and thereafter maintain, repair, replace and renew the access road an access road thereto in the Substation Access Area and shall comply with the requirements for the access road detailed in paragraph D below.

C. Construction works outside the Site but within the Campus Site but not maintained by Project Co – the Retained Estate Handback Infrastructure which comprise Hospital Square Works, Cycle Path Works and Surface Drainage Works

The Board has identified the following works which will be required to be carried out outwith the Site on the RIE Site. These works comprise Hospital Square Works, Cycle Path Works and Drainage Works. These works will be carried out by Project Co and upon completion will not be maintained by Project Co but once completed will form part of the Retained Estate Handback Infrastructure. These works include:

Hospital Square Works:

(a) The design and construction of new roadway, hard and soft landscaping works to the area between the Chancellor's Building, RIE Facilities and the redline boundary to the north and east of the Site;

(b) Emergency Departments: The design and construction of new roadways, hardstandings and parking areas at the new entrance to the RIE Facilities and the Facilities' emergency departments including without limitation.

- Roundabout at the termination of the road north of the link to the RIE Facilities.
- RIE Day Surgery/PCIU ambulance drop off that will have access to the roundabout referred to in item a) above.
- Taxi rank and drop off set back from the road outside Ann Rowling Clinic
- Drop off set back from the road opposite the taxi rank and drop off referred to in item c) above.

- Roundabout at the RIE Facilities entrance for access to the DCN proximity parking and RIE Facilities Day Surgery/PCIU ambulance drop-off.

- The ambulance drop-off for the RHSC ED from Old Dalkeith Road. This shall have a minimum of 5 ambulance drop off spaces for the Adult and Paediatric Ambulance ED. The layout shall prevent Project Co's Operational Term vehicles from stopping ambulances from having access to the ED ambulance drop off spaces for the ED within the Facilities and RIE ED. For the avoidance of doubt there may also be element of these works carried out on the Site in which case any such elements are part of the Facilities and not Retained Estate Handback Infrastructure.

- Emergency visitor parking for the RHSC ED from Old Dalkeith Road. For the avoidance of doubt there may also be element of these works carried out on the Site in which case any such elements are part of the Facilities and not Retained Estate Handback Infrastructure.

- Link to the existing Adult Ambulant Entrance to the RIE ED and its 6 ambulance drop off spaces.

(c) Project Co shall create an access to the basement of the Facilities, the VIE Compound and energy centre at the Site from Old Dalkeith Road.

Drainage Works:

There may also be connections into some existing surface water drainage. If Project Co requires to connect the surface water drainage systems for the Facilities into the existing surface water drainage systems on the RIE Site then surface water drainage systems must be designed and constructed by Project Co such that they may be connected to surface water drainage systems at the agreed connection points in the Initial Drainage Proposal. Project Co shall provide design, construction and other information which shall be part of Project Co's applicable Interface Proposals to and for approval by the Board about the surface water drainage systems serving the Facilities and Project Co shall comply with Section 5 (Access Areas, Drainage and Substation) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A, the Initial Drainage Proposal, the Supplemental Drainage Proposal, the Access Strategy and where applicable any Access Strategy and/or Amended Drainage Proposal agreed or determined pursuant to Section 2 (Access Areas and Amended Drainage Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A,

Cycle Path Works:

For details of the cycle works see paragraph 3.8.4 of this Sub-Section C.

D. Construction works outside the Campus Site and maintained by Project Co

Substation Works – Project Co shall be responsible for getting a dedicated HV power source for the Project via a dedicated Scottish Power substation. The Board has identified the Substation Site as the possible location for a dedicated substation for the Project.

If Project Co chooses to locate the substation on the Substation Site then Project Co shall provide design, construction and other information which shall be part of Project Co's applicable Interface Proposals to and for approval by the Board about the substation and access thereto which access may be formed only on the Substation Site and Project Co shall comply with the provisions regarding the Substation Access and cables in paragraphs 6 to 8

of Section 5 (Access Areas, Drainage and Substation) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Substation Proposal.

If a substation is constructed on the Substation Site then in order to get power from the substation to the Site the Board has identified a route for the HV power cable, the Substation Cable Route, on the Bioquarter Site. The cable route to the Facilities may enter the Site via the Service Strip (shown shaded yellow and hatched in black on Plan 2) and the cable route may not cross the Retained Site at any other point. In constructing the cable on the Substation Cable Route, Project Co shall be responsible for all design, construction, maintenance, repair, replacement and renewal and shall comply with paragraphs 2 and 4 of Section 2 (Operational Construction Issues) and paragraphs 1 to 3 and 6 to 8 of Section 5 (Access Areas, Drainage and Substation) and Section 6 (Service Strip and Foul Service Strip) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and the Access Strategy and Substation Proposal and the Service Proposal and where applicable any Access Strategy and/or Amended Service Proposal agreed or determined pursuant to Section 2 (Access Areas and Amended Drainage Proposal) and/or Section 3 (Amended Service Proposal) of Part 2 (Interface Proposals Procedure) of Appendix A.

4.5.11 Workmanship, Construction Accuracy & Tolerances

Project Co shall ensure that general workmanship conforms to current revisions of BS 8000: Series “Workmanship on Building Sites”, which covers typical building construction activities. Where specialist design proposals require construction activities outside the scope of this document, Project Co shall propose specific quality procedures relating to these activities based on Good Industry Practice current at the time, as a minimum.

Project Co shall ensure that workmanship for all construction and component assemblies is to the highest standards in every respect. Work is to be true to detail with sharp profiles, straight and free from defects, marks, waves or flaws of any nature impairing strength, performance or appearance.

The buildings and the external works shall be designed and set out by Project Co in accordance with BS 5606:1990 “Guide to Accuracy in Building”.

In some situations the tolerances identified in BS 5606 may not be appropriate for the particular elements or combination of elements in the Facilities. Where special levels of accuracy are required in relation to Project Co’s proposals these shall be stated by Project Co. Project Co shall consider the recommended procedure set out in Figure 8, Section 3, Appendix B, of BS 5606.

Project Co shall identify critical dimensions and setting out points on all its drawn information.

4.5.12 Control of Noise, Vibration and Dust

Project Co will ensure that unacceptable dust and pollution as a result of construction works or any other activities undertaken on the Site is not created at locations where patients, staff, visitors of members of the public might be exposed to pollutants and areas adjacent to ventilation intakes on the Campus Site (in particular intake vents at the existing operating theatres at the RIE Facilities and at the University Facilities). The ambient air quality standards to be met are as outlined in the table below:

Ambient air quality standards

Pollutant	Averaging Period	Air Quality Objective	
		Concentration (µg/m^3)	Allowance
Nitrogen Dioxide (NO_2)	1-hour	200	18 per calendar year
	Annual	40	-
Particulates (PM_{10})	24-hour	50	35 per calendar year
	Annual	40	-
	Annual	18	-
Particulates ($PM_{2.5}$)	Annual	12	-
		25	-
		15% reduction	-

Project Co shall comply as a minimum with the mitigations detailed in the Planning in Principle – Environmental Statement dated July 2011 and Addendums dated August 2011 and October 2011. Project Co shall comply with BS 5228-1:2009 Code of practice for noise and vibration control on construction and open sites Part 1: Noise and BS 5228-2:2009 Code of practice for noise and vibration control on construction and open sites Part 21: Vibration. Project Co shall comply with Control of Noise (Code of Practice for Construction and Open Sites) (Scotland) Order 2002. Project Co shall comply with the noise controls set in HAI-SCRIBE 2 review.

Project Co shall ensure that the design and installation of any plant, machinery or equipment shall be such that any associated noise complies with N25 when measured within any nearby living apartment, and no structure borne vibration is perceptible within any nearby living apartment.

The attention of Project Co is drawn to the provisions of Sections 60 and 61 of the Control of Pollution Act 1974, with reference to the control of noise in relation to any demolition or construction works. Where such works are adjacent to occupied property, Project Co shall ascertain from the Site neighbours what requirements or restrictions, if any, shall apply, particularly in relation to Aspergillus. The restrictions may relate to the type of construction plant to be used, siting of construction plant, methods of working to be adopted, the hours of work permissible and may, in addition, impose a maximum noise level that must not be exceeded.

With regard to piling operations, the Board considers it essential that steps are taken by Project Co to limit the effects of noise and vibration. Project Co is required therefore to demonstrate through the selection of the method of piling that full consideration has been given to this requirement.

Project Co shall at all times ensure that the appropriate silencers and/or noise suppression apparatus are correctly fitted to construction plant and equipment.

Project Co shall fit all compressors, percussion tools and vehicles with effective silencers of a type recommended by the manufactures of the compressors, tools or vehicles but in any event to the requirements of BS 5228-1:2009.

Any equipment of a semi-permanent nature used by Project Co, which produces noise on a regular basis, shall be positioned to cause the minimum disturbance to adjacent areas. Project Co shall ensure absolute care is taken at all times throughout the course of the Works to prevent the egress of water, dust, debris or any microbiological contamination out

of the Site and into adjacent buildings. In particular, Project Co shall establish any specific requirements for the control of dust.

Project Co shall ensure that all of the contractor and subcontractor's workforce are trained on the pollution and noise reduction measures in operation during the Works.

4.5.13 Meetings with Consort during the Construction of the Works

Project Co shall attend meetings with the Board and Consort during the construction of the Works. The Board shall manage the meetings including chairing and preparing the minutes except for the fortnightly Health and Safety Group meetings that Consort chair and minute. Project Co shall have the same lead person or a named deputy, at all meetings. The meetings that Project Co shall attend are to be agreed with the Board.

4.5.14 Meetings with Immediate Neighbours

Project Co shall attend meetings with the Board and all immediate neighbours during the construction of the Works. Project Co shall manage the meetings including chairing and preparing the minutes Project Co shall have the same lead person, or a named deputy, at all meetings. The meetings that Project Co shall attend are to be agreed with the Board.

4.5.15 Meetings with the Board during the Construction of the Works

Project Co and the Board shall agree the day-to-day; week-to-week meetings to be attended by Project Co and the Board. The purpose, timing, structure, management and content of the meetings are to be agreed by the Board and Project Co. Project Co shall have the same lead person at all meetings as far as possible or a named deputy.

4.5.16 Restrictions on Images and Videos during Construction of the Works

Project Co are required to obtain the Board's agreement prior to the use of CCTV cameras, webcams and the like to take images, videos and the like of the Works whether on or outside the Site.

4.5.17 Completion Requirements

On completion of the Works, Project Co shall provide the Facilities as clean to comply with the Completion Criteria. During the Post-Completion Commissioning Project Co shall provide the Facilities to a "clinically clean" standard of satisfaction of the Board's Head of Service Infection Control. Project Co shall liaise with the Board's Head of Service Infection Control in terms of agreeing the process and standards required to achieve the appropriate level of cleanliness for each location within the Facilities. Project Co shall demonstrate how the proposals facilitate the control and management of an outbreak and spread of infectious diseases in accordance with SHTM 03-01 and SHFN 30.

Project Co shall adopt a systematic and thorough approach to the commissioning of the Facilities including the setting to work, testing and providing the handover documentation for the same.

Project Co shall approach the commissioning activities as an entirely separate procedure undertaken by Project Co and ensure all activities interface with the buildings themselves, building services and equipment provisions.

Project Co shall ensure that the ability to commission the systems and installations is considered at an early stage and is designed into the Facilities and is an inherent part of the overall buildings solution.

During the design stage Project Co shall detail outline commissioning periods required on-site such that these are built into the Programme and Outline Commissioning Programme.

During the Construction Phase Project Co shall ensure that installations comply with the design intent of the drawings and that all installation and commissioning activities at the Facilities are performed correctly. This shall include ensuring physical access is easily achievable to all commissioning stations and devices.

By the date for Project Co to make available the principal operation and maintenance manual set in Clause 18.5 of the Project Agreement, Project Co shall provide to the Board a complete set of electronic records representing the design, construction, testing and commissioning and completion of the "as-constructed" Facilities that include the routes of all building services. This shall include, but not be limited to, a full set of as-built records, drawings, specifications and the like and the documents in the Completion Criteria, incorporating all changes to the design and all remedial works during construction. The documents and drawings format(s) and [ ] number of copies are to be provided by Project Co. For the purposes of Clause 17.18 and 18 of the Project Agreement all final as-built records for the Facilities shall include, as a minimum:

a) Design information including all relevant design calculations, parameters, assumptions, standards, specifications, product data sheets for all components and parts, including details of the influence on the design of actual construction methods, including any change or remedial works during construction.

b) As built drawings for all component parts of the Facilities;

c) Testing & Commissioning records for all discrete components, subsystems, systems and the Facilities as a whole;

d) Operating and Maintenance manuals;

e) Health and Safety File;

f) Full set of design, construction, testing and commissioning and completion records/certification.

g) All other information that is required to be collated under the Construction (Design and Management) Regulations 2007 as amended from time to time.

Project Co shall provide to the Board, at the Actual Completion Date, a certificate confirming that the Facilities comply with the requirements of NHS Scotland Firecode.

Construction records and all information relevant to the construction of the Facilities shall be stored in a secure electronic data room created specifically for this purpose by Project Co for access after completion. The system for storage of data and information shall be designed by Project Co and shall generally be compatible with the Board's existing systems. The format of the data room and the system for storage of data shall be designed by Project Co and submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement. Project

Co shall be responsible for management and administration of the data room for the Project Term.

4.5.18 Oversailing Activities

When Project Co intends to oversail any part of the Retained Site and/or Retained Estate in connection with the Works and/or any works in the Operational Term then Project Co shall comply with the Oversail Strategy and Section 4 (Oversail) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A and/or where applicable any Additional Oversail Strategy agreed or determined pursuant to Section 1 (Oversail) of Part 2 (Interface Proposals Procedure) of Appendix A.

5 General Construction Requirements

5.1 Schedule of Life Expectancies

The buildings, including building services components, shall be designed with materials, components and techniques that are readily available, reliable, sustainable and easily maintainable in use. The Board supports buildings constructed using components with proven technology, with high life expectancy, leading to minimum cost in use.

Good Industry Practice for a design life at the Actual Completion Date for the elements listed below shall as a minimum be:

a) Structure, including substructure	70 years
b) Floor Structure	70 years
c) Roof Structure	70 years
d) Drainage and below ground civil engineering infrastructure	70 years
e) External Walls	70 years
f) External Openings, windows and door	25 years
g) Roof Finishes	25 years
h) External finishes	25 years*
i) External Hard Surfaces	20 years
j) Internal partitions including openings	25 years
k) Internal Doors	25 years
l) Internal finishes (excluding soft flooring)	15 years*
m) Soft flooring	12 years
n) Internal fixtures and fittings	15 years
o) Engineering plant	CIBSE Guidance

p) Engineering services distribution systems CIBSE Guidance

*excluding painted finishes

Project Co shall demonstrate that the design life proposed for any element will be achieved.

Materials and components forming part of the Facilities, which require maintenance and replacement within the life of the Facilities, shall be selected, located and fixed in such a way as to minimise future inconvenience, disruptions and to avoid temporary closure of the Facilities.

5.2 Infection Prevention & Control

The Board requires the highest priority on infection prevention and control to be given in relation to the movement of goods and in particular the segregation as far as is reasonably practical of clean linen, food trolleys and the removal of waste, soiled linen and empty food trolleys.

Project Co shall ensure all aspects of the Facilities allow for the control and management of any outbreak and/or spread of infectious diseases in accordance with the following:

a) Infection Control in the Built Environment: Design and Planning (SHFN 30);

b) Scottish Infection Manual – “Managing the Risk of HAI in NHS Scotland”;

c) Health Facilities Scotland – Healthcare Associated Infection – System for Controlling Risk in the Built Environment (2007)

d) Guidance provided by Clinical Standards Board NHS HIS;

e) Textiles and Furniture (SHTM 87);

f) Ventilation in Healthcare Premises (SHTM 03-01);

g) “Guidance on Prevention and Control of Clostridium difficile Infection (CDI) in healthcare settings in Scotland” Health Protection Scotland, 2009; and

h) NHS Lothian Infection control web based manual http://www.nhslothian.scot.nhs.uk/Services/A-Z/InfectionControl/Pages/default.aspx;

5.3 Thermal Requirements

Project Co shall ensure the buildings’ envelopes complies with Section 6 of 2011 Non-domestic Technical Handbook to The Building (Scotland) Amendment Regulations 2010 and the following criteria:

a) The entire building envelope shall be thermally broken and no details that allow cold bridging shall be used;

b) The whole building envelope shall be provided with a continuous air and vapour tight skin layer with a vapour resistance of not less than 200 Mns/g when tested in accordance with BS 3177. This barrier shall be on the accommodation side of any insulation and may be formed of differing materials at different parts of the construction provided that continuity is maintained in all places. The vapour barrier material shall be non-combustible;

c) The building fabric shall include passive design measures to limit summer temperatures to figures given within the Environmental Matrix; and

d) The work to the fabric to achieve the above standards shall include but not be limited to enhanced window performance, high solar performance glazing systems, brise soleil and enhanced thermal insulation value.

5.4 Acoustics

Project Co shall define the acoustic criteria to be adopted on a room-by-room, and corridor-by-corridor basis with reference to SHTM 08-01: Acoustics. Project Co shall be responsible for demonstrating compliance with the agreed criteria.

Project Co shall endeavour within their design, to minimize the transfer of noise, dust and vibration throughout the Facilities. In particular, the design shall take account of the potential for disruption to the clinical function of the Facilities caused by noise, dust, vibration or other nuisance, however caused, as a result of future modifications / remedial works that may be required to the Facilities.

Project Co shall demonstrate in their design, how it shall address the issue of undesirable noise transmission in patient waiting areas. Project Co shall endeavour to minimise and mask ambient noise sufficiently to preserve patient privacy, confidentiality and maintain a calming atmosphere.

Project Co shall ensure that the acoustic design of the Facilities shall give due consideration to the requirements of the deaf and hard of hearing. In particular the level of background noise shall be such that it does not cause particular difficulty for those with such conditions.

In addition, Project Co shall ensure all specialist audiology sound-proofing in accordance with the Board's Construction Requirements this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements), Sub-Section E (Specific Non Clinical Requirements) and this Schedule Part 6 Section 6 (Room Data Sheets) are designed into the Facilities.

5.5 Room Mock-ups

Project Co shall provide the design of the room mock-ups including the 1:50 floor plan with loaded floor, walls and ceiling including details showing Equipment. The design for the mock-ups shall include the detailing for the floor finishes including skirting interface. Project Co will provide accommodation for, and full scale mock-ups of the following rooms, as a minimum, for use in the design development and approval process:

a) Touch Down Base;

b) Adult Single Bedroom with ensuite;

c) Paediatric Single Bedroom with ensuite

d) Paediatric Four Bedded room;

e) Clean Utility Out Patient Department and

f) Clean Utility In-patients

These shall be built with all services, equipment, doors and windows. They shall include the floor, wall and ceiling finishes. The services and equipment do not need to be live. Group 3 equipment will be provided by the Board for Project Co to install into the rooms.

The design and construction of the room mock-up shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement. They shall be provided in a timely manner, to ensure they add value to the design development and approval process.

5.6 Integration with Engineering Services

Internal walls, partition systems, ceiling voids and service risers shall be capable of integrating services, e.g. wiring, plumbing, medical gases and service terminals as required without detriment to the performance of any building services and other Facilities performance criteria such as fire resistance or acoustic properties. Engineering Services shall be co-ordinated such that satisfactory means of maintenance access is provided which minimises the potential for disruption to the Board's operations.

5.7 Building Envelope

The building envelope includes all external wall, façade and roof cladding elements associated with the Project. Project Co shall design the building envelope to provide a high quality enclosure to the accommodation and shall provide resistance to impact damage and intruder break-in, either by cutting or disassembly of the wall components. It shall incorporate an external finish which is essentially self-cleaning irrespective of the frequency of maintenance. Whilst selection of all materials and construction techniques is the responsibility of Project Co, there are a number of key criteria which must be satisfied by Project Co, as follows:

a) All selected materials shall be compatible with each other;

b) All selected materials shall be subject to the approval of The City of Edinburgh Council as part of the overall planning approval process;

c) The selected materials shall have a verifiable life expectancy in line with the criteria set out in paragraph 5.1 and certain specific elements, such as sealants, which may have a design life of less than the period stated, shall be identified and submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement and shall be the subject of a planned maintenance programme for replacement;; and

d) Any cladding systems chosen for use on this Project shall be designed and constructed to resist silently, without detriment to the required performance or appearance, the action of the elements including wind, rain, hail, snow, ice, solar radiation, temperature changes, moisture movement, structural movements, construction tolerances, thermal movements, the internal environment of the buildings and dead or imposed loads. The systems shall include the necessary provisions to enable regular cleaning from outside and regular routine maintenance to take place, without disturbance to the activities within the buildings, in accordance with the current provisions of the amended Workplace (Health, Safety and Welfare) Regulations 1992 and Ability to Open Windows Safely guidance.

Project Co shall ensure that the buildings are constructed and the design is detailed to limit air infiltration to minimum levels to reduce energy consumption and improve internal environmental conditions.

Performance demonstration tests for all roof and wall elements shall be carried out by Project Co in accordance with the following:

Project Co shall ensure all testing of mock-up assemblies of parts of the buildings construction are completed satisfactorily before work starts on the Site in relation to the building envelope.

Project Co shall arrange for the testing of all completed wall and roof assemblies to prove compliance with the requirements of The Building (Scotland) Regulations 2004 and its amendments

Project Co shall ensure that the external hard and soft landscaping around the buildings shall allow access for the appropriate maintenance / cleaning system and equipment utilising the hierarchy of control measures included within the Work at Height Regulations 2005 as amended. Appropriate provisions shall be incorporated by Project Co to allow the safe use of the appropriate maintenance / cleaning system including but not limited to safe access to the workplace and equipment. The structural frame and external skin of the buildings shall be designed by Project Co to accommodate the loading requirements of access equipment and operatives, where the cleaning and maintenance system uses this method.

Project Co shall design the buildings' envelope to prevent rainwater entry into the building structure and the internal accommodation. Where water penetrates cladding elements, as part of the functional design and construction techniques, Project Co shall ensure it is controlled and drained externally.

5.8 Internal Areas

Project Co shall ensure that the internal areas of the buildings shall allow access for the appropriate maintenance / cleaning system and equipment utilising the hierarchy of control measures included within the Work at Height Regulations 2005 as amended. Appropriate provisions shall be incorporated by Project Co to allow the safe use of the appropriate maintenance / cleaning system including but not limited to safe access to the workplace and equipment. The internal frame and internal skins of the buildings shall be designed by Project Co to accommodate the loading requirements of access equipment and operatives, where the cleaning and maintenance system uses this method.

5.9 Ceilings Heights & Voids

The floor to ceiling heights, or the floor to the underside of ceiling mounted plant where there are no ceilings, shall be designed to accommodate the nature and use of the accommodation.

Project Co shall provide ceiling heights and voids that provide an interface between the mechanical and electrical services installations and the accommodation below with the integration of service outlets, lighting, grilles and other fittings.

Project Co shall configure the design, wherever possible, to accommodate future flexibility.

The Board accepts that there will be a limited number of areas where future flexibility will be less easily achieved. These areas may include (but not be limited to): operating theatres; shielded rooms; and rooms designed to accommodate heavy imposed loads.

An appropriate and safe void allowance above all ceilings shall be provided, including appropriate and safe points of access for maintenance of services. These shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement. The void

allowed shall be adequate for the proper co-ordination and installation of engineering, cabling (including IT) and other services.

Co-ordination with the electrical, mechanical and communication services shall be an inherent part of the ceiling and building design. Within each area the installation of the engineering services provision shall be co-ordinated with the ceiling layout and allow simple relocation if required.

Suspended ceilings shall be readily demountable without suffering damage or becoming soiled and shall be easily cleaned. Frequently accessed voids shall be fitted with robust hinged locking doors or hatches.

Project Co shall ensure that the void above the ceiling is fully accessible from below, unless otherwise agreed by the Board, and adequate for the proper installation and co-ordination of the services, and for their future maintenance, repair and replacement. Allowance shall be made by Project Co for the installation of additional services in the future wherever possible. Where the design does not include the need for ceiling voids for services there shall be an allowance made by Project Co for a dedicated zone for the installation of ceilings and services at a later date.

Project Co shall ensure that the ceiling layouts are co-ordinated with the drainage, mechanical and electrical services installations. Project Co shall demonstrate its solution to this requirement prior to the commencement of construction.

Ceiling mounted booms required for patient support and monitoring systems in theatres, Paediatric Intensive Care Unit (PICU), treatment or x-ray rooms shall be co-ordinated with the ceiling layouts.

Project Co shall ensure the design and construction provide flexibility in terms of fixtures and fittings, i.e. locations of individual pieces of equipment can be readily changed and not unduly restricted by the type of construction.

Project Co shall ensure that the ceiling voids are designed to accommodate the specific requirements of the fire strategy for the Facilities – and in particular, the provision of cavity fire-barriers within compartments.

5.10 Corridor Widths and Heights

Corridor widths and heights shall satisfy the relevant guidance provided by:

a) BS8300:2009

b) The Equality Act 2010;

c) SHFN14 “Disability Access”;

d) HBN 00-04;

e) SHTM 81; and

f) Other relevant statutory guidance.

The hospital streets are to have a minimum unobstructed width of 3 metres. Other corridor widths shall be as defined by the nature and use of the accommodation. Corridor heights shall be as defined by the nature and use of the accommodation. Main interdepartmental

corridors in areas that patients may travel in beds shall be of sufficient width to allow two beds, with any attached equipment, to pass. The corridors width and height shall allow the installation, removal or replacement of clinical and non clinical equipment. Minimum widths and heights shall apply along the whole length of the corridor.

5.11 Door Widths and Heights

Clear widths and heights of all door openings in addition to satisfying the requirements of The Building (Scotland) Regulations 2004 and The Building (Scotland) Amendment Regulation 2011, shall comply with the guidance of BS 8300:2009, SHTM 81, SHTM 58 and the relevant section of HBN 40. Door widths shall be identified in the relevant Room Data Sheet.

The door opening widths and heights in clinical areas shall be sufficient to allow the safe passage of a four section profiling electric bed with associated equipment and escort alongside.

Notwithstanding the above, Project Co shall be responsible for establishing, through detailed consultation with the Board, additional specific requirements for door widths and heights in all areas of the Facilities. Consideration shall be given to providing sufficient door width in areas where the Board's operations rely on the use of larger items of equipment such as waste containers and regeneration trolleys.

Door widths, heights and door configuration shall be provided to allow for the delivery and removal of equipment to each area.

5.12 Windows

Project Co shall ensure that due consideration is given to the location and extent of glazing on external walls with regard to solar gain and heat loss. Solar control glazing, or appropriate solar shading, shall be used on windows on east, west and south facing elevations. The use of blinds or other device placed between secondary glazing or double sashes shall not be considered appropriate solar shading.

Courtyards, and courtyard elevations, shall be designed by Project Co so that daylight to usable room spaces at the lowest level of the courtyards is adequate for normal tasks within the rooms.

The Board wish to see the use of natural daylight contributing towards the achievement of a high standard of environmental quality.

Natural light shall be provided in public spaces and in occupied private and staff spaces within the Facilities as far as is practical. Natural and artificial light sources shall be designed to avoid or minimise glare.

Window area and sill height, privacy and security requirements will require special consideration for ground floor accommodation to allow sufficient daylight and views out whilst maintaining privacy from people outside the building.

Where transparent window glass requires to be rendered translucent for reasons of privacy either by obscure glazing or by the use of applied reflective films, then consideration shall be given to the effect of internal artificial lighting during the hours of darkness. This particularly, but not exclusively, applies to all patient areas situated at or adjacent to external public spaces.

Project Co shall provide all windows with a security rating classification of 2 or 3 for manual intervention attack when tested in accordance with Loss Prevention Standard LPS 1175 : Issue 6 : Table 4: May 2007 and shall meet the relevant performance standard in the appropriate British Standard. Glazing and glazing sizes shall be kept to the minimum compatible with the requirements of lighting, surveillance and visibility.

Where possible all windows shall be designed by Project Co to be cleaned both externally and internally from the inside, unless otherwise agreed by the Board. Project Co shall ensure no portions of windows, either fixed or opening shall come below the level of worktops or desks included in the Schedule Part 11 Equipment Schedule.

Project Co shall ensure opening windows are provided with good quality well-fitting seals and shall be capable of opening at the top and bottom of the frame and shall be fitted with restrictors to give a maximum opening of not more that 100mm in normal use. The effect of such restrictors shall be taken into account by Project Co when calculating the effect on efficient and effective natural ventilation requirements for the room. Project Co shall ensure all windows required for ventilation shall be provided with controllable trickle ventilators within the head of the frame or with two stage key lockable handles giving 5 – 10mm ventilation gap. The opening lights of the windows, and any control devices, shall not interfere with the location or operation of blinds or curtains. All windows and fittings shall be compliant with anti-ligature requirements.

External sills shall be designed to prevent birds from roosting.

Project Co shall ensure that locking devices, to enable the windows to be released for cleaning purposes, shall be by key or other device such that the locks cannot be released by unauthorised persons.

Project Co shall ensure that all handles or control gear shall be placed at levels which enables them to be operated by staff standing on the floor without the use of loose poles, and which do not conflict with the location of the adjoining construction elements, including blinds and curtains. Where windows are placed over worktops or desks, or where the operation as described above is not achievable, mechanical or electrical means of opening shall be provided by Project Co with controls located in a suitable position within the room concerned.

Project Co shall test the windows and other external opening assemblies (louvres and doors) in accordance with the following.

a) BS EN 1027:2000 Windows and Doors – Watertightness – Test Method;

b) BS EN 12210:2000 Windows and Doors – Resistance to Wind Load - Classification; and

c) The Test Report Format contained in the withdrawn standard - BS 5368, Part 4: 1986 (EN86).

5.13 Finishes

5.13.1 General Finishes

Project Co shall select finishes on the basis of the following:

a) Accessibility;

b) Appropriateness;

c) Durability;

d) Robustness;

e) Compatibility;

f) Maintainability;

g) Suitability for life cycle replacement;

h) Co-ordination with other finishes;

i) Suitability for infection control;

j) Health and Safety attributes;

k) Life Expectancy set out in paragraph 5.1;

l) Easy of future maintenance; and

m) Appearance.

All wall finishes and backgrounds shall be selected and installed in accordance with the NHS Requirements set in paragraph 2.3, and appropriate British and European Harmonised Standard Specifications and Codes of Practice. The Board's requirements are identified in this Schedule Part 6 Section 6 (Room Data Sheets) and the finishes listed in the table set out in paragraph 1.2.3 of Schedule Part 8 (*Review Procedure*).

Areas of the Facilities that are subject to potential damage from trolleys, vehicles, beds or other similar traffic shall have adequate protection to comply with SHTM 69 as a minimum.

The finishes detailed in the Table of Finishes in accordance with Schedule Part 8 Review Procedure and shall demonstrate the finished quality standards of certain specific fittings and finishes that will be constructed by Project Co during the design and construction stages. Project Co will create these mock-ups that will form the benchmark for quality control of site operations.

Project Co shall also select finishes which do not give rise to offensive odours developing. Accordingly, finishes shall be selected with due regard to usage, potential spillage and cleaning regimes (details provided in Sub-Section E) and health and safety issues in relation to performance and cleaning regime.

Project Co shall ensure that all floor, wall and ceiling finishes include adequate provision for movement joints, in accordance with current recommendations, to cater for any movements of the structure and/or the background material of the finish. Project Co shall ensure that the location and detail of the joints shall be fully co-ordinated with the overall interior design. Project Co shall indicate the position of all movement joints on drawings to be submitted as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

The use of inspirational colour patterning, motifs and texture shall be considered by Project Co in appropriate areas throughout the building. Where carpeted areas are required due consideration shall be given by Project Co to the use of durable wool-rich carpets if appropriate to the room function.

Project Co shall submit to the Board for review by the Board in accordance with paragraph 1.2.3 of Schedule Part 8 (Review Procedure), Table of Finishes and clause 12.6 of the Project Agreement the decoration for the Teenage Cancer Trust accommodation.

Where possible, internal surfaces shall allow cleaning and repair of elements that may be vandalised, with the minimum of effort.

5.13.2 Flooring

Project Co shall ensure all level, stair treads and nosings, and inclined flooring shall meet the following minimum slip resistance requirements:

a) “Pendulum Test Value” of 36 or greater (when either dry or contaminated); and

b) “Rz surface micro-roughness (microns µm)” of 20 µm or greater for water-wet, low activity pedestrian areas.

Project Co shall procure that test results in the “installed” condition are independently verified by the Health & Safety Laboratory, Buxton, Derbyshire. The pendulum test shall be performed using a pendulum-coefficient of friction instrument with “Four-S” rubber (Standard Simulated Shoe Soil) and Slider 55 rubber, in accordance with approved HSE test methodology.

For the avoidance of doubt, the obligation to follow the pendulum-coefficient of friction methodology is a specific obligation and is derived from the HSE, which is their preferred method of test.

Project Co shall ensure that all entrances to the Facilities incorporate sufficient length of appropriate floor matting designed to remove contaminants including water, dirt and leaves from footwear, trolley wheels etc. A water evaporation system such as a hot air curtain shall be provided at each entrance.

All floor finishes shall comply with SHTM 61 and have low absorption, low radius of ignition and low dirt retention.

Project Co shall comply with all of the recommendations provided in SHS Safety Action Notice SAN(SC)05/08.

Project Co shall prepare a Flooring Finish Selection Matrix in accordance with SHTM 61, 2009 in order to demonstrate to the Board that the selected finishes are suitable for their locations.

The particular conditions in the plaster suite accommodation shall be taken into account when selecting floor finishes.

5.14 Partitions

Project Co shall ensure partitions address special construction requirements including x-ray protection and gamma ray shielding i.e. concrete or lead. It is important that Project Co comply with the shielding requirements from the Board’s Radiation Protection Advisor.

Partitions shall be designed to take account of following criteria:

a) Structural strength of overall partition, and adequacy of support for fittings, fixtures and equipment, both planned and future;

b) Sound reduction;

c) Fire resistance;

d) Moisture resistance;

e) Resistance to biological infection;

f) X-ray shielding;

g) Gamma ray shielding; and

h) Protection from damage.

5.15 External Materials

Project Co shall ensure that selected materials are robust and durable. The choice of materials for cladding and external surfaces shall comply with the performance levels of the Board's Construction Requirements and provide an appropriate design solution in terms of quality, scale, colour, texture, serviceability, statutory and environmental requirements.

5.16 Architectural Hardware

The locking system shall be fully suited across the Facilities, and shall interface with swipe card/other entry systems where provided. The locking system shall interface with the Board's existing 'swipe card' or other electronic entry systems currently employed at the RIE Facilities. Particular requirements with respect to electronic door access / security requirements are contained in paragraph 9.19.6.

5.16.1 Ironmongery

Project Co shall provide ironmongery which shall enhance the overall quality of the interior design concept. Project Co shall ensure ironmongery is of robust construction suitable for its specific purpose and usage characteristics and in accordance with the Room Data Sheets. For ease of use by elderly or disabled persons Project Co shall ensure handles are colour contrasted with the door background colour and of easy grip design.

Samples of all the ironmongery products shall be prepared in accordance with paragraph 2.3 and paragraph 5.5. The lock suiting information is to be provided as Reviewable Design Data for review in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement post Financial Close. This is so that details of lock suiting will be submitted by Project Co to the Board to allow adequate time for discussion and amendment if necessary before the fittings are required for installation in the buildings. All door closers shall be fully adjustable.

5.16.2 Blinds & Curtains

Project Co shall select blinds and curtains to relate to the overall interior design concept and to the specific requirements for each in relation to colour, pattern, material, fire resistance,

non-flammability, opacity, light reflectance and light absorption. Blinds and Curtains shall be Class O rated. Windows in clinical areas shall be fitted with disposable curtains. Windows in non-clinical areas shall be fitted with blinds that are of the non-disposable type.

Project Co shall ensure that materials for blinds and curtains shall also comply with the requirements of the Board's Head of Service Infection Control for cleaning, washing and maintenance, and comply with SHFN 30 and SHTM 87 and relevant Safety Action Notices. All blinds and curtains shall be compliant with anti-ligature requirements.

The locations and fixings for both blinds and window curtain tracks shall be co-ordinated by Project Co with the window and internal window sill design from the outset of the building design development and the fixings shall be designed by Project Co to take the proposed maximum loadings possible for the tracks concerned. Curtain tracks shall be designed by Project Co to overlap the window openings so that they do not allow light to pass into the room when drawn. Controls for blinds and curtains shall be co-ordinated by Project Co with the window design and its opening gear, including any operating handles, levers or stays that may be required and shall be located conveniently for staff or patients to operate as appropriate.

Project Co shall fix bed curtain tracks at the height recommended in the relevant guidance and Project Co shall ensure bed curtain tracks are co-ordinated with other service outlets and the window positions, where applicable. An adequate ventilation gap must be provided by Project Co at the curtain head.

Where Project Co are required to provide "vistamatic" blind type controls to observation panels, doors and screens, appropriate sight lines shall be maintained into single bedrooms and counselling / interview rooms.

Where blinds are required for privacy reasons, but are deemed not to meet the infection control criteria for a particular area then Project Co shall provide an alternative means of ensuring that privacy is maintained.

5.17 Hand Washing Facilities

Project Co shall ensure that all hand washing facilities comply with CEL 03 (2012) Water sources and potential infection risk to patients in high risk units and in clinical areas are provided with sensor taps and electronic valves to the supply spouts and that they shall conform to SHTM64 in all relevant respects; particularly;

a) Single spout mixer to achieve correct temperature;

b) Water temperature thermostatically controlled; and

c) Supply and waste connections to concealed services.

5.18 Staircases, Ramps, Balustrades, Walkways, Escalators & Lifts

Where staircases, ramps, balustrades, walkways, escalators and lifts are provided in addition to those required to satisfy means of escape criteria, these shall be designed to relate to the anticipated capacity of use and clearly designated for public, staff or service circulation.

Where ramps are provided in addition to those required to satisfy means of escape criteria these shall be suitable for independent and/or assisted wheelchair users, trolleys and ambulant disabled people.

Dependent on the nature and configuration of the Project Co's design proposals, Project Co may be required to provide staircases for fire fighting access, smoke control, dry and wet riser provision agreed with The City of Edinburgh Council's Building Control Department and the Scottish Fire and Rescue Service.

Particular attention shall be given to evacuation lifts where there may be a high percentage of wheelchair users on upper floors.

Any passenger or bed / passenger lifts required for vertical transportation shall have a minimum clear entrance of 1300 mm.

5.19 Soft Landscaping Requirements

Project Co shall incorporate areas of soft landscaping into the Facilities to complement both buildings and hard landscaped areas' of the Site and the adjacent areas of the Retained Site in accordance with the requirements of paragraph 7.1.

5.20 Wayfinding & Signposting

Wayfinding shall be so designed to meet the needs of different groups of people coming onto the Site, such as children, the elderly, the physically and visually impaired, as well as for service delivery purposes and contractors.

Signs shall be consistent to the end of the journey, identify functional specialities to facilitate the separation of different clinical zones.

Signposting from parking areas to entrances shall be clear and unambiguous.

Project Co shall observe the guidance and advice referred to in paragraph 2.2 General Design Issues item b.

Non-specialist language shall be used. Consideration shall be given to the use of iconic and pictorial signs as an alternative to written words.

5.21 Wall Protection

Project Co shall establish the most suitable form of protection at the most effective height location and orientation that shall prevent direct impact with the building fabric, its fixtures and fittings. SHTM 69 provides guidance and recommendations on this subject.

Project Co shall undertake a detailed review of those pieces of mobile equipment both Clinical and Non-Clinical, that are expected to be used by the Board and Project Co within the Facilities. This review shall include a process of risk assessment and shall be organised to determine the type and extent of protection that is required to the building fabric. Project Co shall submit the findings of the review to the Board as Reviewable Design Data for review by the Boards (in particular the Board's Radiation Protection Adviser) in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement. Project Co shall comply with the findings of the review including providing the design and construction required by the review.

Project Co shall be required to demonstrate that the proposal provides the most effective height, location and orientation of protection that shall prevent direct impact with the building fabric.

Mobile equipment currently used by the Board includes (but is not limited to) the following, however Project Co shall be responsible for establishing a comprehensive schedule of all mobile equipment and associated dimensions sufficient to inform the design:

- Cots / Incubators / Beds / Patient Trolleys / Mobile X Ray Machines / Resuscitation Trolley's / Mobile Ultrasound Machines / Mobile EEG / Retrieval Team Equipment / Mobile Hoists / Wheelchairs / Food Trolleys / Mortuary Box / Supply delivery trolleys / Cleaning Equipment - Hoovers/Washers / Disposal Holder collection trolleys / Linen Trolleys / Sterile Supply Trolleys

Project Co shall endeavour to minimise the extent of impact damage incurred by ensuring corridors are free of awkward corners / obstructions. Project Co shall ensure that doors in corridors are of sufficient width to accommodate all forms of hospital traffic and shall, where necessary, be designed to be held in the open position or to automatically open where appropriate.

A combination of some or all of the following forms of protection would be deemed appropriate in corridors and hospital streets:

a) Crash rails;

b) Defensive coves; and

c) Corner treatment and reinforcement.

Exposed services such as ducts, radiators and pipework can be badly damaged when struck by trolleys etc. Project Co shall incorporate measures to avoid damage to these elements.

5.22 Static Discharges

Project Co shall seek to eliminate, by choice of material coupled with control of the environment the release of static charge, in accordance with the recommendations contained in SHGN Static Discharge (1999).

Project Co shall co-operate with the Board in the production of relevant risk assessments in accordance with HTM 00-07 “Resilience planning for the healthcare estate”.

5.23 Standardisation & Prefabrication

The use of standardised / prefabricated elements and building components to achieve good quality control, ease and speed of installation and flexibility for future use is welcomed. Their use shall ensure Operational Functionality can be achieved and offering value for money.

In order to take advantage of the repetitive nature of construction, maximise productivity and efficiency and minimise construction periods and waste, consideration shall be given to off-site prefabrication. It shall specifically be applied to repetitive elements e.g., sanitary assemblies, bathrooms or complex equipment such as plant assemblies.

Project Co shall adopt standardised and / or pre-fabricated components and elements of construction which improve product quality, guarantee consistency of performance enhance efficiency of maintenance, and provide flexibility for future changes, ease of replacement and value for money.

5.24 Materials

Project Co shall ensure that all materials incorporated into the works shall comply with the requirements of The Construction Products (Amendment) Regulations 1994, and all other parts of the Board's Construction Requirements.

Project Co shall ensure that all products and materials to be incorporated into the Facilities shall be of sound and satisfactory quality and unless otherwise agreed by the Board shall be new. Project Co shall not construct the Works utilising substances which are hazardous to health, including but not limited to substances referred to as being hazardous to health and safety in The Control of Substances Hazardous to Health Regulations 2002 and The Control of Substances Hazardous to Health (Amendment) Regulations 2004.

Where materials and components are not specifically identified as complying with The Construction Products (Amendment) Regulations 1994, Project Co shall ensure that they comply with the relevant British Standards, Eurocodes and Codes of Practice. Where materials and components are available in varying qualities complying with two or more of the relevant regulations or standards, the higher quality products shall be used.

Project Co shall ensure that the whole quantity of each product and material required to complete the Works is of a consistent type, size, quality and overall appearance and is fit for its intended purpose. Project Co shall ensure all products and materials are handled, stored, prepared and used or fixed strictly in accordance with the manufacturers' written instructions or recommendations and not be damaged when incorporated into the Works.

Project Co shall not construct the Works utilising substances which are hazardous to health, including but not limited to substances referred to as being hazardous to health and safety in "The Control of Substances Hazardous to Health (Amendment) Regulations 2004"

Project Co shall ensure that:

a) the materials selected or specified by or on its behalf for use in the Facilities (or any part or parts thereof) are in accordance with the guidance contained in the Good Practice Guidance for selecting materials and this paragraph 5.24; and

b) there shall not be specified for use nor shall there be incorporated or used in connection with the Facilities any materials or substances which are expressly prohibited by the Project Agreement or any part of it or which are generally known not to be in accordance with British or European Standards and Codes of Practice at the time of specification or use (as applicable), or any materials or substances which are deleterious to health and safety or to the durability of buildings and/or other structures and/or finishes and/or plant and machinery in the particular circumstances in which they are used, or any materials or substances identified as deleterious, unsatisfactory or unsuitable in the relevant circumstances in the Good Practice Guidance for selecting materials and, in addition to and separate from the foregoing, any substances or combination of substances publicised prior to the time of construction in any Building Research Establishment Limited ("BRE") publications issued as part of the BRE Professional Development service which the BRE recommend are not used for building purposes or for the type of buildings comprised in the Project.

Project Co shall obtain confirmation that all timbers are "Certified Wood".

Project Co shall certify at the Actual Completion Date that none of the materials, products or constructions defined as not being appropriate above have been used in the construction of the Facilities, or incorporated in them, other than where specific written consent from the Board has been obtained. Project Co shall also notify the Board of any other material which

may become designated as prohibited at any time after incorporation into the project, during the Project Term.

5.25 Sustainability

Project Co shall promote sustainable development by demonstrating an integrated approach to the social, environmental and economic well-being of the area served, now and for future generations. The Facilities shall also reflect the objectives of any local agenda strategy supported by The City of Edinburgh Council including Edinburgh Standards for Sustainable Building (2010).

Project Co shall design the Facilities to support the environmental services and to conserve and utilise energy in line with the Climate Change Scotland Act 2009 and the public sector duty to meet national targets of 42% reduction of CO2 emissions arising from burning of fossil fuels and 80% by 2050. NHSScotland HEAT targets on energy conservation and CO2 emissions are in place to meet the requirements of this public sector duty. The design of the environmental control system shall be co-ordinated and integrated with the design of the structure and the occupied areas in order to maximise the control and flexibility of the installations.

A grey water recycling scheme should be assessed for applicability in this project.

Project Co shall promote sustainable development by demonstrating an integrated approach to the social, environmental and economic well-being of the area served, now and for future generations. Project Co shall ensure that the design and completed Facilities comply with the recommendations of Local Agenda 21, including reflecting the objectives of any Local Agenda 21 strategy supported by The City of Edinburgh Council.

The Facilities shall, as far as reasonably practicable, deliver benefits to the environment. Project Co shall:

a) Implement a strategy to meet the BREEAM requirements outlined in 5.25.1 below;

b) Minimise waste during construction and operation;

c) Using Corporate Greencode, implement an Environmental Management System (EMS) for accreditation aligned to ISO 14001;

d) HTM 07-07 Sustainable Health and Social Care Buildings: Planning, design, construction and refurbishment;

e) Reduce the use of fuels which contribute to ozone depletion, global warming, air and water pollution and depletion of non-renewable resource;

f) Respect the local landscape and protect natural habitat and species and comply with the UK Biodiversity Action Plan;

g) Avoid sources of ionising and electromagnetic radiation to the extent determined by the relevant HTM;

h) Avoid any design features associated with sick building syndrome;

i) Maximise the opportunity for waste minimisation and re-cycling;

j) Maximise efficient and effective removal and transport of waste;

k) Adopt maintenance regimes which maintain optimum performance;

l) Where possible avoid the use of harmful building products and processes; and

m) Explore the use of prefabricated elements to achieve good quality control, ease and speed of installation and flexibility for future use;

n) Project Co shall comply with the relevant NHS Requirements, including, but not limited to:

1. The development of a Local Environmental Strategy in line with sustainable development in NHS;
2. New environmental strategy for the National Health Service;
3. Corporate Greencode;
4. Good Corporate Citizenship Assessment Model (GCCAM);
5. Carbon/ energy management in healthcare; and
6. The Board's target of utilising some 20% of renewable energy sources shall be achieved by Project Co.

Project Co shall design the Facilities to support the environmental services and to conserve and utilise energy. The design of the environmental control system shall be co-ordinated and integrated with the design of the structure and the occupied areas in order to maximise the control and flexibility of the installations.

5.25.1 BREEAM

Project Co shall ensure that the Facilities achieve as a minimum a "Very Good" rating when assessed against BREEAM 2011 New Construction (SD5073).

Under the BREEAM 2011 New Construction (SD5073) there are now mandatory requirements specifically under energy, CO2 emissions, water and ecology. In addition, BREEAM embraces energy efficiency and passive design strategies for ventilation and thermal control to enhance internal comfort. The Facilities shall therefore also meet a BREEAM ENE1 target of 6 credits (excellent) in accordance with the BREEAM Scheme Document for New Construction (SD5073) Section 6.ENE1

BREEAM requires a design stage assessment, carried out and completed before construction starts on site, by Project Co. In addition a post construction review is required at completion carried out by Project Co. The post construction review assesses "as built" specifications and actual construction practice on site and shall maintain the 'Very Good' rating.

BREEAM Pre-assessment is in the Disclosed Data..

5.26 Energy Strategy

Project Co shall provide Facilities that achieve an optimum level of energy and utility conservation. Project Co shall:

a) Minimise internal areas requiring mechanical ventilation;

b) Minimise direct solar gain to avoid air conditioning/comfort cooling;

c) Maximise daylight factors in staff, patient and visitor areas;

d) Maximise utilisation of plant and systems;

e) Maximise control and flexibility of the installations; and

f) Ensure that the Facilities are designed and built to facilitate their operation in accordance with the Corporate Greencode.

Project Co shall provide Facilities that achieve a maximum water consumption target of 170,000 litres/bed/year and include measures that they propose to allow the Board to minimise consumption.

Project Co shall take due account of developments in Information and Medical Equipment Technology and any potential impact that this technology may have on the Energy Strategy for the buildings. Particular attention shall be paid to potential opportunities for heat gain within the Facilities provided due to the installation of additional or higher performance plant and equipment.

5.27 Fire Planning Strategy

Project Co shall demonstrate in the design for the Facilities a clear understanding of the policies and principles underlying fire safety in NHS premises.

In all cases the proposed fire strategy shall be fully co-ordinated and be agreed with the Scottish Fire and Rescue Service, The City of Edinburgh Council's Building Control Department and the Board's Fire Officer. Any proposals which deviate from the stated requirements of The Building (Scotland) Regulations 2004 and The Building (Scotland) Amendment Regulations 2011, SHTM 81 and SHTM 82, shall be supported by a specialist fire engineer's report which provides a clear understanding of the risks and protection measures to be included. Calculations and supporting information shall also be provided.

5.28 Storage of Gas Cylinders

Project Co shall ensure that all gas cylinders, whether they are connected to external supplies or not, are stored in accordance with SHTM 2023.

Signage must be sited and designed in accordance with the Health and Safety (Safety Signs and Signals) Regulations 1996, BS 5499-10:2006 Safety signs, including fire safety signs - Part 10: Code of practice for the use of safety signs, including fire safety signs and the Health and Safety at Work Act 1974.

5.29 Radiation Protection

Project Co shall be responsible for the design and build of clinical and support facilities where exposure to ionising radiation might occur. This includes the use of x-rays, CT scanners and gamma cameras, and radioactivity (both in the form of sealed and unsealed sources).

Areas where ionising radiation is used shall require the walls, ceilings, floors, doors and screens to act as radiation shields. The design of the Facilities shall be compatible with specialised operational procedures, employed by the Board in order to ensure the health and safety of staff, patients and the public in radiation areas.

Project Co shall comply with the requirements of the Board's Radiation Protection Advisor to ensure that the Facilities combined with the Board's working practices provide adequate radiation protection.

Project Co shall submit proposals for providing screening to rooms containing radiology or other equipment emitting ionising radiations. These must be submitted to the Board as Reviewable Design Data for review by the Boards (in particular the Board's Radiation Protection Adviser) in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

5.29.1 The Designing-in of Radiation Protection

Adequate restriction of the radiation exposure of patients, staff and the public cannot be achieved by considering in isolation either the design of the Facilities, or the working practices to be adopted within it. The inter-relationship of the design of the Facilities and systems of work will be crucial in determining whether or not procedures can be completed quickly and efficiently and thus with the minimum irradiation of staff. Accordingly Project Co shall comply with the requirements of the Board's Radiation Protection Advisor and the operational managers of the relevant services.

Dedicated x-ray rooms and other appropriate areas require the walls, ceilings, floors, doors and screens to be shielded.

X-ray rooms and other appropriate areas are controlled areas whenever an exposure is in progress. The usual practice is to use electrical signs that illuminate at the room entrances when an exposure is underway.

Diagnostic x-rays are taken in other areas, e.g. operating theatres. The workload and x-ray energies involved will determine the amount of shielding required.

5.29.2 Work with Radioactive Materials

Project Co shall make provision so that arrangements can be made to monitor waste prior to being removed for disposal and linen prior to being sent for laundering.

A combination of shielding and speed of operation is required to avoid causing high radiation exposures to patients, staff and others.

Unsealed-source therapy also leads to the production of solid items and waste contaminated with radioactivity (e.g. clothing, food remnants, linen etc). Some can be disposed of by disposal or by maceration. The rest will need to be stored by Project Co in a secure shielded store away, from clinical area, until the radioactivity decays to background levels.

5.29.3 Transport, Delivery & Collection of Radioactive Materials

The arrangements for delivery, collection and storage of radioactive materials need to guarantee the safety of the materials in transit at all times. Appropriately trained staff must be used for moving radioactive packages both within the Facilities and by road. This shall require provision of short term parking.

Project Co shall give consideration to establishment of designated routes for the frequent transport of radioactive sources.

5.30 Static Magnetic Field Protection

The siting and planning of facilities for the use on patients of magnetic resonance imaging (MRI) shall pay particular attention to the characteristics of the equipment required and the need to screen unwanted radio signals from interfering with the MRI equipment and conversely the signals arising from the MRI equipment interfering with equipment elsewhere.

In areas where it is proposed to install MRI equipment Project Co shall ensure that effective magnetic fringe field protection is provided around such areas in accordance with the equipment suppliers' recommendations. Project Co shall discuss and agree proposals as

Reviewable Design Data for review in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement for any such screening with the Board prior to the installation of the MRI equipment.

The design of the Facilities shall be compatible with the specialised operational procedures employed by the Board in order to ensure the health and safety of staff, patients and the public in areas where this type of equipment is to be installed.

Project Co shall ensure that adequate provision for the removal, and replacement, of the equipment is provided and Project Co shall be responsible for agreeing with the equipment supplier reinforced routes through the Facilities, suitably sized access panels in walls, suitable ceiling heights, corridor widths and door openings to facilitate equipment replacement.

The design of the Facilities internally and externally, the patient journey and the construction of the buildings shall recognise the hazards associated with the powerful magnetic fields generated by the imaging equipment.

5.31 Electromagnetic Interference Protection

The siting and planning of facilities for the use on patients of Electroencephalography (EEG) and Evoked Potential Recordings shall pay particular attention to the characteristics of the equipment required and the need to screen unwanted electromagnetic signals from interfering with the EEG and Evoked Potential Recordings equipment and conversely the signals arising from the EEG and Evoked Potential Recordings equipment interfering with equipment elsewhere. Project Co shall comply with the requirements of SHTM 06-01.

Areas where electromagnetic interference will occur shall require the walls, ceilings, floors, doors and screens to act as electromagnetic interference shields. Project Co shall submit proposals for providing screening to rooms containing (EEG) and Evoked Potential Recordings equipment or other equipment emitting electromagnetic interference. These must be submitted to the Board as Reviewable Design Data for approval in accordance with Schedule Part 8 Review Procedure.

The design of the Facilities shall be compatible with the specialised operational procedures employed by the Board in order to ensure the health and safety of staff, patients and the public in areas where this type of equipment is to be installed.

The design of the Facilities internally and externally, the patient journey and the construction of the buildings shall recognise the hazards associated with electromagnetic signals generated by the EEG and Evoked Potential Recordings equipment.

5.32 Facilities Maintenance

The Project Co shall provide Facilities that ensure that the maintenance and replacement of services, finishes, components, elements, systems, furniture and equipment can be carried out effectively within the requirements of clinical operations and functionality.

Project Co shall ensure that the access routes within the buildings shall allow access for the appropriate maintenance / cleaning system, and equipment utilising the hierarchy of control measures included within the Work at Height Regulations 2005 as amended. Appropriate provisions shall be incorporated by Project Co to allow the safe use of the appropriate maintenance / cleaning system including but not limited to safe access to the workplace and equipment. The structural frame, floors and internal walls of the buildings shall be designed

by Project Co to accommodate the loading requirements of access equipment and operatives, where the cleaning and maintenance system uses this method.

5.33 Pest Control

Project Co shall incorporate pest control measures and measures to prevent pest entry to the Facilities.

6 Civil & Structural Engineering Requirements

Project Co shall in carrying out the Works comply with the following non-exhaustive list of civil & structural engineering requirements.

Project Co shall take cognisance of all the civil engineering and structural implications of the requirements described in the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

For the avoidance of doubt the hierarchy of standards and advice detailed in paragraph 2.5 shall apply to this paragraph 6.

6.1 General Requirements

Project Co shall ensure that the design and construction of the civil and structural engineering elements of the buildings and external works meets the following criteria:

a) Be fit for their intended purpose;

b) Be fully co-ordinated with the design of the building fabric, finishes, services, facades, internal walls, medical equipment and existing Site features, including buildings / structures;

c) Include the design and construction of any secondary framing necessary for the support of plant, services, ceiling mounted tracking hoist systems, other lifting equipment or medical equipment;

d) Provide adequate space for the distribution of services, while maintaining the required finished floor levels and the floor to ceiling heights called for in the Room Data Sheets, and elsewhere in this Schedule Part 6 Section 3 Sub-Section C;

e) Maximise the clear zone above the ceilings for services to the degree consistent with overall economy for the Board;

f) Provide fire resistance required by the appropriate SHTM and HTM, and the requirements of the Scottish Technical Standards;

g) Be economically adaptable to meet changing clinical needs; and

h) Require minimum maintenance and be designed to accommodate maintenance requirements for services, equipment and building fabric.

6.1.1 Sewers under the Site

Project Co requires to be aware of the Sewers serving the RIE Facilities and other neighbouring properties on and off the Campus Site part of which Sewers are located within part of the Site as shown coloured green in drawing numberAS/209592/X(52)X/01P1 entitled

"Zone For Diverted Scottish Sewers to South of Site" which forms part of the Disclosed Data, and Project Co shall ensure that:

a) No buildings or other erections are to be constructed nor any trees, shrubs, bushes or other plants or vegetation planted, grown, cultivated or permitted to grow over the route of the Sewer or within a lateral distance measuring from the centre line thereof which are likely to adversely affect the Sewer or would impair safe and reasonable access thereto (which shall be not less than 6 metres);

b) No underground works will be undertaken within a lateral distance measuring from the centre line thereof which may adversely affect the Sewer or would impair safe and reasonable access thereto (which shall be not less than 6 metres).

c) Access shall be provided at all times to the Board and any Board Party and Consort and any Consort Party to the extent required to maintain, repair and renew the Sewer and in accordance with the requirements in Clause 9 (Nature of Land Interests) of the Project Agreement (as varied, amended or supplemented from time to time in accordance with the Project Agreement; and

d) Project Co shall be fully responsible for the consequences of failing to comply with these requirements and the losses which may be suffered or incurred by the Board and/or any Board Party and/or Consort and/or any Consort Party as a result of any act or omission of Project Co and/or a Project Co Party exercising any of the rights and/or performing any of its obligations and/or failing to do so and the provisions of Clause [49.1.6] of the Project Agreement shall apply.

6.1.2 Gas Pipe under the Site

Project Co requires to be aware of the possibility of the gas pipe serving the RIE Facilities part of which may be located within part of the Site and Project Co shall ensure that:

a. No buildings or other erections are to be constructed nor any trees, shrubs, bushes or other plants or vegetation planted, grown, cultivated or permitted to grow over the route of such service media or within a lateral distance measuring from the centre line thereof which are likely to adversely affect the service media or would impair safe and reasonable access thereto (which shall be not less than 6 metres);

b. The provisions of paragraph (a) above shall also apply to any service media being located within a lateral distance of 15 metres from the gas pipe measuring from the centre line thereof;

c. Access shall be provided at all times to the Board and any Board Party and Consort and any Consort Party to the extent required to maintain, repair and renew the gas pipe and in accordance with the requirements in Clause 9 (Nature of Land Interests) of the Project Agreement (as varied, amended or supplemented from time to time in accordance with the Project Agreement; and

d. Project Co shall be fully responsible for the consequences of failing to comply with these requirements and the losses which may be suffered or incurred by the Board and/or any Board Party and/or Consort and/or any Consort Party as a result of any act or omission of Project Co and/or a Project Co Party exercising any of the rights and/or performing any of its obligations and/or failing to do so and the provisions of Clause [49.1.6] (Indemnities) of the Project Agreement shall apply.

6.2 Architectural / Structural Interface

Structural floors shall be designed to have penetrable zones co-ordinated with the modular framework for partitions and services.

For the avoidance of doubt, structural timber floors shall not be permitted.

Columns shall be located in-so-far, as is reasonably practical to coincide with corridor walls in order to minimise intrusion into rooms or corridors. The relationship of columns, ducts and walls shall permit clear internal room surfaces and not obstruct equipment or fittings.

As far as practical, the walls to vertical service shafts shall be non-load bearing and therefore maximising opportunity for future services installation, alteration and maintenance.

The elevation design shall facilitate distribution of services at the building perimeter.

6.3 Performance Standards

Unless otherwise agreed with the Board, Project Co shall ensure that all structural elements are designed in accordance with current revisions of the following standards:

a) Eurocode 0 – BS EN 1990:2002 – Basis of structural design;

b) Eurocode 1 Series – BS EN 1991 Actions on structures;

c) Eurocode 2 Series – BS EN 1992 Design of concrete structures;

d) Eurocode 3 Series – BS EN 1993 Design of steel structures;

e) Eurocode 4 Series – BS EN 1994 Design of composite steel and concrete structures;

f) Eurocode 5 Series – BS EN 1995 Design of timber structures;

g) Eurocode 6 Series – BS EN 1996 Design of masonry structures;

h) Eurocode 7 Series – BS EN 1997 Geotechnical design;

i) Eurocode 8 Series – BS EN 1998 Design of structures for earthquake resistance;

j) Eurocode 9 Series – BS EN 1999 Design of aluminium structures;

k) BS 8500-1:2006 – Concrete: Complementary British Standard to BS EN 206-1. Part 1 Method of specifying and guidance for the specifier;

l) BS 8500-2:2006 – Concrete: Complementary British Standard to BS EN 206-1. Part 2 Specification for constituent materials and concrete;

m) BS 8102:2009 – Code of practice for protection of below ground structures against water from the ground;

n) BS 8204 – Screeds, bases and in-situ floorings;

o) BS 5606:1990 – Guide to accuracy in building; and

p) BS 8000 – Workmanship on building sites.

Note: Eurocodes 0 to 9 – Corresponding National Annexes shall be used where applicable for Nationally Determined Parameters (NDP).

Construction tolerances, unless otherwise stated by the Board shall be no greater than those specified in Tables 1 and 2 of BS 5606. Where the operational constraints of the buildings require special levels of construction accuracy then Project Co shall be responsible for establishing and designing for these.

The performance of components shall be in accordance with the appropriate British Standards and Eurocodes.

Project Co shall ensure that building structures are designed to resist imposed, roof and wind loads not less than those required by current revisions of Eurocode 1 Series – Actions on structures. Project Co shall ensure that building structures are designed to carry the loads of heavy plant, the helipad and helicopters and medical equipment (including ceiling mounted tracking hoist systems) in their permanent positions and any loads that will be imposed upon the structures during the installation, removal or replacement of such heavy items. This requirement may involve the design of 'strong routes' through the buildings and / or specially strengthened areas of the roof onto which heavy items can be lifted. These areas and routes shall be identified by Project Co in their design as Reviewable Design Data for review in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement for agreement by the Board. Consideration by Project Co shall also be given to selection of floor screeds which shall have adequate strength and resilience to resist abrasion and indentation from the use of medical equipment.

Project Co shall ensure that any measures considered necessary shall be taken to protect the buildings from ingress of naturally occurring ground gases.

6.4 Loadings & Structural Flexibility

The Facilities' structural flexibility shall reflect the overall Adaptability Strategy designed by Project Co. Despite any connection to the RIE Facilities the Facilities are to be free standing and must not rely on any other buildings outwith the Site for support.

Project Co's structures shall be designed to cater for the dead loadings associated with the chosen materials for the structure, finishes, partitions and cladding to the buildings. As a minimum, it shall also be designed for the imposed loads as specified in current British Standards and Eurocodes. The design shall also take into account the need for specialist measures to allow for the installation of special equipment and associated services. Structural deflections shall be limited as necessary for the proper installation and functioning of specified equipment.

Project Co shall account for (but not be limited to) the following loading schedule:

a) General floor loadings;

b) Point loads for Clinical equipment and Services;

c) Impact loads;

d) Vibration loads;

e) Special plant foundation loads; and

f) Service loads.

Project Co shall take account of concentrated point loads from both mobile and stationary plant and equipment. The structure shall incorporate reasonable measures to accommodate updated versions of such machinery without major disruption. In addition, Project Co shall ensure that floors and supporting structures have the capacity for retro fitting lifting devices for all fixed items of plant and equipment weighing 35kg or more.

The Room Data Sheets have indicative details on anticipated items of heavy equipment.

For the avoidance of doubt, the Board recognise that no upper limit has been identified and this information will be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement on a departmental / unit / area basis.

Project Co shall take cognisance of the requirements in specified areas for ceiling mounted tracking hoist systems etc with point loads ranging from 375 kg to 750 kg. The structural capability and configuration of these areas shall allow the Board complete flexibility for re-configuration and extension of this equipment and / or retro-fitting of future lifting equipment in these areas.

Project Co shall take account of the need for special screeds, raised or lowered floors, ceiling grid support grids and other such measures to allow for the installation of special equipment and associated services.

Project Co shall ensure that specific areas of the Facilities satisfy particular requirements of the Board's operations or equipment in those areas. Relevant constraints may include but are not limited to maximum allowable structural deflections, differential settlement, vibration and the meeting of any specific tolerances. Project Co shall be responsible for establishing and resolving and seeking approval of any such constraints by submitting details to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Project Co shall take account of dynamic loads from general movement of people through to activities such as aerobics, dance or other rhythmic activities that can give rise to adverse harmonic effects that affect the design.

Lateral stability bracing systems shall not obstruct or hinder clinical or non-clinical or any other use and/or operations at the Facilities and without limitation shall not obscure the windows or doors.

The vibration response of the buildings shall comply with the requirements of SHTM 08-01 Acoustics and be compatible with the requirements of the equipment to be installed.

With respect to the Facilities, Project Co shall:

a) Take due account of future flexibility of the Facilities (in terms of future change of use and / or relocation of equipment);

b) Specifically make allowance for future flexibility of ceiling mounted tracking hoist equipment in specified areas, including the requirement for re-configuration, extension and / or retro-fitting of lifting equipment i.e. the whole of the specified area shall be structurally capable of accommodating hoist equipment;

c) Make specific allowance for items of particularly heavy equipment and / or other onerous loading conditions; and

d) Make specific allowance for installation, transfer and / or removal routes for heavy equipment throughout the Facilities.

Parts of the structure potentially subject to damage from trolleys or vehicles shall be designed with adequate protection to prevent such damage from occurring.

Structural deflections shall be limited as necessary for the proper installation and functioning of special mobile, rail mounted, or fixed equipment.

Project Co shall include, within the design, provision for removal, replacement and upgrading of installed plant and equipment. As part of this element of design, a comprehensive replacement strategy shall be prepared for implementation. This strategy shall, wherever possible, consider how these works can be undertaken whilst minimizing disruption to the function of the completed Facilities.

6.5 Foundations & Sub-structure

All foundations shall be designed by Project Co to Eurocodes to comply with current Codes of Practice taking into account the loadings to be sustained, prevailing ground conditions and the effects of any settlement on new superstructure and on links to adjacent buildings. Proposed solutions shall take account of adjacent foundations or structures and engineering services below ground. Despite any connection to the RIE Facilities the Facilities are to be free standing and must not rely on any other buildings outwith the Site for support.

6.6 Movement Joints

Structural movement joints shall not be located through:

a) Theatre rooms;

b) Treatment and surgery rooms;

c) X-ray and imaging rooms;

d) Pharmacy manufacturing rooms;

e) Kitchens and food preparation areas;

f) Any room with (now or in the future) with ceiling mounted tracking hoists or other similar lifting equipment;

g) Any other room requiring a sterile environment; and

h) Any rooms where there is a risk of biological or other hazard, or risk of penetration by water, grease / oil, or other hazardous or detrimental substance.

Lateral stability bracing systems shall not obstruct or hinder clinical or non-clinical operations and shall not obscure the windows or doors.

6.7 Building Super-Structure & Envelope

Vertical, oblique and lateral loadings from the external walls must be safely transmitted through the structure to the load bearing strata. When under maximum design stress, joints shall maintain full water exclusion properties and design appearance. Despite any connection to the RIE Facilities, the Facilities are to be free standing and must not rely on any other buildings outwith the Site for support.

Project Co shall provide the means for replacing the x-ray equipment during the Operational Term through the external envelope of the rooms housing the x-ray equipment including intermediate support if the equipment is to be transferred into the building from the exterior at upper floors. The external structural solution for the replacement of x-ray equipment shall not adversely impact on architectural appearance of the Facilities. Project Co shall provide the means of replacing the x-ray equipment to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

In addition to providing safe, aesthetically pleasing and durable structures, the structural design must enable the required clear spaces to be achieved with adequate provision of services taking into account maintenance and replacement during the operational life of the buildings. The design must consider construction methods and future maintenance and demolition of the structures and make provision for these to be carried out safely.

The environmental criteria to be applied in confirming the design performance shall be assessed and confirmed by Project Co. Formal testing of elements of the construction by a recognised testing authority will be required as part of the approval process.

6.8 Fire & Corrosion Protection

Project Co shall provide fire protection to all elements of structure and ensure fire ratings are in compliance with space use and the more onerous of Scottish Technical Standards / the Board's requirements. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.

6.9 Durability & Maintainability

All elements of the structure shall be capable of withstanding potential deterioration due to weather, ground conditions, wear and tear, and accidental damage relevant to their location and environment.

Where the requirement for maintenance is less than the required life expectancy of the element(s) practical and realistic arrangements shall be designed into the construction of the Facilities to allow for any necessary repairs, replacements, and painting etc. to be carried out safely without compromising the operational activities within and around the Facilities.

6.10 Other Performance Requirements

Project Co shall ensure that all building elements and retaining structures shall incorporate appropriate means to resist the passage of dampness, both into the building structure and fabric, and into the accommodation, including the resistance to any hydrostatic pressure. Project Co shall ensure that all such construction shall be in accordance with the requirements of The Building (Scotland) Regulations 2004 and its amendments, BS 8102 and Code of Practice CP 102 for Protection of Buildings against Water from the Ground.

6.11 Drainage

Project Co shall design and provide separate foul and surface water drainage systems in accordance with the requirements of The Building (Scotland) Regulations 2004 and its amendments.

Project Co shall be responsible for liaising with Scottish Water to agree connection requirements to the surrounding public sewers and for compliance with relevant provisions of paragraph 4 and paragraph 6.1.1 as regards sewers.

Project Co shall provide, where necessary within the on-site drainage network any isolators, grease traps, retention traps, interceptor tanks and other such devices necessary to prevent the discharge of any potentially dangerous or otherwise contaminative materials to the public sewers.

Foul and surface water drainage shall be designed on separate systems and shall discharge into the existing systems, subject to necessary approvals and for compliance with relevant provisions of paragraph 4 as regards surface water drainage.

Surface water discharge shall be in accordance with the following requirements:

a) A SUDS system designed and constructed in accordance with the Regulations and the guidance contained in 'SUDS: Design Manual for Scotland and Northern Ireland';

b) Water Environment (Controlled Activities) (Scotland) Regulations 2005;

c) A public sewer provided under the Sewerage (Scotland) Act 1968 and amendments;

d) An outfall to a watercourse that complies with any notice and / or consent by SEPA.

SUDS features shall be designed as an integral part of the landscaping.

The drainage systems shall be designed to require no regular maintenance other than the cleaning of gully traps etc. and access for maintenance shall be provided to all drainage runs.

All drainage shall be designed to avoid the risk of local flooding and flooding of the system into which they discharge and/or to properties and/or land served by such systems. Flooding of electrical equipment areas and areas where stray current leakage may occur in the presence of water shall be prevented.

Drainage shall be sufficient to ensure that no areas of standing water occur. The drainage systems shall be capable of coping with, as a minimum, the foul loading and the storm event specified by the relevant authority and shall be considered an integral part of the public sewerage system. The drainage system shall be capable of taking such detritus as may normally arise during the operation of the system and during normal and winter maintenance conditions and those within the design criteria of the relevant authority.

A free passage of air shall be maintained through the foul drainage system.

Flat roofed areas wherever possible shall be drained to eaves gutters. Where such roof is enclosed, without eaves, it shall be drained by a minimum of two grated roof outlets and rainwater pipes, which shall be designed to pass the design rate of run-off assuming one outlet or 33 per cent of the outlets are out of use, whichever is the greater number.

Project Co shall design the drainage system in such a way as to minimise the requirement for internal manholes.

Project Co shall construct the drainage installation such that it complies with the Initial Drainage Proposal and shall comply with relevant provisions of paragraph 4 as regards drainage installation.

7 External Works

Project Co shall design and construct an external works environment for the Facilities that fully integrate with the buildings.

Project Co shall design the external works for ease of navigation around the site by staff, patients and visitors.

Project Co shall appoint an appropriately qualified professional and prepare a comprehensive hard and soft landscaping scheme.

In preparing the hard and soft landscaping scheme for the external works, Project Co shall ensure that due account is taken of the Board's requirements with respect to the integration of artwork.

Project Co shall select external works materials on the basis of the following:

a) Accessibility;

b) Appropriateness;

c) Durability;

d) Robustness;

e) Compatibility;

f) Maintainability;

g) Suitability for life cycle replacement;

h) Co-ordination with other finishes; and

i) Suitability for infection control

j) Health and Safety attributes

k) Life Expectancy set in paragraph 5.1;

l) Easy of future maintenance;

m) Appearance.

In preparing the hard and soft landscaping scheme for the external works, Project Co shall ensure that due account is taken of the Board's requirements with respect to the integration of artwork.

Project Co shall carry out landscaping works outwith the Site boundary in the Yellow Area and Hatched Orange Areas in accordance with the relevant provisions of paragraph 4. All landscaping works shall be compatible with the adjacent parts of the external environment at the Retained Site.

Project Co shall seek advice from the Board to seek to minimise the risk of crime and vandalism on the Facilities. This advice shall be pro-actively sought by Project Co as part of the design process.

Project Co shall seek advice from Lothian and Borders Police's crime prevention representative on the proposals for external works to minimise the risk of crime and vandalism on the Site and the Facilities.

Where possible, Project Co shall ensure that external surfaces allow easy cleaning of vandalised elements, with the minimum of effort.

Project Co shall provide the following principal elements:

7.1 Soft Landscaping Requirements

Project Co shall design, as an integral part of the Facilities, a soft landscaping scheme that will enhance the environment of the Facilities.

The soft landscaping shall be easy to maintain, and plants and shrubs shall reach a state of maturity within three years of Actual Completion Date.

The design of landscaping and selection of plants and shrubs shall aid the reduction in risk of crime.

Project Co shall ensure that the landscaping and gardens are designed in accordance with the following:

7.1.1 General

Project Co shall involve the Board in the decision making process for all proposed planting for the Facilities details of which shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with paragraph 1.2.3 of Schedule Part 8 (Review Procedure), Table of Finishes and clause 12.6 of the Project Agreement.

Project Co shall carry out accurate site surveys prior to design of soft landscape to determine site levels and identify on survey drawings all existing features including any existing mature trees.

Project Co shall by reference to their own ground investigation data; confirm the need for imported topsoil or whether amelioration of existing soil is sufficient to support their soft landscaping proposals. Project Co shall then provide new or utilise existing soils, as appropriate.

Project Co shall carry out any necessary remedial measures to suit planted areas and hard landscaped areas.

7.1.2 Soil Preparation & Topsoil

Soil preparation shall be carried out by Project Co in accordance with BS 4428:1989, Code of practice for general landscape operations (excluding hard surfaces). Project Co shall ensure care is taken with the use of weed-killers. Project Co shall ensure that all topsoil complies with BS 3882:2007, Specification for topsoil and requirements for use.

7.1.3 Trees

Project Co shall ensure that any work to existing trees, whether or not covered by Tree Preservation Orders, shall only be undertaken with the appropriate licence as stipulated by the Tree Preservation Order or with the approval of The City of Edinburgh Council.

Project Co shall ensure that tree protection complies with BS 5837:2012, Trees in relation to design, demolition and construction - Recommendations. A register of the existing trees shall be made including giving each tree a unique number. Before construction commences Project Co shall take photographic records of the existing trees on and adjacent to the Site. The photographs shall record the trees' unique number. A site plan shall record the position of the existing trees noting their unique number.

7.1.4 Shrubs & Groundcover

Project Co shall ensure that all shrubs shall comply with BS 3936 Part 1:1992, and shall be planted to BS 4043: 1989.

Project Co shall ensure that shrub and groundcover protection complies with BS 5837:2012, Trees in relation to design, demolition and construction - Recommendations. A register of the existing shrubs and groundcover shall be made including giving each shrub and area of groundcover a unique number. Before construction commences Project Co shall take photographic records of the existing shrubs and areas of groundcover on and adjacent to the Site. The photographs shall record the shrubs and areas of groundcover's unique number. A site plan shall record the position of the existing shrubs and areas of groundcover noting their unique number.

7.1.5 Planting & Watering

Project Co shall ensure that planting and watering is carried out while soil and weather conditions are suitable for relevant operations.

7.1.6 Turf

Project Co shall ensure that turf is in accordance with BS 3969:1998, Recommendations for Turf for general purposes. Turf shall be free from undesirable grasses and weeds.

Project Co shall avoid grass in courtyards, unless the courtyard is very large. If provided Project Co must ensure there is a suitable, sufficiently wide access away from occupied areas for bringing mowing machinery to the turfed areas.

7.1.7 Health & Safety Considerations

Project Co shall ensure that all weed-killer / pesticides and herbicides and any other chemicals used in association with the landscape works preparation comply with SEPA regulations, the COSHH Regulations, and any other relevant regulations applying to hospital sites.

7.2 Therapy Gardens

The landscaping and therapy gardens provide an opportunity to soften the whole image of the Facilities by a visual presentation of quality and sensitivity that relates to pleasure and emotion rather than the essential clinical impressions that will inevitably be gained by users and visitors.

The gardens shall be easily accessible from the units / departments. It shall be secure and provide space for therapy and privacy. The needs of the patients will be varied and descriptions of their needs can be found in the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements) for the individual departments / units.

Certain parts of the therapy gardens shall be open for general use; other parts shall be private for use by specific patient groups.

The therapy gardens shall be available 24/7, 365 days a year. Attention shall be paid to the lighting of the gardens to allow use after dark and to enable the gardens to be enjoyed in the evenings when viewed from inside the building. Attention shall also be paid to providing covered / heated areas to allow the external environment to be enjoyed in different weather conditions.

All paved areas shall be wheelchair accessible and constructed using non-slip materials. Handrails shall be provided at intervals to allow ambulant disabled people equal access to the gardens. There shall be a number of paved areas thus allowing a number of 'walks' throughout the garden areas, away from the road network and car parks. Kerbs to the paved areas are necessary to avoid the risks of wheelchairs becoming stuck in soft earth.

Seating shall be provided throughout the garden areas. This shall be of a range of styles and heights so that it suits the needs of all service users. Protection from wind and some covered areas shall be provided throughout the garden(s).

7.3 Site Boundary Requirements

No work shall commence on Site until the details of the proposed boundary treatment have been submitted to and approved by The City of Edinburgh Council.

Project Co shall provide boundaries to the Facilities, which provide security, appropriate visual screening and essential maintenance access. Project Co shall engage the Board in the design process for all boundaries details of which are to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with paragraph 1.2.3 of Schedule Part 8 (Review Procedure), Table of Finishes and clause 12.6 of the Project Agreement.

Where appropriate, proposals for the Site boundary treatment shall comply with the relevant parts of BS1722: Fencing.

7.4 Site Access & Circulation

Always subject to complying with the relevant provisions of paragraph 4 and Clause 9 (Nature of Land Interests of the Project Agreement as regards access for pedestrian and vehicular access on and around the Campus Site, the entrances and exits to the Facilities shall be clearly defined and signed; their design shall enhance ease of movement from and to the public roads. The road system shall be designed to facilitate safe, convenient routes

separating transportation groups as far as practical. Attention is to be given to provide clear and well defined routes for emergency vehicles, fire, police and ambulance. The requirements of the Firecode in relation to 'Site Access' shall be considered.

All of the access requirements shall satisfy the requirements of the Board and The City of Edinburgh Council.

Project Co shall define as Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement and seek agreement of The City of Edinburgh Council for the creation of additional pedestrian and / or emergency road access points to suit the specific requirements of the final design.

The colour of the road surfaces shall be black and all footpaths shall satisfy the requirements of the Board details of which are to be provided as Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement, and the requirements of The City of Edinburgh Council.

Project Co shall also provide suitably robust signage for easy site navigation during construction and operational phases.

7.5 Roads, Footpaths, Cycleways & Car Parking

Project Co shall ensure the following as a minimum:

a) Parking for vehicles is to be as close as possible to relevant parts of the Facilities served and the diminishing of the visual impact of parking by appropriate planting shall not impinge on individual parking places;

b) Direct routes from parking areas to the building entrances are provided; and

c) Appropriate and secure cycle storage.

Project Co shall provide as a minimum a network of private roadways on the Site and at the Campus Site providing access to:

a) Car parking;

b) The delivery entrance(s) to the Facilities, waste compounds and service infrastructure; and

c) A taxi / car / ambulance drop off and layover bay.

Project Co shall ensure that all roads, delivery and refuse collection areas have sufficient headroom above them to allow for the passage of appropriate delivery and refuse collection vehicles and are designed to provide sufficient space to allow efficient manoeuvring of such vehicles without undue difficulty, risk of impact or adverse effect of exhaust fumes on occupants of the buildings. Project Co shall ensure that all roads, car parks and other areas that may be used by fire fighting appliances shall have sufficient headroom for such vehicles equipped with fire fighting appliances and are designed to allow their efficient manoeuvring. Project Co shall submit details of the types of delivery vehicles which require to be considered in the design to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Where areas of car parks are required to be traversed by vehicles heavier than 2500kg for maintenance or access purposes, the sub-base, base and surfacing of these areas shall be specifically designed by Project Co for these heavier loads.

Roads, delivery and refuse collection areas, and car parks, together with their supporting groundworks and structures, shall be designed by Project Co to provide full and sufficient access for inspection, maintenance and repair of roads, car parks, delivery and refuse collection areas, structures, underground and underground drainage and sewerage, including existing drainage items such as manhole covers and drains and sewers. Where access for maintenance, repair or replacement of underground services is required under the terms of an easement, the design of all elements affecting the exercise of such an easement or servitude shall also be in accordance with the requirements of the party that has the right to exercise the servitude or easement. See also drainage requirements detailed at paragraphs 4, 6.1.1, 6.11, 8.7.20 and 10.3 of this Sub-Section C.

Project Co shall also comply with the following criteria:

a) Finish: to be macadam, hot rolled asphalt or, if approved by the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement, block paving. Project Co shall provide a black finish to roads, green finish to cycle routes and a red finish to pedestrian routes (subject to agreement with The City of Edinburgh Council);

b) Kerbs: to comply as a minimum standard with BS.1339:2003 “Concrete paving flags - Requirements and test methods”. Dropped, flush, kerbs shall be provided at all pedestrian crossing locations;

c) Pedestrian crossings: details of types, locations, lighting and controls shall be Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement;

d) Markings: to The Traffic Signs Regulations and General Directions 2002 and all Chapters of The Traffic Signs Manual and details of such shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement;

e) Gradients: All gradients shall comply with the provisions of The Building (Scotland) Regulations 2004 and its amendments as applicable. No gradient in excess of 1:20 shall be allowed in parking areas (other than access roadways), and 1:15 on pedestrian staff, patient and visitor access paths from parking areas to the building entrances; and

f) Parking bays: comply with the SHFN 20, HFN 21 and the item on gradients above. Variation from the standard (to make optimum use of the space for example) may be desirable and Project Co shall submit details to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Designs shall cater for the access and parking needs of pedestrians and the physically disadvantaged. This shall involve catering for visitors and staff using different modes of transport in adapted vehicles and with multiple aids / equipment.

Accessible parking bays shall incorporate a minimum additional 1.2m section to the end of each bay. This is to allow tailgate access by disabled people without the need to set down ramps or lifts within the main circulation routes of car parks. The first and last accessible parking bays in a row of ‘in line’ spaces shall be provided with a minimum clear area of 1.2m to both sides.

Parking for the transport requirements of deliveries and waste disposal, ambulances, fire appliances and other specialist and emergency vehicles shall be segregated from public and staff parking.

Car parking provision shall take into account the following requirements:

a) Drop off points;

b) Dedicated parking for those with disabilities, the elderly and those with small children located close to the clinical areas, especially for those with limited mobility and eyesight;

c) Automated controlled entry / egress barrier arms to service vehicles access defined in paragraph 3.8.6 of this Sub-Section C, emergency department parking defined in paragraph 3.9.2 of this Sub-Section C, RHSC Disabled Parent and Child Parking and DCN Disabled Parking defined in paragraph 3.9.3 of this Sub-Section C shall be installed by Project Co. Care shall be taken that the location and design of the control mechanism has sufficient capacity to cope with peak flows and that there shall be clearly defined instructions. The controlled barrier to the proximity parking shall be provided with a height gauge to prevent unwanted high-sided vehicles from entering and shall be well lit at all times;

d) Appropriate parking for on-call clinical night staff as near as practical to the controlled night entrance(s) for staff; and

e) Project Co shall design and provide appropriate signage external to the Facilities to ensure ease of navigation around the Site.

7.6 Hard Landscaping Requirements

Project Co shall incorporate into the Facilities all associated hard landscaping for the Site, including but not limited to the following;

a) Access and hardstanding for emergency and delivery vehicles;

b) Access for building maintenance and window cleaning;

c) Access and circulation for, visitors and patients both on foot, bicycles, in cars or on public transport;

d) Parking for vehicles and bicycles including disabled facilities;

e) Drop-off facilities including lay-bys and bus/transport stops;

f) Service areas, as appropriate;

g) Accommodation for building services plant, waste and materials management, as appropriate;

h) Amenity areas for staff, patients and visitors;

i) Suitable pathways and paving;

j) Protection against noise and environmental pollution;

k) Security provisions, as appropriate;

l) Appropriate Site boundary treatment;

m) Walls, fencing, gates / barriers and hedgerows as appropriate along the Site Boundary and at particular locations inside the Site;

n) CCTV surveillance of the building perimeter, to all car parks, pedestrian routes, therapy gardens, courtyards, roof terraces, external play areas and helipad;

o) External lighting;

p) Suitable means of shelter against adverse weather conditions at entrances, bus / transport waiting, and drop off locations and covered links provided, as appropriate;

q) Automatic vehicle access barriers, as appropriate; and

r) Fire hydrants.

All hardstanding, Site roads, paths, car parks, cycleways, and footpaths etc shall be designed and constructed so as to be free from standing water.

8 Mechanical & Electrical Engineering Requirements

Project Co shall provide the Works to comply with the Environmental Matrix.

Project Co shall in carrying out the Works comply with the following non-exhaustive list of mechanical & electrical requirements.

Project Co shall provide mechanical and electrical systems that help create a “state-of-the-art” building with innovative design. Project Co shall provide an engineering system that utilises the latest technology to create a high quality working environment that will provide a reassuring, enjoyable and convenient hospital for all patients, their families, visitors and staff. Project Co shall ensure the services network is efficient, effective, flexible and unobtrusive. Project Co shall ensure that the system is easy to maintain and shall maximise the opportunities for flexible adaptation and extension of the Facilities.

Electrical, mechanical and communication services shall be designed to be an integral and co-ordinated part of the design. Services shall be clearly identified at regular intervals and at all locations where maintenance access is required.

The location of engineering and utility services shall be co-ordinated with the structure and not constrain or conflict with Operational Functionality. Access to all services shall facilitate ease of maintenance which shall be safe and able to be effectively undertaken. There shall be provision for space to give flexibility for future re-planning and / or re-modelling of the Facilities.

The Board requires the buildings to be designed to achieve an optimum level of autonomy along with energy and utility utilisation. The energy centre shall be for the sole use of the Facilities. The services provided from the energy centre shall be provided from sources solely on the Site.

Project Co shall take cognisance of all the building services implications of the requirements described in the Board’s Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

For the avoidance of doubt the hierarchy of standards and advice detailed in paragraph 2.5 shall apply to this paragraph 8.

8.1 Minimum Engineering Standards

In addition to the publications in paragraph 2 of this Sub-Section C Project Wide Requirement, Project Co shall ensure that the design, construction and selection of components for the mechanical and electrical works comply with, including but not limited to, the following design reference documents :

a) NHS Scotland Firecode;
b) All current relevant legislation and Codes of Practice by CIBSE;
c) All current relevant legislation by HVAC;
d) All current relevant British Standards;
e) European Harmonised Standard Specifications and Codes of Practice;
f) ACS Accreditation (formerly CORGI Regulations);
g) Gas Safety Regulations;
h) The Management, Design and Operation of Microbiological Containment laboratories. HSE 2001
i) Biological Agents: Managing the Risks in Laboratories and Health Care Premises HSE 2005
j) Biological Agents: The Principles, Design and Operation of Containment Level 4 Facilities.
k) Water Research Centre Codes;
l) The Water Supply (Water Quality) (Scotland) Regulations 2010;
m) Electricity at Work Regulations1989;
n) BS 7671:2008) (IEE Wiring Regulations);
o) The control of legionella bacteria in water systems approved Code of Practice;
p) The Electrical Equipment (Safety) Regulations 1994; and
q) Electromagnetic Compatibility Regulations 2006.

The design of the environmental control system shall be co-ordinated and integrated with the design of the structure and the occupied areas as to maximise the control and flexibility of the Facilities.

The following is a non exhaustive list of SHTM's, HBN's and HTM's applicable to the Facilities:

a) SHTM 64: Building Components Series Sanitary Assemblies:
b) SHTM 2010 Parts 1 - 6: Sterilization;
c) SHTM 2023: Access and accommodation for engineering services;
d) SHTM 2030: Washer-disinfectors
e) SHTM 2031: Clean steam for sterilization
f) SHTM 2035: Mains signalling;
g) SHTM 02-01 Parts A and B: Medical gas pipeline systems
h) SHTM 03-01: Ventilation in Healthcare Premises;
i) SHTM 04-01 Parts A - G: The control of Legionella, hygiene, 'safe' hot water, cold water and drinking water systems;
j) SHTM 06-01: Electrical services supply and distribution;

k) SHTM 06-02: Electrical safety guidance for low voltage systems;

l) SHTM 06-03: Electrical safety guidance for high voltage systems;

m) SHTM 08-01: Specialist Services – Acoustics;

n) SHTM 08-02: Specialist Services – Lifts;

o) SHTM 08-03: Specialist Services - Bedhead Services;

p) SHTM 08-04: Pneumatic Tube Transport Systems;

q) SHTM 08-05: Parts A to D: Building Management Systems;

r) SHTM 08-06: Specialist Services - Pathology Laboratory Gas Systems;

s) HBN 00-07: Resilience Planning for Healthcare Establishments;

t) HTM 07-02: EnCO2de; and

u) HTM 07-03: Transport Management and Car Parking.

Project Co shall consider the requirement for ligature resistance fittings and fixings within the building services provision in appropriate areas (identified or otherwise in the Specific Clinical and Non-Clinical Requirements), and generally in keeping with Good Industry Practice.

8.2 Infection Control

Mechanical and Electrical equipment selections and designs shall take cognisance of HAI-SCRIBE in its entirety.

8.3 Engineering Services Interface with Building Fabric

Project Co shall ensure that co-ordination of the electrical, mechanical and communication services shall form an inherent part of the Facilities design.

Services provision, e.g. luminaires, fire alarms, and mechanical services, shall be co-ordinated with the ceiling layout and allow simple relocation if required.

Access to services shall be provided and the services clearly identified at regular intervals and at all locations where maintenance access is required, for example at valves and electricity connection points. Access to building services shall be in accordance with SHTM 2023: Access and accommodation for engineering services.

The positioning of sockets, light switches, alarm buttons and fire “break-glass” panels etc shall be consistently located throughout the Facilities and to specifications set out in BS8300 (unless specific clinical needs take precedence). The positions shall be detailed and shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Structural design shall ensure that structures are co-ordinated to ensure the logical and sequential installation and maintenance of services. For example the use of columns adjacent to vertical service voids shall be minimised.

8.4 Unrestricted Access to Patients

Project Co shall take due consideration of the servicing strategy for highly serviced areas. This shall be inclusive of but not limited to bed areas where clinical staff require 360º free access. Project Co shall not gain access to services above beds for maintenance purposes

8.5 Performance Standards

8.5.1 Energy Performance Certificate

Project Co shall ensure that the Facilities shall operate to achieve an Energy Performance Certificate (EPC) rating of C or better.

Project Co shall provide and display the Energy Performance Certificate (EPC) for each building in the Facilities.

8.5.2 Thermal Comfort

Where maximum internal summer time temperature calculations indicate that the internal temperature will exceed those limits set out in the Environmental Matrix, Project Co shall provide means of reducing the temperature rise.

Measures shall be assessed, modelled and implemented to demonstrate that the internal air temperature of any room or area does not exceed the maximum acceptable level of 25°C for more than 50 hours per annum.

For any room or area that does not meet this criterion, there should be a hierarchy of remedial action to prevent the high temperature by passive means as a priority, adopting a suitable means of comfort cooling as a last resort.

8.5.3 Air Quality

i. Internal

Air quality in all areas shall take account of occupancy levels, internal pollutants, heat gains, external pollutants and atmospheric conditions and shall be controlled to provide adequate comfort and fresh air levels appropriate to the functions of each department area.

Particular attention shall be given to the risk of cross infection within the hospital / healthcare environment and shall be such as to minimise the spread of infection. Project Co shall demonstrate through submission of information to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement, how the proposals facilitate the control and management of an outbreak and spread of infectious diseases, and in particular shall comply with the requirements of SHTM 03-01 (Ventilation in Healthcare Premises). In order to reduce cross-contamination, the design of the Facilities shall incorporate 100% fresh air supply systems only.

Project Co's demonstration referred to above is to cover all aspects of the building, its services, spatial relationships, soft and hard FM proposals and incorporate requirements of the Board's Infection Control Team.

Project Co shall provide natural ventilation wherever possible, except where:

a) The level of outside noise is unacceptable;

b) Safety or security features must be provided;

c) Unpleasant smells are generated either inside or outside the building;

d) Where inflows of air are undesirable;

e) Clinical requirements, as detailed in the Room Data Sheets, do not allow in areas such as isolation rooms, where positive or negative pressure are required; and

f) Areas which are air-conditioned.

ii. External

a) The Project Co shall comply with the requirements of City of Edinburgh Council and other statutory bodies regarding airborne emissions from the Site and shall undertake all studies necessary to prove that emissions and their dispersal will not have any adverse impact on the local community or staff, patients and visitors to the Campus Site.

8.5.4 Vibration

Project Co shall ensure that building services plant and equipment are suitably isolated from the building structure in order to prevent the transmission of vibration. Project Co shall comply with the guidance on the satisfactory magnitude of building vibration with respect to human response given in BS 6472-1:2008 Guide to evaluation of human exposure to vibration in buildings Part 1 Vibration sources other than blasting. Project Co shall comply with the following vibration limits detailed below:

a) Plant rooms on occupied floors 0.015 m/s^2;

b) Plant rooms above and below occupied floor levels 0.050 m/s^2;

c) Remote plant rooms 0.100 m/s^2 ;

d) No structure borne vibration is perceptible within any nearby living apartment.

8.5.5 Acoustics

To allow the effective control of building services noise in the provision of a satisfactory acoustic environment Project Co shall satisfy the following criteria (with reference to British Standards and Minimum Health Planning Standards in particular SHTM 08-01 Acoustics.

a) Careful selection of plant and equipment;

b) Good installation;

c) Correct operation and maintenance;

d) Be such that any associated noise complies with NR25 when measured within any nearby living apartment.

8.6 Incoming Services

8.6.1 General

Project Co shall be responsible for the provision of all new utilities and the energy supply infrastructure to and from the Facilities (whether this is internal or external to the Site boundary), including:

a) Confirmation of the capacity of the proposed system;
b) Liaison with potential suppliers;
c) System development and planning;
d) Any supplies modifications to the periphery of the Site;
e) Any supplies modifications within the Site;
f) Metering and sub-metering of supplies;
g) Strategic planning;
h) Emergency systems; and
i) Power factor correction.

Project Co shall carry out the work outwith the Site boundary in accordance with the relevant provisions of paragraph 4.

8.6.2 Security of Incoming Supplies

Project Co shall provide back up to respond to the failure of the incoming supply of electricity, gas and water supplies to the Facilities.

In particular, Project Co shall provide 100% standby generator capacity for electrical services in accordance with the requirements and recommendations of SHTM 06-01. For the avoidance of doubt, Project Co shall also ensure that the Facilities are provided such that all the requirements detailed in SHTM 06-01 are satisfied.

Project Co shall ensure that energy, water, power supplies, medical gases and communication supplies to and within the Facilities are maintained by agreement with the utility suppliers, the Board, and where necessary by providing standby sources of supply (e.g. dual fuel boilers etc).

Project Co shall develop a strategy to ensure the security of the supply. Project Co shall be required to demonstrate the feasibility of the strategy to the satisfaction of the Board.

Project Co shall investigate adequacy, and provide the Board a report on location and number of connections of local town's water supply, gas and electrical supplies around and to the Site. Project Co shall ensure their town's water, gas, electrical and data/telecommunication connections to the Site maintains an adequate, autonomous and robust service and shall submit full connection details with the proposals.

The incoming gas supply shall be housed in a stand alone gas meter house of adequate size to accommodate the gas supply with gas meter, twin governor gas streams with associated valves and where each stream is sized to meet full Facilities capacity.

8.6.3 Provision for Isolation

Project Co shall ensure that all sections of the supply mains, whether supplying electricity, gas or fluids, can be taken out of service for maintenance without interrupting the supply to the Facilities or to any part of the Retained Estate and/or Retained Site.

Project Co shall provide external isolation of water supplies to the new Facilities. Local isolation of the water supply to all sanitary appliances, and at the final equipment connection points, shall also be provided.

8.7 Mechanical Systems

The Project Co shall design, supply, install, test, commission, operate and maintain all mechanical building services necessary to support the Clinical Services at the Facilities. The following systems are indicative of those anticipated by the Board but are not exhaustive and sole responsibility shall be Project Co's to determine all necessary systems are included.

Systems shall be design, supplied, installed, tested, commissioned, operated and maintained all in accordance with the regulations and standards.

8.7.1 Building Management Systems & Controls

Project Co shall provide a building management system (BMS) to be installed to allow easy, remote, monitoring of measured values and control set points. Communication with (and between controllers) will utilise the main hospital data network and therefore the data traffic between controllers and dependency on the network shall be minimised. There will not be a requirement for CCTV video or sound files to be transferred, via the network, and therefore it is not envisaged that a high data bandwidth will be needed. All BMS systems generally have the same functionality and therefore the choice of manufacturer shall be the responsibility of Project Co, but consideration should be given to existing systems that are currently on the network which are "Sigma" from Schneider Electric or "Desigo" from Siemens.

Should multiple BMS systems/suppliers be used Project Co shall require to fully integrate these into a single 'master' BMS system and to provide training to the Board in the areas required for 'read only' access.

Project Co shall ensure all plant can be operated in automatic mode (via a BMS) or manual mode should a corruption in BMS software occur. Furthermore, physical bypasses shall be provided where appropriate for maintaining service, for example at control valves.

Project Co shall install a new digital BMS that controls all mechanical systems. The BMS should not be considered as a "life & limb system" and should only control the mechanical systems but should interface to the other systems such as lighting. Monitoring of security, CCTV, lifts etc will only be of an information type and BMS will not be relied upon to deliver "life alarms". Also, future replacements of systems should be considered at this point and one system should not control everything. Systems do become obsolete (and manufacturers fail) and if one system were to be used for "everything" then all the system could be compromised and need changing at the same time. This would be a very costly exercise with multiple complications. If "interfaces" were to be used between separate systems the

problem of catastrophic failure is avoided with only one system compromised making it easier to manage during restoration of services.

It shall assist in minimising energy consumption. Project Co shall ensure that the Facilities have a hard-wired link between the BMS and fire alarm and other life safety systems to enable plant shutdown if required during fire situations as well as complying with the relevant provisions of paragraph 3 and 4 as regards fire, security, and CCTV. Project Co shall ensure that the BMS is capable of producing energy consumption reports to the Board's requirements. The Board shall have full access to all new graphics which shall be fully visible to the Board with 'read only' rights to the BMS. The BMS front-end shall be internet enabled to allow secure access from any internet based PC without the need for further licences.

Project Co only shall have control and adjustment of BMS settings.

The BMS system shall be designed, installed and commissioned in accordance with the manufacturers' instructions and industry best practise. The following documents shall also be taken into consideration:

a) Standard Specifications for BMS, AG 9/2001, BSRIA;

b) Library of system control strategies, AG 7/98, BSRIA;

c) Automatic control, CIBSE Commissioning Code C: 2001;

d) Specifying building management systems, TN 6/98, BSRIA; and

e) SHTM 08-05.

The Board controls philosophy is to provide a safe, healthy and comfortable environmental condition in the Facilities, whilst focusing on energy conservation measures. Project Co shall ensure that the controls effectively deliver the requirements of the Board. Project Co shall adopt Good Industry Practice in the application of BMS controls.

Project Co shall ensure that an energy and life cycle cost conscious approach is adopted for all stages of the BMS. Project Co shall ensure that this includes the initial design of a system through to final commissioning; the planned maintenance; and the servicing of the plant.

Project Co shall ensure that the programming of the outstations shall be carried out in a consistent, structured manner. Project Co shall ensure that strategies shall be kept as simple and as uniform as possible. Project Co shall ensure that the BMS incorporates the following non-exhaustive list of full functionality and monitoring points;

a) The control and timing of heating, cooling and ventilation plant to ensure optimum energy and environmental performance, including multiple temperature zone controls, zone valves and individual area and room temperature sensors.

b) Optimum start of heating, cooling and ventilation plant to minimise the operational costs of achieving desired values by occupation time.

c) Optimum stop of heating, cooling and ventilation plant to minimise the operational costs of running plant during the required occupancy period.

d) Facility to program night set back set points for individual areas, individual optimisers, individual time schedules and areas that require heating continuously but not consistently.

e) Protection for the mechanical plant and building fabric during external frost conditions.

f) Protection for the building fabric, from condensation, when the mechanical plant is timed off.

g) Protection for the mechanical plant and building fabric during severe external air low temperatures.

h) Provision to automatically shut off heating plant when the external air temperature has risen above a pre-determined set value. The plant will automatically restore normal operation when the external air temperature falls to below a separate pre-determined value.

i) Weather compensation of any heating circuit dependant on external air temperature. This compensated set value will be accessible for easy adjustment.

j) Weather compensated heating circuits will also have room temperature influence to raise (and lower) the calculated set point with reference to a room temperature set point.

k) Where dual plant has been installed this shall be able to be automatically duty cycled by the BMS on a weekly or hours-run basis. Failure of the duty plant shall notify the system and automatically (after a short period of time) bring on the standby plant.

l) All ventilation plant and air handling units shall be individually monitored and controlled through the BMS.

m) All extract fans shall be individually timeclock controlled and monitored through the BMS.

n) Representative graphic slides will be required for all the controlled plant on the system. A hierarchical structure shall be adopted that allows other relative slides to be directly accessed from the current slide. These slides shall match the standard slides for the respective existing systems details of which shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

o) The system shall automatically flag-up alarms for remote interrogation. Essential critical alarms shall be also routed via SMS texts to an out-of-hours “on call” mobile phone. Great care shall be given to selection of the alarms that are deemed to be essential critical alarms.

p) The current state of plant, temperatures, set-values etc shall be accessible from a simple, intuitive index tree structure on the BMS “front-end” interface.

q) Application of energy metering, via the BMS, will allow Renewable Heat Incentive and energy saving schemes and to be implemented. This will require heat meters to be installed on each plate heat exchanger and heating circuit and connected into the BMS via MODBUS type interface. These meters may be used for fiscal purposes and would assist in providing information as to energy use.

r) The BMS shall monitor but not control the fire alarm system. The fire alarm system shall be hard-wired to the heating/ventilation plant to switch the plant off when required. The BMS input from the fire alarm system would mirror the action of the fire alarm hard-wired connection to also switch the plant off to prevent nuisance alarms from being generated.

s) The BMS shall monitor the control circuit state within each control panel and on failure of the control circuit would switch off the demands for the connected plant. This will assist in identifying the control circuit state and also in preventing the system

from being swamped by nuisance alarms. Care shall be taken that the control circuit failure does not give the impression that a fire alarm event has happened.

t) The automatic start-up of plant (timed on, restoration of fire alarm or control circuit) will be staged in over a period of a few minutes to prevent surges on the supply to the control panels.

u) The BMS will status monitor other systems such as medical gas alarm, fire alarm fault, security system fault, lift motor fault etc but will NOT be expected to carry out any function with this information. All the systems connected will have their own strategy that will not be affected by the operation of the BMS.

v) The BMS will monitor common fault alarms for security, smoke dampers, CCTV, staff attack, disabled alarms and nurse call.

w) Local independent cooling systems serving IT rooms will be controlled by their own control system to the dictates of their own, independent, temperature control sensor. The BMS will have a dedicated sensor located beside the control sensor for monitoring purposes only. Information from the cooling system such as “Running” and “Failure” will be connected into the BMS.

x) Boilers and Chillers independent control systems will have electronic interfaces to connect to the respective BMS. This is envisaged to be a MODBUS connection that will allow operational data – such as temperatures, conditions, set values, run-times and alarms to be “mapped” onto the BMS as real values.

y) Fans and pumps will be inverter driven and speed set via an analogue output from the BMS. This will allow trim to be applied to reduce operational costs as and when possible. Independent pump (and fan) speed control should be avoided as remote speed control, by BMS, is unlikely to be achievable.

z) Information from inverter drives used for fans and pumps such as running state and trip state will be echoed back to the BMS via connections internal to the respective control panels. These signals will also illuminate indicators on the control panel facia.

aa) Piped across pumps and fans will be differential pressure switches that will provide indications of actual running condition of the plant. These conditions will be echoed back to the BMS via connections internal to the respective control panels. These signals will also illuminate indicators on the control panel facia.

bb) The BMS will be programmed with settable operational user levels to allow the filtering of functionality to be determined dependant on users experience and training.

cc) Where local room temperature controllers are utilised they shall be integrated with the BMS to allow the BMS to monitor the current characteristics of the controller. Characteristics such as current room temperature, actual room set-point, controller state, valve positions etc. It should also be possible to set values into the controllers remotely from the BMS. Examples of the set values are: Enabling the controller, main set values, lower set point limit, upper set point limit. Every room controller will be represented individually on the BMS to allow specific rooms default conditions to be set remotely. The BMS software shall be written to allow for night set-back room temperature set points to be applied if required.

dd) Electricity metering shall be provided on specific distribution boards and connected into the BMS via MODBUS type interface.

ee) All renewable/LZC technology systems shall be individually metered and connected into the BMS via MODBUS type interface to permit the Board to monitor record and maximise financial benefits from each system.

ff) The BMS shall be capable of monitoring the hot and cold water temperatures, including stored cold water and volume records.

gg) The BMS shall be capable of monitoring the UPS/Emergency generators.

hh) The BMS shall be capable of remote monitoring of all critical fridge/freezers.

For clarity "multiple temperature zone controls" throughout this BMS section refers to BMS connected equipment to allow for zoning throughout the building to ensure that each department and on a floor-by-floor basis can be time controlled via the BMS to allow for current (and future) changes to departmental occupational / heating requirements.

The BMS will include all the required control equipment (Fan / pump starters, sensors, valve actuators, pressure switches, pressure transducers, relays, power wiring, control wiring, network wiring, hand over-ride switches, panel indicator lamps, all other associated control panel items, site specific software including graphic slides) to provide a complete working system control system.

Project Co shall ensure the BMS is set up in a way that enables the monitoring of points on a continuous basis by the Board in order to facilitate trend analysis. Project Co shall ensure that this includes temperature profiles, valve positions and plant operation periods. Project Co shall ensure that it is possible to obtain historic data on specified points for a period of at least 14 days in order to facilitate fault diagnosis in the event of a problem.

Project Co shall ensure that the monitoring of domestic hot water and cold water (including tanks and end-of-line outlets) is continuous and carried out throughout the Facilities (not just at central plant) in order to demonstrate compliance with the Board's Legionella prevention strategy and conforms to relevant legislation, and NHS guidance.

Project Co shall ensure that the BMS is installed to control all plant where there is an operational requirement or a life cycle cost benefit, including but not limited to:

a) Boiler plant;

b) Air handling plant;

c) Ventilation plant;

d) Cooling plant;

e) Domestic hot water plant;

f) Duty/Standby control; and

g) Lighting interior and exterior (localised control shall also be considered).

Project Co shall ensure that all major plant items shall be designed and controlled to provide "real time" status monitoring, including run, fault, and alarm reporting. Project Co shall ensure that this includes boilers, pumps, pressurisation units, air handling plant, fans and air conditioning. Project Co shall provide a modular boiler system for the Facilities which will be of a dual fuel nature with storage capacity to meet the Board's statutory civil contingency requirements, which is 200 hours of peak winter demand.

Project Co shall ensure that the requirements of the following paragraphs are incorporated into the proposed Building Management System for the Facilities;

i. Zone Control

Project Co shall ensure the Facilities are capable of individual temperature control for all patient areas; to be achieved with the use of BMS controlled zone controls. Areas of 24-hour operation shall be independently controlled from non 24 hour areas to ensure optimum efficiency and in discrete areas consideration shall be given to localised zoning depending on the orientation of the buildings. Proper consideration is required to the level and extent of temperature sensing and monitoring devices to provide both accurate and cost effective zonal control.

ii. Optimisation & Compensation

Project Co shall ensure Good Industry Practice is adhered to regarding control regimes incorporating time, optimisation and weather compensation.

iii. Smart Metering

Project Co shall ensure the use of meters giving high accuracy at low flow rates and that metering points give consumption in SI units including any time bands as appropriate. Project Co shall ensure data collection and report production is by electronic systems.

Project Co shall allow sub-metering of electricity, heating and domestic water usage for each individual department / unit.

Project Co shall allow sub-metering of electricity usage for each individual department / unit and as required to satisfy the requirements of Section 6 of the Scottish Technical Standards.

As a minimum all incoming utilities shall be metered. In addition, any relatively large use of electricity, such as DHW trace heating, external lighting or mechanical plant, shall be metered separately and in line with BREEAM Healthcare stipulations.

The metering equipment shall be located at the most appropriate location for easy manual accurate reading to be taken of the load and reading should also be relayed to a central meter station in the energy centre.

Project Co shall make provision to allow the regular monitoring and reporting procedures to be implemented during the Operational Term. The installation of sub-metering is required and is to be introduced to allow accurate departmental energy usage and costing information to be obtained.

The Board believes that the feedback of information on consumption levels is essential to ensure that any adverse variances are recognised and a course of remedial action initiated. The system shall be designed and installed so that monitoring can be carried out on a continuous basis to enable energy consumptions to be data logged and profiled.

The system shall be designed and installed to permit calibration/accuracy checks on all meters (primary and sub) on an ongoing basis as an integral part of the services commissioning and prior to project completion to ensure BMS accuracy.

The BMS shall be installed to automatically read and provide trend analysis to a range of energy / water meters. All meters including those of the utility supply companies and internal sub-meters shall be automatically read by the BMS at pre-determined intervals. Project Co shall ensure that the BMS is capable of reading utility meters on a continuous basis in order to facilitate trend analysis. The energy metering shall include (but not limited to):

Electricity

a) Main incoming HV supply;

b) Main LV Switchboard;

c) External lighting (separate sub-meter for car park lighting);

d) All distribution boards with separate meters for power and lighting;

e) Departmental power and lighting;

f) HVAC control panels;

g) Cooling plant;

h) Standby electrical energy sources, rotating and static; and

i) Tenant areas (if provided).

For the purpose of energy estimates, hours run meters shall be provided for all Air Handling Unit (AHU) fans.

Water

a) Main incoming water supply; and

b) Internal sub-meters.

Gas

a) Main incoming gas supply; and

b) Internal sub-meters.

Oil

a) Delivered to Site; and

b) Used on Site, by individual pieces of equipment.

iv. Smart Meter Type

The new smart meters must be capable to ‘store measured energy consumption data for multiple time periods; and at least half hourly’ and they must ‘provide remote access to such data by the licensee’. The meter shall allow access to data to be available in a day + one.

The metering shall be provided by an independent provider of metering and data services. This will allow the supplier to be changed without being bound by any metering and data services, and without losing meter data during the supplier change over.

v. Communication Protocol

In recognition of the advances being made in building management systems, Project Co shall ensure that the BMS platform is compatible with a range of diversified core systems and standard protocols such as BACnet, LonTalk, Modbus, and OPC. The use of these standard

communication protocols will allow for more effective integration and help prepare for future devices and technologies. It will also facilitate the use of communication between different manufacturers control equipment.

vi. User Interface

Project Co shall ensure that once installed and commissioned the 'smart' meters have a BMS user interface that is sufficiently user friendly to facilitate multi-user access, without the need for the users to be controls or software specialists. Project Co shall meet the requirements of the Board in so far as that; the Board envisages that navigation around the BMS, via the "front end" will be by a combination of floor plans, plant & equipment graphics and drop down menus or "software" knobs.

Project Co shall provide the Board with a system capable of remote off-site access through the BMS from a number of locations, in order that it can monitor internal and utility consumptions / trends. Software access to be security password controlled.

Project Co to prepare and present sample software tutorial on BMS graphics (Graphical User Interface) to the Board/end user as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement at a time suitably in advance of project completion to allow software/graphic modifications in line with the Board comments.

vii. System Selection

Project Co shall ensure that all materials and equipment used are standard components, regularly manufactured for this and/or other systems and not custom designed specially for this project. Project Co shall ensure that all systems and components have been thoroughly tested and proven in actual use, for at least two years, within other NHS establishments of a similar size and complexity to this one. All components and/or systems shall be type tested and carry the CE mark.

Project Co shall confirm that both the hardware and software will be fully supported for a minimum period of 15 years from the Actual Completion Date. Future compatibility shall be supported for no less than 10 years from the Actual Completion Date. Compatibility shall be defined as the ability to upgrade existing field panels to current level of technology, and extend new field panels on a previously installed network.

8.7.2 Towns Water Connection to the Site

Project Co shall provide a secure as possible single towns water connection to the Site from the local Scottish Water network exploring opportunities for and if feasible incorporate dual supplies to ensure increased site resilience and subject to complying with the relevant provisions of paragraph 4.

8.7.3 Site Mains Water, Fire Water, Quality & Distribution

Project Co shall develop the Site potable and fire water networks as separate systems, each arranged in a ring with adequate valving to achieve robustness in continuity of supply.

Project Co shall filter the Site potable water to the criteria set out in SHTM 04-01 Parts A - G and commensurate with the piping material proposed.

In determining the pipework material the Project Co shall take cognisance of the latest best practice in the Scottish NHS.

8.7.4 Fossil Fuels

Project Co shall be responsible, in conjunction with Transco in determining the philosophy for the provision of fossil fuels to the Site. Options that Project Co may consider are un-interruptible gas or the provision of dual fuel burners and a heating oil standby facility. Irrespective of the option proposed by Project Co the availability criteria described elsewhere in Clause 9 and Schedule Part 14 (Payment Mechanism) of the Project Agreement and/or the Services Specifications will be strictly adhered to.

8.7.5 Heating System

Project Co shall provide all heating systems required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and to:

a) Zone and control heating circuits to provide an efficient and comfortable environment;

b) Provide valve isolation such that isolation of circuits/sub-circuits shall have minimal disruption to the remaining departments;

c) Provide 24 hour occupied (and unoccupied) wards and departments with a night set-back facility;

d) Provide temperature and ventilation night set-back facilities so that when departments are unoccupied they will have frost and anti-condensation protection.

Project Co shall provide high efficiency, low NOx heat generation and heating water distribution plant, serving good quality heat emitters to ensure satisfactory heat distribution within the area served. Project Co shall arrange heat emitters and all heating pipework such that in all areas, the surface temperature limits as laid down in SHTM 04-01 Parts A - G are not exceeded. Project Co shall not utilise heating pipework as a heat emitter within patient areas.

Project Co shall pay particular attention to effective use of warm air curtains in entrance / draft lobbies.

8.7.6 Domestic Water Services

The water supply system for the Facilities shall include a new dedicated supply from Scottish Water's off site infrastructure and also incorporate on-site bulk water storage (24-hours) and subject to complying with the relevant provisions of paragraph 4.

Treatment of potable cold water supplies is considered undesirable and the provision of a wholesome supply from Scottish Water's mains with the minimum of storage and handling is the preferred approach.

Project Co shall design and install the domestic cold and hot water supply installations to fully comply with the requirements of SHTM 04-01 Parts A - G. Project Co shall include for all specialist treatment plant that may be necessary. Project Co shall provide water sampling points as required by SHTM 04-01 Parts A - G with due regard for clinical requirements and provision of Clinical Services.

Secure local isolation shall be provided by Project Co at all sanitary appliances, and at final connection points to equipment. Project Co shall provide secure external isolation to the buildings.

Project Co shall provide plumbed in water dispensers at ward level in accordance with Schedule Part 11, Equipment Schedule. The installation of ice machines is prohibited.

Project Co shall provide plumbed water to specialist services such as, but not limited to, washing machines in specialised units and dishwashers in ward areas in accordance with the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements), and in particular Schedule Part 11, Equipment Schedule.

Project Co shall provide plumbed water to all vending machines as required throughout the Facilities in accordance with the Board's Construction Requirements Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements), and in particular the Schedule Part 11, Equipment Schedule.

The Project Co's attention is drawn in particular to SHTM 04-01 Parts A - G concerning pipework materials and standards of filtration to be used in Scottish health care facilities.

All clinical hand washing facilities shall be provided with automatic sensor taps. In order to assist in achieving the water consumption target (see paragraph 5.26 of this Sub-Section C) Project Co shall consider the use of low flush toilets and insert spray caps where appropriate to taps to ensure the conservation of the water supply. Project Co shall install systems into the urinal facilities to reduce the flush requirements.

As required within SHTM 04-01 Parts A - G, no flexible or braided hoses shall be permitted for final connections between domestic water distribution pipework and appliances/outlets.

Project Co shall consider the environmental benefits and economic viability of greywater re-cycling on Site and if beneficial to the project shall incorporate such a system into the building services and flood abatement philosophy for the Site. Project Co shall describe fully its mode of operation and integration into the Site.

Project Co shall evaluate the benefits and feasibility of rainwater harvesting for process areas only which if adopted, Project Co shall ensure that the rainwater from the roof of the Facilities and hardstandings is collected, stored and re-used for toilet flushing purposes and if appropriate separated to serve supply points for irrigation of the external areas of the proposed Facilities.

Project Co shall ensure that the recycling facility for the separate greywater and rainwater systems allows for appropriate filtration and complies with any flood abatement philosophy for the site.

8.7.7 Hot Water Supply

Appropriate operational engineering systems for hot water and steam shall be included in the design of the Facilities.

Domestic hot water systems shall be designed to provide adequate flow to satisfy maximum demand whilst minimising stored hot water and energy consumption. The provision of some storage is desirable to minimise the impact of hot water generation on boiler power.

Project Co shall install Type 3 (in accordance with NHS Model Engineering Specification D08) thermostatic mixing valves at all HWS outlets to comply with SHTMs and SHGNs except where 60°C water is a particular requirement so that the mandatory requirements for the control of Legionella and other bacteria within the system are met.

Energy efficient hot water boilers shall be provided in all staff rest rooms and kitchen areas.

8.7.8 Mechanical Ventilation & Air Conditioning

The heating, ventilation and air conditioning systems shall be logically designed to operate efficiently incorporating heat recovery and providing local control where required. Project Co should ensure avoidance of simultaneous heating and cooling, either by the ventilation system itself or between the ventilation system and any other heating and cooling system,

The energy and power systems shall be appropriately designed to provide fully integrated designs in terms of the incorporation of engineering services into the building fabric and external spaces.

The need to maintain comfort conditions in accordance with the Room Data Sheets in all areas but particularly in clinical areas is of paramount importance and Project Co shall develop strategies for achieving these conditions together with minimum energy consumption.

Project Co shall provide natural and mechanical ventilation, comfort cooling, and air conditioning to suit the Facilities and clinical requirements and provision of the Clinical Services. Project Co shall provide a climate control facility in clinical and staff areas which are provided with comfort cooling (if applicable). The use of low carbon solutions is anticipated for such requirements.

Project Co shall provide the air lock to the first floor of the Link Building to the RIE Facilities in accordance with the Interface Output Specification, the Connection Proposal and relevant provisions or Paragraph 4 concerning any connections to the Link Building.

Project Co shall ensure heat gain from all equipment and personnel is allowed for in sizing and selection of the systems.

Project Co shall demonstrate how the proposals facilitate the control and management of an outbreak and spread of infectious diseases in accordance with SHTM 03-01, SHFN 30 and HAI-SCRIBE.

Project Co demonstration is to cover all aspects of the building, its services, spatial relationships, Soft and Hard FM proposals (as appropriate) and incorporate requirements of the Board's Infection Control Team.

Project Co shall ensure that ventilation systems installed in areas classified as hazardous are designed to relevant standards.

Where grilles or diffusers are used within rooms Project Co shall ensure they are:

a) Arranged to avoid draughts; and

b) Designed to minimise noise intrusion into the space.

Project Co shall incorporate provision to include humidification to the AHU plant at a future date.

8.7.9 Combined Heat and Power

Project Co shall consider the environmental benefits and economic viability of Combined Heat and Power (CHP) and if beneficial to the project shall incorporate CHP into the building design, avoiding any 'dumping' of heat or export of power off-site. Project Co shall describe fully its mode of operation and integration into the mechanical and electrical services to demonstrate their assessment and viability.

8.7.10 Medical Gases

Project Co shall provide all medical gases required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific-Non Clinical Requirements), such as but not limited to:-

a) Oxygen Vacuum Insulated Evaporator (VIE) shall be for the sole use of the Facilities. The Oxygen VIE shall be provided from sources solely on the Site.

b) Nitrogen provided on the Site

c) Nitrogen oxide provided on the Site;

d) Medical air 4 bar;

e) Surgical air 7 bar; and

f) 50% oxygen / 50% nitrous oxide provided on the Site.

Medical gas bottles, plant areas and stores shall be accommodated within suitably designed buildings / rooms / enclosures with good access, natural ventilation and satisfactory noise emissions control.

All medical gas installations which serve clinical departments shall be connected to essential electrical supplies.

The status of the central medical gas plant shall be monitored by an alarm system with a status signal to an alarm panel located in a manned office. The panel shall also report the alarm to the BMS.

Project Co shall install the piped medical gases in accordance with SHTM 02-01 and "Model Engineering Specification C11".

Project Co shall install outlets as defined in this Schedule Part 6 Section 6 (Room Data Sheets).

Project Co shall provide a medical gas distribution system sized to accommodate the demand of the Facilities at the Actual Completion Date and handover, with the capacity to accommodate an increase in demand (flow and consumption) of no less than 25% throughout the Facilities.

Project Co shall ensure that the provision of medical gases to the point of use is continuous. Where Project Co are providing medical gases via cylinders they shall provide manifold systems with automatic change over from duty to standby to no less than two equal banks of cylinders. The capacity of such arrangements should be in line with that outlined within SHTM 02-01 and "Model Engineering Specification C11" along with necessary alarm systems to alert staff as to a fault conditions.

Project Co shall ensure that adequate points of isolation exist to all medical gas systems.

8.7.11 Medical & Dental Vacuum

Project Co shall provide medical and dental vacuum systems as required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements).

Medical and dental vacuum plant areas and stores shall be accommodated within suitably designed buildings / rooms / enclosures with good access, natural ventilation and satisfactory noise emissions control.

Installations shall be connected to essential electrical supplies and shall be in compliance with SHTM 02-01.

The status of the central medical and dental vacuum plant shall be monitored by an alarm system with a status signal to an alarm panel located in a manned office. The panel shall also report the alarm to the BMS.

8.7.12 Anaesthetic Gas Scavenging System

Project Co shall provide an active Anaesthetic Gas Scavenging System (AGSS) as required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements).

AGSS plant areas and stores shall be accommodated within suitably designed buildings / rooms / enclosures with good access, natural ventilation and satisfactory noise emissions control.

The installation shall be connected to essential electrical supplies.

The status of the AGSS shall be monitored by an alarm system with a status signal to an alarm panel located in a manned office. The panel shall also report the alarm to the BMS.

8.7.13 Non-Medical Gases

Project Co shall provide all non-medical gases required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific-Non Clinical Requirements).

Non-medical gases shall be provided as either bottled or piped installations as deemed appropriate.

Gas bottles, plant areas and stores shall be accommodated within suitably designed buildings / rooms / enclosures with good access, natural ventilation and satisfactory noise emissions control.

All critical non-medical gas installations i.e. certain laboratories etc shall be connected to essential electrical supplies.

The status of the central non medical gas plant shall be monitored by an alarm system with a status signal to an alarm panel located in a manned office. The panel shall also report the alarm to the BMS.

Project Co shall install the non medical gases in accordance with SHTM 08-06, SHTM 02-01 and "Model Engineering Specification C11".

Project Co shall install outlets as defined in Schedule Part 11, Equipment Schedule.

Project Co shall provide a non medical gas distribution system sized to accommodate the anticipated demand of the Facilities at the Actual Completion Date having regard to Schedule Part 11 (Equipment Schedule) and the Room Data Sheets, with the capacity to accommodate an increase in demand (flow and consumption) of no less than 25% throughout the Facilities.

Project Co shall ensure that the provision of non medical gases to the point of use is continuous. Where Project Co are providing non medical gases via cylinders they shall provide manifold systems with automatic change over from duty to standby to no less than two equal banks of cylinders.

Project Co shall ensure that adequate points of isolation exist to all non medical gas systems.

8.7.14 Bedhead Services

Project Co shall provide bed head services as defined in the Schedule Part 11, Equipment Schedule. Project Co shall ensure that bedhead services are designed and installed in accordance with SHTM 08-03.

8.7.15 Sterilisation

Project Co shall provide clean steam and associated sterilisation plant and distribution systems as required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements). Plant and associated systems shall be designed to SHTM 2031 and SHTM 2010. Discharges to drain are to be treated / managed in accordance with SEPA requirements.

8.7.16 Special Water Services

Project Co shall provide all special water services required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements), such as but not limited to:

a) Special supplies such as de-ionised water to laboratory equipment;

b) Special supplies such as de-ionised water to equipment washers / disinfection equipment; and

c) Special supplies for Renal Dialysis.

8.7.17 Laboratory Gases

Project Co shall provide all laboratory gases required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements), such as but not limited to:-

a) Nitrogen; and

b) Carbon Dioxide.

All pipework shall be distributed in ventilation spaces within the ceiling void with maximum permissible separation from the electrical services and hot pipe services. Natural gas installation in the building shall comply with the all current Gas Safety Regulations, incorporating emergency manual / automatic isolation in each room with gas draw-offs. Reinstatement of natural gas following emergency isolation shall also follow an inherently safe regime.

8.7.18 Local Exhaust Ventilation Systems

Project Co shall provide all LEV systems including but not limited to that required to support the provision of catering, workshop and maintenance facilities on Site.

8.7.19 Fume Cupboard & Micro-biological Safety Cabinets

Project Co shall provide fume cupboard and both CAT II and CAT III microbiological safety cabinet exhaust systems as required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements). Systems shall comply with NHS Specifications and Guidance documentation which shall include a matched supply system into the room(s) containing fume cupboards and micro-biological safety cabinets. Fume cupboard design and installation shall be to BS EN 14175. Microbiological Safety Cabinet design and installation shall be to BS EN 12469: 2000 Biotechnology - performance criteria for microbiological safety cabinets and BS 5726: 2005 Microbiological safety cabinets.

8.7.20 Drainage

Project Co shall provide all necessary drainage to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements) and their aspirations regarding reduced water consumption which shall include but not be limited to:

a) General foul water drainage;

b) General surface water drainage;

c) Kitchen drainage, inclusive of grease traps;

d) Laboratory drainage;

e) Radioactive waste;

f) Drainage from areas handling radio isotopes, or other contaminants such as silver;

g) Bedpan disposal system; and

h) Drainage from oil bund areas, inclusive of oil interceptors.

Project Co shall consider the environmental benefits and economic viability of greywater re-cycling on Site and if beneficial to the project shall incorporate such a system into the building services and flood abatement philosophy for the Site. Project Co's Proposals shall describe fully the system's mode of operation and integration into the Site.

Project Co shall ensure all drainage discharges from Site are strictly in accordance with the limits set by SEPA.

Drainage systems shall be provided which function reliably with the minimum of blockages, leaks etc. Materials and jointing systems with a proven track record shall be chosen.

The design of the system shall be such as to create the minimum disruption in the event of blockages.

Project Co shall construct the drainage installation such that it complies with the "Initial Drainage Proposal" and the Supplemental Drainage Proposal and the relevant provisions regarding drainage in paragraph 4.

8.7.21 High Specification Air Conditioning Systems

Project Co shall provide high specification, full function and close control air conditioning systems to support the Board's Clinical Output Specification that are contained in Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements), such as but not limited to:

a) Laminar flow rooms and / or operating theatres; and

b) Areas handling radio isotopes or other radiological contaminants.

Air conditioning systems installed in the above areas shall be higher specification air conditioning systems with standby motors belted up in accordance with SHTM 03-01, 04-01 and NHS Model Engineering Specification C04.

8.7.22 Ventilation and Air Conditioning of Isolation Rooms

Project Co shall provide air conditioning systems to Isolation Rooms to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements), NHS Standard Infection Control Precautions (SICPs) and maintaining strict positive / negative pressure differentials.

Ventilation and air conditioning systems for these rooms shall be designed and installed in accordance with SHTM 03-01, 04-01 and NHS Model Engineering Specification C04. Project Co shall demonstrate how the proposals facilitate the control and management of an outbreak and spread of infectious diseases.

8.7.23 Pneumatic Air Tube Transport System

Project Co shall provide a pneumatic air tube transport system for the Facilities with links to the RIE Facilities. The locations to be served in the Facilities are indicated on the RHSC Pneumatic Air Tube Transport System Requirement Table and DCN Pneumatic Air Tube Transport System Requirement Table below and, as required to support the Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements). All of the Facilities pneumatic air tube transport system stations shall deliver to and receive from the laboratories and pharmacy located within the RIE Facilities, Rooms G5119 and S6107 respectively. In addition to the provision of the system within the Facilities, Project Co will also be responsible for the installation of the link to and the system including supporting plant within the RIE Facilities in accordance with predetermined routes advised by the Board. The installation must be consistent with the overall communications policy of the hospital. Project Co shall ensure the pneumatic air tube transport system shall be designed and installed in accordance with SHTM 08-04: Specialist services Pneumatic tube transport systems: Part A: Overview and management responsibilities and Part B: Design considerations and good practice guide. The system shall be 160 mm diameter multiple carrier microprocessor controlled with all associated infrastructure comprising two transmission tubes (one to and one from the RIE Facilities) accommodating up to five carriers travelling simultaneously in any direction. Notwithstanding the foregoing, the system

shall be designed to take a minimum of 21 transactions per hour (not including the return of capsules). The system will have a 70% maximum system capacity.

Project Co shall design and construct the Pneumatic Tube System in accordance with the Appendix B (Interface Output Specification) and the relevant provisions of paragraph 4 as regards the PTS.

RHSC Pneumatic Air Tube Transport System Requirement Table

Ref	Department	Pneumatic Air Tube Delivery System Required and Number	Location
RHSC SPECIFIC DEPARTMENTS			
A	***Front Door - ED / Assessment Ward***		
A1	Emergency Department	2	1 Laboratory Area and 1 outside Resuscitation Room
A2	Paediatric Acute Receiving Unit - 34 Beds	1	Central Location Staff Base
B	***Critical Care / HDU / Neonatal Surgery***		
B1	PICU and HDU's - 24 Beds	2	1 close to Room 5/8 and the other close to Room 14
C	***RHSC In Patient Pathway / Ward Care***		
C1.1	Medical Inpatients - 23 Beds	1	Staff Base Central location
C1.2	Surgical Long Stay Inpatients -15 Beds	1	Staff Base Central location
C1.3	Neuroscience Inpatients - 12 Beds	1	Staff Base Central location
C1.4	Haematology / Oncology Inpatients & Daycases - 17 Beds & 2 Chairs	1	Staff Base Central location
C1.8	Surgical Short Stay Inpatients - 14 Beds	1	Staff Base Central location
C1.9	Inborn Metabolic Disorders Lab	1	
D	***RHSC Ambulatory Care***		
D1	RHSC Main Outpatients	2 - (1 Ground Level 1 First Level)	In corridor In the D1 Area Reception Area
D9	Medical Day Care Unit - 5 Beds	1	Reception Area
H	***Academic***		
H2	Clinical Research Facility	1	Close to reception area

DCN Pneumatic Air Tube Transport System Requirement Table

Ref	Department	Pneumatic Air Tube Delivery System Required and Number	Location
DCN SPECIFIC DEPARTMENTS			
L	***DCN In Patient Pathway / Ward Care***		
L1	DCN Acute Care - 24 Beds	1	Staff Base closest to Resuscitation Room
L2	DCN Inpatients - 43 Beds	1	Near to MD Staff Office closest to PIU
M	***DCN Out Patient Departments***		
M1	DCN Outpatients	1	Reception Area
JOINT DEPARTMENTS			
P	***Combined Theatres***		
P1	Operating Theatres & RHSC Surgical Day Case Unit	2	1 located close to reception area in DCN & RHSC end
Q	***Combined Radiology***		
Q1	Radiology	1	Located close to DCN Reception Area

8.8 Electrical Systems

8.8.1 Main & Sub-Main Distribution

Project Co shall provide a main and sub-main distribution system for the new Facilities incorporating all connections from the utility provided HV supply, LV main switchgear, sub-main cabling and distribution boards as required, to provide separate essential and non-essential supplies to power and lighting throughout the Facilities designed in accordance with SHTM 06-01 and SHTM 06-02 respectively.

The utility provided HV Supply shall include a new Scottish Power substation that may be located adjacent to Car Park F on the Substation Site. Project Co shall comply with the relevant requirements for the substation and cables detailed in paragraph 4 the relevant Interface Proposals and Appendix A.

A new HV board and standby generators shall be housed within a new energy centre which shall supply via an 11kV ring new HV Substations located within the building.

The design of the LV Distribution shall ensure that redundancy is provided throughout the Facilities and include features such as dual fed distribution boards.

Project Co shall incorporate no less than 25% spare capacity (for the Facilities as designed) to the main distribution switchgear, standby generator etc within the Facilities and size the installations (all distribution panels, containment, risers etc.) to accommodate additional future spare requirements.

Project Co shall provide automatic power factor correction equipment in accordance with SHTM 06-01.

8.8.2 Standby Generation

Project Co shall provide a standby mains failure generator system for the Facilities to provide 100% power in the event of loss of the mains supply and comply with requirements set out in paragraph 8.6.2 of this Sub-Section C.

The standby generator design shall be based on a N+1 arrangement.

The system shall include for controls to operate and maintain the generator inclusive of facilities to automatically synchronise with the switchboard.

The provision of services to modern healthcare facilities is critical to its continuous operation and proposals shall include adequate resilience and support systems in all areas of the design.

Project Co shall ensure all critical services shall be maintained in the event of:

a) A primary supply failure;

b) A main distribution failure; and

c) A local distribution or equipment failure.

Loss of any critical service shall not disrupt the operation of the Facilities and sufficient no break back-up systems shall be included to assure continuity of services.

In sizing the generators Project Co shall include the 25% spare electrical capacity identified for the general power distribution systems.

Project Co shall ensure the quality of generated supply is to be compatible with the requirements of specialist clinical equipment.

8.8.3 Electrical Small Power

Project Co shall provide socket outlets throughout the Facilities to provide for general facilities, cleaner’s requirements and for connection of particular items and portable equipment as required throughout the Facilities. Project Co shall provide power supplies suitable for personal domestic appliances (e.g. hairdryer) in changing rooms. Segregation shall be provided between “clean” and “dirty” power supplies.

Project Co shall provide all necessary single and three phase power supplies for plant and equipment.

8.8.4 Lighting

The lighting installation shall be designed by Project Co to comply with the latest versions of the following publications and all other relevant guidance including CIBSE Lighting Guides and in particular LG2

Project Co shall provide the lighting levels and uniformity of light suitable for the task to be carried out and in accordance with the appropriate guidelines. The Board requires a lighting design / installation which provides good uniformity over the task area i.e. ≥ 80%.

Project Co shall ensure that luminaires are complete with an appropriate high efficiency diffuser / controller and be suitable for the application for which they are proposed.

Project Co shall incorporate the use of daylight into the lighting design. Project Co shall design and orientate the building such that the daylight can be used to best effect, supplemented by the artificial lighting system to provide the appropriate levels of illumination.

8.8.5 Interior Lighting

All access routes to plant areas shall be lit to provide safe access for maintenance.

Hazardous areas shall be provided with the appropriate classified luminaires.

All light switches for public areas shall be provided such that they cannot be operated by unauthorised persons.

Whilst the lighting design must be functional for clinical use, Project Co shall ensure that the overall lighting concept will produce an aesthetically pleasing environment. All lighting equipment shall be co-ordinated with the building structure. Project Co shall aim to use a mixture of fittings and retail lighting techniques to create a welcoming atmosphere and balanced visual environment.

Project Co shall provide and install the most energy efficient form of lighting to provide occupiers with improved visual comfort while reducing noise levels and running costs.

Project Co shall ensure that corridor lighting is multi circuited to facilitate use of 100% or 50% of the luminaires. Where the corridor is over 15 metres in length, consideration shall be given by Project Co to zoned lighting and the use of presence detection sensors to maximise efficiency.

Night lighting shall be provided within all corridors either by individual fittings or by selective switching of the general corridor wall/ceiling luminaires. Project Co shall ensure night lighting in corridors shall not spill into patient bedrooms, or other bedded areas.

Luminaires shall be located to provide ready access for lamp changing and maintenance, whilst still providing the recommended level and quality of illumination to the area.

Night lighting shall be provided at nurse stations, patient bed areas and locations where call systems are installed.

Artificial illumination shall be provided to Treatment (activity / consulting) Rooms, etc by fully recessed, hermetically sealed modular light fittings, switched at the room door positions. Treatment Room luminaires which provide the general lighting shall be controlled by at least two circuits depending on the arrangement of fluorescent tubes in each fitting. The design of these luminaires by Project Co must provide ease of access for lamp changing.

Luminaires, their colour and material finish shall be selected to co-ordinate with the architectural intent throughout the circulation areas. Low wattage 2700K luminaires to be used in particular rooms shall be selected on their ability to create a calm and “homely” atmosphere. Project Co shall consider the inclusion of wall mounted luminaires and /or uplighters.

All lamps used in clinical areas shall have as a minimum a colour rendering capability of ≥ 85 CRI. For practical reasons consideration shall be given by Project Co to using the same luminaire in both clinical and non-clinical spaces within the same ward. A reading light with an on/off switch shall be provided at each bedhead location. Project Co shall provide an additional switch on the nurse call handset.

Where luminaires of the fully recessed type (modular and / or downlighter) are installed within fire rated ceilings, they shall be provided with a one hour rated fire canopy. Project Co shall also ensure that they maintain the integrity of the ceiling and that the canopies are tested to “BS 476 Fire tests on building materials and structures Parts 20 and 23, clause 5. Project Co shall also ensure that all canopies meet the requirements of Class O materials”.

Luminaires with prismatic diffusers installed on fire escape routes shall be fitted with flame retardant diffusers to TP(a) classification in Part B (Fire safety) of the Building Regulations in England: Light Diffusers and Wall Coverings, minimum Class 3 surface spread of flame.

Bed head observational lighting (watch lighting) shall be provided where specified in high dependency and critical care wards. The observational lighting shall be separately switched and controlled from the general lighting. Refer to Schedule Part 11, Equipment Schedule for details of where observational lighting is required

Wall or ceiling mounted examination lighting shall be provided where specified in intensive therapy, high dependency and coronary units. Refer to Schedule Part 11, Equipment Schedule for details of where examination lighting is required

Laser and x-ray warning lights shall be provided outside theatres, major treatment rooms and x-ray rooms and interfaced with the laser / x-ray machines

Food factory type luminaires shall be provided in areas in which food is prepared, cooked and stored.

Ensure that in the entrance areas, functional lighting is supplemented by additional lighting to enhance the interior and create an aesthetically pleasing environment.

Plant areas, roof void areas, ducts, lift motor rooms, shafts and similar utility areas shall be additionally illuminated utilising suitably IP rated luminaires.

Project Co to provide over-mirror lights in all male and female changing rooms, where indicated in the Schedule Part 11 (Equipment Schedule).

8.8.6 Exterior Lighting

The perimeter, including any main entrance canopies and pedestrian walkways, to all buildings shall be lit by the use of LED energy efficient luminaires mounted on walls, columns and/or bollards. All on-site access roads, footpaths and cycle ways shall be lit to levels compatible with the adjacent roads. The lighting shall satisfy the requirements of BS EN 13201 and BS 5489:2003 Code of practice for the design of road lighting. Lighting shall be provided to all direction signs around the Site where these are not adequately illuminated by external lighting.

All access routes to plant areas shall be lit to provide safe access for maintenance.

All wall mounted luminaries shall be fed by back entry. Cable runs on the outside of buildings shall not be permitted.

All external columns, bollards etc. shall be provided with fused cut-outs and termination facilities for cabling.

All luminaries shall be wired on multiple circuits to avoid loss of light to whole areas in the event of a mains/circuit failure.

Project Co shall illuminate the main entrances, the buildings perimeter and pedestrian walkways by use of energy efficient luminaires, wall, column and / or bollard mounted. The installation shall achieve the requirements of BS EN 13201 and BS 5489:2003 Code of practice for the design of road lighting, providing external lighting for safety and security purposes.

When selecting luminaires, Project Co shall give consideration to light pollution, vandalism, security, energy efficiency and local residents' needs.

Project Co shall control external lighting to minimise energy consumption, by photocell or movement sensor, the lamp type selected must be sympathetic to frequency of switching dictated by the control means. Project Co shall consider the use of solar powered lighting.

8.8.7 Lighting Control & Wiring

Project Co shall provide automatic control of lighting control using natural light level sensing. Control lighting for unoccupied periods by use of the BMS scheduling capability, with movement sensing override for safety. Project Co shall provide a safe minimum light level at all times.

Project Co shall ensure that the lighting design incorporates a flexible switching arrangement to allow for varying activities within each room and for cleaning purposes. Switches for public areas shall be positioned by Project Co so that unauthorised persons cannot switch the lighting.

Lighting within all WC's, Staff WC's and changing rooms shall be controlled via passive infrared sensors/movement detectors or similar, with adjustable time control facilities.

Lighting within clinical areas shall be manually controlled.

Project Co shall arrange the circuiting of luminaires to control groups of fittings in order to provide flexibility of switching arrangements. Such a facility is particularly important in large spaces where the level of daylight is not uniform and artificial lighting is likely to be needed for long period in areas remote from windows.

Project Co shall provide alternative circuits together with two-way or intermediate switching at all section doors and corridor direction changes for lighting in corridors and circulation areas.

Where multi-gang lighting control switches are required Project Co shall provide a label fixed to the grid under the switch plate, indicating the switches are fed from different supplies.

Project Co shall wire lighting circuits within rooms/areas on the same phase as the general power circuits.

8.8.8 Emergency Lighting

Project Co shall connect the emergency lighting to addressable self-monitoring control panels with each luminaire containing an interface unit that will be monitored and controlled by the control panel which shall report to the BMS system. Project Co shall ensure that the emergency luminaires are automatically tested in accordance with the requirements of the British Standards.

The emergency luminaires may be of either the maintained or non-maintained variety. Project Co shall ensure that they are powered by a suitable battery supply connected by an auto-changeover switch or utilise self-contained battery packs within luminaires (3-hour rated). Project Co shall ensure that the emergency luminaires will be automatically energised in the event of a failure to the local lighting circuit.

Project Co shall comply with the requirements of BS 5266 Emergency Lighting and European Legislation CEN/TC 169 WG3 Emergency Lighting of Buildings.

8.8.9 Standby Lighting

Project Co shall provide 100% standby lighting via the generator to enable normal activities to continue during the loss of a normal mains supply.

Project Co shall ensure that the quality of standby lighting is equal to that of the normal lighting at the task points.

8.8.10 Uninterruptible Power Supplies

Project Co shall provide Uninterruptible Power Supplies (UPS) to serve life-support equipment within area and rooms listed in the UPS Required Table below and the requirements of Board's Construction Requirements of this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) in accordance with SHTM 06-01 Electrical Services. UPS to be provided to individual rooms shall be as stated on the Room Data Sheets. Project Co shall provide UPS for the Helipad and the NHS Lothian Server Room's ventilation/cooling. The UPS shall provide a no-break supply during loss of normal mains power supply and subsequent emergency generator power supply. The UPS System shall be of modular parallel design and will have N+1 redundancy. UPS requirements for the NHS Lothian Server Room are detailed in the Responsibility Matrix within paragraph 9.7.

UPS Required Table

Level	Area	Rooms
Basement		
Ground Floor	Emergency Department Co-Joined Radiology	Resuscitation Room(s) 4 Major Treatment Rooms MRI Rooms CT Rooms Gamma Camera Rooms Control Rooms
First Floor	Co-Joined Theatres Critical Care DCN Acute Care	9 Theatres and anaesthetic rooms MRI Room Angiogram Interventional Room Recovery Spaces 24 Cubicle Spaces Receiving / Resuscitation Room
Second Floor	Ehealth	Server Room's ventilation/cooling
Third Floor	Medical In-Patients	Transitional Care Rooms
Fourth Floor / Roof	Helipad	Helipad RFFS Accommodation Helipad Fire Suppression System Lighting to Helipad; Helipad ramp and Helipad stairs

These units shall provide one hour standby duration in accordance with relevant Health Planning Standard documents.

8.8.11 Lifts

Project Co shall provide bed passenger lifts (suitable for inclusion of at least one hospital bed (orthopaedic bed)), goods lifts, service lifts (dumb waiters), general passenger lifts and evacuation lifts for emergency conditions within the buildings in accordance with but not limited to SHTM 08-02, SFPN 3 and SHTM 81. All lifts provided for the movement of patients shall be supplied from the essential services supply in accordance with SHTM 06-01.

Three of the lifts in the DCN / 'Hot' core are to provide access to helipad located on the roof. Two in number Patient Bed lifts and one in number FM lift shall serve the roof area that the helipad is located on. The lifts are to have call buttons at roof level and key operated access to the roof from inside the lifts.

RHSC Patient Bed and Passenger lifts shall not stop at floors that are exclusively served by DCN departments with manual override.

DCN Patient Bed and Passenger lifts shall not stop at floors that are exclusively served by RHSC departments with manual override.

Project Co shall give consideration to the following in the provision of lifts:

a) The lifts shall be vandal / damage proof but aesthetically pleasing and appropriately sized - (min size for bed and associated equipment);

b) A minimum of one lift shall be sized to accommodate the lifting of the major component parts of medical equipment for replacement during maintenance with particular attention given to lifting the MRI scanner components to and from the ground and upper floors. Project Co shall require to liaise with relevant clinical and estates staff to identify the most onerous components during the design stage. When the more onerous components are to be used the Board will have the right to decide what constitutes the more onerous component.

c) Banks of lifts shall be appropriately controlled to maximize movement;

d) Collective controls of groups of lifts shall be used;

e) All floors including plant levels shall be served

f) Project Co's control rooms shall be easily accessible and designed to minimise the need for artificial cooling;

g) Emergency hands free telephones in lifts shall be accessible to the blind, partially sighted, deaf and wheelchair users. Telephones shall be linked to lift car audio inductive loop;

h) Lifts for people and goods shall be separated;

i) Dedicated lifts are required for theatres or swipe controlled staff access override; and

j) Disabled friendly controls, information etc (wheelchair accessible height of buttons, tactile numbers, voice messages, and visual alarm) shall be incorporated in the lift design.

8.8.12 Escalators

Where Project Co provides escalators within the buildings they shall adhere to the requirements of all relevant British Standards and in particular with BS EN 115 Safety of escalators and moving walks.

8.9 Lightning Protection & Earthing

Project Co shall provide a lightning protection system for the protection of the structure, the contents and occupants. The lightning protection installation shall be in accordance with the latest version of BS EN62305 Protection against lightning. The lightning protection system shall comprise of air termination network, down conductors, earth termination network and all required equi-potential bonds.

Project Co shall provide a system of earthing that shall ensure sufficient and fast operation of protective systems in the case of earth faults.

The earthing system shall comply with BS7671:2008 Requirements for electrical installations (IEE Wiring Regulations), BS7430:1998 Code of Practice for earthing and with the Electricity at Work Regulations 1989.

The earthing system shall comprise of earth electrode system, main and supplementary earth bars, main and supplementary equi-potential bonding.

8.10 Fire Detection & Suppression Systems

Project Co shall ensure that the fully addressable automatic fire detection system for the Facilities is fully compliant with the performance criteria laid down under SHTM 82 (including Supplement A) and the latest revisions to BS 5839. The design of the Facilities shall be in full accordance with HTM 05-02, including both vertical and horizontal compartmentation and evacuation routes. All circulation doors shall be installed with integrated electro-magnetic door hold open devices with all security door locks interlocked for evacuation in a fire condition.

Project Co shall provide sprinkler protection to those departments surrounding High Dependency departments (above, below and adjacent on the same level) as required by SHTM 82 Section 3.

Project Co shall ensure that the system must be an L1 fully addressable analogue system incorporating an auto-dialler / monitoring facilities with the capability for remote site monitoring via an internet PC connection. The system should also be provided with a full 2 way communication link to the RIE Facilities, subject to the details being agreed with the Board and Consort as part of the Project Co's Proposals and/or as Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement and provided. Project Co shall carry out the necessary connection work to the fire alarm system at the interface with the Link Building in accordance with the Interface Output Specification for the Link Building, the Connection Proposal and the relevant provisions of paragraph 4.

The system shall be equipped with sufficient sounders to maintain sound outputs in different areas in accordance with SHTM 82, and incorporate visual strobe indicators for a fire condition in accordance with the requirements of the Equality Act 2010. Project Co will provide voice evacuation announcements and shall agree with the Board if manual voice evacuation or pre-programmed announcements are to be provided as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Project Co shall ensure that the Facilities are divided into zones by ward / department / unit area as well as by floors with mimic or repeater panels at each nurse station (or equivalent) and at least one panel per floor located in a central circulation area. In the event of fire the Facilities shall be capable of individual zone evacuation with all other zones receiving awareness signalling. Project Co shall ensure that all fire alarm panels are capable of giving details of system status for fire, fault, and alarm conditions including full text descriptions of location. All panels shall be capable of data / event logging and report generation. Manual call points must be provided at every exit and staircase with no point in the building being more than 30m travel from a call device.

Materials and equipment shall be the catalogued products of manufacturers regularly engaged in production and installation of automatic fire detection systems and shall be manufacturer's latest standard design that complies with the Board’s Construction Requirements.

Project Co shall ensure that this system will have a documented history of compatibility by design for a minimum of 15 years. Future compatibility shall be supported for no less than 10 years. Compatibility shall be defined as the ability to upgrade existing systems to current level of technology, and extend new field panels on a previously installed network.

Project Co shall take into account the need for maintaining patient security during alarm testing i.e. the testing regime shall not allow for ordinarily secure doors to open as a result of routine testing.

Project Co to provide fire suppression systems in NHS Lothian Server and Node rooms, IPS Room and main HV and LV switchrooms.

Fire hose reels are not acceptable within the Facilities. For the avoidance of doubt, Project Co shall provide all fixed fire fighting equipment to comply with statutory requirements and the requirements and recommendations of NHS Scotland Firecode.

Project Co shall review requirements for fire hydrants with The City of Edinburgh Council's Building Control Department and Scottish Fire and Rescue Service.

The fire systems for the Facilities will have to be designed and constructed and replaced, repaired, renewed and maintained such that they may be connected to, communicate and operate with the fire systems at the RIE Facilities. It is envisaged that such connections and a control box for the fire systems will be proximate to the Link Building. The rights to make and replace, repair, renew and maintain such connections are subject to design, construction and other information being provided as part of Project Co's applicable Interface Proposal for approval by the Board and Project Co shall comply with the requirements for installing, maintaining, repairing, renewing and replacing interface links between the fire alarm system within the Facilities with those within this RIE Facilities as part of the RIE Works subject to and in accordance with:

a) Section 7 (Link Building) of Part 1 (Interface Construction Issues and Interface Proposals) of Appendix A;

b) Interface Output Specification; and

c) Connection Proposal.

8.11 Information and Communications Technology

Refer to paragraph 9.

8.12 Engineering Flexibility & Zoning

Heating, ventilation, electrical and medical gas zoning shall be configured to promote flexibility in order to enable re-modelling and re-planning to be undertaken at a future date.

All engineering services shall be zoned with isolation and safety provision, for the whole of the Facilities and for individual wards and departments. Project Co shall also ensure that zoning accounts for:

a) The requirement for "dirty" / "clean" separation;

b) Solar movement; and

c) The necessity for isolation of part of the Facilities without affecting the entire Facilities.

8.13 Services Capacity Reserve

In accordance with Good Industry Practice, all plant, plant spaces and building services systems shall be specifically designed and provided with defined reserve capacity allowances and future expansion capabilities for the Facilities (e.g. distribution boards with 25% spare capacity for the buildings as designed).

In addition to the reserved capacity allowances in relation to the building as defined in this Sub-Section C, Project Co shall also ensure reserve capacity, service termination, zoning and general arrangement supports any future extension of the building that may be an optional feature of Project Co's Proposals.

8.14 Service Routes

All service voids, risers and other spaces shall allow for installation of additional services and shall provide a defined reserve of a minimum 25% of useable area through routing cross sectional area. All isolating valves and other items requiring particular access shall be positioned at convenient locations with permanent access provision and which do not impede execution of the clinical functions or and/or provision of the Clinical Services in the space.

Services shall be arranged in a clearly zoned spatial hierarchy in ceiling voids, risers and plant spaces.

Access to services shall not be given in clinical areas.

All service voids, risers, plant rooms and other service / plant spaces shall be designed to easily facilitate the future removal of building services within each space.

In order to minimise potential disruption to the Board due to maintenance of building services, Project Co shall where practicable route services through common spaces such as corridors and avoid through routing within department areas.

All new ductwork shall be provided to allow cleaning of internal surfaces and components to be undertaken as detailed in the HVCA Document TR19 Cleanliness of Ventilation Systems.

8.15 Commissioning & Testing

All buildings, services and equipment shall be commissioned by Project Co to ensure that all they are compliant with the quality and performance specifications, including manufacturer's recommendations, and that all systems operate to the Board's satisfaction.

Project Co shall as a minimum commission the Facilities in accordance with the 'Guidance to Engineering Commissioning' published by The Institute of Hospital Engineers (1995).

Project Co shall be responsible for demonstrating and certifying to the Board the successful completion of all commissioning testing, and compliance with all relevant standards.

Project Co shall provide a comprehensive set of Operation and Maintenance Manuals (in hard and electronic forms) for all installed and commissioned equipment in a format specified in paragraph 4.5.17 and in accordance with the requirements in Clauses 17.18 and 18 of the Project Agreement.

Project Co shall provide such staff training as is deemed necessary by the Board details of training proposed shall be submitted to the Board as Reviewable Design Data for review by

the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

9 Information and Communications Technology (ICT) Requirements

9.1 Introduction

The Board recognises the importance of information and communication in the provision of Clinical Services and Non-Clinical Services and Operational Services in the modern health care environment; having the right information available and efficient means of communication enables improved efficiency. There is an increasing reliance on ICT infrastructure to meet these requirements both in terms of performance and availability.

This specification is intended to co-ordinate the various aspects of ICT provision within the Board's operations. The specification does not describe all individual systems and their operation in great detail, but identifies the various information and communication systems, the Board's current strategies for their development and maintenance, the obligations placed on Project Co.

9.2 Overall Requirements

Project Co shall design, construct, manage and maintain a comprehensive, resilient and robust ICT infrastructure for the Facilities. For avoidance of doubt, this includes the detailed requirements set out in the Interface Output Specification and Connection Proposal and relevant provisions of paragraph 4 and in the Schedule Part 11, Equipment Schedule.

Particular consideration shall be given to how ICT can be used to aid patient and staff flow throughout the Facilities.

Project Co shall provide only those ICT systems that are fully compatible with the Board's operational IT systems. For avoidance of doubt, it is the responsibility of Project Co to ensure the full integration and compatibility of the ICT systems. Project Co shall comply with the NHS Lothian E-Health Strategy.

Although this paragraph 9 will be of prime interest to the ICT designer, there is information contained here that Building Services designers and Architects may require for their designs.

9.3 User / Functional Requirements

Project Co shall liaise with the Board to robustly identify and capture all User and Functional Requirements required within each ICT system to support key departmental operational requirements.

Project Co shall ensure that these captured user and technical requirements are contained within the subsequent design and selection of appropriate and compatible manufacturer products and systems.

9.4 System Availability

Project Co shall design each ICT system to meet the System Availability targets set by the Board. This shall include the provision of appropriate hardware and software redundancy within the system design.

9.5 System Assurance

Project Co shall demonstrate that the proposed ICT design solutions comply with the Board's User and Functional Requirements.

Project Co shall submit a Reliability Block Diagram (RBD) for each ICT system to demonstrate that the Board's System Availability targets are met. This shall highlight the Mean Time Before Fail (MTBF) data for each hardware component of the system and show the required hardware and software redundancy implemented within the design.

Project Co shall be responsible for the overall system integration of the telecommunications system, ensuring that all aspects of the system design and installation meet the Board's requirements

9.6 Minimum Engineering Standards

In addition to the publications in paragraph 2 Project Wide Requirement, Project Co shall ensure that the design, construction and selection of components for the ICT works comply with, but not limited to, the following design reference documents:

a) All current relevant British Standards;

b) European Harmonised Standard Specifications and Codes of Practice;

c) Applicable NHS Requirements

d) Electromagnetic Compatibility Regulations 2006;

e) ISO/IEC 11801:2002 Information Technology - Generic Cabling for Customers Premises;

f) BS EN 50173-1: 2011 (Information Technology – Generic Cabling Systems)

g) BS EN 50174-1: 2009 (Information Technology – Cabling Installation Part 1 Specification and Quality Assurance)

h) BS EN 50174-2: 2009 (Information Technology – Cabling Installation Part 2 Installation Planning and Practices inside Buildings)

i) BS EN 50174-3:2003 (Installation technology. Cabling installation. Installation planning and practices outside buildings)

j) BS 6701:2010 Telecommunications equipment and telecommunications cabling. – Specification for installation operation and maintenance.

k) BS 7718: 1996 Code of Practice for Installation of Fibre Optic Cabling.

l) BS 7430: 1998 Code of Practice for Earthing

m) BS EN 50310: 2000 Application of Equipment Bonding and Earthing in Buildings with Information Technology Equipment

n) TIA/EIA-568 B-SET: 2001 (Commercial Building Telecommunications Cabling Standards).

o) TIA/EIA-569 B-SET: 2004 (Commercial Building Standard for Telecommunications Pathways and Space).

p) TIA/EIA-606-A: 2002 (Administration Standard for commercial Telecommunications Infrastructure)

q) TIA/EIA-607: 1994 (Commercial Building Grounding and Bonding Requirements for Telecommunications)

r) TIA/EIA-TSB67: 1995 (Transmission Performance Specifications for Field Testing of Unshielded Twisted Pair Cabling Systems)

s) ISO/IEC 11801:2002/Amd 2:2010/Cor 1:2010 (Information Technology – Generic Cabling for Customer Premises)

t) Relevant technical specifications (or equivalent) in the following order of precedence;

u) British Standards transposing European Standards;

v) European technical approvals;

w) common technical specifications;

x) International Standards; or

y) other technical reference systems established by the European standardisation bodies.

z) If the technical specifications referred to in u) are insufficient to meet the ICT requirements, Project Co shall make reference to the following technical specifications (or equivalent):

aa) British Standards;

bb) British technical approvals;

cc) British technical specifications relating to the design, calculation and execution of the work or works and use of the products; or

dd) DfT publications, standards and technical memoranda.

ee) Relevant OFTEL and DTI Standards, Publications and Regulations.

ff) Relevant Legislation.

In complying with any standard, Project Co shall equally comply with any published amendments and revisions issued up to Financial Close.

9.7 Responsibilities Matrix

Responsibilities for the delivery of aspects of the various ICT systems are set out in the table below:

Service / Technology	System Design	Construction / Provision	Management	Maintain/ Lifecycle Replace
1. Information Technology (IT)				
System management	N/A	N/A	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)
System architecture, design	Project Co to Board approval	Project Co	Board	Project Co
Hardware (inc. PCs, printers)	Board	Board	Board	Board
Hubs, servers/switches	Board	Board	Board	Board
NHS Lothian Server Room	Project Co to Board approval	Project Co	Board	Board
NHS Lothian Node Rooms	Project Co to Board approval	Project Co	Board	Board
Containment	Project Co to Board approval	Project Co	Project Co	Project Co
Cabling and faceplates	Project Co to Board approval	Project Co	Project Co	Project Co
Testing & Commissioning of Project Co Equipment	N/A	Project Co (with Board in attendance)	Project Co	Project Co
Testing & Commissioning of Board Equipment	N/A	Board	Board	Board
IT dedicated UPS	Project Co (infrastructure only) to Board approval - Board to provide as a part of Hardware	Project Co (infrastructure only) - Board to provide as a part of Hardware	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)
Final connections to hardware, hubs, UPS, external links and other equipment	N/A	Board	Board	Board
Facilities for seminar rooms, presentation spaces, reception areas, offices	Project Co (infrastructure only) to Board approval, refer Schedule Part 11, Equipment Schedule	Project Co (infrastructure only) / Board (equipment)	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)
Links to Other Organisations	Project Co (infrastructure only) to Board approval	Project Co (infrastructure only) / Board (equipment)	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)
Video Conferencing links/ facilities – external, internal	Project Co (infrastructure only) to Board approval, refer Schedule Part 11, Equipment Schedule	Project Co (infrastructure only) / Board (equipment)	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)

Service / Technology	System Design	Construction / Provision	Management	Maintain/ Lifecycle Replace
2. Telephone System

10. Others (Cont'd)				
Television / radio, common areas/patient information systems – Groups 2A, 2B and 3 Equipment as per Schedule Part 11, Equipment Schedule	Project Co (infrastructure only) to Board approval, refer Schedule Part 11, Equipment Schedule	Project Co (infrastructure only) / Board (equipment)	Board (equipment) / Project Co (infrastructure)	Board (equipment) / Project Co (infrastructure)
11. Building Management System (BMS)				
System management	Project Co	Project Co	Project Co	Project Co
System architecture/design	Project Co to Board approval	Project Co	Project Co	Project Co

Where in the foregoing table any item is stated to be for the Board approval then all information relating to such item shall be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

9.8 Structured Cabling System

The Structured Cabling System (SCS) shall be a single fully integrated design to provide the physical connectivity for the following systems, as a minimum:

a) data network;

b) voice network.

Project Co shall provide a data network infrastructure capable of supporting as a minimum but not limited to the following systems:

a) On-line clinical and non-clinical information systems.

b) Internet, intranet and email services; and

c) Patient Entertainment System

Project Co shall provide a voice network infrastructure that is capable of supporting, but not limited to the following systems:

a) Conventional voice;

b) Voice over internet protocol (passive provision for future VoIP installation);

c) Modem and fax services;

d) Phone to the bedhead;

e) Public area telephones; and

f) Public taxi ordering telephones.

Project Co shall provide the necessary resilience within the voice and data network designs.

9.8.1 Cabling

The Board's requirement for structured cabling is Cat 6a.

All cabling installed shall allow for a minimum of 25% spare capacity.

Cables, which pass through the infrastructure of a building shall be suitably protected against damage. Through walls and floors this shall involve an appropriate type of sleeve, through any form of metalwork or stiff plastic then a rubber grommet shall be used.

9.8.2 Data Patch Panels

Project Co shall take cognisance of the ICT requirements and provide patch panels accordingly.

9.8.3 Data Outlets

The data and voice outlets shall be RJ45 and shall utilise lead-frame technology for improved performance and reduced depth. The outlet contacts shall be silver-plated and positioned at 45º to the copper core of the cable to increase the number of possible re-terminations and provide a gas tight seal.

The outlets shall be appropriate for the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non Clinical Requirements); and the rooms / spaces identified.

9.9 NHS Lothian Server and NHS Lothian Node Rooms

Project Co shall provide all NHS Lothian Server and NHS Lothian Node Rooms and any other ICT equipment rooms required to serve the ICT systems to be provided for the Facilities.

No Project Co equipment shall be installed within any NHS Lothian Server Room or NHS Lothian Node room.

The final size and location of the NHS Lothian Server and NHS Lothian Node Rooms shall be dependent upon Project Co's final design the details of which shall be Reviewable Design Data (e.g. physical restrictions of cable run lengths etc).

Project Co shall ensure that the environmental conditions in the NHS Lothian Server and NHS Lothian Node Rooms are sufficient to allow for safe operation and working on plant and equipment. Project Co should also avoid the use of basement spaces due to the risk of flooding. No water, steam or waste services shall be located either in or directly above NHS Lothian Server / NHS Lothian Node Rooms due to risk of water damage. Project Co shall install security bars / shutters on the windows.

9.10 Wireless Network

Project Co shall provide 100% wireless network coverage throughout the Facilities.

Project Co shall establish the required number of Wireless Access Points by means of a comprehensive wireless access survey of the Facilities.

Each Wireless Access Point shall be Power-over-Ethernet (PoE) and provided with a double data outlet mounted below the ceiling,. Project Co shall provide the wireless equipment at each Wireless Access Point, with the cabling used to connect the wireless access points to the Board's Wireless Access System.

9.11 External Services

Routes shall be provided by Project Co from two independent external access points (ducts) to the NHS Lothian Server Room. These shall be of a size suitable for external grade multi-core fibre cable(s), and copper multi-core cable(s). Project Co shall ensure that the Board is granted free access to these ducts at all times so that it may access communications services provided by any third party it wishes to nominate.

9.12 Helpdesk

Project Co will establish a Helpdesk in the RHSC building all in accordance with the requirements of Schedule Part 12 Section 1 with associated to infrastructure to receive respond to calls. The helpdesk and infrastructure should also have the facility to receive and redirect calls to the NHSL Estates Helpdesk as necessary.

9.13 Communication & Connectivity with the RIE Facilities

9.13.1 Infrastructure

Project Co shall provide a 24 core single mode fibre optic cable from the NHS Lothian Server Room in the Facilities to the RIE Facilities. The connection will be to the Communications Rooms 1 and 2 and Server Rooms 1 and 2 in the RIE Facilities. Project Co shall provide 2 x fibre backbone cabling (Topology: - Diverse Star; Type: - OS1 - 9 micron; Cores: - 24 for each type with 100% expansion capacity to be provided in the cable tray runs).

9.13.2 System Connectivity/Interfaces between the Facilities and RIE Facilities

Project Co shall provide links for the Data network to the RIE Facilities. Project Co shall comply with the requirements of the Interface Output Specification, Connection Proposal and the relevant provisions of paragraph 4.

9.14 Induction Loop

The design of the Facilities shall include a system of induction loops with suitably located dedicated sockets and signage in areas such as reception areas, bedded bays, single, treatment, consulting, counselling and interview rooms. Additionally, the design shall reflect these requirements in areas such as offices where staff may require this facility.

Project Co shall provide induction loop or infrared systems in accordance with the Equality Act 2010 requirements. The final provision and locations are to be submitted as Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement, dependent upon the final design solutions. The Board would prefer to see a building-wide system installed but experience has shown that this often raises issues of confidentiality.

Project Co shall therefore ensure the provision of portable hand held systems for use by visitors that shall be made available at Enquiry/Information Desks at the Entrances. This shall ensure that the parts of the Facilities not provided with induction loops or infrared systems are made accessible to all users.

The “ear” symbol denoting the presence of an induction loop shall be prominently displayed. A sign shall explain clearly to people using hearing aids how they can benefit from the induction loop.

Alternatively, proven systems that do not raise issues of patient confidentiality can be proposed by Project Co to provide Facilities wide coverage as appropriate.

9.15 Public Address System

No requirement for a general public address system within the Facilities.

9.16 Intercom

Project Co shall provide an intercom system for the Facilities to meet the requirements of Board’s Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and other areas highlighted in Schedule Part 11 Equipment Schedule and Board’s Construction Requirements Part 6 Section 6 Room Data Sheets.

9.17 Video Telemetry

Project Co shall provide a video telemetry system within the Facilities to meet the requirements of the Board’s Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) in the rooms identified. The video telemetry system shall be provided over fibre optic connections between the relevant departments.

9.18 Public Telephone Ordering Service

Project Co shall install the telephone system for the public to make free phone calls to order a taxi and contact other organisations that may include Traveline Scotland, Smokeline and NHS24. The Board will determine the organisations to be contacted by the public telephone ordering service. Project Co shall provide a telephone system that shall accommodate new or replacement telephone numbers during the Operational Term. The public telephone ordering service is to be provided in the DCN reception and RHSC reception. The Board will provide the telephone handsets and signage for the handsets as Board Equipment in accordance with the relevant provisions of Schedule 11, Equipment Schedule. The Board will arrange the taxi ordering service prior to Completion and during the Operational Term.

9.19 Security

9.19.1 General

Project Co shall provide security systems specifically designed to meet the requirements of each department / unit and shall comply with the Interface Output Specification, the Connection Proposal and relevant provisions of paragraph 4.

The systems shall present a secure and reassuring environment for patients, staff, families and visitors by providing appropriate security measures within the particular restraints imposed by clinical demand and personal freedom. The design of the Facilities shall ensure maximum protection and minimize exposure to crime in internal and external areas.

Project Co shall provide the required control, monitoring and recording equipment within the security office. The security system needs to allow for the security officer to be able to respond to alerts (staff attack and fridge/freezer alarms) when not in the security office.

The design for all security systems shall be in line with the general principles of the approach suggested by Secured by Design.

Local alarm annunciation shall be provided within wards and at the central security desk.

The Board will monitor the CCTV system, including controlling access to, and the disclosure of, CCTV images.

9.19.2 Panic Alarm System

Project Co shall provide a panic alarm system, which will provide total coverage for the Facilities. The system shall be capable of emitting both audible and visual warnings to alert staff and security to the fact that there is an attack or a situation has arisen in which patients, visitors or other staff members are in danger. Service requirements shall dictate where the alarm is annunciated but as a general guide the panic alarm shall raise an alarm locally and at the security office. The system shall be capable of highlighting the exact location of the staff member in distress.

The system shall be inclusive of personal panic alarms for all staff.

9.19.3 Nurse Call Systems

Project Co shall provide a comprehensive nurse call system at all bed locations (and ensuites), nurse stations, toilets and showers, TV Rooms and all other areas frequented by patients (refer to Schedule Part 11, Equipment Schedule for details). The system must be capable of emitting both audible and visual warnings for the following situations:

a) To summon a nurse (Patient to Nurse);

b) To highlight a medical emergency (Nurse to Nurse); and

c) To highlight a non-medical emergency (Nurse to Nurse).

Project Co shall ensure that both visual and audible warnings are sited in positions that enable the appropriate staff to respond to the exact location of the call both efficiently and effectively. Project Co shall ensure that the warnings, both visible and audible, shall be

specific to the type of emergency and must be consistent throughout all areas of the Facilities. The system incorporates a two-way hands free voice communication system with paging facility.

Project Co shall provide systems that comply fully with the requirements of relevant Health Planning Standards in particular SHTMs, HTMs, SHBNs and HBNs. In addition these systems shall interface fully with the information technology system to enable on-screen alerts at locations details of which are to be submitted as Reviewable Design Data for review and agreement by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

Project Co shall ensure that the nurse call button / cord meet the need of the particular patient that may be required to use the Facilities. Patients may have cognitive problems or have difficulties with mobility. The Nurse Call units for all patients shall be provided with safety cords.

9.19.4 Patient and Equipment Tagging System

Project Co shall provide patient and equipment tagging to the locations detailed in RHSC and DCN Patient and Equipment Tagging System Requirements Table. Details of the method of tagging are to be submitted as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

9.19.5 Alarms & Intruder Detection System

Project Co shall provide an Intruder Detection System (IDS) within the Facilities to provide out of hours security cover. This shall be provided by PIR Detectors located within the corridors, and rooms with ground floor windows internally adjacent to any roof access points. In addition Project Co shall ensure that restricted areas have door contacts available for monitoring unauthorised entry.

Project Co shall ensure that the proposed alarm systems for the Facilities include lifts, refrigeration equipment and other critical equipment. Project Co shall ensure that the alarm systems can be monitored on Site and also remotely outwith the Facilities.

9.19.6 Security Access Control

Project Co shall provide a comprehensive access control system to all external access doors and to internal doors requiring restricted access including access control doors to NHS Lothian Server and NHS Lothian Node Rooms, Main entrance doors to Departments, FM and Patient Bed Lifts, Helipad and each ward bay. Project Co shall provide a comprehensive access control systems to meet the requirement of the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements). In addition other areas with restricted access as defined by the Board.

Ward access control doors shall also be fitted with a video entry door access system. All video entry camera shall be suitable for viewing of visitors in wheel chairs.

Project Co shall ensure the system includes all necessary power supplies, card readers, actuators, egress buttons and emergency "break-glass" release units.

The system installed by Project Co shall be separate from the Board's data network.

Project Co shall provide door entry video intercom systems to the main entrance door and the delivery entrance.

9.19.7 External CCTV

Project Co shall provide a comprehensive colour CCTV system covering all external access points, car parking and external pedestrian circulation routes around the Site.

The system installed by Project Co shall be separate from the Board's data network.

The design shall also take cognisance of the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

Project Co shall ensure that the system comprises a multi-channel digital recorder with a recording frame per second for each camera which is in accordance with a detailed engineering specification to be agreed with Lothian and Borders Police.

The digital recorder shall also control playback of images onto a CCTV monitor.

All recorded images should be of sufficient quality to be used for evidential purposes.

9.19.8 Internal CCTV

Project Co shall provide a comprehensive colour CCTV system covering all corridors, entrances, lift lobbies, First Floor link to the RIE Facilities, Emergency Department, hospital street and other areas where members of the public gather or areas where access is to be restricted i.e. wards.

The system installed by Project Co shall be separate from the Board's data network.

The design shall also take cognisance of the Board's Construction Requirements in this Schedule Part 6 Section 3 Sub-Section D (Specific Clinical Requirements) and Sub-Section E (Specific Non-Clinical Requirements).

Project Co shall ensure that the system comprises a multi-channel digital recorder with a recording frame per second for each camera which is of sufficient quality to allow recorded images to be used for evidential purposes.

The digital recorder shall also control playback of images onto a CCTV monitor.

9.19.9 Monitoring of CCTV Images

All internal and external CCTV camera images shall be transmitted back to the CCTV monitoring equipment located within the security office to be provided within the Facilities.

9.19.10 Clinical Equipment

Each ward drug fridge shall be alarmed to warn of common faults. The sounder shall be located locally for ward fridges in areas manned 24/7 or located in the Security base when the area is not manned 24/7.

Each Ultra Low Temperature freezer, laboratory fridge and laboratory freezer in H1 Child, Life and Health, H2 Clinical Research and U1 Inborn Metabolic Disorders Laboratory shall be alarmed to warn of common faults. The sounder shall be located locally for fridges and freezers in areas manned 24/7 or located in the security office when the area is not manned 24/7.

9.19.11 Car Park Barriers

Project Co shall provide all power and control wiring associated with vehicle access barriers and shall be compatible with card solutions in use on other Board sites.

9.20 TV & Radio Facilities

Project Co shall provide the infrastructure for reception and distribution of television and radio for use by patients, visitors and staff. This shall include external aerials / dishes, containment and cabling / distribution and the like to enable Freeview TV services and Radio Lollipop Radio services to be distributed throughout the Facilities.

Television and radio will primarily be required for individual rooms and spaces as set out in the Schedule Part 11, Equipment Schedule.

10 Helipad Requirements

Project Co shall provide a rooftop helipad sited such that it gives direct access to the DCN 'Hot' core.

10.1 Minimum Compliance Requirements

In addition to the publications in paragraph 2 (Project Wide Requirement), Project Co shall ensure that the helipad shall be sited, constructed and maintained in accordance with the compliance requirements contained in:

a) HBN15-03 Hospital Helipads;

b) The Air Navigation Order 2009, as amended;

c) International Civil Aviation Organisation (ICAO) Annex 14 Volume II, as amended;

d) ICAO Doc 9261-AN/903 Heliport Manual;

e) Civil Aviation Authority (CAA) Safety Regulation Group CAP 168 Licensing of Aerodromes; as amended;

f) CAA Safety Regulation Group CAP 437 Offshore Helicopter Landing Areas - Guidance on Standards;

g) CAA Safety Regulations Group CAP 789 Requirements and Guidance Materials for Operators;

h) CAA CAP 637 Visual Aids Handbook:

i) Joint Aviation Authority (JAA) Joint Aviation Requirements JAR-OPS 3: Commercial Air Transportation (Helicopters):

j) National Fire Protection Association (NFPA) 418 Standard for Heliports

10.2 Helicopter Operators

The helipad shall be designed to accommodate helicopters provided by the following helicopter operators:

a) Scottish Ambulance Service Air Ambulance

b) Ministry of Defence (MOD),

c) Maritime and Coastguard Agency (MCA),

d) Police Helicopters,

e) all other emergency service providers, and

f) their replacements.

Project Co shall consult with the helicopter operators during the design, construction and operation of the helipad and this will only be done through the Board. Project Co will have no direct contact with the helicopter operators.

10.3 Helipad Requirement

The helipad shall be designed to permit daytime landings, night-time landings and take offs and flights affected by poor visibility and low cloud. The helipad will require to pass inspection by the Civil Aviation Authority and Mobile Air Operations Team (MAOT) before the Actual Completion Date particularly with regard to compliant visual aids, lighting and Rescue and Fire Fighting Services (RFFS) provision for the helicopters to be served. Adequate space shall be made available for critical engineering services such as fire fighting, helipad access and helipad lighting. Electrical equipment providing power to the helipad must be supported by an Uninterrupted Power Supply (UPS) provided by Project Co. The lighting shall not cause a trip hazard.

The helipad will be constructed at least 3 metres above the roof with at least one ramp. The ramp(s) shall provide a landing at least 1 metre below the level of the helipad on which RFFS personnel can stand with their fire-fighting equipment to observe the arrival and departure of helicopters. The helipad shall be constructed from fire resistant materials. The helipad's drainage shall be separate from both the surface water and foul water drainage systems and shall only pass into the public drainage system once it had passed through a petrol/fuel interceptor.

The patient route from the helipad to the RIE Facilities and RHSC Emergency Departments will be through the Hot Core. There are to be two patient bed lifts, an FM lift and a stair in the Hot Core serving the helipad. The lifts are to have call buttons at the roof of the building (proximate to the helipad) and have key operated access to the roof from the interior of the lifts. Access to the roof area from the lifts and the stair will have security access control. The lifts and stair core structure must terminate below the level of the helipad.

Project Co shall appoint an aviation design specialist with expertise in designing helipads. The Board shall be consulted on the selection and appointment of the aviation design specialist. Project Co shall appoint an aviation design specialist. Project Co shall incorporate the advice and recommendations of the aviation design specialist in meeting the requirements of Schedule Part 6 Construction Matters.

For the avoidance of doubt the Board shall be "the person" referred to in paragraph 2.8 of HBN 15-03 being "the person in charge of an area intended for taking off and landing must cause to be in operation such lighting as will enable the pilot to identify the landing area and direction, and to make a safe landing and takeoff". The Board will provide the trained person for night operations. Project Co shall provide all hardware for the lighting requirements of the helipad. The Board will provide at least one trained person for night operations.

Contrary to paragraph 2.9 of HNB 15-03 the helipad will operate at night, with low visibility and in all levels of cloud cover. The helipad will be provided with Helicopter Approach Path Indicator (HAPI) that complies with CAA CAP 637 Visual Aids Handbook.

There is no requirement for refuelling of helicopters. Helicopters will not be based at the helipad.

The helipad is to be category H2 in terms of ICAO Annex 14 Volume II, Chapter 6 and is to have RFFS to H2 RFFS Standard to comply with CAA Safety Regulations Group CAP 789. Project Co shall ensure that the helipad is sufficiently robust to accommodate the largest of

these helicopters in common use in the UK. In terms of HBN 15-03 item 11.9 the helicopter operator is Air Ambulance.

The RFFS facilities will be provided by Project Co during construction and during the Operational Term. The risk assessment to justify the scale of RFFS facilities and standards will be carried out by the Board and provided to Project Co.

The accommodation for male and female RFFS personnel to store, lay out and put on their protective equipment quickly is to be located on the floor serving the helipad. A drench shower to allow PPE to be cleaned / decontaminated before the RFFS personnel enter the building is to be located by the external entrance to the accommodation for male and female RFFS personnel.

Project Co shall provide the means for CCTV viewing of the whole of the helipad from monitors located in the Security Office. In addition when the helipad is in operation Project Co shall provide the means for CCTV viewing of the whole of the helipad from monitors located in the accommodation for the RFFS personnel.

The Board will provide the RFFS personnel. The RFFS personnel are not expected to spend long periods on the helipad. The Board will provide the RFFS medical equipment. The Board will be required to make contact with the CAA to inspect the (RFFS) and lighting.

The stores for the rescue and medical equipment, complementary fire-fighting agents and dedicated patient trolley and a Unisex WC shall be located on the floor serving the helipad.

The name of the hospital to appear to the pilots is “RIE”.

The Board will produce the Development Control Plan that refers to the helipad.

Project Co shall have responsibilities in regard to HBN 00-07: Resilience Planning for the Healthcare Estate for the helipad. Details of the helipad are to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement.

The Board should include specific risks created by helicopters using the hospital helipad in their overall site risk assessments.

The Board shall provide the Helipad Operation Manual and audit the helipad routinely for compliance with the Manual.

10.4 Helipad Permissions

The Board will prepare the details for and obtain the necessary permission for the helipad from the Scottish Ministers (in their capacity as land owners). The Board will make the Police aware of the helipad’s presence prior to Financial Close.

PART 6

Section 3: The Board's Construction Requirements

Sub-Section D: Specific Clinical Requirements

This Schedule Part 6 Section 3 Sub-Section D forms the Specific Clinical Requirements included in the Board's Construction Requirements Specification. Project Co shall satisfy all the requirements under this Sub-Section D.

It contains design philosophy and specific requirements for each of the clinical services to be provided from the Facilities.

PART 6

Section 3: The Board's Construction Requirements

Sub-Section E: Specific Non-Clinical Requirements

This Schedule Part 6 Section 3 Sub-Section E forms the Specific Non-Clinical Requirements included in the Board's Construction Requirements Specification. Project Co shall provide Facilities which interface with all the requirements under this Sub-Section E.

Derogation Request

Date	Notes	Reference
15/09/2014	*03 Drop Seals -REWORDED AS AGREED BY NHSL*	IHSL-ACO-001

BCR Clause

[copy text from BCR's / PA, include clause numbers]

In Scottish Health Technical Memorandum 08-01: Specialist services Acoustics (May 2011) it is stated that:

Doors
2.71 Doors are inevitably a weakness in a partition and will reduce the overall acoustic performance of most constructions.
2.72 Reasonable acoustic performance cannot be achieved without seals around the whole door perimeter, including threshold and meeting stiles. It is recognised that there can be significant restrictions on the use of door seals; therefore, doors should be sealed as far as practically possible.
2.73 Possible conflicts with the desired acoustic performance include opening force (including under emergency conditions), infection control, patient safety (for example if double-swing doors are required) and ventilation regimes. Designers should make an informed decision about the provision of door seals when the other restrictions are considered.

Relevant Regulation - HBN, SHTM, Building Regulations etc

[copy text from relevant docts, include clause numbers]

Scottish Health Technical Memorandum 08-01: Specialist services Acoustics (May 2011) - SHTM08-01.

Requirement

[summarise what is being asked for in the docts above]

Table 5 of SHTM08-01 - Matrix showing sound-insulation performance required (dB DnT,w), presents the installed sound-insulation performanced (DnT,w) required for different room types.

Derogation

[why derogation is required]

Due to infection control issues drop seals will only be used in the following rooms:

1. Sleep laboratory
2. Audiology rooms
3. Radio Lolipop Studio
4. Medical Resonance Imaging Rooms
5. Laboratory areas within Specialist Biochemistry Lab and Child Life & Health
6. Single isolation room within Clinical Research Facility
7. Testing rooms within Audiology
8. Plaster Suite within ED + RHSC Outpatients
9. Splinting/Casting Room within RHSC Therapies
10. Orthotics Workshop within RHSC OPD

As stated in 2.72 of SHTM08-01 reasonable acoustic performance cannot be achieved without seals around the whole door perimeter.

In terms of airborne sound insulation between adjacent rooms an indirect airborne transmission path occur through the doors of both rooms. The magnitude of this indirect airborne transmission path is essentially determined by: i) the performance of the

both rooms. The magnitude of this indirect airborne transmission path is essentially determined by: i) the performance of the doors, i.e. the magnitude will increase if the performance of the doors decrease (for ex. if seals are not provided around the all door perimeter) and ii) the location of the doors, i.e. the magnitude will increase if doors from both rooms are close to each other or if they are facing each other.

Therefore, derogation of the acoustical requirement regarding airborne sound insulation between rooms is needed (acoustical requirement stated on Table 5 of SHTM08-01) for:

2. All adjacent rooms that due to user requests have their doors close to each other (side by side) or facing each other.

3. All adjacent rooms that have doors, movable walls, gaps or any other system interconnecting each other.

Proposal
It is proposed that in cases where due to user requests adjacent room have their doors close to each other (side by side) or facing each other the requirements stated in Table 5 of SHTM08-01 should be decreased to 6dB. *It is proposed that in cases where due to user requests adjacent rooms are meant to be interconnect to each other by means of doors, movable walls, gaps or any other system, the requirements stated in Table 5 of SHTM08-01 should not be applied.*

BCR Clause

[copy text from BCR's / PA, include clause numbers]

In Scottish Health Technical Memorandum 08-01: Specialist services Acoustics (May 2011) it is stated that:

2.67 Where observation windows are included between adjacent rooms, partitions (including the glass) should ideally achieve the target ratings given in Tables 4 and 5. However, it can be difficult to fit windows that meet the full acoustic specification into the width of partitions. In this case, as a minimum, the glazing configuration alone should achieve an Rw that is no more than 10 dB below that of the required Rw for the partition alone. This will reduce the sound insulation by an amount that depends on the size of the observation window in relation to the size of the partition.

Relevant Regulation - HBN, SHTM, Building Regulations etc

[copy text from relevant docts, include clause numbers]

Scottish Health Technical Memorandum 08-01: Specialist services Acoustics (May 2011) - SHTM08-01.

Requirement

[summarise what is being asked for in the docts above]

Table 5 of SHTM08-01, Matrix showing sound-insulation performance required (dB DnT,w), presents the installed sound-insulation performanced (DnT,w) required for different room types.

Derogation

[why derogation is required]

As stated in SHTM08-01 it can be difficult to fit windows that meet the full acoustic specification into the width of partitions, therefore in these cases a derogation of the acoustical requirement regarding airborne sound insulation between rooms is needed (acoustical requirement stated on Table 5 of SHTM08-01).

Proposal

[what is Project Co alternative Proposal]

It is proposed that in cases where observation windows are included between adjacent rooms, the glazing configuration alone should achieve an Rw 10 dB below that of the required Rw for the partition alone.

BCR Clause

2.3 NHS Requirements
In addition to the standards listed in paragraph 2.4 of this Sub-Section C, unless the Board has expressed elsewhere in the Board's Construction Requirements, a specific and different requirement, the Facilities shall comply with but not be limited to the provisions of the NHS Requirements as the same may be amended from time to time:
i. Firecode
Project Co shall ensure the Facilities comply with the NHS Scotland Fire Safety Management - a suite of documents which explains the policy and technical guidance in fire precautions in hospitals and other healthcare premises, comprising the Health Facilities Scotland Fire Safety Policy, the Scottish Health Technical Memoranda (SHTM) and Scottish Fire Practice Notes (SFPN) which all comprise NHS Scotland Firecode, the Fire Safety Documentation Reference Guide and A Model Management Structure for Fire Safety.
Project Co shall prepare proposals in accordance with NHS Scotland Firecode to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement prior to the submission of the proposals for approval by the Relevant Authority including without limitation building control department.
In the event of a conflict between the requirements of the local building control officers and NHS Scotland Firecode the more onerous requirements shall take precedence. Project Co shall notify the Board as soon as such conflict is known or suspected and shall further advise the Board of Project Co's proposed relevant design solution as early as possible before formal submission for review by the Board. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.
Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 81 part 1 July 2009
5.19 Where vertical travel is a component of the escape arrangements and bed lifts are installed in the building, they should be escape bed lifts.

Requirement

The guidance within SHTM 81 part 1 recommends that bed lifts are designed as escape bed lifts however the guidance within SFPN 3 Escape Bed Lifts notes that provision should be sufficient.
4. Physical requirements for escape lifts
Escape lift provision
4.1 Sufficient escape lifts should be provided and sited appropriately to accord with the fire evacuation strategy for the premises, developed with full consideration
of the issues outlined in Section 3.
4.2 Where an escape lift is one of a group of lifts within one protected enclosure, all the lifts in the group should be escape lifts in accordance with the standards
specified in this SHTM.
4.3 Sufficient escape lifts should be provided, appropriately remote from each other so that should a fire affect one escape lift, sufficient escape lifts will remain
available for use to enable the organisation's fire evacuation strategy and procedures to be implemented.

Derogation

Not all bed lifts will be designed as escape bed lifts however a sufficient number of escape bed lifts will be provided.

Proposal

It is Project Co's intention to negotiate the number and location of lifts designed as escape bed lifts with the NHS. It is acknowledged that due to the management requirements for the use of lifts during evacuation only a limited number would be used at any one time and therefore providing a limited number is more practical.
It is noted that in England and Wales the applicable HTM guidance recommends a minimum of 2 escape bed lifts. RHSC + DCN will be provided with at least 2 escape bed lifts.

Reference Docts - Sketches, drawings, reference material extracts etc

2.3 NHS Requirements

In addition to the standards listed in paragraph 2.4 of this Sub-Section C, unless the Board has expressed elsewhere in the Board's Construction Requirements, a specific and different requirement, the Facilities shall comply with but not be limited to the provisions of the NHS Requirements as the same may be amended from time to time:

i. Firecode

Project Co shall ensure the Facilities comply with the NHS Scotland Fire Safety Management - a suite of documents which explains the policy and technical guidance in fire precautions in hospitals and other healthcare premises, comprising the Health Facilities Scotland Fire Safety Policy, the Scottish Health Technical Memoranda (SHTM) and Scottish Fire Practice Notes (SFPN) which all comprise NHS Scotland Firecode, the Fire Safety Documentation Reference Guide and A Model Management Structure for Fire Safety.

Project Co shall prepare proposals in accordance with NHS Scotland Firecode to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement prior to the submission of the proposals for approval by the Relevant Authority including without limitation building control department.

In the event of a conflict between the requirements of the local building control officers and NHS Scotland Firecode the more onerous requirements shall take precedence. Project Co shall notify the Board as soon as such conflict is known or suspected and shall further advise the Board of Project Co's proposed relevant design solution as early as possible before formal submission for review by the Board. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 81 part 1 July 2009

3.11 The departments in the following List A should:

never be directly below, nor directly adjoin, operating theatres, intensive therapy units or special care baby units; and be provided with a fire suppression system where they are directly below, or directly adjoin, any other hospital department to which patients have access.

List A
- Boiler House
- Central Stores
- Commercial enterprises
- Flammable stores
- Laundry
- Main electrical switchgear
- Main kitchens
- Refuse collection and incineration
- Works department

Other high hazard departments may be adjacent to very high dependency patient access areas if an automatic fire control system is installed in addition to fire resistant structural separation.

A hospital department in List B should be provided with an automatic fire suppression system where it is directly below, or directly adjoins, operating theatres, intensive therapy units, or special care baby units.

List B
- Central staff change
- Central sterile supplies
- Hospital sterilizing and disinfecting unit
- Health records
- Pathology
- Manufacturing pharmacy

('Non-domestic technical handbook'; 2008; Section 2; Annex B; paragraph 2.B.1.)

Requirement

The guidance recommends that certain departments are not located next to one another or are provided with sprinklers.

Derogation

Theatres will adjoin the atrium space and suppression is not proposed for the basement kitchen or plant areas.

Proposal

The theatres will be fire separated from the atrium space with medium duration and the basement kitchen and plant areas will be low risk.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 2 – department adjacencies

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 81 part 1 July 2009
6.8 Ductwork passing through a compartment or sub-compartment boundary must be provided with remotely resettable fire and smoke dampers operated by
smoke detection.

Requirement

Fire / smoke damper recommended to all compartment / sub-compartment walls.

Derogation

Derogation required since these areas would not benefit from fire / smoke dampers; fire only are considered more appropriate.
Dampers to ductwork between the following spaces shall operate on fire actuation only.
Dampers between plant spaces
Dampers within ductwork serving Intensive Treatment Areas

Proposal

It is proposed that within the above noted spaces that the guidance within BS9999 Clause 33.4 Method 1 is followed.
This method does not require the ductwork to provide any degree of fire resistance, since the fire is isolated in the compartment of origin by the automatic actuation of fire dampers within the ductwork system.
Fire dampers are therefore sited in the duct at the point where it penetrates a fire-separating element:
Fire Rated walls between noted spaces
Compartment floors between risers and noted spaces
Agreement is required to be reached with the Board and Boards Fire Officer, and the derogation is not approved by the Board until that agreement is obtained through design yet to be fully developed and presented through the RDD process.

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 81 part 3 April 2013

3.6 Departments that provide care for very high dependency patients should not be located adjacent to an atrium, nor should any part of the department or their

supporting facilities be located within the atrium.

Requirement

theatres not permitted next to atrium.

Derogation

High dependency areas (theatres) are located adjacent to the atria therefore a fire engineered approach has been taken to demonstrate that with the proposed level of fire protection in the atria and adjacent areas the functional requirements of the guidance will be achieved.

Proposal

During the reference design stage the adjacency of the theatres to the atrium was discussed with NHS Lothian fire officer. This adjacency still exists with the proposed design and the same mitigation principles are proposed:

Medium duration fire protection to walls of theatres adjacent to atrium,

Sprinkler protection to atrium,

Smoke control to atrium.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 10 atrium

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 81 part 3 April 2013

3.48 An atrium should be enclosed to provide compartmentation between the atrium space and adjacent accommodation, with construction having a minimum

period of fire resistance of medium duration (60 minutes.) for integrity, insulation and load bearing capacity.

Requirement

Enclosing structure (including glazing) of atrium should be medium duration since access to adjoining areas is possible above the atrium base.

Derogation

Atrium glazing (with the exception of those to theatres) to be toughened glass in a suitable framing structure.

Proposal

It is proposed that the atrium enclosure walls meet the medium duration fire protection integrity and insulation. Calculations show that the smoke temperature will be significantly below 140°C therefore it is proposed that glazing within the atrium enclosure will be fixed lights of toughened glass in a suitable framing structure with the

exception of glazing serving the first storey theatre department. This area has an obvious higher patient dependency category therefore 60 / 60 glazing in a suitable framing will be provided to these areas. The glazing which will be used in the atrium has been confirmed by HLM as a choice of two. These options would be either:

- *Single glazed unit at least 12mm thick*
- *Double glazed unit at least 6mm and 4mm thick*

The above types of glass would fail at 470°C-600°C therefore flame impingement is not considered an issue.

This shall be further demonstrated by calculation during RDD. Agreement is required to be reached with the Board and Boards Fire Officer, and the derogation is not approved by the Board until that agreement is obtained through design yet to be fully developed and presented through the RDD process.

Reference Docts - Sketches, drawings, reference material extracts etc

BCR Clause

2.3 NHS Requirements

In addition to the standards listed in paragraph 2.4 of this Sub-Section C, unless the Board has expressed elsewhere in the Board's Construction Requirements, a specific and different requirement, the Facilities shall comply with but not be limited to the provisions of the NHS Requirements as the same may be amended from time to time:

i. Firecode

Project Co shall ensure the Facilities comply with the NHS Scotland Fire Safety Management - a suite of documents which explains the policy and technical guidance in fire precautions in hospitals and other healthcare premises, comprising the Health Facilities Scotland Fire Safety Policy, the Scottish Health Technical Memoranda (SHTM) and Scottish Fire Practice Notes (SFPN) which all comprise NHS Scotland Firecode, the Fire Safety Documentation Reference Guide and A Model Management Structure for Fire Safety.

Project Co shall prepare proposals in accordance with NHS Scotland Firecode to be submitted to the Board as Reviewable Design Data for review by the Board in accordance with Schedule Part 8 (Review Procedure) and clause 12.6 of the Project Agreement prior to the submission of the proposals for approval by the Relevant Authority including without limitation building control department.

In the event of a conflict between the requirements of the local building control officers and NHS Scotland Firecode the more onerous requirements shall take precedence. Project Co shall notify the Board as soon as such conflict is known or suspected and shall further advise the Board of Project Co's proposed relevant design solution as early as possible before formal submission for review by the Board. When the more onerous requirement is to be used the Board will have the right to decide what constitutes the more onerous requirement.

Any fire strategy which affects the Site will also have to have regard to, be compatible with and operate in conjunction with the fire strategy and procedures for the RIE Facilities and/or Retained Estate, as applicable.

Relevant Regulation - HBN, SHTM, Building Regulations etc

SHTM 82 Fire Alarm & Detection Systems April 2013

3.6 A Category L2 or L3 system should be provided for healthcare premises other than hospitals. A category L1 system should be provided throughout all parts of

hospital premises. However, detectors need not normally be provided in the following areas:

voids and roof spaces of any depth that contain only:

MICC wiring, or wiring clipped to a metal tray or within metal conduit or trunking;

non-combustible pipework and ducts;

metal or plastic pipes used for water supply or drainage.

bath/shower rooms;

toilets in staff areas;

small cupboards (less than 1m2);

operating theatres.

In any case the omission of detectors should be subject to a fire risk assessment taking into account the specific matters identified in paragraph 3.4.

Requirement

The guidance within SHTM 82 recommends that detection is provided within voids unless they only contain items as noted within the guidance.

Derogation

The recommended list of acceptable items within ceiling voids has been expanded upon to include further items that are considered to be of a similar acceptable risk level.

Proposal

Design Note 5 provides an explanation for the methodology to be adopted for the risk assessment of the void content and an overview of the types of items considered to be acceptable.

The items have been assessed on being an ignition source, their ignition potential and their flammability.

It is proposed to develop this process as part of the design development to risk assess the specified products and the quantity to be installed to establish the risk to patients.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 5 void detection

BCR Clause

2.4 Minimum Design & Construction Standards

Project Co shall also ensure that the Facilities comply with Good Industry Practice, NHS Scotland requirements, relevant statutory requirements (including highways) and required consents including, but not limited to, the following as the same may be amended from time to time:

r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments (note the current version is 2013 and this will be applicable to the project under Building Warrant application).

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.1.14 Ventilation ductwork should be fire-stopped in accordance with BS 5588: Part 9: 1999. Section 6 of BS 5588: Part 9: 1999 provides guidance on design and construction including fire resisting enclosures, fire resisting ductwork and the use and activation of fire dampers.

Requirement

the recommendations within BS5588 refer to SHTM guidance (SHTM 81 and 82 are the relevant documents).

Derogation

Derogation required since these areas would not benefit from fire / smoke dampers; fire only are considered more appropriate.
Dampers to ductwork between the following spaces shall operate on fire actuation only.
Dampers between plant spaces
Dampers within ductwork serving Intensive Treatment Areas

Proposal

It is proposed that within the above noted spaces that the guidance within BS9999 Clause 33.4 Method 1 is followed.
This method does not require the ductwork to provide any degree of fire resistance, since the fire is isolated in the compartment of origin by the automatic actuation of fire dampers within the ductwork system.
Fire dampers are therefore sited in the duct at the point where it penetrates a fire-separating element:
Fire Rated walls between noted spaces
Compartment floors between risers and noted spaces

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note1 damper actuation

r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments (note the current version is 2013 and this will be applicable to the project under Building Warrant application).

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.1.14 Compartment walls and compartment floors (including a fire resisting ceiling) are intended to prevent fire passing from one compartment to another. Openings
and service penetrations through these walls or floors can compromise their effectiveness and should be kept to a minimum.

Requirement

Hospitals require compartment floors at each level (atrium passes through compartment floors).

Derogation

Derogation required for inclusion of atrium, (atrium to be designed using fire engineering).

Proposal

Atrium to follow appropriate fire engineering principles and guidance for atria design.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 10 atrium

Date	Notes	Reference
05/09/2014	*04 Escape Routes*	IHSL-FIRE-011

BCR Clause

2.4 Minimum Design & Construction Standards
Project Co shall also ensure that the Facilities comply with Good Industry Practice, NHS Scotland requirements, relevant statutory requirements (including highways) and required consents including, but not limited to, the following as the same may be amended from time to time:
r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments (note the current version is 2013 and this will be applicable to the project under Building Warrant application).

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.9.12 Escape routes in residential buildings
In residential buildings occupants are particularly vulnerable to fire when asleep. Occupants may also be unfamiliar with their accommodation and escape routes.
Those occupants on the fire floor should be provided with the opportunity to reach a protected zone (or other escape route) in relative safety and as quickly as possible, therefore, the movement of fire and smoke to the escape route should be inhibited.
In a residential building, where any corridor escape route serves sleeping accommodation it should be constructed of walls providing a short fire resistance duration and any door in the wall should be a suitable self-closing fire door with a short fire resistance duration. However the fire door to the cleaners cupboard need not be self closing provided it is lockable.
This guidance may need to be adapted in a residential building used as a place of lawful detention due to the unique operational factors.
For additional guidance on residential care buildings and hospitals see annex 2A and 2B.

Requirement

Ward corridors are recommended to be short duration fire protection.

Derogation

Derogation is required since making all these walls / doors / glazing / peentrations fire rated reduces the day to day functionality of the spacesand creates a significant increase in cost / ongoing maintenance without improving fire safety.

Proposal

Project Co consider that the development of reduced patient numbers per room has a positive impact on limiting fire spread and ability to evacuate those at immediate risk within the room of fire origin.
Open Nightingale wards and multiple bed wards require a significantly greater evacuation time to move those at immediate risk of a fire within the room; the same principle also applies to bed bay wards and in each case no further division is required.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 8 residential corridors

r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments (note the current version is 2013 and this will be applicable to the project under Building Warrant application).

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.9.30 Temporary waiting spaces

The speed of evacuation of occupants with sensory, cognitive and/or mobility impairments can be much slower than other building users. Therefore, a space

should be provided to allow them to wait temporarily, before completing their escape to a place of safety.

Requirement

Temporary waiting spaces required to stair enclosures.

Derogation

Evacuation within the clinical part of the buildingwill be managed by PHE; including those visiting/ working in the areawho require additional assistance with vertical movement therefore temporary waiting spaces are considered necessary within clinical areas.

Proposal

Parents, guardians or carers will remain with child (patient) during an incident and their evacuation will be managed by staff through PHE.

Others will be directed to adjoining compartments not affected by fire where stairs and lifts will remain in use.

The functionality of these vertical routes (lifts & stairs) during a fire incident is considered as adequate mitigation for non-provision of temporary waiting spaces within the stair enclosures.

Reference Docts - Sketches, drawings, reference material extracts etc

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.14.7 / 2.B.6

If a building is not fitted with an automatic fire suppression system, no point on any storey should be more than 45m from the nearest main outlet measured along an unobstructed route for laying a fire hose.

Requirement

Hose laying distances to be max. 45m from outlet.

Derogation

Small sections of the design at ground, first, second and third floors result in areas in excess of the 45m distance. The worst case scenario is 54m, 9m in excess of the guidance requirements.

The number of areas in which the hose laying distance exceeds 45m is negligible. All area in which non-compliance occurs are highlighted in Figure 14, Figure 16, Figure 15 and Figure 16 of the fire strategy document.

Proposal

Historically up until the issue of NDTH 2010, a hose laying length of 60m was permitted within buildings not fitted with an automatic fire suppression system. This change in guidance which resulted in reducing the hose laying length from 60m to 45m came following The Building Disaster Assessment Group research on behalf of the UK Government. This research was to assess the interaction between building design and the operational response of fire and rescue services.

Within this technical report the evaluation in reduction of fire hose laying lengths during fire fighting operations derived from the physiological demands on firefighters engaged in search and rescue and on the restrictions that may be imposed by their equipment.

In practice, attending Fire and Rescue Services appliances are fitted with hoses which are much longer than 45m this is to take account of when operating fire hoses within buildings the fire hoses have a tendency to "snake" when charged thus limiting their effective length. The marginal increase is not considered by Project Co to affect functionality of fire fighting operations.

Reference Docts - Sketches, drawings, reference material extracts etc

See fire strategy WSP-SZ-XX-DC-572-500_03 Appendix Design note 9 hose laying

r) The Non-Domestic Technical Handbook 2011 to The Building (Scotland) Regulations 2004 and its amendments (note the current version is 2013 and this will be applicable to the project under Building Warrant application).

Relevant Regulation - HBN, SHTM, Building Regulations etc

2.B.1

Fire hazard rooms

In order to contain a fire in its early stages, the listed rooms are considered to be hazardous and should be enclosed by walls providing a short fire resistance duration (see annex 2.D).

Requirement

Fire hazard rooms to be fire rated.

Derogation

Enclosure of individual fire hazard rooms can cause functionality / maintenance issues due to provision of fire rated walls and fire protection of services passing between adjoining rooms.

The provision of clusters will still ensure that fire and smoke are inhibited from spreading beyond the fire enclosure of origin until any occupants have had the time to leave that compartment and any fire containment measures have been initiated.

Proposal

Where two or more fire hazard room are adjacent, then the enclosure of the rooms (the cluster) will be treated as a fire hazard room.

Patient-access fire hazard rooms are not to be regarded as part of a cluster.

Reference Docts - Sketches, drawings, reference material extracts etc

05/09/2014	01 Luminaire Colour/Temperature	IHSL-MEP-009

BCR Clause

PART 6 (CONSTRUCTION MATTERS)
SECTION 3 (BOARD'S CONSTRUCTION REQUIREMENTS)
Page 121 Item 8.8.5
Luminaires, their colour and material finish shall be selected to co-ordinate with the architectural intent throughout the circulation areas. Low wattage 2700K luminaires to be used in particular rooms shall be selected on their ability to create a calm and "homely" atmosphere. Project Co shall consider the inclusion of wall mounted luminaires and /or uplighters.
All lamps used in clinical areas shall have as a minimum a colour rendering capability of ≥ 85 CRI. For practical reasons consideration shall be given by Project Co to using the same luminaire in both clinical and non-clinical spaces within the same ward. A reading light with an on/off switch shall be provided at each bedhead location. Project Co shall provide an additional switch on the nurse call handset.

Relevant Regulation - HBN, SHTM, Building Regulations etc

BSEN12464-1/SLL Code For Lighting

Requirement

Luminaires, their colour and material finish shall be selected to co-ordinate with the architectural intent throughout the circulation areas. Low wattage 2700K luminaires to be used in particular rooms shall be selected on their ability to create a calm and "homely" atmosphere. Project Co shall consider the inclusion of wall mounted luminaires and /or uplighters.
All lamps used in clinical areas shall have as a minimum a colour rendering capability of ≥ 85 CRI. For practical reasons consideration shall be given by Project Co to using the same luminaire in both clinical and non-clinical spaces within the same ward. A reading light with an on/off switch shall be provided at each bedhead location. Project Co shall provide an additional switch on the nurse call handset.

Derogation

The specified 2700K colour temperature can refer to a tungsten source, the modern luminaires we will utilise have 3000K for a warm white lamp that still provides a 'homely' atmosphere and using compact fluorescent or LED energy efficient lamp.

Proposal

The specified 2700K colour temperature can refer to a tungsten source, the modern luminaires we will utilise have 3000K for a warm white lamp that still provides a 'homely' atmosphere and using compact fluorescent or LED energy efficient lamp.

SHPN 04-01

Requirement

Adult In-patient Facilities, Paragraph 3.17, recommends for multi-bed rooms the provision of an assisted shower room (withWC, shower and whb) and a separate semi-ambulant WC (with hand-rinse basin).

Derogation

A separate semi-ambulant WC will not be provided in DCN multi-bed rooms.

Proposal

Project Co will provide an assisted shower room (with WC, Shower & whb) and a staff base base (services only, to allow for the future wc installation) in line with the NHSL requirements. This proposal was signed off through the UGM process.

SHPN 04-01
Requirement
Adult In-patient Facilities, Appendix 1 Example bedroom layouts, figure 15, example layout for 4 bedded room, shows both the assisted shower room and the separate semi-ambulant WC located adjacent to the corridor wall.
Derogation
Project Co will not provide 4-bedded bays in line with figure 15.
Proposal
Project Co will provide a variant layout with the assisted shower room located on the outside wall and a staff base adjacent to the corridor wall at the entrance to the multi-bed room. This arrangement improves the visibility into and out of the room from the corridor while maintaining optimum natural light and external views. This proposal was signed off through the UGM process.

Derogation Request

Date	Notes	Reference
17/09/2014	01 Single Rooms - Bed Spacing 02 Proposal wording revised 22/09/14	IHSL-ARC-027

BCR Clause

2.3 NHS Requirements
Sub-Section C, para 2.3viii, Scottish Government Health Directorates Circulars (CEL and HDL)

Relevant Regulation - HBN, SHTM, Building Regulations etc

CEL 27 (2010)

Requirement

Provision of Single Room Accommodation and Bed Spacing - Para 5. Accordingly, the Chief Medical Officer has concluded that the guidance set out in the above CEL (CEL 48 2008) that there should be a presumption of 100% single rooms in future hospital developments, is confirmed as the policy for NHSScotland except for:

• existing accommodation which is being refurbished, where taking into account the constraints of the existing building, a minimum of 50% single room accommodation would be allowed but as close to 100% as possible would be expected; and

• in new developments where there are clinical reasons for not making 100% single room provision they should be clearly identified and articulated in the appropriate Business Case. However, each case would be subject to Scottish Government agreement as part of the Business Case approval process.

Derogation

The following wards / in-patient areas will be provided with less than 100% single rooms:- A2 PARU, B1 PICU,L1 DCN Acute Care, C1.1 Medical In-patients, C1.2 Surgical Long Stay, C1.3 Neurosciences In-patients, C1.4 Haematology & Oncology, C1.8 Surgical Short Stay and D9 Medical Day Care.

Proposal

Project Co have complied with the Boards Clinical Output Based Specifications for the following wards / in-patient areas which will be provided with approximate % single rooms as follows:- A2 (65%), B1(38%),L1(67%), C1.1(65%), C1.2 (47%), C1.3 (33%), C1.4 (67%), C1.8 (43%) and D9 (40%). Only F1 CAMHS and L2 DCN Adult In-Patients will have 100% single rooms. There are 149 single-bed rooms out of a total of 223 beds which is approximately 67% overall.

2.3 NHS Requirements
Sub-Section C, para 2.3viii, Scottish Government Health Directorates Circulars (CEL and HDL)

Relevant Regulation - HBN, SHTM, Building Regulations etc

CEL 27 (2010)

Requirement

Provision of Single Room Accommodation and Bed Spacing - Para 6. In relation to the issue of bed spacing for multi-bedded rooms, the current advice remains unchanged. That is, taking account of ergonomic criteria, primarily the space required for patient handling and other activities which take place in the immediate vicinity of the bed, it is recognised that the minimum bed space should not be less than 3.6m (wide) x 3.7m (deep).

Derogation

The multi-bedded rooms in RHSC Wards A2, B1, C1.1, C1.2, C1.3, C1.8 do not comply with this as the beds are not laid out in a parrallel configuration with rectangular bed spaces.

Proposal

Project Co's proposals have adopted NHSL reference design generic room layout which is a cruciform (St Andrew's Cross)arrangement with only one bed on each of the four walls. This room type is proposed for the following RHSC Wards :- A2, B1, C1.1, C1.2, C1.3, C1.8which were signed off during the UGM process.

Requirement

Project Co shall ensure all windows required for ventilation shall be provided with controllable trickle ventilators within the head of the frame or with two stage key lockable handles giving 5 – 10mm ventilation gap.

Derogation

Project Co will not provide tricke vents to the head of all windows required for ventilation.

Proposal

Project Co will provide controllable trickle ventilators within window frames. Locations of vents within frames subject to appointment of specialist supplier/ manufacturer and also to Board agreement/sign off of sample/mock up of actual window system proposed.

SHS Safety Action
Notice SAN(SC)05/08

Requirement

Project Co shall ensure that all entrances to the Facilities incorporate sufficient length of appropriate floor matting designed to remove contaminants including water, dirt and leaves from footwear, trolley wheels etc. A water evaporation system such as a hot air curtain shall be provided at each entrance.

Derogation

Project Co will not provide the recommended 6m of barrier matting at the ambulant emergency department entrance.

Proposal

Project Co will provide a maximum of 3.7m length barrier matting to the ambulant emergency department entrance due to limited entrance lobby depth.

SHTM 08-01

Requirement

Derogation

Proposal

SHTM 08-01 Ceilings - We would suggest that there may be a conflict between SHTM 08-01 - Acoustics and any infection control requirements.SHTM 08-01 notes that room acoustics are to be considered:It recommends that all rooms be treated with acoustically absorptive surfaces with exception for acoustically non-important rooms (such as store rooms) and rooms where there are over-riding factors such as cleaning, infection control, patient safety, and clinical and maintenance requirements.2.106 Sound-absorbent treatment should be provided in all areas (including all corridors), except acoustically unimportant rooms (for example storerooms etc), where cleaning, infection-control, patient-safety, clinical and maintenance requirements allow. (underlined by me). 2.110 Acoustically-absorbent materials should have a minimum absorption area equivalent to a Class C absorber (as defined in BS EN ISO 11654:1997) covering at least 80% of the area of the floor, in addition to the absorption that may be provided by the building materials normally used. If a Class A or B absorbent material is used, less surface area is needed. (See Appendix B for an example of how to calculate the absorption area required for materials with different absorption class.) In rooms / corridors / streets provided with lay in grid tiles Clause 2.110 is achieved by the specification of tiles (Armstrong Bioguard Acoustic would suffice). However the following rooms may have solid plasterboard ceilings (which do not provide the sound-absorbent requirements as Clause 2.110) but due to infection control issues may not require additional absorption:

- Theatre suites
- Isolation rooms and lobbies
- Interventional Radiology / Cardiac Cath Lab
- Food preparation areas
- Decontamination suite
- Treatment rooms
- Plaster rooms
- DCFP
- Operating Theatres

- Anaesthetic Rooms
- Prep Rooms
- Scrub
- Interventional Radiology
- DCFP(We believe that this covers all clinical areas)

Health Facilities Scotland would like to thank the principal contributors and the Steering Group led by the Department of Health for their efforts in producing the HTM 03-01 Part A document.

HTM 03-01 Part A has been updated and amended by Health Facilities Scotland for use in NHSScotland as SHTM 03-01 Part A and the contribution from the National Heating & Ventilation Advisory Group is gratefully acknowledged.

Preface

About Scottish Health Technical Memoranda

Engineering Scottish Health Technical Memoranda (SHTMs) give comprehensive advice and guidance on the design, installation and operation of specialised building and engineering technology used in the delivery of healthcare.

The focus of Scottish Health Technical Memorandum guidance remains on healthcare-specific elements of standards, policies and up-to-date established best practice. They are applicable to new and existing sites, and are for use at various stages during the whole building lifecycle.

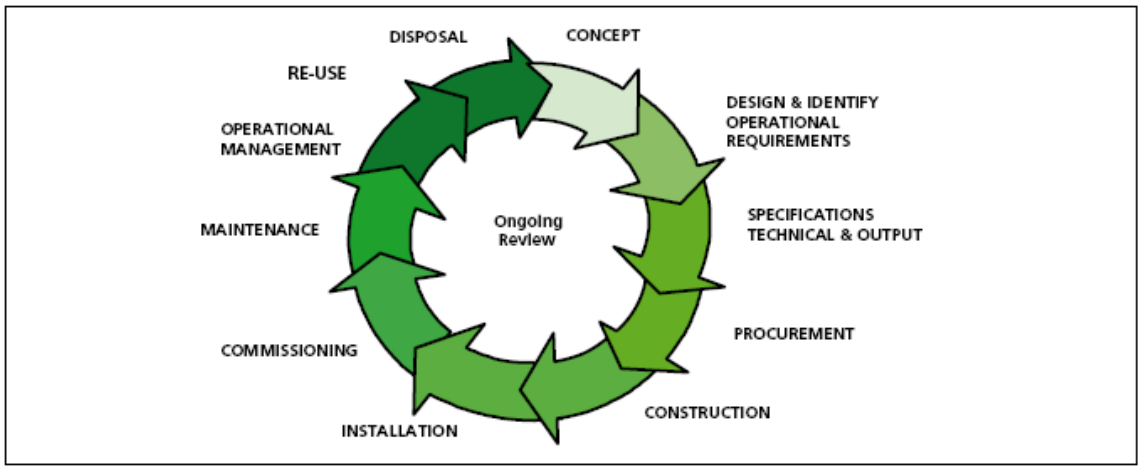
Healthcare providers have a duty of care to ensure that appropriate engineering governance arrangements are in place and are managed effectively. The Engineering Scottish Health Technical Memorandum series provides best practice engineering standards and policy to enable management of this duty of care.

It is not the intention within this suite of documents to repeat unnecessarily international or European standards, industry standards or UK Government legislation. Where appropriate, these will be referenced.

Healthcare-specific technical engineering guidance is a vital tool in the safe and efficient operation of healthcare facilities. Scottish Health Technical Memorandum guidance is the main source of specific healthcare-related guidance for estates and facilities professionals.

The core suite of eight subject areas provides access to guidance which:

- is more streamlined and accessible;
- encapsulates the latest standards and best practice in healthcare engineering;
- provides a structured reference for healthcare engineering.



Healthcare building lifecycle

Structure of the Scottish Health Technical Memorandum suite

The series of engineering-specific guidance contains a suite of eight core subjects:

Scottish Health Technical Memorandum 00: Policies and principles (applicable to all Scottish Health Technical Memoranda in this series).

Scottish Health Technical Memorandum 01: Decontamination.

Scottish Health Technical Memorandum 02: Medical gases.

Scottish Health Technical Memorandum 03: Heating and ventilation systems.

Scottish Health Technical Memorandum 04: Water systems.

Scottish Health Technical Memorandum 05: Reserved for future use.

Scottish Health Technical Memorandum 06: Electrical services.

Scottish Health Technical Memorandum 07: Environment and sustainability.

Scottish Health Technical Memorandum 08: Specialist services.

Some subject areas may be further developed into topics shown as -01, -02 etc and further referenced into Parts A, B etc.

Example: Scottish Health Technical Memorandum 06-02 Part A will represent: Electrical Services – Electrical safety guidance for low voltage systems.

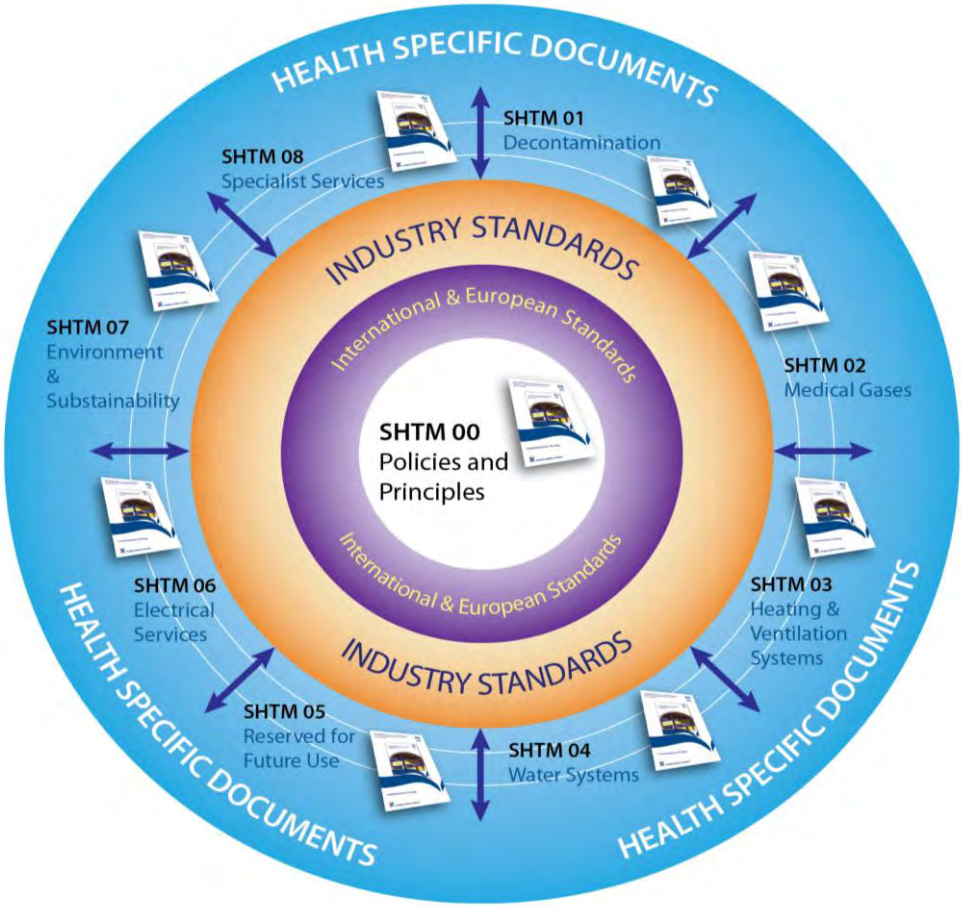
In a similar way Scottish Health Technical Memorandum 07-02 will simply represent:

Environment and Sustainability – EnCO_2de.

All Scottish Health Technical Memoranda are supported by the initial document Scottish Health Technical Memorandum 00 which embraces the management

and operational policies from previous documents and explores risk management issues.

Some variation in style and structure is reflected by the topic and approach of the different review working groups.



Engineering guidance

1. Introduction

1.1 Ventilation is used extensively in healthcare premises or primary patient treatment in operating departments, high dependency units and isolation facilities. It is also installed to ensure compliance with quality assurance of processed items in pharmacy and sterile supply departments and to protect staff from harmful organisms and toxic substances, for example, in laboratories.

1.2 This edition of Scottish Health Technical Memorandum 03 'Ventilation in healthcare premises' is published in two sections. It is equally applicable to both new and existing sites. It gives comprehensive advice and guidance to healthcare management, design engineers, estate managers and operations managers on the legal requirements, design implications, maintenance and operation of general and specialised ventilation in all types of healthcare premises.

1.3 Current statutory legislation requires both 'management' and 'staff' to be aware of their collective responsibility.

1.4 'Ventilation' is also provided in healthcare premises for the comfort of the occupants of buildings. More specialised ventilation will also provide comfort but its prime function will be to control closely the environment and air movement of the space that it serves in order to contain, control and reduce hazards to patients and staff from airborne contaminants, dust and harmful micro-organisms.

1.5 Ventilation systems in themselves present little danger to patients or staff. However, they do possess the ability to transmit hazards arising from other sources to large numbers of people. The danger may not become apparent until many patients and staff have been affected.

1.6 The sophistication of ventilation systems in healthcare premises is increasing. Patients and staff have a right to expect that it will be designed, installed, operated and maintained to standards that will enable it to fulfil its desired functions reliably and safely.

1.7 The Health and Safety at Work etc Act 1974 (HSW Act 1974) is the core legislation that applies to ventilation installations and these installations are intended to prevent contamination, control closely the environment, dilute contaminants or contain hazards. Their very presence indicates that risks to health have been identified.

Statutory requirements

1.8 The Control of Substances Hazardous to Health (COSHH) regulations place upon management an obligation to ensure that suitable measures are in place to protect their staff and others affected by the work activity. These methods may include both safe systems of work and the provision of a specialised

ventilation system. In laboratories the requirements are often met by the provision of fume cupboards and safety cabinets.

1.9 The existing requirements to provide ventilation, implicit under HSW Act 1974 and COSHH, have been made explicit by the Management of Health and Safety at Work Regulations 1999, the Workplace (Health, Safety and Welfare) Regulations 1992 and the Provision and Use of Work Equipment Regulations 1998, all issued as a result of European Directives.

1.10 Where specialised ventilation plant is provided as part of the protection measures there is a statutory requirement that it be correctly designed, installed, commissioned, operated and maintained. The local exhaust ventilation (LEV) section of the COSHH regulations requires that the plant be inspected and tested at least every 14 months by an independent organisation and that management maintain comprehensive records of its performance, repair and maintenance.

1.11 Certain substances have Occupational Exposure Limits (OEL) set out in Guidance Note EH 40 published annually by the Health and Safety Executive. If special ventilation systems are provided in order to achieve these standards they will be subject to the COSHH regulations as above.

1.12 All ventilation systems should conform to the principles set out in the Approved Code of Practice and guidance document entitled “Legionnaires’ disease: the control of *Legionella* bacteria in water systems” (commonly known as ‘L8’) published by the Health and Safety Executive and Scottish Health Technical Memorandum SHTM 04-01: The control of *Legionella*, hygiene, “safe” hot water, cold water and drinking water systems.

1.13 Special ventilation plants installed in laboratories dealing with research, development or testing, whether involving drugs, animals or genetically modified organisms, may be subject to particular legislation with regard to their operation in addition to that mentioned above. Further information is given by the Health and Safety Executive Health Services Advisory Committee in:

- safe working and prevention of infection in clinical laboratories;
- safe working and prevention of infection in clinical laboratories: model rules for staff and visitors;
- safe working and prevention of infection in clinical laboratories in the mortuary and post-mortem room.

1.14 Plants installed in units manufacturing medicinal products to the standards set out in the current European Guide to Good Manufacturing Practice may also be subject to particular legislation with regard to their operation in addition to that mentioned above.

1.15 Records should be kept of equipment design and commissioning information. The Health and Safety Executive, Medicines Inspectorate and other interested bodies have a statutory right to inspect them at any time. All records should be kept for at least five years.

1.16 The fire regulations require that if ventilation ductwork penetrates the fabric of a building it should be designed and installed so as to contain the spread of fire. (for further information refer to Firecode Series SHTMs 81, 83 and 85)

1.17 Increased health risks to patients will occur if the more specialised ventilation systems installed to supply high quality air to operating departments do not achieve and maintain the required standards. The link between post-operative infection and theatre air quality has been well established. Plants serving conventional operating departments, for instance, will be required to ensure the separation of areas within the suite by maintaining a specific direction of air flow between rooms, even when doors are opened. They will also maintain the selected operating department environmental conditions regardless of changes in the outside air conditions or activities within the space. In addition ultra-clean operating ventilation systems that are designed to provide an effectively particle-free zone around the patient while the operation is in progress, have been shown to reduce significantly post-operative infection in patients undergoing deep wound surgery. Their use for other forms of surgery may well be required.

1.18 Ventilation systems that can be shown to be inappropriate, inadequate or ineffective and that give rise to proven failures can result in a civil suit by the patient against the operators.

1.19 If the plant has been installed to dilute, extract or contain harmful substances (the definition of which now includes microorganisms) its failure may expose people to unacceptable levels of hazard. Proven failures can give rise to a civil suit against the designers and operators by the individuals who have been affected. This would be in addition to the actions brought as a result of breaching the statutory requirements.

1.20 There is a statutory requirement to provide ventilation in all enclosed workspaces. It may be provided by either natural or mechanical means. The following are some of the factors that determine the ventilation requirements of a workspace:

- human habitation (minimum fresh air requirement);
- the activities of the department, that is, extraction of odours, aerosols, gases, vapours, fumes and dust – some of which may be toxic, infectious, corrosive, flammable, or otherwise hazardous (see Control of Substances Hazardous to Health (COSHH) regulations;
- dilution and control of airborne pathogenic material;
- thermal comfort;
- the removal of heat generated by equipment (e.g. catering, wash-up, sterilising areas, electrical switch rooms, uninterruptible power supply (UPS) cupboards and some laboratory areas);
- the reduction of the effects of solar heat gains where other forms of reducing the solar effect is not available or practical, i.e. solar blinds;
- the reduction of excessive moisture levels to prevent condensation (for

example Hydrotherapy pools);

- combustion requirements for fuel burning appliances (see BS5376, BS5410 and BS5440);
- 'make-up' supply air where local exhaust ventilation (LEV) etc., is installed.

Mechanical ventilation systems are expensive in terms of capital and running costs, and planning solutions should be sought which take advantage of natural ventilation either where the use of the area in question is not critical to airflow patterns or pressures, or where backup systems are available when natural ventilation cannot be achieved.

1.21 When new ventilation systems are accepted for use, full information as to their designed mode of operation together with recommended maintenance procedures should be provided as part of the handover procedure.

Requirement	Reason	Application
Statutory	Health and Safety at Work etc Act	Operating department Laboratories Pharmacy
	COSHH regulations	Areas containing identified biological or chemical hazards Areas containing oxygen displacing gases
	Local Exhaust Ventilation (LEV)	Enclosed work-spaces Workshops
Functional	Comfort	Situations where the quality of the environment for staff and patients is critical to their general performance and well-being
Clinical	Post-operative infection reduction	Operating suites used for general surgery, casualty, obstetrics/gynaecological and maternity procedures
	Reduction of deep wound sepsis	Ultra-clean operating suites for transplant, deep wound surgery, hip replacement, bone grafting and bone marrow transplant procedures
	Isolation from contact with bio hazards	Isolation units for patients who present a biological, chemical or radiation hazard to others. Isolation units for patients with a reduced immune system

Table 1: Reasons for providing ventilation

Functional overview – Terms in use

1.22 The terms 'ventilation' and 'air-conditioning' are often incorrectly used to describe the same equipment. A general explanation of the terms is given below.

Ventilation

1.23 Ventilation is a means of removing and replacing the air in a space. In its simplest form this may be achieved by opening windows and doors. Mechanical ventilation systems provide a more controllable method. Basic systems consist of a fan and either collection, (extraction) or distribution (supply) ductwork. More complex systems may include the ability to heat and filter the air passing through them. Ventilating equipment may be required in order to remove smells, dilute contaminants and ensure that a supply of 'fresh' air enters a space.

Air-conditioning and mechanical cooling

1.24 Air-conditioning is the ability to heat, cool, dehumidify and filter air. For full air-conditioning, humidification may also be provided. This means that the climate within a space being supplied by an air-conditioning plant can be maintained at a specific level regardless of changes in the outside air conditions or the activities within the space. Mechanical cooling may be provided where close control of 'comfort conditions' within a space is required but humidity control is not needed.

Special ventilation

1.25 In healthcare premises, certain activities will necessitate the provision of ventilation equipment with additional special features in order to achieve and maintain specific conditions. These may be needed in order to assist with the treatment of patients or maintain the health and safety of staff. The precise reason for providing special ventilation will depend upon the intended application. The list below indicates some of the more typical reasons:

- to remove, contain or dilute specific contaminants and fumes;
- to ensure the isolation of one space from another;
- to preserve a desired air flow path from a 'clean' to a 'less clean' area;
- to provide control of the cleanliness of a space;
- to provide 'close' control of temperature;
- to provide 'close' control of humidity.

1.26 The following departments will usually have specialised ventilation requirements, either for a single room or throughout a suite of rooms:

- operating department;
- laser surgery unit;
- intensive treatment unit;
- infectious diseases isolation unit;
- manufacturing pharmacy;
- specialised imaging, X-ray and scanning unit;

- pathology containment laboratories;
- mortuary and dissection suite;
- research laboratory;
- sterilising and disinfecting unit (SDU);
- endoscopy unit;
- renal dialysis suite;
- ultrasound facilities;
- audiology room.

1.27 Ventilation may be provided in a wide variety of ways. These will include:

- extensive purpose-built air-conditioning units housed in their own plant rooms;
- proprietary 'packaged' systems often sited outside on a roof or;
- wall-mounted electric fans located at the point of use.

1.28 A fixed volume of air may be supplied, often expressed in terms of the resulting number of air changes per hour (ac/h) within the space being ventilated. It may also be expressed in terms of litres/second/person. Alternatively the volume of air supplied may be varied in order to maintain a specific pressure relationship between the area supplied and other surrounding areas. In some situations a combination of both methods may be adopted.

1.29 Modern plants are fitted with the means to recover energy from the extract air where this can be justified without causing contamination of the incoming supply air.

1.30 Ultra-clean systems use the same basic plant and equipment as standard air-conditioning but are in addition fitted with a terminal device that supplies the air in a unidirectional manner to the working area. Their standard of filtration will be capable of delivering air with a very low particle count to the space that they serve.

Local exhaust ventilation

1.31 Local exhaust ventilation (LEV) is a term used to describe systems installed to prevent hazardous substances from entering the general atmosphere of the room in which they are being used. Their primary function is to protect staff from the effects of their work activity.

1.32 Simple LEV systems comprise a capture hood, extract ductwork and fan. These are used to contain industrial types of hazard such as fumes from welding processes, gas discharges from standby battery banks and dust from woodworking machinery. The vapour given off when large quantities of chemicals are decanted into ready-use containers and fumes from X-ray film processing units are further examples of chemical hazards often controlled by LEV systems.

1.33 In laboratories, pharmaceutical manufacturing facilities and operating suites, LEV systems usually take the form of semi-open fronted cabinets within which the hazardous substance is manipulated. These cabinets either have their own filtered air supply or are fed with air from the room. The air extracted from the cabinet is passed through a high-efficiency filter before being discharged either to the atmosphere or back into the room. Microbiological safety cabinets, laboratory fume cupboards, cytotoxic drug cabinets and fixed or mobile disinfection enclosures are all examples of this type of facility.

1.34 Mortuaries and dissection suites may have LEV systems incorporated within the dissection table, specimen bench and bone saw.

Management action

1.35 The guidance contained in this SHTM should be applied in full to new installations and major refurbishments of existing installations.

1.36 Ventilation will need to be provided:

- as a requirement for patient care;
- in order to fulfil a statutory duty.

1.37 In assessing the need for more specialised ventilation and the standards desired for patient care, managers will need to be guided by their medical colleagues and by information published by Health Facilities Scotland.

1.38 The statutory need for ventilation falls into two categories:

- in the first, the need for specialised ventilation and the standards to be adopted are clearly set out in specific pieces of legislation. An excellent example of this is the current legislation surrounding the manufacture of medicinal products in the European Community. The managers of the departments affected by this type of legislative requirement should be aware of their needs and be able to advise on the standards to be achieved;
- the second type of statutory requirement arises due to the interpretation of both the Health and Safety at Work etc Act and the Control of Substances Hazardous to Health (COSHH) regulations. The person tasked with conducting COSHH assessments will be able to advise as to the need for, and standard of, ventilation in each particular case.

Design and validation process

1.39 It is essential when undertaking the design of a specialised ventilation system that the project be considered as a whole. The process model set out below should ensure that all relevant factors are considered.

Step	Question	Design statement and information required	Comment
1	Why is the system required?	Healthcare applications Statutory elements Non-healthcare applications	
2	What is the required system performance?	Room air flow pattern Air change rate Differential pressures Air quality Room air condition Noise limits	
3	What are the constraints on the distribution system?	Location, Size, Materials Dampers, Access, Insulation Fire considerations Room terminals	
4	What are the minimum requirements for the AHU(s)?	Intake / Discharge positions *Legionella*, Health and Safety Access, Fire, Electrical safety Leaks, Insulation, Cleanliness Filtration, Drainage	
5	What control functions are required?	User control requirements Estates control functions Energy management Environmental conditions Control sequence logic Run, Set back, Off philosophy	
6	How will the system performance be validated?	Validation methodology Instruments used Design information required [*Design air flow rates* *Design air velocities* *Pressure differentials* *Noise levels* *Air quality* *Installation standard*]	
7	The system will only be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life.		
8	Handover to client	Basic design information Commissioning results Validation report	

Table 2: Design and Validation process model

Use and function of typical equipment used in ventilation plant

1.40 Typical equipment used in ventilation systems is listed below together with a brief description of both function and use.

General

1.41 The equipment built into the ventilation system and its ductwork should be of a type that will neither cause nor sustain combustion. No materials that could sustain biological activity should be used in the construction or assembly of the system.

Air Intake

1.42 An uncontaminated air supply to the system is essential. In order to achieve this, the air intake will be positioned so that air discharged from extract systems or other dubious sources cannot be drawn in. Exhaust fumes from vehicles can present particular problems. The area surrounding the intake will need to be kept clean and free of vegetation and waste material in order to reduce the possibility of biohazards or fire. The intake itself will be protected by a louvre and mesh screen to prevent rainwater, vermin and insects etc from entering the system.

Damper

1.43 Several types may be fitted:

- automatic dampers fitted immediately behind the air intake and extract louvres. They will automatically close when the system is shut down in order to prevent an uncontrolled circulation of air;
- balancing dampers are fitted into each branch of the air distribution ductwork system so that the design air flow rate can be set during the commissioning process;
- where ductwork passes through a fire compartment wall, ceiling or floor a fire and/or smoke damper may be required;
- plant isolating dampers are fitted so that the main plant can be isolated from its air distribution duct system. They are manually operated and enable cleaning and maintenance of the air-conditioning equipment to be carried out.

Ducting

1.44 The means by which air is conveyed from the intake to its point of use. Ducting is usually constructed of galvanised steel and will normally be insulated to reduce noise and conserve energy. Ducts can also be formed in concrete, brickwork, stainless steel or plastic and may be rigid or flexible.

Fan

1.45 A series of rotating blades that move the air in the direction required. Fans are usually powered by electric motors either directly connected to them or driven through belts and pulleys. A fan may be arranged either to force air into or draw air from a ductwork system.

Attenuator / silencer

1.46 A device that will contain and absorb the noise emitted by a fan. They may be required to reduce disturbance caused by noise breaking out through the air intake and also noise transmitted along the ductwork to the conditioned space.

Filter

1.47 A filter consists of a labyrinth of fibrous material contained in a frame. It is designed to capture and hold particles being carried in the airstream. Because of the size range and number of particles that exist in air no filter can remove them all. The purpose of filtration is to reduce their number and size range to an acceptable level. Filters of progressively higher grades are fitted through the ventilation system:

- primary filters (coarse) are designed to collect the larger particles and are intended to keep the air-conditioning plant clean;
- secondary filters (fine) will remove the staining particles from air and keep the conditioned space visibly clean;
- high efficiency particulate air filters (HEPA/absolute) will remove virtually all particles from air. These may be required in order to reduce contamination in the working area either biologically or in terms of particle count.

Filters may be fitted to extract systems to protect energy recovery devices. They may also be fitted to remove biological, radiation or chemical hazards and if so, are often contained in a 'safe change' facility in order to protect those carrying out maintenance.

Activated carbon filters will reduce odours in extracted or recirculated air.

Heater battery / heater coils

1.48 A series of heater batteries or heating coils with or without fins through which steam or hot water is circulated. Heat is given up to the air passing over the battery thus increasing its temperature. Heating is usually carried out in stages, the final battery being controlled by the end user. Small batteries may be electric.

Humidifier

1.49 A device for increasing the humidity of air by adding moisture. For ventilation in healthcare premises this is normally achieved by releasing 'clean' steam into an air supply duct. The steam will be completely absorbed into the air, increasing its humidity. The level of humidity may be preset or controlled by the end user.

Cooler battery / cooling coil

1.50 A series of finned coils mounted in the air supply duct. Either chilled water or refrigerant is circulated through the coils causing heat to be removed from the air. This will reduce its temperature and may also condense moisture out of the

air. As free moisture in a duct can be a source of contamination the coil will be fitted with an eliminator and drainage system.

Eliminator

1.51 A device for catching and removing water droplets from an air stream. It may form part of a cooling coil or be a separate device.

Drainage system

1.52 A means of removing water from ductwork and disposing of it safely. Typically it will consist of a tray mounted in the duct to catch moisture, a glass water seal trap, continuously falling drainage pipework and an air break in the drain run to prevent waste water returning and contaminating the duct.

Access doors and observation ports

1.53 Doors and removable panels providing access for routine maintenance and cleaning. The doors should be fitted with glazed ports and suitable lighting provided so that the correct operation of devices such as cooling coils, humidifiers and filters can be easily observed without needing to switch off the plant.

Energy recovery

1.54 Many plants are fitted with the means to recover energy from the extract air without causing contamination of the incoming supply air. These devices will be fitted with a drainage system and may incorporate an eliminator. Several types of energy recovery systems are available.

1.55 Precise definitions of ventilation and air-conditioning terms are given in the Chartered Institution of Building Services Engineers (CIBSE) Guide B.

Typical plant

1.56 The layout of a typical plant that conforms to the requirements for healthcare applications is shown in Figure 1 overleaf. It contains most of the equipment described above.

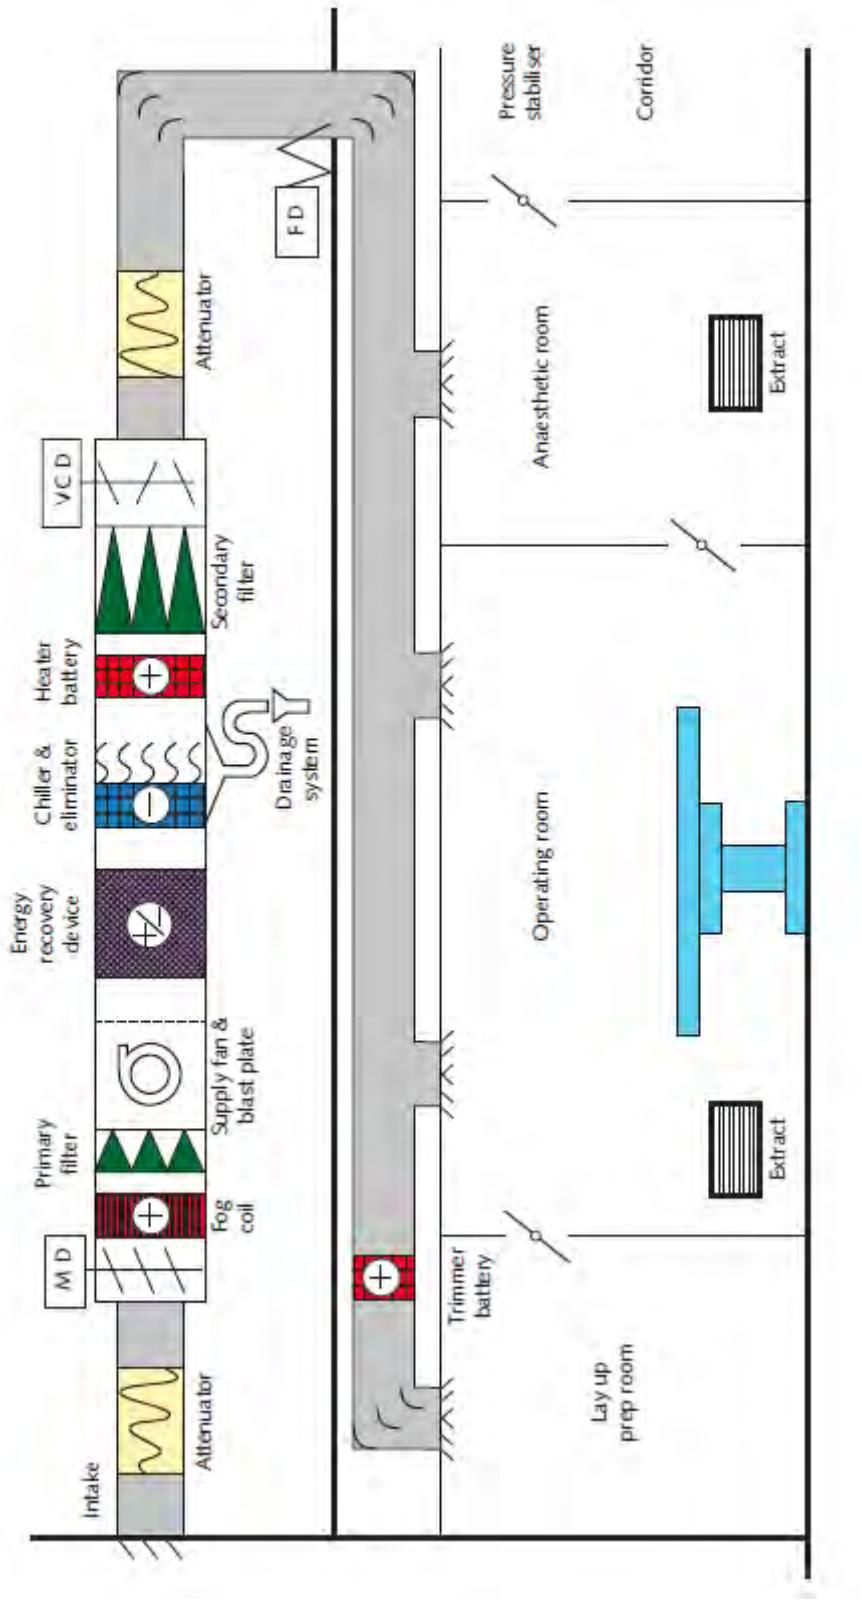


Figure 1: Design and Validation process model

2. Provision of ventilation in healthcare buildings

2.1 It is acknowledged that planning constraints imposed by the building shape and/or functional relationships of specific areas will invariably result in some measure of deep planning thus reducing the opportunity for natural ventilation. However, ventilation costs can be minimised by ensuring that where practicable, core areas are reserved for rooms that have a functional requirement for mechanical ventilation. Examples are sanitary facilities, dirty utilities and those rooms where clinical or functional requirements have specific environmental needs; and where for reasons of privacy, absence of solar gain etc., windowless accommodation is acceptable. Other spaces appropriate to core areas are those that have only transient occupation and therefore require little or no mechanical ventilation, for example circulation and storage areas.

Natural ventilation

2.2 Natural ventilation is usually created by the effects of wind pressure. It will also occur if there is a temperature difference between the inside and the outside of the building. The thermo-convective effect frequently predominates when the wind speed is low and will be enhanced if there is a difference in height between inlet and outlet openings. Ventilation induced by wind pressures can induce high air change rates through a building provided air is allowed to move freely within the space from the windward to the leeward side.

2.3 As the motivating influences of natural ventilation are variable, it is almost impossible to maintain consistent flow rates and ensure that minimum ventilation rates will be achieved at all times. This variability is normally acceptable for general areas including office accommodation, general wards, staff areas, libraries rooms, dining rooms and similar areas which should, where possible, be provided with opening windows of a design that facilitates natural ventilation.

2.4 Current guidance restricts the amount windows can be opened for safety reasons and as many designs are top-hung, their ability to permit natural ventilation is limited. It may therefore be necessary to provide dedicated ventilation openings in the fabric of the building to allow a sufficient natural flow of air into and out of the space. Paragraph 2.20 also refers.

2.5 In all cases, excessive heat gain, indoor air quality requirements or external noise may limit or preclude the use of natural ventilation.

Extract ventilation systems

2.6 Separate extract ventilation will be required for sanitary facilities, lavage areas, dirty utilities and in rooms where odorous, but non-toxic fumes are likely, in order to ensure air movement into the space. 10 air changes per hour have been found necessary, particularly in geriatric and psychogeriatric accommodation. This will assist with infection control procedures. A single

fan/motor unit can be suitable for individual rooms, but multi-room systems should be provided with duty and standby fans or motors to meet this need.

2.7 Toilets should have an extract ventilation rate as set out in the building regulations. Where WC's are located in shower and bathroom spaces, the ventilation required for the WC will normally be adequate for the whole space.

Supply only ventilation

2.8 Mechanical supply ventilation will be required in areas where it is important to maintain a positive pressure in order to prevent the ingress of less clean air, e.g. in pharmacy aseptic suites, sterile supply packing rooms, operating theatres and their preparation rooms (air change rates are given in Table A1).

Supply and extract ventilation

2.9 Mechanical supply and extract ventilation should be provided in rooms where there is a need to control room pressure in relation to adjacent spaces. Intensive Care Units, (ICU), isolation suites and treatment areas are typical applications.

Mechanical or comfort cooling

2.10 Cooling is very expensive in terms of energy costs and should be provided only where necessary to maintain a comfortable environment for staff and patient, or to ensure satisfactory operation of equipment. The imaging department in particular may require cooling to offset the equipment load.

2.11 Calculations and thermal modelling should be undertaken to ensure that during the summertime, internal temperatures in patient areas do not exceed 28ºC (dry bulb) for more than 50 hours per year taking into account the level of design risk for the application.

2.12 Certain non-patient areas may also require cooling and will typically include some laboratories, central wash-up and other areas that are subject to high equipment heat gains.

2.13 Where deep planning of other continuously occupied spaces, for example offices, is unavoidable, there will also be occasions when acceptable levels of comfort can only be maintained by cooling. Planning solutions of this type however will be exceptional.

2.14 Refrigeration plant should be of sufficient capacity to offset heat gains and maintain areas at a temperature that does not exceed the external design shade temperatures by more than about 3ºC taking into account the level of design risk for the application.

Air-conditioning

2.15 Full air-conditioning is only required in a very small number of areas within healthcare buildings and due to the capital and running cost its inclusion should be kept to a minimum. Paragraphs 3.14 - 3.15 and 4.91 - 4.93 also refer.

2.16 Areas whose functions may warrant the installation of air-conditioning include operating departments, intensive therapy units, manufacturing pharmacies and areas with particularly sensitive equipment.

Specialised ventilation

2.17 Due to the nature and extent of activities carried out in healthcare buildings, there will be a need for a wide range of specialised ventilation systems. The types of system which are generally required in individual departments and typical arrangements are given in Section 7.

2.18 The activities within some departments will require the provision of local exhaust ventilation (LEV). This is a statutory requirement under COSHH wherever the escape of chemicals, toxic fumes, biological material or quantities of dust into the general area would present a hazard to the occupants.

Ventilation for general areas

2.19 Table A1 provides recommended air change rates, temperatures and pressures for general areas that require mechanical ventilation in healthcare buildings.

Use of natural ventilation

2.20 The air tightness of new buildings has improved to the point that infiltration through building leakage can no longer be relied upon to provide sufficient air-flow. Attention must therefore be given to the provision of purpose-made ventilation openings to achieve the necessary flow rates. The air entering the openings may need to be controlled by motorised dampers linked to temperature and / or occupancy sensors in the ventilated space.

2.21 Internal partitions, fire compartment walls and closed doorways can often impede the flow path, and when this happens, the process will be more dependent on single-sided ventilation. Nevertheless, even with this degree of compartmentation, acceptable ventilation may still be achieved without window openings that would prejudice safety, security or comfort.

2.22 Some types of window, for example, vertical sliding, can enhance single sided air change by temperature difference, and these will improve the overall rate of natural ventilation in protected or sheltered areas where the effect of wind pressure is likely to be minimal.

2.23 It is generally considered that natural cross-flow ventilation is able to give reasonable air distribution for a distance of up to 6 metres inwards from the external façade, provided that reasonably clear air paths are maintained. Beyond this distance in areas where clear air paths cannot be maintained and in areas where high minimum air change rates are specified, mechanical ventilation should be provided.

2.24 Further information can be found in SHTM 55 ‘Windows’, BS5925 ‘Code of practice for ventilation principles and designing for natural ventilation’ and

CIBSE Applications Manual AM10: 'Natural ventilation in non-domestic buildings'.

Mixed mode ventilation

2.25 This comprises an assisted form of natural ventilation. Fans are fitted in the purpose made damper-controlled ventilation openings. Alternatively a separate ventilation unit may be installed. In both cases the dampers and fans are controlled under the dictates of temperature and occupancy sensors to ensure a minimum air flow rate while taking advantage of natural ventilation effects when present.

2.26 Where natural or mixed mode ventilation is adopted with complex air paths, the designer should produce an air flow diagram in order to ensure correct provision of air transfer devices. CIBSE Applications Manual AM13: 'Mixed mode ventilation in non-domestic buildings' gives guidance.

Mechanical extract ventilation

2.27 General extract systems can vary in complexity from a single wall-mounted fan to a ducted air system with dual extract fans.

2.28 Replacement air is generally provided by a central supply system (as described below). Unless special precautions are taken, the latter may result in an unacceptable level of draughts occurring in winter, and possible risk of unacceptable levels of noise transmission.

2.29 If individual systems are used, the ventilation can be operated intermittently, provided it continues to run for at least 15 minutes after the room is vacated, as with light switch-operated fans in individual toilets.

2.30 If general exhaust systems are used; it is recommended that filtered and tempered replacement air is provided via a central supply plant to adjoining lobbies or corridors, to prevent the risk of discomfort caused by the ingress of cold air. Fire compartmentation requirements must be maintained.

2.31 Information on specialised extract systems is given in Section 7.

Mechanical supply systems

2.32 Where mechanical supply systems are required, the fresh air should be tempered and filtered before being delivered to the space, to avoid discomfort.

2.33 The air should be heated using a constant or variable temperature source, but generally only to the space air temperature. In most instances, the low-pressure hot water heating (LPHW) should offset any fabric loss, so that setback room temperatures can be maintained during unoccupied periods without the need for the ventilation system to operate.

Balanced ventilation

2.34 Balanced ventilation systems are merely a combination of a supply and extract systems of equal volume; and either a single space or a whole building may be considered to be balanced. A balanced system is necessary in instances where it is essential to maintain consistent air movement within an area, for example, treatment rooms.

Cascade ventilation

2.35 In operating departments it is normal practice to supply air to the operating room, and allow it to pass through less clean areas – corridors, utility rooms etc. (from where it is eventually extracted).

Recirculation systems

2.36 Due to the nature of the use of mechanical ventilation systems within healthcare buildings, there are few opportunities for the application of recirculation air systems. They are however normally used for HEPA filtered clean room applications where the extract air is significantly cleaner than the outside supply. Recirculation is also routinely used in the canopy section of Ultra Clean Operating theatre ventilation systems.

2.37 Where the designer is considering the installation of a recirculation air system, due account must be taken of:

- minimum fresh air supply volume required by the Building (Scotland) Regulations 2004 (currently 20%);
- prevention of contamination of supply air from vitiated air in extract systems;
- prevention of stratification occurring within plenum chambers and mixing boxes which may result in freezing of downstream coils;
- ensuring sufficient velocities through control dampers (ideally 5-6m/s) to provide suitable authority; and good shut-off;
- modulating control of mixing to provide optimum on-plant conditions;
- use of ‘free cooling’ by cycling the dampers to minimum fresh air when the enthalpy of the outside air is above that of the extract air under conditions when cooling is required.

Chilled beams

2.38 The use of chilled beams for the provision of heating, cooling and ventilation is increasingly common in healthcare premises. The use of Active Chilled Beams providing tempered filtered air to a heating / cooling device within the room can provide effective local control of environmental conditions.

2.39 Care should be taken in positioning chilled beams to ensure the avoidance of cold draughts particularly when used in the cooling mode. The control settings should ensure that the external elements of the beam are always above dewpoint.

2.40 Consideration should be given to the ease with which specific types of chilled beam units can be accessed for cleaning having regard to the need to control the infection risk. The impact of maintenance requirements on room availability should also be considered.

Split comfort air-conditioners

2.41 Split comfort air-conditioners, room conditioners or cassette units are used increasingly where there is a small local requirement for cooling for operational purposes. They can provide an effective economic solution to cooling needs, where a central refrigeration system is not practicable.

2.42 The units re-circulate room air so provision for a fresh air make up, either by natural or mechanical means, to the standard required by the Building (Scotland) Regulations must be provided.

2.43 The recirculation of room air presents problems with indoor air quality (IAQ) and may increase the risk of healthcare associated infection (HAI). Split units should not therefore be used in critical patient areas.

2.44 Split units may be used for single room applications or as multiple linked units that can independently provide either heating or cooling, all served by a single outdoor unit. These systems enable good temperature control of a number of rooms with maximum energy efficiency.

2.45 Whether single or multiple systems are used, it is essential that the designer gives due consideration to the source of electrical supply, location of the heat rejection unit, environmental effects to the refrigerant used and drainage provision for the cooling coil condensate.

2.46 The units will require routine maintenance for filter change and cleaning; they should therefore be installed in an accessible position.

Dilution ventilation and clean air flow paths

2.47 Dilution ventilation has in the past been used to control levels of hazardous substances in a space. This approach is no longer considered acceptable. The COSHH Regulations require that known hazardous substances should be substituted by safe alternatives. If this is not possible then they should be controlled at source by the use of closed systems such as anaesthetic gas scavenging units or exhaust protective enclosures such as fume cupboards.

2.48 The exposure of staff to casual spillages of substances such as medical gases in anaesthetic rooms should in the first instance be dealt with by establishing a clean airflow path. Air should be supplied at high level and extracted at low level directly behind the anaesthetic equipment position. The philosophy of establishing a clean air-flow path from the supply point; to the staff; on to the patient and out via a low level extract would also apply in recovery rooms and maternity delivery rooms including labour, delivery, recovery & post partum (LDRP) Rooms. A suitable air change rate will provide dilution ventilation as an additional safeguard; see Table A1, Table A2 and Note c.

2.49 In operating theatres the patient will be on a closed breathing circuit in a room with a high air change rate. Under these circumstances the dilution effect would be considered sufficient to control any casual exposure to anaesthetic gases.

Mechanical ventilation systems

System selection

2.50 Natural ventilation is always the preferred solution for a space, provided that the quantity and quality of air required, and the consistency of control of ventilation to suit the requirements of the space, are achievable with this method. If this is not the case, a mechanical ventilation system will be required.

Choice of central/local plant

2.51 Mechanical ventilation is expensive to operate, and as such, should be controlled to operate when the space being served requires to be ventilated. In addition, loads on refrigeration plant are rarely constant owing to changes in solar gain, occupancy and use of heat-generating equipment and lights, therefore control of temperature is critical.

2.53 If the ventilation loads throughout a department or building are in phase, or are not significant, a central plant with single zone control can be adopted. However, this is rarely the case, and elsewhere, the condition or quantity of supply air to different areas or zones of the building must be varied accordingly. This can be done by providing either individual plants to each zone, or separate zone terminal control. Where there is a high density of rooms with similar ventilation requirements in an area of a building or department, it is usually economical to combine them into a central system.

2.54 In large buildings, a choice between a single distribution system and multiple smaller systems may arise. Large distribution systems and their plant can have the advantage of lower operating costs, but require more space for vertical shafts and horizontal distribution. In general, very long runs of ducting should be avoided to prevent undue heat losses or gains, excessive leakage, and difficulties in balancing during commissioning. As the pressure losses in the long runs will be greater and a higher initial static pressure will be required, this will lead to a more expensive class of ductwork. Multiple smaller distribution systems may be more expensive in capital and operating costs but they avoid long runs, large ducts and vertical shafts, and this may reduce overall building costs. They also provide a more robust service as the failure of an individual system does not prevent the use of the rest of the building.

Zoning of the building

2.55 The efficiency and effectiveness of any ventilation or air-conditioning installation depends largely on the zoning and control of the installation. The factors to consider when determining the zoning of a ventilation system for a building or department are:

- periods of occupancy;

- fresh air/ventilation requirements;
- smoke control.

2.56 Where the ventilation system is not merely tempering the air, but also providing the heating and/or cooling requirements, the following additional factors will need to be considered:

- internal or peripheral location;
- orientation of windows;
- variation in internal loads;
- level of control required.

2.57 For single zone plant in staff areas, local control (with a run-on timer if required) is recommended, as this can be turned off when the space is not in use, thus saving both thermal and electrical energy. Most supply and extract systems, conversely, are required to operate continuously while the department is occupied, thus some form of time or use control is necessary.

2.58 The control of individual plant items is covered in Section 4, with examples of typical control strategies in Section 6. For control of particular specialised ventilation and air-conditioning systems refer to Section 7 of this document.

2.59 On very rare occasions a duplicate standby air handling plant may be justified. If installed it must be provided with a gas-tight damper at its junction with the supply distribution duct, so that no back-flow can occur. Standby plants can become sources of contamination if warm moist air is allowed to dwell within them. Their design and control system must ensure that this cannot happen.

Specific requirements for hospital departments

2.60 Specific requirements for individual spaces and departments are included in the Health Building Notes (HBNs) and Activity Database (ADB) A-Sheets, or Scottish Health Planning Notes (SHPNs).

3. Assessment of service requirement

Selection of design criteria

External design conditions

3.1 The most accurate data that is available for the summer and winter conditions at the site should be used. The Metrological office can supply data for the United Kingdom.

3.2 Healthcare mechanical ventilation systems will normally be 'full fresh air'.

3.3 Local adjustments such as for height above sea level, exposure factor, or other climate peculiarities, should be made as appropriate.

Internal design conditions

3.4 The design conditions selected within patient areas must strike a balance between the comfort requirements of staff and patients, who often have very different levels of clothing and activity.

3.5 Recommendations for the dry resultant temperature and humidity of individual spaces are shown on Activity Database (ADB) A-Sheets. Table A1 gives a summary.

Minimum fresh air requirements

3.6 For most applications involving human occupancy, the dilution of body odours is the critical factor in determining ventilation requirements. Where natural ventilation or mechanical full fresh-air systems are used, all ventilation air will be fresh.

3.7 Where odour dilution is the overriding factor, it is recommended that 10 litres/second/person should be taken as the minimum ventilation rate.

3.8 Smoking is not permitted in healthcare premises. If permitted for example in residential care, it will be confined to designated areas. It therefore follows that these areas will contain a high percentage of smokers so the ventilation rate would be at least 36 litres/second/person for these applications (CIBSE Guide A; Table 1.10 refers).

3.9 In non-standard applications such as laboratories, aseptic suites, operating departments, etc., the particular requirements for each area should be considered independently in order to determine the overriding minimum requirement for ventilation.

Limiting supply air conditions

3.10 For most applications in healthcare buildings, it is the temperature differential between the supply and room air, rather than the actual temperature of the

supply air which is the critical factor. The maximum recommended supply-to-room air temperature differential is:

summer cooling: - 7K

winter heating: + 10K

3.11 It is also necessary to keep supply air humidity below 70% during winter in order to minimise risks associated with condensation.

Air purity

3.12 In healthcare premises, the standard of filtration will depend on the activities within the occupied spaces. With the exception of special areas, (for example manufacturing pharmacies), the requirement for aerobiological needs is not stringent and filtration is only required to:

- maintain hygienic conditions for the health and welfare of occupants, or for processes such as food preparation;
- protect finishes, fabrics and furnishings; to reduce redecoration costs;
- protect equipment either within the supply air system; that is, to prevent blocking of coils, or in the space itself to prevent dust collection.

3.13 Given that almost all viable particles will originate from the occupants of a space and not from the incoming air, dilution is the more important factor aerobiologically. Therefore, for general areas a G4 filter will be suitable. More critical areas will require a F7 filter. HEPA filters will only be required in Ultra Clean systems.

Humidity control requirements

3.14 Providing humidification is expensive in terms of plant, running costs and maintenance, and therefore its use should be restricted to where it is necessary for physiological or operational reasons.

3.15 Humidification was originally required for some healthcare applications, e.g. operating theatres, in order to control the risk associated with the use of flammable anaesthetic gases. The use of such gases has now ceased. Humidification is therefore no longer required unless there is a very specific application requirement.

Maximum noise levels

3.16 Noise will be generated in an air distribution system by the fan, ductwork fittings, dampers and grilles. The specified maximum noise level will depend on the activities within the occupied spaces.

3.17 The overall noise levels should not exceed the values given in Scottish Health Technical Memorandum 08-01: ‘Acoustics’, although general requirements are given in Table 3.

3.18 Attenuation should be incorporated into the ductwork system or plant arrangement as necessary to reduce noise from fans and plant items in order to achieve the acceptable limits within the rooms at the design air flows.

3.19 Plant noise should not be greater than 80dB(A) within the plant room from the fans, coolers, heaters, humidifiers etc. when starting up or running, and should be reduced to lower noise levels where the plant is near to departments sensitive to noise.

3.20 Attention must be given to the reduction of tonal components. High tonal components from air diffusers etc. can seriously disturb concentration over longer periods even when the overall noise level is low. Broadband noise causes less annoyance. Reference should be made to SHTM 08-01: 'Acoustics'.

3.21 The designer requires knowledge of the total hospital layout and operational policies, to assign acceptance magnitudes to all the possible noise sources, in order to arrive at the correct rating.

Room	Overall noise level - NR	Ventilation plant commissioning - NR	Ventilation plant design - NR
Operating department	50 (55)	45	40
Ward areas	33	30	30
Sanitary facilities	45	40	35
Industrial areas	50	45	40
Circulation areas	50	45	40

Table 3: Interior noise level

3.22 In Table 3, above, the overall noise level takes account of all internal and external noise sources. The commissioning noise level is the level measured with a sound level meter in the unoccupied room, taking account of the external noise together with the noise generated by the ventilation system. When occupied and in use, this commissioning level will constitute a continuous background noise which will allow the overall noise level to be achieved. The ventilation plant design noise level is that generated by the plant alone with no other noise source being considered. The levels suggested make recognised allowance for the ingress of environmental noise that must be considered in the overall design, that is, in specifying the attenuation of walls, partitions, ceilings, etc.

3.23 The recommended criterion is measured as the "A" weighted sound pressure level expressed in decibels, which should not be exceeded for more than 10% of the time.

3.24 The designer must also consider noise escaping to the external environment and this must not be unacceptable to occupants of adjacent buildings.

Calculation of building loads

Air infiltration

3.25 Air infiltration occurs due to a complex combination of wind pressure, thermal effects, location relative to other features and the construction standard of the building. The infiltration rate is governed by the size and number of openings in the building envelope and the complexity of internal air paths.

3.26 CIBSE Guide A (2006) Section 4 provides information and formulae for the calculation of air infiltration and natural ventilation of buildings. In all cases the requirements of the appropriate section of the Building (Scotland) Regulations must be met.

Summertime temperatures

3.27 The calculation method for determining the summertime temperature is described CIBSE Guide A (2006) Section 5. However, it is very important to select the time of day and time of year of peak loadings for the calculations. These will be dependent on the orientation and proportion of solar to total heat gain. In establishing outside design values, the design risk having regard to the function and occupancy of the building should be considered.

3.28 Where calculations indicate that internal temperatures will frequently exceed the selected design external shade temperature by more than 3K for a period that exceeds the building design risk, methods of reducing temperature rise should be implemented. Options include: - reducing solar and casual gains, the use of chilled beams or ceilings, increasing ventilation rates or providing mechanical cooling. In some situations it may be possible to alter the thermal mass of the structure to 'move' the peak temperature event time so that it occurs outside of the occupancy period. Calculations and thermal modelling should be undertaken to ensure that during the summertime internal temperatures in patient areas do not exceed 28°C dry bulb for more than 50 hours per year. It has been found that there is a relationship between preferred indoor temperatures and mean outside temperature. Fig A2 in CIBSE Guide A indicates this relationship.

Peak heating load

3.29 Peak heating local calculations are necessary on all mechanical supply systems to establish the size of heater batteries and subsequently the central plant.

3.30 Where ventilation systems provide tempered air to spaces that have supplementary LPHW to offset the building fabric losses, the plant heating load should be calculated based on the external winter design temperature, the design internal air temperature, and the calculated total air volume (including a suitable allowance for leakage).

3.31 Where the ventilation system is the only means of heating a space, an increase in load equivalent to the calculated fabric heat losses from the space should be added to the ventilation load. A check of supply temperature difference should

be made. If it exceeds 10K the ventilation supply volume should be increased to suit.

Condensation risk

3.32 A check should be made to ensure that the selected air condition will not lead to surface condensation on low-temperature elements of the ventilated space.

3.33 Where there are local sources of moisture that would require excessive levels of ventilation to avoid condensation, the designer should consider the capture and removal of moisture at the source of the evaporation via an exhaust hood or similar device.

3.34 In intermittently heated buildings, it is necessary to consider the condensation risk at night setback conditions as well as during normal operation. Calculation methods for this assessment are given in CIBSE Guide A.

Peak cooling load

3.35 In addition to the base data of airflow rates and temperatures, when calculating cooling loads, the designer must take into account:

- solar cooling loads;
- surface conduction cooling loads;
- internal gain cooling loads;
- cooling loads due to high-level humidity control;
- method of control of internal conditions;
- fluctuations in internal temperatures.

3.36 When the peak internal loads have been assessed and a suitable allowance made for non-coincidence, the supply temperature can be calculated.

3.37 Once the lowest required supply temperature of the air handling unit has been established, and an allowance made for temperature rise through the fan and ductwork (usually 1K for low pressure systems), the off-plant enthalpy can be established from a psychrometric chart or table.

3.38 The cooling loads for all plants on the chilled water system should be calculated at each of the individual peak times in order to establish accurately the required (diversified) capacity of the chiller.

Annual energy consumption

3.39 Annual energy consumptions of heating-only ventilation systems are simple to calculate based on supply-to-external air temperature rise, and frequency of occurrence of external temperatures as given in CIBSE Guide A.

3.40 Minimum air volumes are usually fixed by the room loads or fresh air requirements. However, the designer may increase airflow to some rooms or

zones in order to balance loads, as detailed in the following paragraphs on "Calculation of plant requirements."

3.41 The method of zoning and control can significantly influence energy consumption.

3.42 The nature of air-conditioning operation, comprising cooling and reheating for humidity or zonal temperature control, makes prediction of energy consumption very complex. It is imperative that these calculations are performed to ensure optimum energy efficiency.

3.43 The concept of load and plant operation charts is outlined in the CIBSE Guide A. The method requires the designer to establish the minimum and maximum loads on all zones across the range of external temperatures between winter and summer design conditions. Once the load chart is complete, the plant chart converts the loads to supply temperatures, which are then superimposed on external air temperatures.

3.44 When all temperatures for all zones are plotted on the plant operation chart, set points and resetting schedules can be established. From this information, the outputs of individual heaters, coolers and humidifiers can be established at any given external temperature. When those loads are computed against annual frequency of occurrence of external temperatures as given in CIBSE Guide A, the annual energy consumption of individual elements, and thus the air-conditioning system, can be established.

3.45 In order to prevent surface condensation occurring, it is necessary to provide sufficient ventilation to maintain the maximum and ambient dew-point temperature below the lowest surface temperature, the coldest usually being the glazing. Paragraphs 3.33 and 3.34 also refer.

Calculation of plant requirements

Air supply volumes

3.46 The minimum air supply volume for a room is determined by the greatest of these three criteria:

- the minimum fresh-air requirement;
- the minimum supply volume for the room load as determined by the maximum heating or cooling supply temperature differential;
- the desired/required air change rate.

Plant sizing

3.47 Once the design airflow has been established the cross-sectional area of the air-handling unit can be calculated based on a maximum coil face velocity of 2.0 m/s.

3.48 In order to establish the length of the air-handling unit, it will be necessary to refer to manufacturers' literature, ensuring all necessary access panels and components are included as detailed in Section 4.

3.49 The fan duty should be calculated by adding the resistances of all elements that contribute to the pressure drop of the index circuit.

3.50 The main elements that must be considered are:

- inlet or discharge louvres;
- plant entry and discharge;
- attenuators;
- components within the air-handling unit;
- duct-mounted heaters and filters (including a dust allowance);
- ductwork distribution;
- ductwork fittings, including: fire dampers, volume control dampers, bends and sets, tees, changes of section;
- air terminal device;
- discharge velocity.

3.51 Where packaged air-handling units are installed, the fan pressure drop is usually quoted as external plant resistance, and thus the designer does not need to calculate the resistances of individual plant items. The designer should, however, ensure that an allowance has been made for filter clogging; and confirm whether the fan pressure quoted is fan total or static pressure.

3.52 Resistances of ductwork and fittings may be obtained from the CIBSE Guide A. However, the designer should exercise some care when using tabulated pressure loss information for fittings that are relatively close together.

3.53 Upon completion of the resistance calculation exercise, the designer should make allowances for calculation and construction tolerances as indicated in Table 4.

Criteria	Low pressure systems	Medium/high pressure systems
Volume flow rate margin for leaking and balancing requirements	+5%	+5%
Total pressure loss margin A. for increase in volume flow rate (above)	+5%	+5%
B. for uncertainties in calculation	+5%	+10%
Combined total pressure loss margin	+10%	+15%

Table 4: Typical fan volume and pressure margins

Plantroom size and location

3.54 The ventilation plant and associated equipment should be positioned to give maximum reduction of noise and vibration transmitted to sensitive departments; while at the same time, achieve an economic solution for the distribution of services.

3.55 It is not recommended that noise and vibration generating plant be housed either directly above or below sensitive areas (for example, operating or anaesthetic rooms) unless there is no alternative, in which case, additional care and attention must be given to the control measures.

3.56 The plant must also be located so that it is remote from possible sources of contamination, heat gains and adverse weather conditions. The design should ensure that wind speed and direction have a minimal effect on plant throughput.

3.57 Safe access to and around plant is essential to facilitate inspection, routine maintenance, repair and plant replacement.

Provision of primary services

3.58 Where more than one air-handling plant requires cooling, remote central cooling plants with piped chilled water are preferred. In the case of a single plant, a multi-stage direct-expansion cooling coil with refrigerant piped from an adjacent compressor/condensing plant could be considered. If this option is selected, a refrigerant gas detector mounted in the base of the duct and an alarm system audible to the end-user will also need to be provided (as dictated by COSHH Regulations).

3.59 Clean dry steam is preferred for humidification, provided that the boiler water treatment does not render the steam unusable for direct humidification.

3.60 If a suitable supply of steam cannot be obtained from the steam main, a steam generator should be provided locally, or a self-generating humidifier installed. Electric humidifiers require considerable electrical loads and if a gas supply can be derived, this would be preferable. The location of a local steam generator is critical if condensate is to drain back into it.

Inlet and discharge sizing and location

3.61 Air intakes and discharge points should preferably be located at high level, to minimise the risks of noise nuisance to surrounding buildings, contamination and vandalism.

3.62 Intakes and discharges should be designed and located so that wind speed and direction have a minimal effect on the plant throughput.

3.63 Helicopter landing pads in the vicinity of ventilation intakes and discharges can result in large short-term pressure changes. This can cause pressure surges in supply systems and reverse airflows in extracts. Exhaust fumes from the helicopter may also be drawn into intakes. For general information, refer to Health Building Note (HBN) 15-03 – Hospital helipads.

3.64 Intake points should also be situated away from cooling towers, boiler flues, vents from oil storage tanks, fume cupboards and other discharges of contaminated air, vapours and gases, and places where vehicle exhaust gases may be drawn in.

3.65 Where intakes have necessarily to be sited at or near ground level, the area around them should be paved or concreted to prevent soil or vegetation being drawn in. They should also be caged or located within a compound to prevent rubbish being left in the vicinity. The likely proximity of vehicle exhausts should also be taken into account when determining the protected area around the intake.

3.66 The discharge from an extract system must be located so that vitiated air cannot be drawn back into the supply air intake or any other fresh-air inlet. Ideally, the extract discharge will be located on a different face of the building from the supply intake(s). In any event, there must be a minimum separation of 4 metres between them, with the discharge mounted at a higher level than the intake.

3.67 Discharges from LEV systems should preferably be vertical and usually not less than 3m above roof level. They should not be fitted with a cowl that could cause the discharge to be deflected downwards.

3.68 Each intake and discharge point should be fitted with corrosion-resistant weatherproof louvres or cowls to protect the system from driving rain. Louvres should be sized based on a maximum face velocity of 2 m/s in order to prevent excessive noise generation and pressure loss.

3.69 The inside of the louvres should be fitted with a mesh of not less than 6mm and not more than 12mm to prevent leaves being drawn in and infestation by vermin.

3.70 The duct behind louvres should be self-draining. If this is not practicable, it should be tanked and provided with a drainage system.

3.71 Cleaning access must be provided either from the outside via hinged louvres or by access doors in the plenum behind the louvre. Where a common plenum is provided, cleaning access should be via a walk-in door.

Heat rejection devices

3.72 The design conditions given in Section 2 make no allowance for the elevated temperatures that can occur on the roof of buildings. Refrigeration condensers should, if practicable, be shaded from direct solar radiation, or the design adjusted to take account of the gain.

3.73 Air-cooled condensers must always be the first choice for heat rejection from any refrigeration plant. Evaporative cooling systems must not be used in healthcare premises.

3.74 Reference should be made to Scottish Health Technical Memorandum 04-01: 'The Control of *Legionella*, hygiene, 'Safe' hot water, cold water and drinking

water systems, Part A: Design, Installation and Testing, and Part B: Operational Management, published by Health Facilities Scotland, 2011.

A46676816

4. Air handling unit design and specification guidance

General requirements

Location and access

4.1 Air-handling units should be located in an accessible area secured from unauthorised entry. Siting units in ceiling voids above occupied spaces is not appropriate.

4.2 Units located on roofs must have a safe means of access together with suitable precautions to prevent personnel or equipment falling or being blown off during maintenance activities.

4.3 Units located at ground level should be secured within a locked compound to prevent unauthorised access. Measures should be taken to exclude vehicles from the vicinity to ensure that exhaust fumes will not be drawn into intakes.

4.4 Units may have a working life of approximately 20 years. It can be anticipated that over this period there will be a need to access every element within the unit for deep cleaning. It is also quite possible that the main fan and individual heater and chiller batteries will need replacement. Suitably positioned service connection joints and adequate spacing should permit these items to be withdrawn without the need to dismantle other installed plant or equipment. Batteries significantly wider than 1 metre should be split to permit withdrawal from both sides.

4.5 It is essential that air-handling units are positioned so that all parts are easily and safely accessible for routine inspection and service. If a unit is located against a wall or backs onto another unit then access to all parts must be available from the front. Units greater than 1 metre wide should preferably have access from both sides or access doors large enough to permit the full and safe entry of maintenance personnel.

4.6 Water may be used during routine cleaning or spilt when maintenance is being undertaken. The area around the unit should be tanked to prevent water penetration to adjacent areas and adequately drained.

4.7 Fire precautions should be incorporated in accordance with Firecode. Guidance is available in BS5588: Part 9 and Sections 5 and 6 of this document.

4.8 Combustion equipment must not be located in a fire compartment that houses air-handling equipment.

Technical requirements

4.9 The basic technical requirements of the whole of the ventilation system should meet the relevant clauses of the Model Engineering Specification. It should be noted that the Specification contains a menu of clauses that cover a wide range

of applications, so it is important to select only those that are relevant to the specific application.

Note 1: At the time of writing, Model Engineering Specification C04 was listed for revision in order to bring it into line with the revised standards as set out in this Scottish Health Technical Memorandum. Where conflicts in specification arise, the Scottish Health Technical Memorandum takes precedence.

4.10 It is essential that the main plant/ductwork is located far enough above the floor to permit the correct installation of drainage systems for cooling coils, humidifiers and heat recovery systems. Easy access for maintenance of drainage systems and their associated pipework must be provided.

4.11 Organic materials or substances that can support the growth of microorganisms must not be used in the construction of the plant or its distribution system. The water fittings and materials directory lists suitable materials for sealants and gaskets.

4.12 The plant and its distribution system must not contain any material or substance that could cause or support combustion.

4.13 Plants should have a high standard of air-tightness. The double-skin method of construction with insulation sandwiched between two metal faces is recommended. The panels may be available in a variety of colours at no additional cost. This can aid identification by colour coding of units in a plant room (for example green for general ventilation; blue for theatres; red for laboratories and isolation facilities; grey for extract etc).

4.14 The inside of the plant should be as smooth as possible. Channels, rolled angles or formed sections that could trap or hold moisture should be kept to a minimum. If stiffeners are required, they should be fitted externally. If internal bracing has to be fitted it must be of a design that will not trap or hold moisture.

4.15 Airflow across air treatment components such as filters, heat exchangers and humidifiers will be influenced by the pattern of the approaching airstream. If unsatisfactory conditions are created, the performance of the component will be reduced.

4.16 Access to items that require routine service such as filters, frost batteries and chiller batteries should be via hinged doors. The doors should be large enough (for example 500mm minimum) to allow easy access. Items requiring infrequent access such as attenuators may be via bolted-on, lift-off panels. All doors and panels should be close-fitting and without leaks.

4.17 Care should be taken during installation to ensure that electrical and mechanical services are not installed in positions that will reduce or impede access.

4.18 It can be difficult to turn off AHUs in order to inspect filters and drainage trays. Viewing ports and internal illumination will therefore facilitate routine inspection of such items. Viewing ports should be at a convenient height so that temporary ladders are not required. Internal illumination should be provided by

fittings to at least IP55 rating. Fittings should be positioned so that they provide both illumination for inspection and task lighting. All of the lights in a unit should be operated by a single switch.

4.19 Access to AHUs and items in the distribution system such as filters or heater / chiller batteries should be via fixed ladders and platforms or pulpit-style moveable steps. The installation of distribution ductwork and other electrical or mechanical services should provide sufficient clearance to allow the pulpit steps to be easily wheeled into position.

AHU drainage system

4.20 All items of plant that could produce moisture must be provided with a drainage system. The system will comprise a drip tray, glass trap, air break and associated drainage pipework.

4.21 The drip-tray should be constructed of a corrosion-resistant material (stainless steel is preferred) and be so arranged that it will completely drain. To prevent 'pooling', it is essential that the drain connection should not have an upstand; and that a slope of approximately 1 in 20 in all directions should be incorporated to the drain outlet position. The tray must be completely accessible or, for smaller units, easily removable for inspection and cleaning.

4.22 Each drip tray should be provided with its own drain trap. The drain trap should be of the clear (borosilicate) glass type. This permits the colour of the water seal to be observed thus giving an early indication of corrosion, biological activity or contamination within the duct. The trap should have a means for filling and incorporate couplings to facilitate removal for cleaning. It should be located in an easily visible position where it will not be subject to casual knocks. The pipework connecting it to the drainage tray should have a continuous fall of not less that 1 in 20.

4.23 Traps fitted to plant located outside or in unheated plant rooms may need to be trace-heated in winter. The trace-heating must not raise the temperature of water in the trap above 5°C.

4.24 Water from each trap must discharge via a clear air gap of at least 15mm above the unrestricted spill-over level of either an open tundish connected to a foul drainage stack via a second trap, or a floor gully (or channel). A support should be provided to ensure that the air gap cannot be reduced. More than one drain trap may discharge into the tundish providing each has its own air break.

4.25 Drainage pipework may be thermoplastic, copper or stainless steel. Glass should not be used. The pipework should be a minimum diameter of 22mm and a fall of at least 1 in 60 in the direction of flow. It should be well supported and located so as not to inhibit access to the AHU.

Layout of air handling unit

4.26 The AHU should be arranged so that the majority of items are under positive pressure. Any item of plant requiring a drain should be on the positive pressure side of the fan. A recommended layout is given in schematic from in Figure 3.

4.27 A separate extract unit will generally be required for the area served by each supply unit.

4.28 An energy recovery system will normally be fitted between the supply and extract units.

Provision of dampers

4.29 Fire- or smoke-actuated dampers shall be provided at the locations required by Firecode. (See Paragraphs 5.17 - 5.21).

4.30 Motorised low-leakage shut-off dampers should be located immediately behind the intake and discharge of each supply and extract system respectively. They should be of the opposed-blade type, opening through a full 90° and must close automatically in the event of power failure or plant shutdown to prevent any reversal of the system airflow.

4.31 The quality of motorised dampers is critical. They should be rigid, with square connections fitted with end and edge seals of a flexible material and with minimal play in linkages. The leakage on shut-off should be less than 2%.

4.32 A manually operated isolating damper should be installed between the main AHU and its distribution system to enable the unit to be isolated when cleaning is in progress.

4.33 Good practice will require the fitting of a main volume control damper so that the design airflow rate can be set at commissioning. The damper should be lockable in any position. If it will also be used for plant isolation, it should be capable of being reset to give the design airflow without the need for re-measurement.

4.34 Internal plant isolating dampers or provision for the fitting of shut-off plates between items within a unit are not required.

Vibration

4.35 Vibration from a remote plantroom can be transmitted by the structure of the building, may be regenerated and may sometimes be magnified many times. Units should be selected to have the minimum vibration generation and installed on suitable anti-vibration mounts. Pipe and ductwork should incorporate anti-vibration couplings, preferably in two planes at right angles, as close to the vibration source as possible. Consideration should be given to the use of anti-vibration pipe hangers and supports.

Sequence of components

4.36 The following arrangement of plant components is typical although in many instances not all elements will be required:

- fresh air intake;
- motorised isolation damper;

- frost / fog coil;
- pre-filter;
- energy-recovery device;
- attenuator;
- fan;
- blast plate;
- attenuator;
- chiller battery;
- eliminator;
- heater battery;
- humidifier;
- final filter;
- isolation / volume control damper.

Note 2: Attenuators may be located in the intake and discharge duct if they are of a suitable type (See Paragraphs 4.159 - 4.162)

There may be instances where the above arrangement is not appropriate and the plant arrangement should be planned accordingly.

Fans

General requirements

4.37 The fan should be selected for good efficiency and minimum noise level, but the overriding factor should be the selection of a fan characteristic such that the air quantity is not greatly affected by system pressure changes due to filters becoming dirty or external wind effects.

Acceptable types

4.38 Fans can be of the axial, centrifugal, cross-flow, mixed-flow or propeller type, depending upon the requirements of the system.

4.39 Where used, centrifugal fans should preferably be of the backward-blade type. Alternatively, where noise levels are more critical and pressure requirements are lower, forward-curved blade fans are acceptable. For high-power applications, aerofoil-blade fans may be appropriate.

Selection

4.40 Generally, large ventilation systems will use centrifugal fans due to their efficiency, non-overloading characteristics, and developed pressures.

4.41 Forward curved centrifugal fans can overload if allowed to handle more air than they are designed for.

4.42 Alternatively, it may be appropriate to use mixed flow fans in high-pressure systems.

4.43 Axial flow or propeller fans are generally only used in local through-the-wall systems, or systems with very low pressure requirements.

4.44 Cross-flow fans have very low operating efficiencies, and thus their use is restricted to applications such as fan coil units.

Location and connection

4.45 Fans are normally positioned to 'blow through' the central plant so that the cooling coil and humidifier drains will be under positive pressure.

4.46 The fan performance figures given by manufacturers in their catalogue data are based on tests carried out under ideal conditions, which include long uniform ducts on the fan inlet/outlet. These standard test connections are unlikely to occur in practice, the designer should therefore ensure as far as is practical that the fan performance will not be significantly de-rated by the system. This objective can be approached by ensuring that the fan inlet flow conditions comprise uniform axial flow velocities with low levels of turbulence.

4.47 Where the outlet duct is larger than the fan discharge connections, there should be a gradual transition, with a following section of straight duct, having a length equivalent to three duct diameters.

4.48 The design of the fan intake connection must be carefully considered to avoid swirl in the airstream. When the air spins in the same direction as the impeller, the performance and power consumption of the fan are reduced. When the air spins in the opposite direction to the impeller the power consumption and noise will increase with hardly any pressure increase. Airstream swirl is usually induced by large variations across the fan intake caused by the air passing round a tight bend immediately before the intake.

4.49 Where a centrifugal fan is located with an open intake, the clear distance between the suction opening and the nearest wall should be not less than half the diameter of the inlet. If two fans with free inlets are positioned within the same chamber, their adjacent suction openings should be at least 1 diameter apart.

4.50 Airtight flexible joints should be provided at fan inlet and outlet connections. They should be equal in cross-section to the points of connection and be neither longer than 200mm nor shorter than 100mm.

4.51 For centrifugal fans, a diffuser screen / blast plate should be fitted immediately downstream of their discharge.

Supply fan drive arrangements

4.52 Where the fan drive is via a motor-driven belt and pulley, it should be external to the air stream. This arrangement has the following advantages:

- the fire risk is reduced;
- the drive is visible so it is simple to check that the belt is still there;
- particles shed from the drive belt are outside of the air stream;
- if the belt slips, the “burning rubber smell” is not transmitted down into occupied areas of the premises;
- noise generated by the motor and drive will not be transmitted along the ductwork;
- waste heat is excluded from the system;
- the drive may be through a vee or toothed belt and pulley. The latter have the advantage of eliminating belt squeal on start up and have a longer service life. They are particularly suitable where the fan drive motor is fitted with a soft start and should be located external to the air stream.

4.53 The drive train should be easily visible without the need to remove access covers. Protecting the drive train with a mesh guard is the preferred option. For weatherproof units designed to be located outside, the fan drive will be external to the duct but enclosed. It should be easily visible through a viewing port with internal illumination and access via a lockable hinged door.

4.54 For direct-coupled fan and motor units, the motor should be out of the air stream.

4.55 For induction drive ‘plug’ motor arrangements (where the motor is fitted within the fan and is integral to it) and in line axial fans with a pod motor; the fan / motor combination may be within the air stream provided the motor windings are protected from over temperature by a thermister and lockout relay.

Extract fan drive arrangements

4.56 The preferred method where the fan drive is via a motor driven belt and pulley arrangement will be to locate it external to the air stream.

4.57 The fan drive and motor may be located inside the duct within the air stream provided the motor windings are protected from over-temperature by a thermister and lockout. The drive train should be easily visible through a viewing port, have internal illumination and access via a lockable hinged door.

4.58 Where the system air is explosive, aggressive or has high moisture content, the extract fan motor must be located outside the air stream. This is generally achieved with axial fans by using a bifurcated unit.

Control

4.59 Fans in healthcare applications are normally either single or two-speed. Where there is a requirement for two-speed operation, this is generally via a local user control (for example, in a hood extract system to provide a boost facility) or via a time schedule for energy saving during unoccupied periods.

4.60 Normally only a single motor is required with a standby motor available for fitting as necessary or fitted but not belted. Twin, run and standby motors - with the standby being jockeyed around - are not required.

4.61 Where there is a specified requirement for standby fans, the system should incorporate an automatic changeover facility activated via an airflow sensor. Fault indication should be provided.

4.62 The control of fans in terms of start-up and run is increasingly being vested in computer software. Inverter-drive, variable-speed, soft-start systems are becoming a standard approach. It should be remembered that most healthcare applications require known amounts of air to be delivered while the system is in use. Constant volume systems that deliver specified air-change rates are therefore the norm. Duct- or room-pressure-controlled, variable-speed systems have a very limited application in healthcare.

4.63 It is necessary to ensure that - should the computer control system or its software develop a fault - then the fan can be switched to a direct-start, fixed-speed, manual operation. This is particularly important for critical care systems serving operating suites, high-dependency care units of any type, patient isolation facilities, laboratories and pharmaceutical production suites. Off-site software support is no substitute for the ability of on site staff to override the automatic control and keep the system operating in an emergency. Under these circumstances actions that may shorten the life of the plant are considered of secondary importance to that of preserving the health and safety of patients and staff.

Heater batteries / heater coils

General requirements

4.64 Frost batteries are installed to protect the downstream filters from low-temperature, high-humidity intake air conditions. As they handle unfiltered air they should be constructed of plain tubing without fins and be as near to the outside as possible to minimise condensation during cold weather. Access for cleaning will need to be provided to both sides of the coil.

4.65 Where steam coils are used for a frost battery, they may be constructed using spiral-finned copper tube. As they will be prone to fouling the tube layout and spacing should permit easy access for regular cleaning.

4.66 Main and branch heater-batteries should be constructed of solid-drawn copper-tube coils with copper fins, generally connected in parallel.

4.67 Where there is a wet heating system in the areas served, the main heater-battery should be sized for the ventilation requirements only, and not for the fabric loss.

4.68 Access for cleaning must be provided to both sides of all frost batteries and heater-batteries.

Acceptable types

4.69 Electric, water or steam heater-batteries may be considered. However, electric heater-batteries are expensive to operate and where there are alternatives, their use should be restricted to low-power use (for example trimming control).

4.70 Where steam-supplied heater-batteries are used, their control, venting and trapping systems should be designed so that a vacuum cannot occur within the coil. The condensate drainage arrangements should not allow pressure to build in the main resulting in a back-up of condensate in the coil.

Location

4.71 Where possible, wet-trimmer heater-batteries should be located in plant areas.

4.72 Where it is necessary to locate heater-batteries in false ceilings etc, consideration should be given to the use of electric heaters. If this is not practicable, drip-trays should be installed under both the battery and the control valve assembly to protect the ceiling. A moisture sensor and alarm should be fitted in the tray. In any event, to facilitate maintenance access, they should be located above corridors or other non-critical areas and never above patient occupied spaces.

4.73 Auxiliary fan coil units should not be installed in the ceiling above an occupied space. They should be accessible for routine maintenance and cleaning without the need to cause significant disruption to the operation of the department that they serve.

Control

4.74 LPHW frost coils should be controlled by an off-coil temperature sensor operating a motorised valve to provide a minimum plant “on temperature” of between 2°C and 5°C. The off-coil temperature of the frost coil is generally sensed by a serpentine thermostat downstream of the coil or upstream of the next plant item. This thermostat will shut the fan down if any part of the air stream is below the minimum set-point.

4.75 Steam-supplied frost coils should be fitted with an on/off control operated by a temperature sensor mounted upstream of the battery. These are normally set to open the control valve fully when the outside temperature drops to +1°C. This will ensure that there is no standing condensate in the base of the coil.

4.76 The main heater-battery should be controlled in the same manner under the dictates of either an off-coil temperature sensor, or a room temperature sensor, depending on the plant configuration and method of control. Trimmer heater-

batteries are generally controlled by one or more averaging temperature sensors within the room or rooms in the zone.

4.77 Heater-battery control valves should drive to a closed position on system shutdown or fan failure. The control system should then automatically set to provide frost protection.

Cooling coils

General requirements

4.78 Cooling coils will need to be decontaminated periodically. They must have good access both up and downstream. Hinged access doors with viewing ports and illumination inside the duct should be provided both sides of the coil.

4.79 An eliminator will be required downstream of all cooling coils. The eliminator may take the form of an extension of the coil fins or be a separate device. If a separate device it should be removable as a unit to permit cleaning of the coil face.

4.81 4.80 All cooling coils must be fitted with their own independent drainage system as specified above. A baffle or similar device must be provided in the drip tray to prevent air bypassing the coil. The tray should be large enough to capture the moisture from the eliminator, bends and headers. Where coils are greater than 1m high, intermediate drip-trays will be required.

4.82 Condensate traps manufactured from Borosilicate Glass will allow easy visual inspection and incorporate a self-cleaning smooth non-porous internal surface, complying with ISO 3585 and BS2589 Part 1.

Selection

4.83 Cooling coils supplied with chilled water are the preferred option. For small loads or where chilled water is not available, direct expansion coils may be used.

4.84 Care must be taken in selection to minimise electrolytic action resulting from condensation on the airside. Coils constructed from copper tubes with copper fins extended on the downstream side in the form of an eliminator and electro-tinned after manufacture are preferred. Aluminium fins should only be used if vinyl-coated.

4.85 All parts of the coil and its associated ductwork in contact with moisture must be manufactured from corrosion-resistant materials. Pressed steel coil headers, even if treated, have been shown to be prone to corrosion over time and should not be used. Steel mounting frames and casings present similar problems hence stainless steel is preferred.

Location

4.86 Microorganisms that multiply in moisture cannot be avoided when the coil is dehumidifying. However, locating the final filter downstream of the coils will reduce the risk of infection.

4.87 Cooling coils in AHUs should be located upstream of the final filter.

4.88 Where any cooling coil has to be located above a ceiling, drip-trays should be installed under both the coil and the control valve assembly to protect the ceiling. A moisture sensor and alarm should be fitted in the tray. To facilitate maintenance access, they should be located above corridors or other non-critical areas and never above patient occupied spaces.

Control

4.89 There are two basic methods of control for cooling coils:

- off-coil control – used in multi-zone systems or single-zone systems where close humidity control is required, to provide a constant maximum off-plant condition which satisfies the temperature and high humidity requirements of the zone with the highest load;
- sequential control – used in single-zone systems, or multi-zone systems with averaging sensors where close control is not required. A room or duct temperature sensor controls the cooling coil and heater battery in sequence to maintain constant room conditions.

4.90 The advantage of off-coil control is that accurate humidity control can be provided without relying on humidity sensors, which are prone to inaccuracy and drift. Off-coil control is however, expensive to operate in terms of energy consumption, due to the fact that there is no feedback of room loads, and thus at low loads and in systems where there are large zonal variations, significant over-cooling and reheating will occur.

4.91 On systems with two-speed operating, it is usual to isolate the cooling coil upon selection of low speed. In addition, on system shutdown, low airflow or fan failure, the cooling coil must be isolated.

Humidifiers

Design need

4.92 Humidification was originally required for some healthcare applications in order to control the risk associated with the use of flammable anaesthetic gases. The use of such gases has now ceased. Humidification is therefore no longer required unless there is a very specific application requirement.

4.93 Operating-theatre AHUs do not generally require humidifiers but provision for their retrofitting in terms of space provision and a capped drainage system should be provided.

4.94 Where humidification is required, it will be subject to the specific requirements set out below. These are intended to ensure that the unit will operate safely and not become a source of contamination.

General requirements

4.95 The most important requirement for a humidifier is to create complete mixing of the steam with the air. The manufacturers' instructions should be followed regarding minimum distances which should be allowed before bends or other components. This is particularly important with respect to a filter mounted downstream. If it becomes saturated by the humidifier, organisms can grow through the filter and be released into the duct. These may then be carried on the airstream into an occupied space.

4.96 The section of ductwork containing the humidifier may need to be periodically decontaminated. Hinged access doors with viewing ports and internal illumination should be provided. A label warning that the device emits live steam and should be isolated prior to opening should be affixed to the access door.

4.97 All parts of the humidifier and its associated ductwork in contact with moisture must be manufactured from corrosion-resistant materials. Stainless steel is preferred.

4.98 The electrodes of self-generating electrode-boiler type humidifiers should be stainless steel.

4.99 All humidifiers must be fitted with their own independent drainage systems as detailed in Paragraphs 4.20 - 4.25 or 4.72 and 4.87.

4.100 For self- and locally-generated steam humidifiers, the cleanliness of the water supply is essential for their safe operation. Provision should be made for draining down supply pipework and break tanks for periodic disinfection and cleaning during periods when they are not required in service.

4.101 The addition of treatment chemicals for continuous control of water quality for humidifier/air handling units should be avoided. Consideration could be given to installing a UV system to control microbiological growth. Given the limitations of UV systems, however, this will require filtration to high quality to ensure the effectiveness of exposure of organisms to the UV irradiation. As with all water treatment systems the unit should be of proven efficacy and incorporate UV monitors so that any loss of transmission can be detected.

Acceptable types

4.102 Only steam-injection manifold-type humidifiers are considered suitable for use in health building air-conditioning systems. Water humidifiers of any type should not be used.

4.103 Steam may be derived from the central steam supply provided that it does not contain any treatment carry-over, or generated locally either within or adjacent to the humidifier.

4.104 The introduction of steam should be by an appliance specially designed to discharge dry steam into the air-conditioning system without objectionable noise or carry-over of moisture.

4.105 During the design stage, consideration should be given to the proposed methods for the regular cleansing of the humidifier(s) and their components.

Selection

4.106 The number and length of steam-injection manifolds to be used is dependent on various factors such as duct cross-sectional area, air velocity, dry-bulb temperature and manifold design. Guidance from the manufacturer should be followed closely.

4.107 A mains steam humidifier can be noisy and will be difficult to control if it is operated at an excessive steam pressure. It should be sized for an operating pressure of approximately 1 bar. The pipework supplying it should be provided with a dirt pocket, pressure reducing valve and steam trap installed as close as practicable to the humidifier, so that the steam condition at entry is as dry as possible. A temperature switch on the condensate line (or equivalent design provision by the humidifier manufacturer) should be incorporated to prevent 'spitting' on start-up.

4.108 Most operational problems with mains steam humidifiers arise because of back-pressure in the condensate discharge line which will result in flooding into the duct. Unless the condensate from the device can be discharged and collected at atmospheric pressure, it should be discharged directly to drain.

4.109 A local steam generator, where used, must be fed with potable quality water. Additional water treatment to the standard set out above may be required. If the humidifier is unused for a period exceeding 48 hours, it must automatically drain its water content, including that contained in the supply pipework, right back to the running main and leave itself empty.

4.110 Some steam generators are of a type that requires regular cleaning and descaling. The design must allow for them to be installed such that they can be physically isolated from the air duct in order to prevent contamination of the supply by cleaning agents while this is taking place.

Location

4.111 Careful siting of the humidifier injection manifold is required to prevent the steam impinging onto the side(s) of the duct, condensing and generating excess moisture.

Control

4.112 Accurate humidity control can only be provided on single-zone systems, or multi-zone systems with zonal humidifiers. In the above systems, humidity sensors control the humidifier for low-level humidity control, and override the temperature controls to open the cooling coil valve for high-limit humidity control.

4.113 Multi-zone systems are more usually controlled by a minimum humidity sensor located in the supply duct(s) following the last heater-battery.

4.114 Overriding controls separate from the normal plant humidistat should be installed. Their purpose is to prevent excessive condensation in the conditioned space when starting up. A time delay should be incorporated into the humidifier control system such that the humidifier does not start until 30 minutes after the ventilation/plant start-up. In addition, a high-limit humidistat should be installed to limit the output of the humidifier so that the saturation in the duct does not exceed 70%. This humidistat is to control the added moisture. It is not necessary to install a de-humidifier to reduce the humidity of the incoming air if it already exceeds 70%. The humidifier control system should ensure that the humidifier is switched off when the fan is not running.

4.115 On systems with two-speed operating, it is usual to isolate the humidifier upon selection of low speed. In addition, on system shutdown, low airflow or fan failure, the humidifier should be isolated.

Filtration

General requirements

4.116 The purpose of filtration is to reduce the level of airborne contamination in an air stream. It is generally carried out in stages.

4.117 Filters must be securely housed and sealed in well-fitting frames that minimise air by pass. Air by pass significantly reduces filter efficiency, the higher the filter grade the greater the effect. Mounting frames should be designed so that the air flow pushes the filter into its housing to help minimise air bypass. Mounting frames that withdraw so that the filter can be changed without having to reach into the unit are preferred.

4.118 Neither the filter media, nor any material used in the construction of the filters, should be capable of sustaining combustion. The filter media should be such that particles of it do not detach and become carried away by the airflow.

4.119 Filters need to be readily accessible for replacement so a hinged access door should be provided. The upstream side of the filter should be visible for inspection through a viewing port with internal illumination.

4.120 All filters should be provided with a means of visually checking the differential pressure across them. Direct-reading dial-type gauges marked with clean and dirty sectors are preferred.

4.121 A complete spare set of filters must be provided at handover.

Definition of filter terms

4.122 Particulate air filters are divided into four categories:

- general ventilation filters grades G1 to G4;

- fine filters grades F5 to F9;
- high efficiency particulate filters (HEPA) graded H10 to H14;
- ultra-low particulate air filters (ULPA) graded U15 to U17.

4.123 General filters are graded in terms of their 'Synthetic dust weight 'Arrestance'. This represents the percentage of a test dust captured by a filter. 'Arrestance' provides a good indication of a filter's ability to remove the larger, heavier particles found in outdoor air. These are of a size to block finned batteries and large enough to settle out in the air distribution system.

BS EN 779 grade (Eurovent grade)	% Arrestance	Notes and typical healthcare application
G1 - (EU1)	< 65	Metal mesh grease filter
G2 - (EU2)	65 to < 80	Coarse primary filter
G3 - (EU3)	80 to < 90	Primary air intake; return air; energy recovery device protection
G4 - (EU4)	> 90	General purpose tempered air supply

Table 4: General Filters

4.124 Fine filters are graded in terms of their 'Atmospheric dust spot Efficiency'. This is a measure of the filter's ability to remove the very fine staining particles found in outdoor air. It will indicate how 'visibly' clean a filter will keep a ventilated space. The staining particles are approximately the same size as most common bacteria so it is also a rough measure of the filter's ability to remove microorganisms.

BS EN 779 grade (Eurovent grade)	% Efficiency	Notes and typical healthcare applications
F5 - (EU5)	40 to 60	General purpose panel / bag filter
F6 - (EU6)	60 to < 80	Basic grade bag filter
F7 - (EU7)	80 to < 90	Medium grade bag or pleated paper Conventional operating theatre supply air
F8 - (EU8)	90 to < 95	High grade bag or pleated paper
F9 - (EU9)	> 95	Basic HEPA filter – Level 8 clean rooms

Table 5: Fine Filters

4.125 High efficiency filters (HEPA and ULPA) are graded in terms of their ability to capture their 'Most Penetrating Particle Size' (MPPS). High-efficiency filters self-select the particle that they are least able to trap, hence the MPPS. They are then tested against that size of particle. These filters are designed to provide very high-efficiency filtration of particles in the sub-micron size range.

BS EN 1822 grade (Eurovent grade)	% Efficiency @ MPPS	Notes and typical healthcare application
H10 - (EU10)	85	Ultra-clean theatre terminal
H11 - (EU11)	95	
H12 - (EU12)	99.5	
H13 - (EU13)	99.95	
H14 - (EU14)	99.995	Pharmacy aseptic suite Category 3 room extract
U15 – U17	-	Not generally used in healthcare

Table 6: High Efficiency (HEPA) Particulate Filters

Selection primary filters

4.126 All filters should be of the dry type. Panel filters are cheap and disposable with relatively low dust-holding capacity. They are generally used as pre-filters to eliminate large particles that would otherwise clog or cause damage to the fan and finned heating and cooling batteries. Stainless steel frames that hold disposable pre-cut filter pads are preferred.

4.127 General ventilation supply plant should incorporate primary air filters of grade G3, sized for a maximum face velocity of 2.0 m/s. Additional coarse pre-filters may be justified where the intake air is exceptionally polluted. They are sometimes fitted as a temporary measure when building work is being carried out in the vicinity of the air intake.

Secondary filters

4.128 Where a higher standard of filtration is required, secondary bag or pleated paper panel filters would be used. Rigid frame filters incorporating pleated paper elements are preferred over bag filters for critical care applications such as operating theatres.

4.129 In urban or other areas of high atmospheric pollution, a higher standard of filtration may be justified to reduce the level of staining to internal finishes.

Extract air filters

4.130 Extract filtration will generally only be required where heat-recovery devices are installed. There are a very limited number of specialised applications (microbiological safety cabinets and similar LEV systems) where contaminated air is required to be filtered prior to discharge to atmosphere. If it is safe for staff to work in a room without wearing respiratory protective equipment, it is safe to discharge the room air to atmosphere without filtration.

Return-air filters

4.131 They are used to reduce the load on HEPA filters in recirculating applications such as Ultra Clean operating suite ventilation canopies and pharmacy aseptic suites.

High-efficiency filters – HEPA and ULPA

4.132 HEPA filters are expensive so their use should be kept to a minimum. Applications requiring HEPA filters include the air supply to aseptic suites in manufacturing pharmacies, the discharges from microbiological safety cabinets and isolation facilities.

4.133 If used, HEPA filters should be of the replaceable panel type with leak-proof seals. They should be installed in a manner that permits on-site validation of the filter and its housing. This may involve the release of a Dispersed Oil Particle (DOP) challenge smoke through an injection point upstream of the filter and a measurement of the DOP penetration across the downstream face. Alternatively a particle-counting method may be used.

4.134 HEPA filters are sometimes fitted in extract systems to capture hazardous substances or organisms. Design provision must be made for the subsequent safe handling of contaminated filters by maintenance staff. This may be achieved by:

- sealing the hazardous substance into the filter before it is removed;
- providing a system to fumigate the filter to kill any organisms;
- housing it in a ”safe change” unit that permits the filter to be ejected into a bag and sealed without staff having to come into direct contact with it.

4.135 In view of the costs and problems associated with placing HEPA filters in extracts, it is recommended that a full risk assessment be carried out at the design stage. This should include defining the true need for HEPA filters in an extract; validation of its performance at installation; the method of safely changing a contaminated filter; and its subsequent disposal.

4.136 ULPA filters are very expensive and are designed to remove particles below a size that are either surgically or aerobiologically significant. There would have to be exceptional circumstances in order to justify their use in healthcare ventilation systems.

Activated carbon filters

4.137 Activated carbon filters are able to remove gases and vapours from an air stream and are graded according to the range of substances they can remove. They are not normally fitted in air-conditioning supply systems.

4.138 They are occasionally fitted retrospectively because the main air intake has been poorly sited and is drawing in traffic fumes. Where used they must be protected by a particulate air filter.

4.139 Activated carbon filters are more commonly used in specialised fume extraction systems when the location of the discharge means that dilution cannot be relied upon to disperse noxious fumes.

Location

4.140 The primary filter should be positioned on the inlet side of the supply fan, downstream of the frost coil. The secondary filter, when fitted, should be on the positive-pressure side of the fan. This will prevent air being drawn into the system after the filter and capture any particles shed by items of equipment within the AHU.

4.141 The filter installation must be arranged to provide easy access to filter media for cleaning, removal or replacement, with side or front withdrawal as required.

Control

4.142 Differential-pressure transducers should be provided to monitor and alarm remotely on excessive filter pressure drop. In critical areas dirty-filter indication lights should be provided at the point-of-use.

Energy-recovery

General requirements

4.143 Energy recovery will normally be fitted to all healthcare ventilation systems. It may be omitted only where it would clearly be uneconomic. Where the economic case is marginal, space should be allowed for the retrofitting of an energy recovery system.

4.144 For systems in healthcare premises, a plate heat exchanger or 'run-around coil' system is suitable. Thermal wheels may be used providing they are fitted with a purge sector. The small amounts of air leakage across those devices are not considered significant. Other systems such as heat pumps or heat pipes are also suitable. Selection should be based on relative locations of the supply and extract units, ease of maintenance and practicality. Cleaning access will be required to both sides of any energy-recovery device.

4.145 The following are the minimum energy transfer efficiencies required for devices handling equal air volumes:

- run-around coil – 45%;
- plate heat exchanger – 50%;
- thermal wheel – 65%;
- any other energy-recovery device – 50%.

4.146 If a plate heat exchanger is chosen, the plates should be constructed of metal. Plastic should not be used for internal bypass dampers and drive gears.

4.147 Whichever energy-recovery device is chosen the extract side will need to be protected by a G3 filter and provided with a drainage system as described in Paragraphs 4.20 - 4.25, to remove condensate.

Location

4.148 Energy-recovery devices should be located downstream of the frost battery and pre-filter, prior to the cooling coil or main heater battery on the supply side.

Control

4.149 It is essential to consider the control of both the energy recovery device and the frost battery when assessing the economics of recovery, as all energy provided by the frost battery will directly reduce the heat exchange of the recovery device. To this end, the off-coil setting of the frost coil should be the minimum possible to protect the primary filter (for example +2°C).

4.150 The energy-recovery device should be controlled in sequence with the main heater battery, and should incorporate a control to prevent the transfer of unwanted heat when the air-on condition rises above the required plant set point.

4.151 In instances where the plant is cooling the air, it may be possible to remove heat from the supply air at high ambient conditions, under the dictates of enthalpy sensors in the intake and extract ducts.

Attenuation

General requirements

4.152 Noise will be generated in an air distribution system by the fan, plant items and airflow. The ductwork is a very effective transmitter of this noise hence there is generally a need to limit the noise transmission to meet the requirements of the building. This normally involves the provision of sound attenuation treatment as part of the overall ductwork system design.

4.153 A thorough assessment of the design should be made to assess the noise impact. This should take into account the following primary factors:

- fan- and plant-noise generation;
- air-flow generated noise in ductwork fittings and dampers;
- noise generated at grilles, diffusers and other terminals;
- noise break-in and break-out of ductwork;
- cross-talk and similar interference;
- the noise limitations for the building and surrounding areas;
- external noise generation.

4.154 A method of assessment of these factors and the sound attenuation requirements of ductwork systems is given in CIBSE Guide B.

4.155 The fan is usually the main source of system noise. The sound power that it generates varies as the square of the fan pressure, and thus to limit the fan noise level the system resistance should be kept as low as economically

possible. As a general rule the selected fan should operate close to its point of maximum efficiency to minimise its noise generation. Where there is disturbance to the airflow at the fan inlet, the manufacturer's stated fan noise levels should be increased by up to 5 dB(A). More precise guidance on this aspect may be available from the manufacturers.

4.156 Fans radiate noise through both the inlet and outlet connections and it may be necessary to provide attenuation to limit the noise from both of these connections. It is always preferable and more economic to control noise and vibration at source, or as close to source as possible. It should be noted that attenuators offer a resistance to airflow. The resistance must be included in the fan and ductwork calculations.

4.157 Provided care is taken in the design and construction of low-pressure systems to avoid significant noise generation in the ductwork, attenuation should only be needed to absorb fan noise.

4.158 Noise breakout from all equipment housed in the plantroom must be taken into consideration if control is to be satisfactory. Any ductwork within the plantroom after the silencer should be acoustically insulated to prevent noise break-in or the silencer relocated at the point of entry or exit of ductwork to and from the plant room.

4.159 There is no complete means of control over external noise generation from such as road traffic, aircraft, factory and community noise. Consideration must be given to this at the design and planning stage.

Acceptable types and location

4.160 The noise levels produced by ventilation and other plant should be reduced by either lining the inside of the duct with sound-absorbing material or fitting bespoke attenuator units.

4.161 In supply systems, sound-absorbing material should not be applied to the inside surface of a duct system downstream of the final filter, owing to the risk of mechanical damage and the subsequent dispersal of the media into the ventilation system.

4.162 In supply and extract systems, sound-absorbing material must not be applied to the inside of a duct within 1 metre of a fire damper. The material should be non-particle-shedding and fire-resistant (further guidance can be found in SHTM Firecode suite of documents). Where sound-absorbing material is applied in a section of duct that will be routinely exposed during maintenance activities it should be protected from mechanical damage.

4.163 Bespoke attenuator units with a sound-absorbing infill suitable for the quality of air being handled and protected by a perforated sheet metal casing are the preferred option for critical systems. Absorption of moisture, dirt and corrosive substances into the 'in-fill' and the release of fibrous particles into the airstream should be prevented by the use of a membrane. The membrane material should have a declared service life of at least 25 years. If these conditions can be met then the attenuator may be located in the supply ductwork downstream

of the final filter. When so located, cleaning access should be provided at both ends of the attenuator unit.

5. Air distribution system

Air distribution arrangements

Ductwork distribution systems

5.1 Ductwork systems for ventilating and air-conditioning applications are referred to by their velocity or pressure category, that is, as low, medium or high velocity (or pressure) systems. Heating & Ventilating Contractors Association (HVCA) limits are up to 10 m/s or 1,000 Pa; 20 m/s or 1,750 Pa: and 40 m/s or 3,250 Pa in the case of conventional low, medium and high pressure systems respectively. High-pressure systems are disappearing because of the constraints of the Building Regulations but existing systems may sometimes need to be altered or extended.

5.2 For normal applications in healthcare buildings, low velocity systems are recommended. The use of higher velocities than those recommended is not likely to be economical. Future trends are likely to be towards even lower optimum duct velocities; however, velocities below 2 m/s are unlikely to be justified.

5.3 The site will often dictate the main routing of ductwork systems, but in general, the design should seek to make the layout as symmetrical as possible; that is, the pressure loss in each branch should be as nearly equal as possible. This will aid regulation and may reduce the number and variety of duct fittings that are needed.

5.4 Main distribution ductwork should not be routed above sleeping areas. Where there is no alternative route, additional acoustic insulation will be required.

5.5 Where auxiliary cooling units, fans, filters or trimming devices are installed in the distribution system, they must be independently supported and fitted with a suitable drainage system where appropriate. If they are a source of vibration they should be linked to the distribution ductwork via flexible connections.

5.6 The fan of a Local Exhaust Ventilation (LEV) system provided under the COSHH Regulations should be located outside of the building so that all of the ductwork within the building is under negative pressure. Where the fan has to be within the building it should be located as close as practicable to the outside with an absolute minimum run of discharge ductwork within the building. The discharge ductwork within the building will be under positive pressure so it must not be penetrated by test holes or inspection hatches.

Ductwork materials and construction

5.7 The choice of duct material should take account of the nature of the air or gas being conveyed and the environment in which the duct will be placed.

5.8 Galvanised-sheet-steel is generally suitable and most economical for normal ventilating and air-conditioning applications. Its inherent mechanical strength

renders it resistant to casual damage both during the construction phase and throughout its service life when mechanical and electrical services around it are altered. It also readily withstands the impacts sustained when rotary equipment is used to for internal cleaning.

5.9 In instances where moisture levels and/or corrosive elements in the air being conveyed are very high, aluminium, stainless steel, PVC or GRP (glass-reinforced plastic) ducts should be used. Stainless or black steel are the only suitable materials for high-temperature ductwork.

5.10 In inherently wet areas, such as the base of fresh air inlet ducts and some extract systems, the ductwork may require draining to prevent a build-up of standing water. The layout of the drains should be as specified in Paragraphs 4.20 - 4.25.

5.11 Where builderwork plenum chambers or ducts are used, these may be constructed of various materials. However all such ducts must be rendered and sealed to prevent dust shedding. A greater allowance may need to be made for leakage.

5.12 Galvanised, black and stainless steel ductwork should be manufactured and installed to the current HVCA specification for sheet metal ductwork DW144, but excluding the use of bolt-through supports.

5.13 GRP and PVC ductwork should be manufactured and installed to the current HVCA specification for plastic ductwork DW154.

5.14 Where phenolic-board ductwork is considered, care should be taken to ensure that it is fabricated to a quality standard and installed strictly in accordance with the manufacturers' instructions. Its pressure rating and degree of support should be suitable for the application and ducts should be fitted with mechanical protection where required. Designers should be fully conversant with installation techniques and Installers should be experienced having received training in the techniques required and certified to this effect by the manufacturers. Due consideration should be given to the impact on ductwork pressures created by the closing of dampers. Phenolic-board ducting should not be installed in plant rooms or any other areas where it could be vulnerable to impact damage. Internal cleaning using mechanical (rotary) means is also liable to cause damage to the integrity of surfaces.

5.15 Flexible ductwork is unsuitable for air distribution in healthcare applications. It should only be used to make the final connection to a terminal (See Paragraphs 5.54 and 5.55).

5.16 The inside of the ductwork should be free from structural projections and as smooth as possible. Flanged, gasketed joints are preferred.

Fire aspects, damper types and locations

5.17 It is essential that all relevant fire aspects of ducting systems are agreed with the fire officer before the design is finalised.

5.18 Ductwork must be fire-stopped where it penetrates fire compartment walls, floors and enclosures, cavity barriers and sub-compartment walls or enclosures, and provided with weatherproof collars where roofs or external walls are penetrated.

5.19 Fire/smoke dampers shall be provided at the locations required by SHTM Firecode. The fire-damper mounting frame must be securely attached to the building fabric. Where a fire-damper is not mounted directly in a fire compartment wall, it must be correctly supported and the ductwork between it and the firewall must posses the same fire rating as the firewall that it penetrates. The fire-rated portion of ductwork must not be penetrated by test holes or inspection hatches. All fire/smoke dampers shall be capable of remote re-setting via the Building and Energy Management System (BEMS) or equivalent, after periodic testing procedures.

5.20 An access hatch shall be provided adjacent to each fire damper so that its correct operation can be directly observed.

5.21 Smoke-diverting dampers must be provided on recirculation air systems to divert automatically any smoke-contaminated return air to the outside of the building in the event of a fire; and arranged so that the normally open smoke-diverting damper on the return-air branch to the input unit closes and all the return air is exhausted through the extract fan. Guidance is available in SHTM 81 and BS5588: Part 9.

Duct sections

5.22 Ducting is generally available in rectangular, circular and flat oval sections, although other sections may be made for special situations.

5.23 Rectangular ducting is most common on low-pressure systems, for the following reasons:

- it can readily be adapted to fit into the space available;
- fittings are cheaper than those for circular or flat oval ductwork;
- it can readily be joined to such component items as heating and cooling coils, and filters.

5.24 When sizing ductwork, the designer should take into account:

- both installation and operating costs;
- space limitations imposed by the structure and other services;
- operating noise levels;
- requirements of regulation at the commissioning stage.

5.25 For overall economy and performance, the aspect ratio should be close to 1:1, since high aspect ratios increase the pressure loss, heat gains or losses and overall cost (for example, changing the aspect ratio from 1:1 to 1:4 can typically

increase the installed cost of the ductwork by 40% and add 25% to the heat gains or losses).

5.26 Rectangular ducting should not be the first choice for high pressure systems, and should be avoided in systems operating at high negative pressures, because the strengthening of the flat sides and the sealing requirements necessary to make rectangular ducts suitable for these high pressures are costly.

5.27 Circular ducting is preferable for high-pressure systems, and for systems operating at high negative pressures. In the case of the latter, additional stiffening rings may be necessary. Machine-formed spirally-wound ducting and a standard range of pressed and fabricated fittings can sometimes make circular ducting more economical, particularly in low pressure systems having a relatively low proportion of fittings.

5.28 Flat oval ducting provides an alternative to circular ducting, principally where there is a limitation on one of the dimensions in the space available for the duct run.

5.29 Other sections may be used, such as triangular sections to pass through roof trusses. Such sections present difficulties in the provision of fittings, and connections to standard plant items, and are likely to be more expensive than traditional sections.

Standard ductwork fittings

5.30 All fittings should conform to current HVCA specification DW144. Wherever possible, long radius bends, large radius main branches, not more than 45° angle sub-branches and long-taper transformations should be used.

5.31 Fittings should be arranged with vanes in sub-branches connected directly to grilles and diffusers, and turning vanes in square bends (when used). When vanes are used, additional cleaning access will be required.

5.32 The number of duct fittings should be kept to a minimum and there should be a conscious attempt to achieve some standardisation of types and sizes. Increasing the number and variety of fittings in a system can markedly raise its overall cost.

5.33 Bad design in relation to air flow can lead to vibration of flat duct surfaces, increases duct-generated noise and pressure loss, unpredictable behaviour in branch fittings and terminals, and adverse effects on the performance of installed plant items (such as trimmer batteries).

Branches

5.34 There are many designs of branches and junctions in use. The important features are that the flow should be divided (or combined) with the minimum interference and disturbance. Changes in duct sizes should not be made at the branch but a short distance downstream (or upstream). A good dividing branch

design cannot be effective if the flow entering the branch is not uniform across the section.

Changes of section

5.35 The expansion of a duct section should be formed with sides having a total included angle of no more than 30°, and preferably less than 20°. If the angle of expansion is greater, the flow is not likely to remain attached to the walls of the duct and large eddies will be formed with flow reversal at the walls. This leads not only to a high-pressure loss, but also to non-uniform velocity pattern at the outlet. Where there is insufficient space for a gentle expansion and a greater angle is necessary, internal splitters should be used.

5.36 A contraction in a duct section is less critical, but the total included angle of the taper should not exceed 40° (or 20° where the contraction is made on one side of the duct only)

5.37 The most economical way to change the section of a rectangular duct is to restrict the change of duct size to one side only. If the calculated reduction or increase to the side dimension is 50mm or less, it is usually not economical to change the size at the position. The minimum size of a rectangular duct should usually be 150mm x 100mm.

Other fittings

5.38 As a general rule, fittings should avoid abrupt changes in direction and also sharp edges that cause the flow to separate and form eddies, thus limiting pressure loss and causing noise generation. If the fitting leads to the flow preferentially attaching to one side of the outlet, then a significant length of straight downstream duct is necessary before the next branch or fitting; this length should be greater than five equivalent diameters.

Thermal insulation

5.39 Thermal insulation is applied to ductwork to reduce heat exchange, and to prevent condensation.

5.40 In a duct system, the air temperature changes can be significant, especially when passing through untreated space, and these have the effect of reducing the heating or cooling capacity of the air and of increasing the energy input to the system. The heat transmission to and from the surrounding space can be reduced by effective insulation of the ducts. Extract ductwork conveying air from which heat recovery will be derived should be thermally insulated to the same standard as with associated supply ventilation ductwork.

5.41 Condensation can arise in ductwork systems conveying cooled air and, apart from creating conditions conducive to corrosion of ductwork, condensation affects the heat and vapour-resisting properties of insulating materials themselves which may induce further condensation.

5.42 In normal circumstances, the insulation thickness for heat resistance is sufficient to prevent surface condensation, but in extreme conditions the

insulation thickness for vapour resistance may be greater than that for heat resistance. When cold ducts pass through areas of high dew-point, carefully selected vapour barriers should be applied externally to the insulation.

Noise generation within the ductwork

5.43 Noise is generated in ductwork at sharp edges, by tie rods, damper blades, duct obstructions and sharp bends etc. This air-flow-generated noise becomes an important factor if it is about the same or greater level than the upstream noise level. (Air-flow-generated noise is often referred to as “regenerated noise”).

5.44 The noise level generated by airflow in ductwork is very sensitive to the velocity. The sound power of this noise is approximately proportional to the sixth power of the velocity; that is, a doubling of the duct velocity will increase the sound power by a factor of 64. The duct velocities should therefore be kept as low as possible. In general, duct fittings that have lower pressure loss factors in similar flow conditions will generate less noise.

5.45 Ductwork serving quiet areas should not be routed through noisy areas where noise break-in can occur and increase the noise level in the ductwork.

5.46 Grille, register and louvre noise should be kept to the minimum by selecting types having low noise-producing characteristics, without high tonal noise, and should be fitted with acoustically treated external inlet and outlet louvres.

5.47 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where individual room confidentiality is required. They will normally be of the ‘through-the-ceiling, ‘up-and-over’ type and may include a fire damper if required.

Volume control damper locations

5.48 Manually operated balancing dampers are needed generally:

- in the main duct downstream of the fan;
- in branches of zone ducts;
- in sub-branch ducts serving four or more terminals;
- at terminals not covered by the previous item.

5.49 Dampers integral with terminals should only be used for final trimming of air volumes, otherwise noise and air distribution problems may ensue.

5.50 Dampers in rectangular ducts should be single-bladed when the longer side is up to 450mm but be of the opposed-blade multi-leaf type above this size. In circular ducts, iris-type dampers are recommended. Dampers must be accessible, incorporate a position indicator and means of locking in the commissioned position. Dampers should be located as far away as possible from adjacent branches or plant items.

Cleaning and access door locations

5.51 Cleaning and access doors are required to facilitate access to plant items and ductwork components for inspection, maintenance, cleaning and replacement, and must be of sufficient size to permit safe access for the required functions. Consideration should also be given to the number of doors to be provided. Older installations may be deficient in the provision of access doors and consideration will be necessary to have these incorporated in the course of any refurbishment in the accommodation served.

5.52 Recommended locations for access doors are given in the current HVCA specification DW144 and are generally provided to give access to:

- every regulating damper;
- every fire and motorised damper;
- filter (to facilitate filter withdrawal);
- both sides of cooling/heating coils;
- humidifiers;
- fans; and
- motors and impellers.

5.53 Care should be taken when siting access doors to ensure that no other services to be installed will prevent reasonable access.

Flexible ducting

5.54 Flexible ductwork may be used for final connections to grilles and diffusers provided it is constructed to meet the fire precautions recommended in BS8313. It must not pass through fire compartment walls, floors or enclosures of sub-compartment walls or enclosures, or through cavity barriers.

5.55 Flexible ducting will cause a significant frictional loss and may be difficult to clean and should never be used in lieu of a bend. Where installed it should take the most direct route and be as short as possible, never exceeding 1 metre in length.

Diffuser and grille selection and sizing

5.56 The effectiveness of all ventilation and air-conditioning systems depends on the methods by which air is introduced to, and vitiated air is removed from, the space. The usual results of poor air-terminal selection and/or positioning are: draughts, stagnation, poor air quality, large temperature gradients and excessive noise.

5.57 Air can be supplied to a space in a number of ways, although any device can be broadly placed into one of two categories: that producing a diffused supply, or that producing a perpendicular jet. Diffusers may be radial or linear, and normally utilise the Coanda effect (that is, adhesion of the air stream to an adjacent surface), to reduce the risk of excessive room-air movement. A

perpendicular jet is formed by discharging air through grilles, louvres or nozzles, which are generally adjustable.

5.58 Air-flow patterns produced by both types of terminal are dependent to a large extent on the presence of the Coanda effect.

5.59 Supply air terminals can be incorporated into any room surface, for example, floors, walls (high or low level), desktop etc.

5.60 As they operate on the jet principle, the use of sidewall and linear grilles is restricted to areas where air change rates are low, that is, less than 10 per hour. Perforated rectangular diffusers can provide acceptable conditions within the occupied zone at up to 15 air changes per hour. In areas where a higher air change rate is required, square or circular ceiling mounted diffusers should be used.

5.61 The performance of supply air terminal devices is provided, based on three criteria: throw, spread and drop.

- **throw** is defined as perpendicular or parallel distance from the terminal to the point at which the air velocity is 0.5 m/s isovel;
- **spread** is defined as the width of the 0.5 m/s isovel; and
- **drop** is defined as the vertical distance from the centre line of the terminal to the bottom edge of the 0.25 m/s isovel.

5.62 It is necessary to consider each of these parameters in both summer and winter conditions to ensure satisfactory operation of the air-terminal device, as warm jets behave very differently from cold jets.

5.63 A warm jet tends to rise until it attaches itself to a horizontal surface, while a cold jet falls. Care must be taken to ensure that this does not lead to unacceptable temperature gradients in winter or excessive air velocities in the occupied zone in summer.

5.64 In order to ensure satisfactory air movement within a space, it is necessary to consider interaction between air movement from adjacent terminals, and ceiling mounted fixtures (light fittings etc), as well as interaction between air movement and room surfaces.

5.65 If the supply and extract terminals are too close, short-circuiting may occur, while if they are too far apart, stagnant zones may be formed. Where two opposing air streams meet, the individual velocities must not be greater than 0.25 m/s.

5.66 Supply and extract grilles and diffusers should be fitted with opposed-blade dampers for fine balancing purposes.

5.67 Further guidance on the selection of grilles and diffusers is given in the CIBSE Guide B.

5.68 In operating theatres, the supply terminals must be able to produce a down-flow movement of air in the operating zone 1 metre above floor level. Ceiling mounted diffusers with fixed directional vanes that provide a downward turbulent airflow are the preferred option. Plenum boxes fitted with perforated screens to produce a parallel downward flow are also acceptable. Nozzles or jets of any type are not acceptable. Sidewall-mounted linear diffusers that utilise the Coanda effect to send air across the ceiling and 'drop' it into the operating zone are also not suitable. However linear ceiling mounted diffusers that provide a direct downward airflow around the operating zone may be used.

Transfer grille - size and location

5.69 Air-transfer grilles in walls, partitions or doors form an integral part of the building's air distribution system. Modern doorsets have very low leakage rates so cannot be relied upon to permit even quite small airflows. Failure to make adequate provision for air to move from room to room will result in excessive pressure differentials and 'door whistle'.

5.70 Transfer grilles are required in locations where there is a significant imbalance between the supply and extract rates in a room. They will relieve any pressure differentials that may affect the operation of the spaces and/or the ventilation system and permit airflow in a known direction. However, transfer grilles are vulnerable to damage and, in many instances, as long as the equivalent free area is provided, they can be substituted with undercut door.

5.71 Care needs to be taken to ensure that the positioning of transfer grilles does not interfere with the fire or smoke integrity of the building. In general, the air-transfer grilles should not be installed within fire-resisting boundaries, although if this is unavoidable, they should be fitted with fire- or smoke-dampers.

5.72 Where installed, transfer grilles should be of the non-vision type, sized for a maximum face velocity of 1.5 m/s.

5.73 In photographic dark rooms, lightproof transfer grilles will be required.

5.74 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where individual room confidentiality is required. (See also Paragraphs 5.43 - 5.47).

Pressure stabilisers - size and location

5.75 Pressure stabilisers are required in lieu of air-transfer grilles in areas where it is necessary to maintain pressure differentials between adjacent rooms to prevent reversal of airflows for example, in operating suites, isolation facilities and clean rooms. (See also Paragraphs 7.24 - 7.28).

5.76 Fire precautions for pressure stabilisers are the same as for transfer grilles. For sizing criteria, refer to Paragraph 7.23

5.77 Pressure stabilisers should be of the balanced-blade type, with the facility to make fine adjustment of the pressure setting. They should be silent in

operation and give a seal as tight as practicable when closed. The materials of construction and method of assembly should allow for cleaning and disinfection.

5.78 Pressure stabilisers should be installed in a visible location so that their operation can be readily observed.

5.79 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where confidentiality is required. In these cases, the pressure stabiliser and cross-talk attenuator should be mounted in a short length of ductwork within the ceiling void.

5.80 Pressure stabilisers may need to be fitted with a stand-off baffle on their discharge side to prevent a sight line in situations where a laser will be used. Baffles may also be required to preserve privacy or prevent discharge air causing draughts or disturbing the air distribution pattern in the adjoining room. They are also useful in low-level locations to prevent the airflow path being obstructed by portable equipment.

6. Automatic controls

6.1 Various options for control of single and multi-zone air-conditioning systems are given in CIBSE Guide B.

General requirements

6.2 The basic requirements for an automatic control system are as follows:

- facilities to start, set-back and stop the plant;
- facilities to control the volumetric air-flow;
- facilities to control the system or room pressure;
- temperature control and indication;
- humidity control and indication;
- devices to monitor and indicate the plant's operating state;
- alarms to indicate plant failure, low air-flow, and filter state.

The control functions actually provided will depend on the purpose of the ventilation system.

6.3 There will also be a need to determine the control strategy in the event of a fire either within the zone being served or within an adjoining zone.

6.4 The designer should consider whether it is necessary for the supply and extract fans to be interlocked, either so that the supply fan will not operate unless air-flow is established within the extract system, or vice-versa depending on the required pressures within the rooms being served.

6.5 The sequence switching of units in order to prevent transient reverse airflows will be particularly important in laboratory and pharmacy areas that also contain fume cupboards, safety cabinets and other LEV systems.

6.6 Alarms should be provided to show 'filter fault' and 'low air-flow'. The "filter fault" alarm should be initiated by a predetermined increase of pressure differentials across the filter. The 'low air-flow' alarm should be initiated when the supply air quantity falls to 80% of the design value.

Objectives of control system

6.7 The primary objective of ventilation plant control system is to maintain the space served within the required environmental control limits, at the appropriate times, regardless of external conditions or internal loads and with the minimum energy consumption.

6.8 Often, it is not possible to predict accurately building load variation at the design stage, and thus optimum set points cannot be assessed. Information provided by monitoring the operation of the plant via a Building and Energy Management

System (BEMS) will enable optimum set points to be established and energy consumption reduced. Control of most systems will be via a BEMS. This will enable the operating conditions and control tolerances to be set and monitored. The BEMS may also be set to log the actual energy consumed by the system together with that recovered by the energy-recovery device. This will provide a useful check on overall operating efficiency and provide evidence that energy targets are being achieved.

6.9 BEMS incorporating self-adaptive control algorithms that automatically adjust the set-point to the suit the usage and load are preferred. The provision of movement sensors within the controlled space in order to determine the actual occupancy will facilitate this process.

6.10 The failure of specialised ventilation systems can have grave consequences for the delivery of healthcare. Control systems should therefore be simple, robust and reliable.

6.11 Computer-software-driven control systems are becoming the norm in building services. However, it should be remembered that healthcare ventilation systems need to be available to operate outside of normal working periods when software support is not available. Should the software fail, it will be left to site staff, who may have little knowledge of the control algorithms to restart the ventilation system. It is therefore essential to ensure that a simple means of re-starting critical systems in the event of a software failure is provided (see also Paragraphs 4.62 - 4.63)

Location of controls

6.12 Whether within the plant, duct or room, sensors should be located to provide accurate measurement of the condition of the air being monitored.

6.13 Sensors and control items such as control valves should be located close to the element being sensed or plant item being controlled, in order to minimise time lags within the system which may create over-shoot of conditions beyond the design envelope and result in additional energy consumption.

6.14 There are practical advantages in locating all control valves for an air-handling unit in a bank (at a convenient height) at one end of the unit. (This will not normally result in an undue additional control lag.)

6.15 Some applications require intermittent mechanical ventilation, frequently at a high air-change rate, (for example, in bathrooms and treatment rooms.) Local controls to facilitate this mode of operation should be placed in a prominent position to encourage economical use.

6.16 Local controls that enable the user to select more than one mode of operation should be clearly labelled to identify the particular mode selected. Where the system allows different room pressures to be selected then a direct-reading pressure gauge should be fitted within the eye line of the users to provide an independent confirmation of the resultant mode of operation. A clear

description of the selectable modes of operation should be mounted adjacent to the control switch.

Fire aspects

6.17 A fire control panel should be mounted at the entrance of the area that the ventilation serves. The panel should have restricted access for the fire officer and include independent on/off controls and indication of the supply and extract systems.

6.18 In certain critical care departments it is preferable to maintain the supply ventilation in case of a fire within the area. For example, in an operating department, while undergoing surgery, the patient cannot always be easily moved without significant risk. In the event of a fire in a staff or support area of the department, or adjoining zone, the continued supply of air to a theatre will maintain it at a positive pressure and protect the patient and staff from the effects of smoke. This will allow time for the patient to be stabilised so that he/she can be safely evacuated if necessary. A similar situation occurs for patients in ITU and other critical care units. In all of these cases the ventilation to the critical area should continue to operate unless the AHU starts to draw in smoke. For these departments, a notice should be affixed to the fire control panel drawing attention for the need to liaise with departmental staff before switching off fan units.

6.19 All supply AHUs should have a smoke sensor mounted in the main supply duct immediately downstream of the AHU. In the event of a fire in the AHU or smoke being drawn into the system from an outside source, it should cause the supply air fire damper to close and shut down the AHU.

Time switching

6.20 Facilities to start, set-back and stop the plant should be provided in the plantroom. Remote start and set-back control and indication, if required, should be provided at a manned staff location, for example, at the reception or staff base or, in theatres, within the Surgeon's Panel.

6.21 Many ventilation systems may be completely shut down when the area served is not in active use. Alternatively, where there is a need to maintain a background condition, the ventilation output can be reduced by "setting back" the system. This will significantly reduce energy consumption and extend the life of filters and other system components.

Start-up control

6.22 The plant's start control should contain a control logic that will start the plant in the sequence set out in the following algorithms, Figures 2 - 5

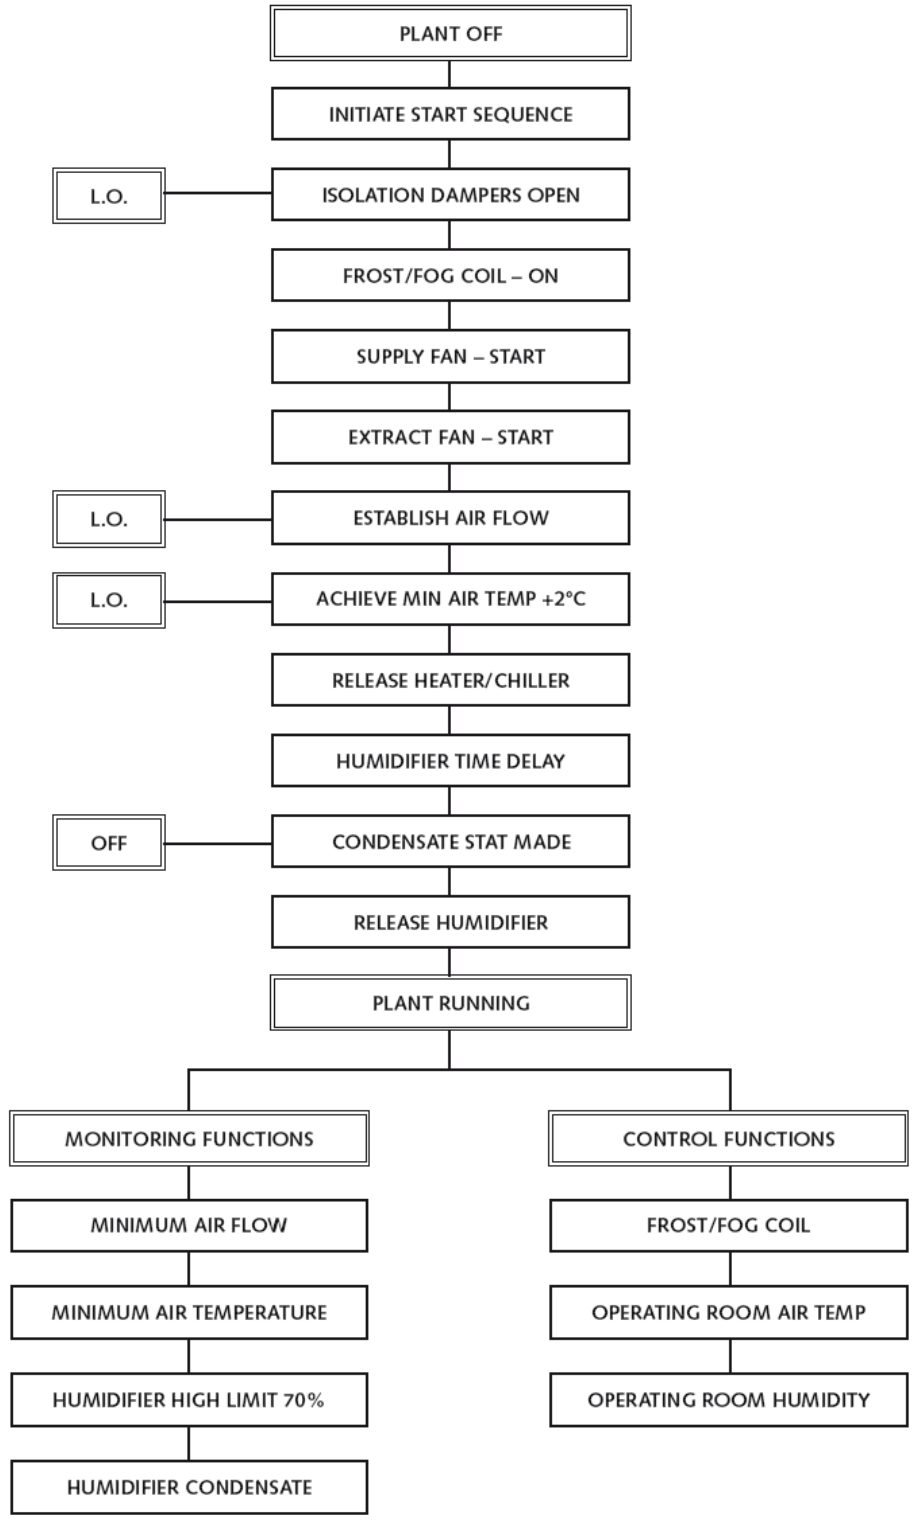

Figure 2: Typical plant control algorithm – normal start-up sequence

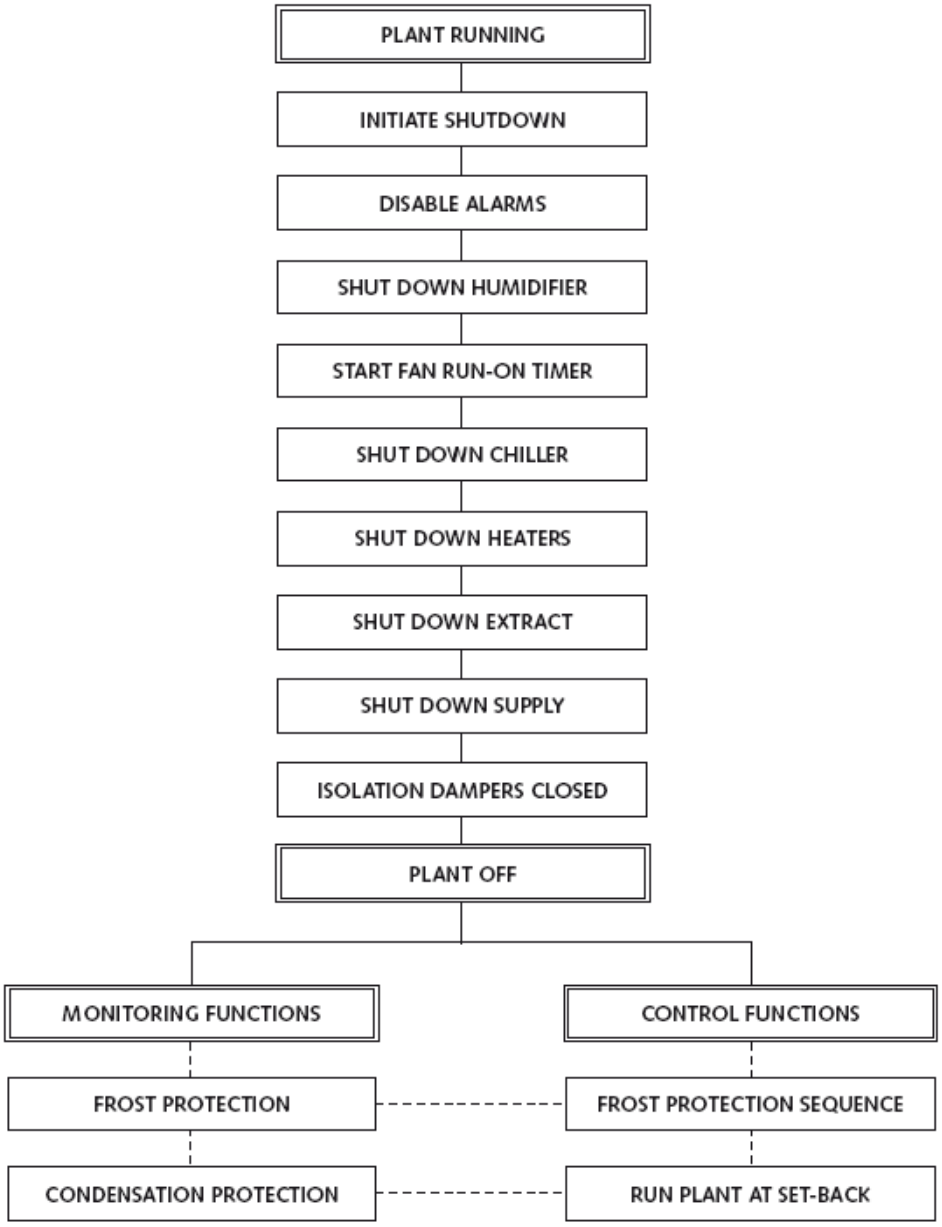

Figure 3: Plant control algorithm – normal shutdown sequence

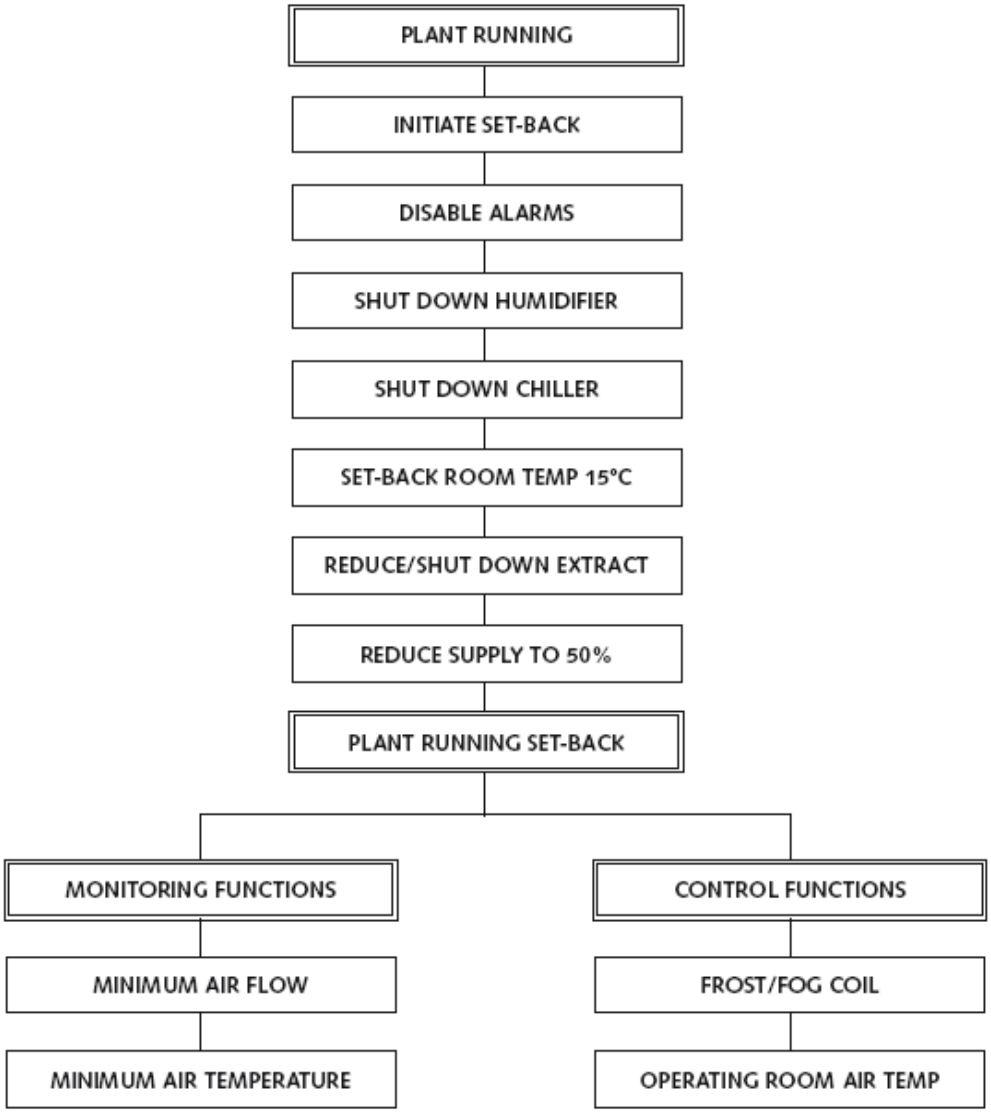

Figure 4: Plant control algorithm – set back sequence

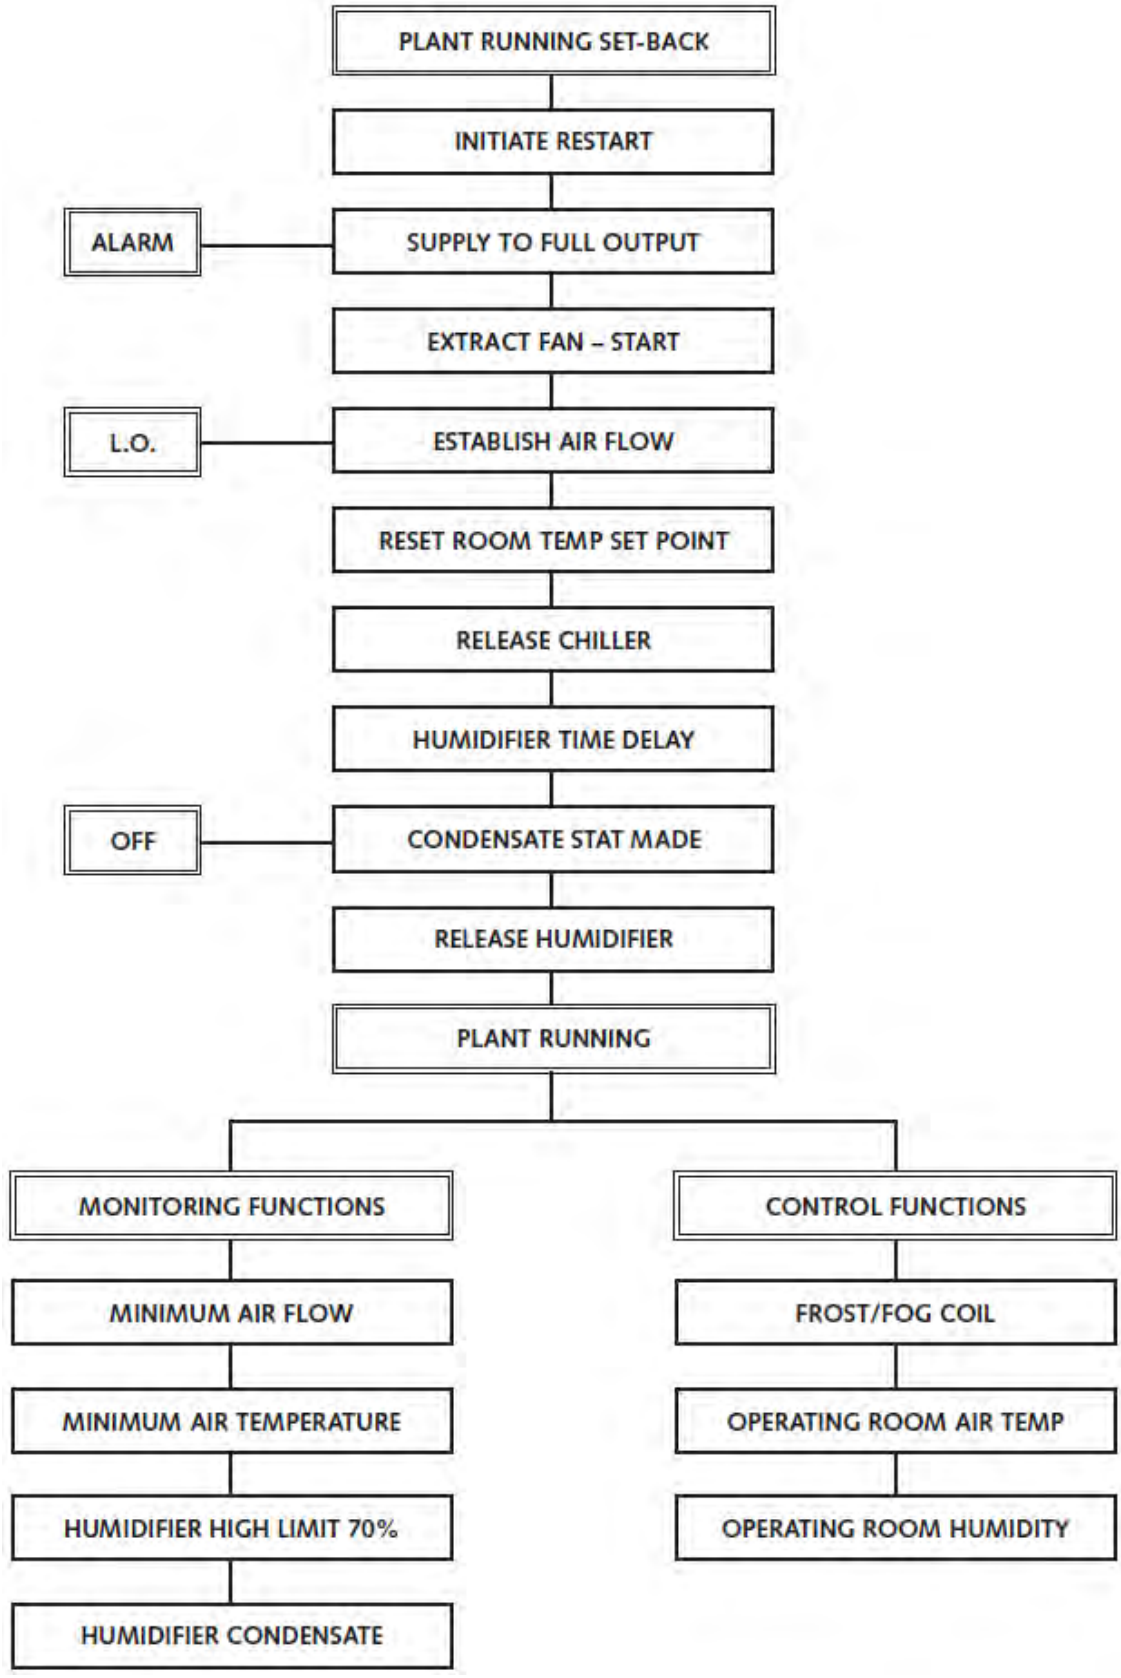

Figure 5: Plant control algorithm – restart from set-back

Set-back control

6.23 Where variable speed controls are installed, the setback facility for each plant should depress the control temperature to around 15°C; exclude any humidification and cooling from the system; and reduce the supply and extract air volumes to around 50%. The extract fan can also be turned off as long as the desired direction of air movement from clean to less clean will be maintained (See also Figures 2 - 5).

Use control

6.24 The installation of movement detectors allows for “use control” of ventilation systems. A simple control logic that reduces the system to a “set-back” condition if there has been no movement detected in the space for, say, 30 minutes and that switches the system “off” if no movement is detected for one hour is recommended for many applications, including operating suites.

6.25 A variation on this can be provided by linking ventilation controls to lighting. For example, in an operating theatre, the system may be off outside of working hours, could run at set-back when the general lighting was switched on and increase to full speed when the operating lamp is switched on. As with movement detection, a 30-minute run-on should be provided at each stage when the lights are turned off.

6.26 Either of the above control strategies may be refined by linking to the BEMS to provide a control logic related to normal working hours and associated ‘real-time’ movement within the zone being controlled. This should result in significant energy savings.

Environmental control

Temperature control methods and application

General

6.27 All control valves must fail safe, that is, close in the event of power or air-flow failure, with the exception of the fog/frost battery control valve, which should open upon power or airflow failure.

6.28 Control valves should be located in an accessible position. Isolation valves should be provided to enable the control valve to be removed for service without the need to drain-down the system.

6.29 Care should be taken to ensure that the installation of control valves and their associated pipework do not obstruct access to the AHU inspection doors and hatches.

Room temperature control

6.30 The limits for room temperature set point are generally between 16°C and 25°C depending on the particular application, and in some specialised instances (for

example, operating departments) are adjustable within a predetermined range by the user.

6.31 The selection of temperature set point for each room or zone may be by a control facility in the room / zone, or remotely at the control panel or BEMS. Where the control device is mounted within the room / zone and adjustable by the user, it should be marked either 'raise' and 'lower' or '+' and '-'. It should control within a specified temperature range to suit the user requirement with a control tolerance of ±1K. All other control set-points should be selectable either on the control panel or at the BEMS interface.

6.32 Where local control is provided, an indication of temperature will be required locally, or at a staff base (if appropriate), using an analogue or digital indicator. The indicator should be large enough to be read from the normal working position (for example, at the operating table in a theatre). This may be mounted in a supervisory or, 'surgeon's' control panel, with the signal repeated on the main system control panel or BEMS. It is important that this indicator displays the actual measured temperature and not the selected temperature.

6.33 Where the supply and extraction systems are designed for ventilation only and there is a wet heating system to provide background heating, care must be taken to avoid one system trying to heat the space while the other system is trying to cool the area.

Frost battery control

6.34 Steam-supplied frost batteries must be operated as on/off devices with their sensor mounted upstream of the battery. This will give 'open loop' control. A set point of +1°C is recommended.

6.35 Low pressure hot water (LPHW)-supplied frost batteries should be controlled using the proportional mode. Their sensor should be located downstream of the battery to give 'closed loop' control. A set point of between 2°C and 5°C is recommended.

6.36 If the temperature downstream of the frost battery, as sensed by a serpentine thermostat, falls below the required set point over any part of the coil, the plant must automatically shut down in order to prevent damage to the other batteries. The serpentine thermostat must not be in direct contact with the coil.

Off-plant control

6.37 The control logic must prevent the chiller and pre-heater being on at the same time.

Humidity control methods and application

6.38 In order to prevent excessive condensation when starting up from a total plant shut-down, a time delay should be incorporated into the control system such that the humidifier does not start until 30 minutes after the ventilation plant starts up.

6.39 Irrespective of the method of control, a high-limit humidistat should be installed to ensure that when the humidifier operates, the condition of the air in the duct does not exceed 70% saturated, particularly during plant start-up.

6.40 With certain types of steam humidifiers, it may be necessary to install a thermostat in the condensate line from the humidifier's steam supply, to ensure that the steam at the control valve is as dry as possible before it is injected into the air supply.

6.41 The humidifier and cooling-coil control must be interlocked so that they cannot be on at the same time.

6.42 The humidifier control system should ensure that it is switched off with the fan. It is preferable to design the control system so that the humidifier is isolated for an adequate time before the fan is turned off so as to purge humid air from the system.

6.43 All control valves must fail safe (that is, close in the event of power failure) and the humidifier must be interlocked with the low airflow switch.

Multi-zone control methods and application.

6.44 Close control of all air-conditioning parameters may be difficult to achieve with multi-zone systems, since each zone will in theory require a re-heater and humidifier to give total control of humidity if that is what is required. In reality such close control is rarely required in practice. It is therefore usual with multi-zone systems to provide control of zonal temperature only, with humidity control where fitted being based on average conditions within all zones, or minimum conditions within one zone.

6.45 Where there is a requirement for close control of air-conditioning parameters in a number of zones (e.g. an operating department) separate plants should be provided for each zone in order to avoid the need for expensive over-cooling and reheating of individual zones.

6.46 Most multi-zone systems within healthcare premises are controlled based on off-coil control within the central plant, with trimmer heater batteries on individual zones.

Alarms and indication

6.47 Supply and extract systems should include indicator lamps on the control panels to confirm the operational status of each system. Where the usage is on a regular daily pattern, time control with a user-operated timed manual over-ride should be provided.

6.48 Where a system is provided for a particular space, the indicator should be in, or immediately adjacent to, that space and local controls should be provided with labels clearly defining their function (eg. isolation suites.)

6.49 The 'plant failure' and 'low air-flow' alarms should be initiated by a paddle switch or other device located in the main air supply duct. This should operate when

the air quantity fails to reach or falls to around 80% of the design value and will give indication of fan failure, damper closed, access door left open, or any other eventuality that could cause a reduction of air quantity. Monitoring the current drawn by the fan motor is not a substitute for a sensing device that is directly affected by the air-flow.

6.50 The 'filter fault alarm' should be initiated by a predetermined increase of pressure differential across the filters, thereby indicating a dirty filter.

6.51 Direct-reading gauges or manometers should be installed across filters to give maintenance staff an indication of their condition.

6.52 Visual indication should be provided at a manned staff location (for example, the reception or staff base) and on the main control panel and BEMS to show 'plant failure' and 'low air flow'.

BEMS

6.53 Control of most systems will be via a Building Energy Management System (BEMS). This will enable the operating conditions and control tolerances to be set and monitored. The BEMS may also be set to log the actual energy consumed by the system and recovered by the energy recovery system. This will provide a useful check on the overall operating efficiency and provide evidence that energy targets are being achieved.

7. Specialised ventilation systems

7.1 This section contains design information for a range of healthcare ventilation applications.

7.2 The following departments will require a degree of specialised ventilation.

- the Operating department;
  - treatment rooms;
  - endoscopy, day case and minimum invasive suites;
  - cardiology and operative imaging suites;
  - conventional operating theatres;
  - Ultra-clean ventilation (UCV) operating theatres;
  - barn theatres;
  - recovery and ancillary areas.
- Obstetrics;
  - maternity theatres;
  - birthing rooms;
  - LDRP Rooms;
  - SCBU.
- critical areas and high-dependency units of any type;
- Isolation facilities;
  - infectious diseases units;
  - bone marrow and other transplant units;
  - chemotherapy and oncology units.
- Sterile Supply and Decontamination Units;
  - wash rooms;
  - inspection and packing rooms;
  - sterile pack stores.
- the Pharmacy departments;
  - aseptic suites;
  - extemporaneous preparation areas;
  - radio pharmacies.
- the Pathology department;
  - laboratories;
  - cat 3 and 4 rooms.

- the Mortuary and Post mortem suite;
  - mortuaries;
  - post-mortem rooms;
  - specimen stores.
- Hydrotherapy units;
- Burns units;
  - burns theatres;
  - treatment rooms;
  - isolation rooms;
  - tissue banks.
- Emerging specialties;
  - gene therapy units;
  - stem-cell laboratories.
- Infrastructure;
  - plant rooms housing combustion equipment;
  - welding facilities;
  - wood working workshops;
  - electric vehicle charging areas.

7.3 Design information for many of these applications is given in Appendix 1 Table A1, Appendix 2 and in the following Chapters within this section.

7.4 It is not possible within this existing document to give definitive guidance for every healthcare specific ventilation application. Additional detailed guidance may be issued in due course in the form of supplements.

General information

7.5 The section on operating theatres is the most extensive and contains much information that is common to other applications. Each theatre suite should have its own dedicated air-handling unit and extract fan. Where no specific guidance is given the principles set out below should be followed:

- the foregoing sections of the document contain general information on healthcare-specific aspects of ventilation system design and specification;
- a set of standard solutions for the design of general operating theatre suites to conform to past and new standards is given in new standard layouts Nos 1, 3, 5 and 7 and those for UCV theatres in new standard layouts Nos 2, 4, 6 and 8 within Appendix 3;
- the CIBSE Guides A & B contain basic information on ventilation design that can be applied to most applications;

- where a British or European standard exists that is specific to the application (for example, a clean room) it should be used as the basis of the design requirement;
- air should always move from clean to less-clean areas. A hierarchy of room cleanliness is given in Table A2;
- differential pressure will prevent contamination between areas when doors are closed. Information on air leakage through closed doors and hatches for a range of differential pressures is given in Table A3;
- the flow of air will prevent contamination between areas when doors are open. Information on air leakage through open doors and hatches for a range of differential pressures is given in Table A4;
- if anaesthetic gases are used, 15 air changes per hour will be required;
- a methodology for calculating a design solution for a non-standard suite of operating rooms is given in Appendix 4. This may be adapted as necessary to suit other less complex applications where air is required to cascade from clean to less clean areas.

7.6 The supply of air to a room has four main functions:

- to dilute airborne contamination;
- to control air movement within such that the transfer of airborne contaminants from less clean to cleaner areas is minimized;
- to control the temperature and if necessary the humidity of the space;
- to assist the removal of and dilute waste gases where used.

7.7 Because of the complexities of controlling air-movement patterns, much design effort will be required for this aspect. It is important that the design makes the best possible use of the air available, as excessive supply airflows for the control of air movement should not be used. The amount of air supplied will be determined by the number of doors and desired air-change rate.

7.8 There are four routes whereby airborne contaminants may appear in a room:-

- through the supply air;
- shed directly by the room occupants;
- arising as a result of the work activities;
- transferred from adjacent spaces.

7.9 Particles entering with the supply air can be controlled by the selection of suitable filter grades.

7.10 Particles shed directly by the room occupants can be controlled by:

- restricting access to essential persons only;
- the choice of the occupants' clothing;

- the room's air-change rate.

7.11 Particles arising as a result of the work activity can be controlled by:

- enclosing, semi-enclosing or otherwise controlling the work-based source;
- the room air-change rate.

7.12 The transfer of particles from adjacent spaces can be controlled by:

- differential pressure;
- air-flow paths.

7.13 Air change rates are given in Table A1. These figures have been found to give sufficient dilution of airborne contaminants, provided the mixing of room air is reasonably uniform.

7.14 A downward-displacement turbulent air distribution is generally preferred. The supply and extract diffusers should be positioned to ensure that all parts of the room are actively ventilated and that where necessary the staff will be in a clean air-flow path. (See Section 5 for additional guidance on supply terminals).

7.15 Horizontal-flow room-air distribution with or without a Coanda effect can be a source of draughts and difficult to set up correctly. Its use should be confined to non-critical areas.

Air movement control

7.16 The design of the system should seek to minimise the movement of contaminated air from less clean to cleaner areas. Transfer grilles enable air to pass in either direction between rooms of equal class and pressure. Pressure stabilisers operate in one direction only; they allow excess air to be directed to the area desired and assist in maintaining room pressure differentials. When closed they prevent significant reverse air-flow.

7.17 The relative locations of supply and extract terminals and their design air-volume rates will determine the basic airflow between adjacent spaces. Transfer grilles and pressure stabilisers will permit and control the flow of air between spaces ensuring a flow from the clean to less clean areas. Failure to provide such devices will lead to uncontrolled air flows when personnel move between rooms. They may also result in doors being held partially open by air pressure

Temperature and humidity control

7.18 To achieve the required room conditions, supply flow rates are calculated conventionally, taking account of all heat and moisture gains and losses, and of maximum permissible temperature differences between the room and supply air. In most applications the base heating load will be provided by a heating system. In critical systems the room or suite being considered will be within the heated building envelope so the ventilation will be sized to suit the casual gains or losses.

7.19 Temperature differences of up to 10K for winter heating and 7K for summer cooling must not be exceeded.

7.20 It is acceptable for the humidity to swing uncontrolled between 35% and 70% saturation.

Removal and dilution of waste anaesthetic gases

7.21 Anaesthetic gases are subject to occupational exposure limits. Waste anaesthetic gas must be contained and removed by a suitable gas-scavenging system. Some leakage from the anaesthetic equipment and the patient's breathing circuit will occur with all systems, particularly during connection and disconnection; and from the interface with the patient. The air movement scheme should ensure that this leakage is diluted and removed from the room. Anaesthetic agents are heavier than air so placing the supply terminal at high level with an extract at low level, adjacent to the anaesthetic gas terminal units will ensure that staff are in a clean air-flow path.

7.22 In LDRP and delivery rooms the use of anaesthetic gas is controlled on demand by the patient. This may result in significant leakage which, in order to reduce staff exposure, will need to be controlled by establishing a clean airflow path. A supply at high level at the foot-end of the bed with extract at low level at the head-end will provide such a path.

Fire aspects

7.23 When considering the overall airflow movement, careful thought needs to be given to the operation of the ventilation system, to limit smoke spread in the event of a fire.

Door protection

7.24 Air should flow from the cleaner to the less clean areas as shown in Table A2. There are several factors that affect the likelihood of a reverse air- flow through doorways:

- when a person passes through a doorway, both the passage of the person and the movement of the door flap cause a transfer of air between the areas separated by the door;
- when a door is left open there is a transfer of air between the two areas separated by the doorway. This is caused by air turbulence, but is greatly increased by any temperature differential between the areas (a 1.4m wide doorway may allow the transfer of 0.19 m^3/s of air in each direction when there is no temperature difference, but when the temperature differential increases to say 2K, the volume transferred may increase to 0.24 m^3/s).

7.25 Two methods of door protection are used in order to reduce the likelihood of contamination of clean area by a reverse air-flow from a less clean area:

- closed door protection – a pressure differential is created across a closed door so that any air leakage is from the clean to the less clean area.

Table A3 gives details of closed door leakage rates for a range of differential pressures;

- open door protection – the pressure differential drops (See Table A5) and is effectively replaced by a flow of air through the doorway from the clean to the less clean area. The flow of air needs to be sufficiently large to ensure that significant reverse airflow cannot occur and will be related to the relative cleanliness of the areas being considered. Table A4 gives air-flow rates for open door protection related to door / opening size and classification of the adjoining areas.

7.26 Pressure stabilisers enable the room differential pressure to be set when the doors are shut, thus providing closed-door protection. When a door is opened the stabilisers will close, forcing air to be directed through the doorway thus providing open-door protection.

7.27 The recommended air-flow rates to achieve this are given in Table A3. Provided that the dilution criteria in Table A1 are met, the occasional small back-flows created (when two doors are opened simultaneously; or when there is a high temperature difference across an open door) will have little effect on the overall air cleanliness of the affected room.

7.28 In applications where it is critical to maintain a specific airflow and /or pressure regime (for example isolation rooms) all windows in the zone should be locked shut or sealed. Trickle vents, if fitted, will also need to be sealed.

Systems design

7.29 The design of the ventilation system for an area depends on the overall configuration of the department. Where the department is served by more than one AHU, the control of the units may need to be interlocked so that reverse air-flow patterns do not occur.

7.30 Dual-duct high velocity systems have advantages, but are noisy, costly and may give rise to unacceptable values of humidity. Single-duct, low velocity/pressure systems are preferred.

7.31 Extract grilles should be sited and balanced to promote air movement in the desired direction.

7.0 (a) Operating department ventilation systems

7.32 The information given in this section relates to general operating suites. It will be applicable to other types of theatre suite such as maternity, burns, cardiac, etc. The standard values given may need to be adjusted to reflect non-standard room sizes, pressure regimes and air change rates.

7.33 A method of obtaining a design solution for non-standard theatres is given in Appendix 4.

7.34 Additional information for Ultra-clean ventilation (UCV) theatres is given in Section 7.0 (b).

General

7.35 The supply of air to an operating room has four main functions:

- to dilute airborne contamination;
- to control air movement within the suite such that the transfer of airborne contaminants from less clean to cleaner areas is minimized;
- to control the temperature and if necessary the humidity of the space;
- to assist the removal of, and dilute, waste anaesthetic gases.

7.36 Because of the complexities of controlling air-movement patterns, much design effort will be required for this aspect. It is important that the design makes the best possible use of the air available, as excessive supply airflows for the control of air movement should not be used. The amount of air supplied to the operating room will be determined by the number of doors and desired air-change rate.

7.37 The detailed considerations upon which the supply air-flow rate is based are as follows.

Dilution of airborne bacterial contaminants

7.38 There are four routes that airborne contaminants may appear in an operating room:

- through the supply air;
- shed by operating staff;
- produced by the surgical activities;
- transferred from adjacent spaces.

7.39 Supply flow rates for the main rooms of the operating suite are given in Appendix 3. For the other areas where room sizes and activities vary from site to site, air-change rates are given in Table A1. These figures have been found to give sufficient dilution of airborne bacterial contaminants, provided the mixing of room air is reasonably uniform.

7.40 A downward-displacement air distribution is preferred; it may be either turbulent or laminar flow. For turbulent flow the supply-air diffusers should be positioned either in the centre of each quadrant of the ceiling or along a line between the centres of each quadrant. This should ensure that all parts of the room are actively ventilated and that there will be adequate air movement at the operating table. Laminar flow would be provided by a perforated plenum terminal centred above the operating table. (See Section 5 for additional guidance on supply terminals).

7.41 Suspended articulated equipment is usually fitted in theatres. These require significant structural steelwork in the ceiling void to cater for the loads imposed by the resulting bending moments. It is important to ensure that the void is

deep enough to accommodate both the steelwork and the ventilation ducts. The location of the steelwork must not prevent a suitable layout of the ventilation ductwork and correct positioning of the supply air terminals. It needs to be recognised that the correct ventilation of an operating theatre plays a significant part in controlling healthcare acquired infections and is not subordinate to the desire to make equipment easy to move.

7.42 Horizontal flow distribution with or without a Coanda effect can be difficult to set up correctly and are unlikely to be as effective in Theatre applications. It should not be used in new installations. However space constraints may force its retention or replacement when refurbishing existing installations. Where fitted, the supply grilles will require a means of directional adjustment.

7.43 For general operating theatres, the air supply would be filtered in the AHU. Terminal HEPA filters are not generally required.

Control of air movement within the suite

7.44 The design of the system should seek to minimise the movement of contaminated air from less clean to cleaner areas. Transfer grilles enable air to pass in either direction between rooms of equal class and pressure. In older designs suitably dimensioned door undercuts were often used in lieu of transfer grilles. Pressure stabilisers operate in one direction only; they allow excess air to be directed to the area desired and assist in maintaining room-pressure differentials.

7.45 The relative locations of supply and extract terminals and their design air-volume rates will determine the basic air-flow between adjacent spaces. Transfer grilles and pressure stabilisers will permit and control the flow of air between spaces ensuring a flow from the clean to less-clean areas of the suite. Failure to provide such devices will lead to uncontrolled airflows when personnel move between rooms and doors being held partially open by air pressure.

Temperature and humidity control

7.46 Supply flow rates to achieve the required room conditions, are calculated conventionally, taking account of all heat and moisture gains and losses, and of maximum permissible temperature differences between the room and supply air. In most applications the room being considered will be within the heated building envelope.

7.47 Temperature differences of up to 10K for winter heating and 7K for summer cooling must not be exceeded.

7.48 It is acceptable for the humidity to swing uncontrolled between 35% and 60% saturation.

Removal and dilution of waste anaesthetic gases
