7.49 Anaesthetic gases are subject to occupational exposure limits. The air-movement scheme should ensure that staff are in a clean air-flow path. (See Paragraph 7.21).

7.50 Air extracted from operating suites should not be re-circulated, as it may contain malodorous contaminants. However an energy recovery system should be fitted in the extract in order to reduce the plant energy consumption. (See Paragraphs 4.142 - 4.147).

Fire aspects

7.51 When considering the overall air-flow movement, careful thought needs to be given to the operation of the ventilation system, to limit smoke spread in the event of a fire. However, this is a highly staffed department with a low fire risk/load status and these factors need to be recognised when developing the fire strategy. It is considered satisfactory to treat the complete operating department as a single fire compartment providing there are at least two exits from it. Over-compartmentalisation can lead to difficulties in establishing clean air-flow paths and room-air dilution rates. This will lead to an increased risk of healthcare-associated infections. Staff areas within the department should be treated as a sub-compartment. (See Paragraph 6.18).

Door protection

7.52 Air should flow from the cleaner to the less clean areas as shown in Table A2. The factors that affect the likelihood of a reverse airflow through doorways are discussed in Paragraphs 7.24 - 7.26.

7.53 It is not possible to design an air-movement scheme, within the restraints of the amount of air available that will protect the operating room when two doors are simultaneously opened. The design process that has been used considers that each door is opened in turn and ensures that the direction and rate of air-flow through any open doorway is sufficient to prevent any serious back-flow of air to a cleaner area.

7.54 Provided that the air-change rates in Table A1 are met, dilution will be sufficient to ensure that the occasional small back-flows created (when two doors are opened simultaneously; or when there is a high temperature difference across an open door) will have little effect on the overall air cleanliness of the affected room.

7.55 The following general points should be taken into consideration during the design of operating suites:

- Number of exits – the fewer the number of rooms (and therefore doorways) leading from the operating room the better, as traffic is reduced and less complicated air-movement control schemes are required.
- Scrub and hand-wash facilities – these may be a part of the operating room, often in a bay. The bay would count as part of the operating room volume

and should have a low-level active or passive extract to remove the moisture-laden air. Should a separate room be required for the scrub area, a door between the scrub-up room and the operating room is an inconvenience to scrubbed staff, and could be replaced by an opening. This opening should be larger than a normal single doorway, but the scrub would not, in these circumstances, be considered part of the operating room volume.

- If an alcohol scrub regime is employed, individual theatre scrubs may not be required and would be replaced by a common departmental pre-/post-operation scrub position in the corridor. This would require local extract to prevent a build-up of moisture.
- Preparation 'Sterile Pack Store' (SPS) – if it is intended to 'lay-up' instruments in the operating room, the preparation room is then used simply as a sterile pack store. The nominal room pressure can therefore be the same as that of the operating room and the airflow between the two rooms in either direction. Air supplied to the preparation room may be directed into the operating room either through a door mounted transfer grille or if no door is fitted, through the opening. Alternatively, stock ready-use sterile items can be located in a bay within the theatre. In this case, a portion of the total theatre supply air should be provided in the bay to ensure it is actively ventilated.
- Preparation room 'lay-up' – when the preparation room is used as an instrument 'lay-up' room, it should be regarded as being of greater cleanliness than the operating room, and the design should minimise the transfer of air from the operating room to the preparation room. Air supplied to the room may be directed to the operating room through a pressure stabiliser taking care not to compromise the airflow pattern in the operating room. The air may also be directed into a corridor;
- Service corridor – if materials to be disposed of are placed in impervious material for transportation, it is not necessary to have a separate corridor for this purpose. However, a service corridor has many operational advantages it terms of the flow of materials through the theatre suite. It also permits routine service and maintenance access without compromising the use of adjacent theatre suites.

Standard air-movement control schemes

7.56 In the previous versions of this guidance standard air movement control schemes were given that provided a range of design solutions to typical operating suite layouts. These were satisfactory design solutions for 'standard' sized rooms within the suite but were never intended to be universal for any sized room or suite. Guidance on operating suites contained in HBN 26 (2004) has increased the recommended size of operating room from approximately 35m^2 to 55m^2. Associated room sizes and air change rates have also increased. This means that the original standard solutions are no longer appropriate for new-build installations.

7.57 Because of the resulting increase in the volume of air supplied to the theatre, provision needs to be made either to actively remove it or allow it to escape

passively through pressure stabilisers. The increase in room size has also made the number and position of air-supply terminals critical to the effective ventilation of the room.

7.58 Four new standard solutions have been developed to reflect the current guidance on theatre suite layout and room sizes given in HBN 26 (2004) as well as the general increase in air-change rates.

7.59 The most commonly used original standard solutions have been revised and updated. They have been retained in this guidance, as they will remain applicable to older theatre suites that are being refurbished to their original performance standards. They will also be applicable in existing departments where space constrains do not permit the upgrading of suites to the latest standard of performance or where a pre-built "shell" is being fitted out.

7.60 It is important to recognise that in any situation where a "non-standard" room size or theatre suite layout is being considered, the designer must return to first principles when developing a solution. Examples of non-standard configurations would be:

- cardiac theatres that typically have an operating room half as big again as normal, a perfusion laboratory and no anaesthetic room;
- operating departments served by a central instrument lay-up preparation area rather than individual prep rooms;
- balanced-flow theatres for infectious cases.

Appendix 4 contains a methodology for assisting the designer to arrive at a suitable solution.

7.61 The new and revised standard design solutions are as follows:

No 1 – Typical Conventional theatre – room sizes as HBN 26;

No 2 – Typical UCV theatre – room sizes as HBN 26;

No 3 – HBN 26 illustrated Conventional theatre;

No 4 – HBN 26 illustrated theatre with UCV terminal fitted;

No 5 – Pre-2006 Conventional theatre, single corridor (former SHTM 2025; 1b);

No 6 – Pre-2006 UCV theatre, single corridor (former SHTM 2025; 1a);

No 7 – Pre-2006 Conventional theatre, two corridor (former SHTM 2025; 5b);

No 8 – Pre-2006 UCV theatre, two corridor (former SHTM 2025; 5a).

7.62 Details of these standard solutions are given in Appendix 3. They contain diagrams that show the relationship of rooms and the various doors and transfer devices between them, **but should not be regarded as architectural layouts.**

The schemes have been developed using the calculation procedure described in Appendix 4. Important features of the solutions are:

- Zone trimmer heaters – a trimmer heater battery is advocated when calculations indicate that the temperature differential between rooms may be greater than 2K. Generally this will only be the case in the preparation room when designated as a lay-up.
- The preparation room (sterile pack store)/operating room interface – these rooms are deemed to be of equal cleanliness, and thus a transfer grille is required between these rooms or the door can be replaced with an opening wider than a standard door.
- Preparation (lay-up)/disposal room interface – pressure relief dampers are recommended here to provide an air path when doors are closed, while preventing back-flow when a door is opened elsewhere.
- Operating room/anaesthetic room interface – pressure stabilisers, or in some cases, carefully sized transfer grilles are recommended here, and between the anaesthetic room and corridor, and between the operating room and corridor.
- Operating room/scrub room interface – an opening is provided between these rooms. The flow of air through the opening provides protection, and gives bacterial dilution within the scrub room; the air is then exhausted to the corridor via a pressure stabiliser.

7.63 No mechanical supply or extract ventilation is provided in the scrub room, and thus when a door is opened elsewhere in the suite, the stabiliser will close, allowing the air to be re-directed to help protect the doorway. If the scrub is a bay within the theatre then a suitably positioned pressure stabiliser and / or active extract should be provided to ensure air movement and prevent a local build-up of moisture.

7.64 Any other scheme may be used and the standard solutions applied, if the following conditions are met:

- room relationships in air network terms are as shown in the plans;
- door-gap measurements approximate to those given in Scottish Health Technical Memorandum 58: ‘Internal doorsets’, (but see also Table A3 and Note 3);
- casual heat gains are accounted for;
- a trimmer battery is installed in the air supply system to the preparation room;
- leakage through the structure is kept to a minimum.

Note 3: It should be noted that many doors are now fitted with cold smoke seals as standard. These will significantly reduce the door leakage rate when new and undamaged. It is therefore recommended that provision for the design door leakage is factored into the sizing of the appropriate transfer grille or pressure stabiliser. Failure to do this will result in air gap whistles and doors being held partially open by air pressure.

7.65 It is recommended that every effort should be made to adopt one of the schemes described above.

Air terminals and air distribution within rooms

7.66 The selection and sighting of air diffusers will be critical in establishing an efficient pattern of mixing. To this end the diffusers selected must be fit for purpose. Ceiling mounted circular 'air master' style, square 'four-way blow' or similar diffuser designs that provide a downward displacement, turbulent airflow are the preferred option. (See Paragraph 5.68).

7.67 Plenum-type 'laminar'-flow-style diffusers with a footprint that encompasses the operating site are acceptable but may be prone to buoyancy effects as a result of temperature difference. Manufacturers' type-test data should be consulted to ensure that the terminal will achieve the required performance envelope. Note that these are not true laminar-flow systems in the strict sense of the word but produce a downward-displacement parallel-flow style of air distribution.

7.68 The diffuser equipment chosen should not cause 'dumping' and it should provide a velocity 1 metre above floor level at the operating position of between 0.2 m/s and 0.3 m/s.

7.69 In the operating room, the supply air terminals must be at high level, and should all be adjustable for rate of flow as well as being easily cleaned and silent in operation.

7.70 In order to ensure that all parts of the operating room are actively ventilated, there should be an air-out path on each face or in each corner of the theatre. This may be provided by a pressure stabiliser, transfer grille, active or passive extract terminal. A minimum of three, but preferably four, air-out paths - approximately equally spaced - should be provided.

Automatic control

7.71 The automatic control of ventilation in operating suites needs to be simple and robust. Over-reliance on complex room pressure and flow relationships linked to automatic fan speed control is unnecessary and in the long term have been shown to be unreliable. Complex software algorithms that can only be accessed and interpreted by off-site specialists should not be used. Whichever control strategy is chosen it is important that on-site staff have the facility to override the control system and keep the ventilation operating at least until the surgical procedure is complete. (See also Paragraph 6.11)

7.72 Theatre air-conditioning control sensors should be actively ventilated. They would typically be located in a sampling extract duct mounted in the surgeon's

panel, positioned at normal working height (1.8m above finished floor level) and be accessible for cleaning and the removal of fluff and lint.

7.73 Wall-mounted passive-temperature and humidity sensors are not recommended.

7.74 Controls should be provided to enable operating department ventilation plants to be closed down when the operating suites are unoccupied. (See also Paragraphs 6.24 - 6.26)

7.75 When in the 'off' mode, the control system should ensure that the ventilation plant is automatically reinstated if the space temperature falls below 15°C.

7.76 The theatre control panel should include plant status indication; clearly-readable temperature and humidity indicating gauges; and means of adjusting the set point for temperature. Theatre ventilation plant status indication should be located at the staff control base.

7.77 Where it is considered necessary to fit a humidifier, it should be selected to humidify to 40% saturation at 20°C during the design winter outside conditions. The cooling coil should be able to remove sufficient moisture so that 60% saturation at 20°C is not exceeded during the design summer outside conditions.

7.78 Each operating suite should be served by an independent supply and extract plant.

Ventilation of operating department ancillary areas

General

7.79 There are advantages in providing mechanical ventilation to all areas of the department. Maintaining operating suite airflow patterns is simpler and grilles and diffusers can be sited to eliminate condensation on windows. Where radiators or embedded wall or ceiling panels are installed they should be confined to the corridors and staff-only areas of the department.

Ventilation requirements

7.80 Table A2 gives guidance on the operating department areas in descending order of cleanliness, and this should be considered in the overall design of the department ventilation systems. The specified flow rates of air through doors given in Table A4 for the operating suite are not necessary for other areas of the department. However, the air-flow directions must be maintained from the clean to the less clean areas.

7.81 All windows in the department should be double-glazed and hermetically-sealed in order to ensure that the desired airflow pattern is maintained under all external environmental conditions and to avoid infestation. Trickle vents if fitted will need to be sealed.

Systems design

7.82 The design of the ventilation system for the ancillary rooms depends on the overall configuration of the department. The plant for the ancillary rooms may need to be interlocked to the theatre suite plants so that reverse air-flow patterns do not occur.

7.83 Extract grilles should be sited and balanced to promote air movement along the clean and access corridors towards the reception/transfer areas. This should not affect the air distribution in the operating suite(s).

Reception

7.84 The aim in these areas is to provide comfortable conditions having regard to the movement control requirements of the department as a whole. The number of air changes will depend on the particular design.

Sterile pack bulk store

7.85 The store needs to be maintained at a positive pressure in order to preserve the cleanliness of the outside of the packs; 6 air changes are recommended.

Recovery

7.86 The air-change rate in the recovery room will be rather higher than that needed merely to provide clean, comfortable conditions, as it is necessary to control the level of anaesthetic gas pollution; 15 air changes are recommended, with a balanced air flow.

7.87 The supply air terminals should be ceiling mounted above the foot-end of the recovery bed positions. Extract should be at low (bed height or below) level behind the bed head positions or in the corners. This will establish a clean airflow path so that staff do not inhale anaesthetic gases exhaled by recovering patients.

7.0 (b) Ultra-clean ventilation systems

General requirements

7.88 The design philosophy of a conventionally ventilated operating suite is based on the need to dilute contaminants and control both the condition and movement of air in an operating suite. Ultra-clean ventilation (UCV) is a means of significantly increasing the dilution effect by providing a large volume of clean filtered air to the zone in which an operation is performed and sterile items are exposed. Air is discharged above the operating zone and while not truly laminar, its downward displacement purges the clean zone of contaminants and particles generated by the activities within it. The airflow in and around the clean zone also serves to prevent particles originating outside the zone from entering it. The resulting reduction in contaminants has been shown to reduce significantly post-operative sepsis following certain orthopaedic procedures.

7.89 The number of bacteria that are present in the air at the wound site and exposed surgical items is dependent on the operating team, their procedural discipline, choice of clothing and the type of UCV system. Ultra-Clean air is defined as that containing not more than 10 CFU/m^3.

7.90 UCV systems are very successful in reducing contaminants at the wound site so it is often considered that there is no need for complex air movement control schemes in the rest of the suite. However, when designing the ventilation scheme, it should be noted that the users may switch the UCV terminal to "set-back" when non-orthopaedic surgery is taking place. This is because the high airflow rates can cause increased moisture evaporation of exposed tissue that may be detrimental to the surgical outcome. In recognition of this, the ventilation scheme should be capable of providing operating conditions to at least a "conventional" theatre standard throughout the suite with the UCV in set-back mode. It should also be remembered that suitable levels of ventilation will always be required in the peripheral rooms.

7.91 UCV systems can be designed and built from first principles or a range of bespoke modular units of varying shapes and sizes are available with each manufacturer having a slightly different approach to UCV design. Some systems are fitted with partial or full walls to delineate the clean zone and direct a laminar or exponential downflow of air within it. Other designs utilise slotted linear supply terminals to produce an air curtain around the clean zone together with laminar-flow diffusers to provide a downward-displacement supply within it. **Notwithstanding any variation in the design philosophy, all UCV systems will be required to achieve completely the performance standard set out in the "Validation" section of this document**. (Section 8)

7.92 As with conventional theatres, each UCV operating suite should have its own dedicated air handling unit (AHU) to the standard set out in Section 4 of this document. To ensure operational flexibility and permit routine maintenance, air handling units should not be shared between suites.

7.93 In retrofit installations, site conditions may preclude individual AHUs for each suite. In these circumstances an AHU may be shared between not more than two operating suites providing each suite has its own control of temperature. An accessible airflow measurement test point should be provided in the supply branch duct to each theatre so that the primary air volume to each UCV canopy can be determined. In addition the branch supply and extract should be capable of being physically isolated and the main air-flow rate reduced so that either suite can be taken out of use without detriment to operating conditions in the other.

7.94 An inherent feature of a UCV system is its large airflow so it is essential to re-circulate the air supplied to the operating theatre and/or to recover its energy in order to optimise operating costs.

7.95 The primary fresh-air volume supplied to a UCV suite will be the same as in a conventional suite and it should be dispersed to the rooms in the suite in the same manner. This is an important aspect of the design and requests by UCV suppliers for increased primary air-supply volumes should be resisted.

7.96 Laying-up in the clean zone is preferable for infection control reasons. Where a Sterile Pack Store (SPS) Preparation room is provided a transfer grille will be required in the preparation room / theatre door.

7.97 If the Preparation room is intended to be used for laying-up instruments, a pressure stabiliser will be required between the prep room and theatre. It should be fitted with a stand-off baffle to prevent air transfer interfering with the ultra-clean airflow distribution.

7.98 Separate scrub-up or disposal facilities are not necessary for air cleanliness although operational policy may prefer such a provision. A separate anaesthetic room should, however, be provided.

7.99 There is no aerobiological reason why two or more UCV systems should not be installed in a common area as long as adequate spacing is provided. These are known as “barn theatres” and require special design considerations and operational discipline. The relative positions of the UCV units, temperature control range and location of doors and openings to other areas will all significantly affect the airflow at the operating positions.

Types of UCV system

Remote plant systems

7.100 In a remote plant system, all the air-conditioning equipment is located outside of the operating room, except for the unidirectional air-flow terminal, terminal filter, air diffuser and the return-air grilles (see Figure 6).

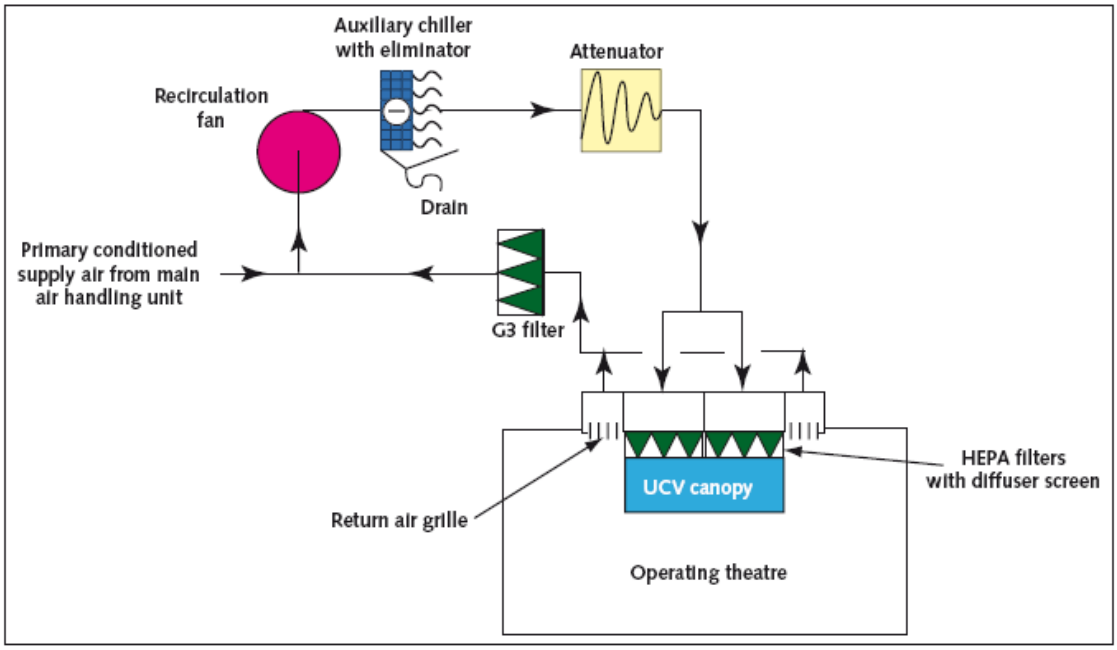

Figure 6: UCV theatre with remote air recirculation

7.101 This arrangement is the preferred option for new installations as it has the following advantages:

- the recirculation fans are out of the theatre thus reducing noise. Multiple recirculation fans can be replaced by a single fan unit with its drive out of the air stream;
- casual heat gains from recirculation fan(s), canopy lights, equipment and people within the theatre can be removed by a chiller battery in the return air stream. This will prevent heat build-up in the theatre;
- the return-air filters can be changed without needing access to the theatre making routine maintenance more feasible;
- the opportunity exists to locate the HEPA filter in the primary supply duct rather than the theatre terminal. This will reduce the number of filters required and allow them to be changed without entering the theatre.

Modular systems

7.102 Modular systems are frequently used in retrofit applications. Vertical or horizontal units are available.

7.103 Vertical-flow modular units comprise a ceiling-mounted air-terminal module containing return-air filters, return-air fans, final filter and air diffuser. Primary air is supplied by a remote air-conditioning unit at the volume and to the standard required for a conventional operating suite. (see Figure 7)

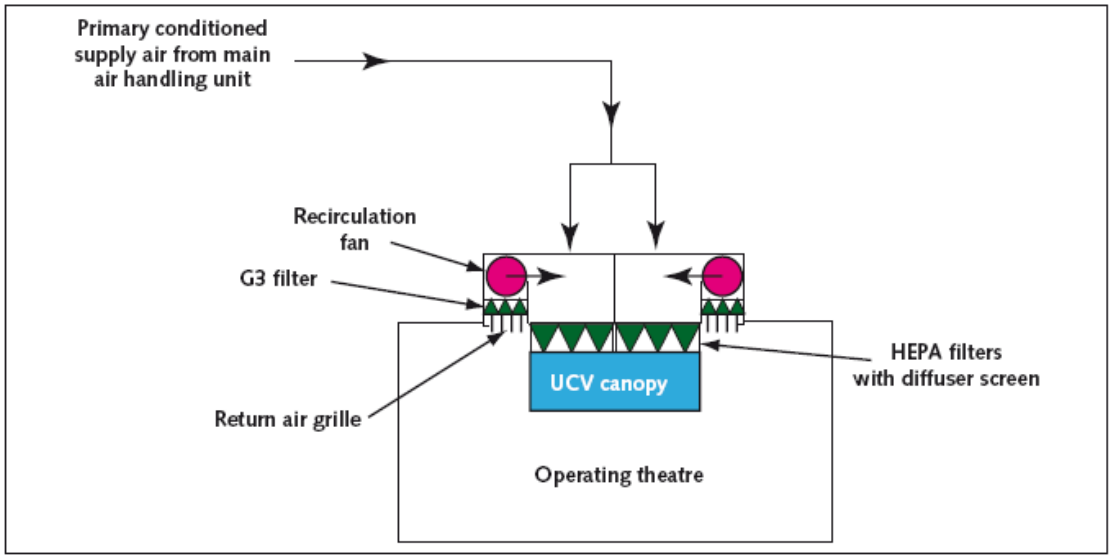

Figure 7: UCV theatre with modular system

7.104 Horizontal or cross-flow modular units comprise a wall-mounted air-terminal module standing vertically to produce a horizontal flow of air and containing final filter/diffuser, return-air filters and fans. The module may incorporate a cooling unit or be supplied with 'fresh air' from a separate primary cooling system.

Vertical flow UCV systems

7.105 Vertical-flow systems have a superior performance and are more effective at reducing infection risks. Air-curtain or partial-wall systems are acceptable, but are known to be more susceptible to problems arising from performance

deterioration, poor operating-team discipline and high occupancy rates than is the case with full-wall systems. A full-wall is considered to be any wall terminating not more than one metre above the finished floor level.

7.106 Because of the large volume of air being moved in a relatively small space, the siting of the return-air grilles can cause short-circuiting of the air discharged through the UCV terminal. If the return-air grilles are positioned at high level, partial walls should be provided to control short-circuiting. The partial-walls shall be not less than 1m from the operating room walls and terminate at least 2m above floor level. The clearance should be increased proportionally for larger terminals (that is, 1.15m for 3.2m x 3.2m units and 1.25m for 3.5m x 3.5m units). In all cases, the sidewalls should terminate at 2m above floor level.

7.107 Siting the return-air grilles around the periphery of the theatre at low level will eliminate short-circuiting, remove the need for partial walls and give an improved airflow path. In any event there should be an air-out path on each face or in each corner of the theatre. These may be provided by combination of pressure stabilisers and passive or active low level extract grilles. Failure to provide air-out paths on all faces of the theatre may result in the surplus air causing entrainment into the clean zone.

7.108 Vertical systems should have a clean zone large enough to encompass the operating site and all of the instrument trays likely to be needed for the surgical procedures to be undertaken. Ophthalmic and minor hand surgery would typically require a 1·4m circular or rectangular terminal. For major orthopaedic procedures a minimum size of 2·8m x 2·8m will be required. This is the area projected on the floor under the supply air terminal within the partial walls, full walls or air curtain. Any air outside this zone cannot be guaranteed to be ultra-clean although given the dilution factor the level of microbiological contamination will be much lower than the general level in a conventional operating room. The use of lines or a coloured area on the floor delineating the extent of the clean zone will assist staff and is therefore essential.

7.109 When upgrading an existing conventional theatre to an ultra-clean standard the only solution may be the installation of a modular system. In these units, the heat gains from the return-air fans and terminal lights may warrant the inclusion of supplementary cooling within the module although modern luminaries contribute substantially less unwanted heat. However issues of cooling coil drainage, condensate removal and maintenance access within the space constraints of the module may make this option impracticable. The additional cooling load should then be catered for by conditioning the primary air to compensate.

7.110 If an existing AHU is to be retained, it may require modification to ensure that it achieves the minimum standards set out in Section 4 of this document. The fan may need re-rating to accommodate the change in system resistance. The cooling coil may also need to be upgraded to cater for the increased load resulting from the return air fans and terminal lights. Failure to make adequate provision for this may make the theatre unusable during prolonged warm spells.

7.111 A factor affecting the air-flow pattern is the supply or room air temperature difference. When the supply-air temperature is significantly above room temperature, buoyancy effects will reduce the volume of air reaching the operating zone. If it is anticipated at design stage that this will be a regular occurrence, then a system incorporating full-walls should be used. Demountable extensions that convert a partial-wall to a full-wall unit are available.

7.112 Convection up-currents from the surgical team and operating lamp tend to counter the movement of clean air towards the operating site, hence the air velocity reaching the operating level is critical. The minimum velocity given below has been selected to take account of these factors and is greater than the theoretical minimum value.

7.113 For all vertical UCV systems the design discharge velocities will be as follows:

Air velocity 2 metres above floor level:

- partial-wall system = 0.38 m/s average;
- full-wall system = 0.30 m/s average.

Air velocity 1 metre above floor level:

- all systems = 0·2 m/s minimum within the operating zone.

The validation Paragraphs 8.75 – 8.86, gives details of the method of measurement.

7.114 Variable-speed recirculation fans with differential pressure control may be the most suitable solution for maintaining consistent performance and energy saving.

Horizontal UCV systems

7.115 Horizontal UCV air-flow systems have been shown to be less effective than vertical systems and are not the preferred solution. There may be occasions, however, where architectural, engineering, economic or workload considerations prevent the installation of a vertical-flow system and only a horizontal-flow system can be installed.

7.116 Horizontal- or cross-flow modular units comprise a wall-mounted air terminal standing vertically to produce a horizontal flow of air across the operating field. The terminal module contains the final filters, air diffuser, return-air grilles, filters and fans. The module may incorporate a full air-conditioning unit or be supplied with 'fresh-air' from a separate primary air-conditioning system. In the latter case the return-air fan power may warrant the inclusion of a supplementary cooling coil within the module.

7.117 The system should have sidewall panels at least 2·4m apart. The panels may fold to facilitate cleaning of the theatre. The minimum height of the terminal should be 2·1m and a deflector at the top of the filter/diffuser will be acceptable

as an alternative to a full roof. These dimensions reflect currently available equipment and may impose operational constraints in addition to a lower level of performance common to these systems.

7.118 In the horizontal flow systems, personnel working between the filter and surgical wound will disperse bacteria that are more likely to contaminate exposed surgical instruments and enter the wound. This may be minimised by the use of improved clothing and operating procedure to reduce dispersion of bacteria. The use of lines on the floor delineating the extent of the clean zone and hatching or colour coding the 'no-entry' zone between the air diffuser and patient will serve to prompt staff and are therefore essential.

7.119 The air discharge velocity as measured 1m from the diffuser face should have a mean value of 0·4 m/s. The validation Section 8 gives details of the method of measurement.

Filters

7.120 The main plant primary and secondary filters should be to the standards and in the location set out in Section 4.

7.121 Terminal filters should be provided within the airflow terminal or in the air supply to it. High efficiency particulate air (HEPA) filters grade H10 as specified in BS EN 1822 will be required as a minimum. There is no aerobiological benefit in fitting filters of a higher grade than this, although for practical reasons most UCV manufacturer recommend the fitting of H12-grade filters.

7.122 In some modular UCV units, the terminal filter is used as a pressure equaliser to balance airflow and filters of a higher grade with a greater pressure drop may be recommended by their manufacturer. The increased resistance may affect the velocity of air reaching the operating level and there will be penalties in terms of installed fan power and higher noise levels.

7.123 The final filters should be installed in a leak-proof housing in a manner that allows the terminal unit, filters and their seals to be validated. A challenge test will be carried out during commissioning to prove the effectiveness of the complete installation.

7.124 Where UCV units are constructed in sections, a means of measuring the pressure drop across the terminal filters in each section should be provided. The pressure test-points should be located outside of the partial wall, capped to prevent air leakage and accessible within the theatre without the need to open the unit inspection panels. Alternatively direct-reading pressure gauges should be fitted.

7.125 The UCV system will require a return-air filter to capture the relatively coarse particles that would otherwise significantly reduce the life of the final filter. This should be at least a G3 grade to BS EN 779. In remote recirculation systems there may be advantages in fitting a higher grade return air filter, as it will reduce the load on the terminal HEPA filters and extend their life.

Noise level

7.126 If sound-attenuating material is used to line any portion of the inside of the UCV unit it should be non-particle-shedding and fire-resistant. (Further guidance can be found in SHTM Firecode suite of documents).

7.127 The maximum noise level in an operating room fitted with a UCV terminal of any type shall not exceed 50 NR. The validation section gives details of the method of measurement.

Lighting and operating lights

7.128 CIBSE lighting guide LG2 and BS EN 12464-1 give detailed information of lighting requirements. Operating luminaires should comply with the photometric requirements detailed in relevant sections of BS EN 60601.

7.129 The position of the UCV light fittings and style of partial walls, where fitted, should neither adversely disturb the airflow nor result in significant spatial variations in illuminance levels.

7.130 In vertical units, specialised task lighting should be provided by toroidal, cruciform or small multiple dome-shaped luminaires as they have good aerodynamic properties. The ideal luminaire will have a minimal effect on the airflow regardless of where it is positioned. Large-diameter saucer-shaped luminaires should not be used in vertical-flow systems as they will occlude the airflow in the critical central zone. It is important to consider the suitability of existing luminaires when retrofitting UCV systems.

7.131 In vertical UCV installations a minimum of 2·75m from floor to underside of the diffuser is required to allow for supporting mechanisms and lamp articulation. When upgrading existing systems this dimension may not be achievable. However, when parked, the lowest point of the central light stem, luminaire and articulation arms should never be less than 2m above floor level.

7.132 The traditional means of light support is a central column that passes through the UCV terminal and is rigidly fixed to the building structure. The position of the support therefore prevents air being supplied at the centre of the terminal. Separate supports displaced from the centre of the clean zone would lead to improved airflow. This approach was advocated in the 1994 version of HTM 2025 but at the time of writing no UK manufacturer has chosen to adopt this solution.

7.133 In horizontal units the size or shape of the specialised task luminaire has little effect on the air-flow pattern.

Controls and instrumentation

7.134 The functions of the supply AHU and extract ventilation should be continuously monitored by a BEMS control unit. The controls and instrumentation for the main plant are set out in Section 6.

7.135 UCV systems will additionally require:

- a set-back facility that can reduce the air supplied through the UCV terminal to a volume that equates to not less than 25 air changes per hour of the operating room gross volume whilst still leaving the supply AHU operating at full speed;
- a facility to turn the entire system, supply AHU and UCV terminal, off. (an emergency stop is not required);
- a read-out sufficiently large to be clearly visible from the operating table that shows the temperature of the air being supplied by the UCV terminal;
- a read-out sufficiently large to be clearly visible from the operating table that shows the relative humidity of the air being supplied by the UCV terminal;
- a red indicator light that will illuminate when either the supply AHU or the UCV terminal fails, either or both are switched off or are at set-back;
- an amber indicator light that will illuminate when the UCV terminal is at set-back and the supply AHU is running;
- a green indicator light that will illuminate when both the supply AHU and UCV terminal are operating at full speed;
- a blue indicator light that will illuminate when the UCV terminal air flow, as detected by a differential pressure sensor, falls below 80% of the design flow rate.

AHU	UVC terminal	Indicator light	Comment
Off or Fault	Off or Fault	Red	Ventilation not operating at a suitable level to commence surgical procedures
Off or Fault	On (set-back)		
Off or Fault	On (full speed)		
On (set-back)	Off or Fault		
On (full speed)	Off or Fault		
On (set-back)	On (set-back)		
On (full speed)	On (set-back)	Amber	Ventilation provided to at least conventional theatre standard
On (full speed)	On (full speed)	Green	Full UCV standard conditions
-	-	Blue	HEPA-filter resistance causing low air flow

Table 7: Indicator light logic table

7.136 The switching devices and indicators should be incorporated in the surgeon's panel and their functions clearly labelled. In retrofit installations an auxiliary panel for the UCV may be the most practical option. If fitted it should be mounted adjacent to the surgeon's panel and their control functions interlocked as necessary.

7.137 When a system is designed to have partial walls with full-wall extensions, a volume control facility may be incorporated to allow the system to be run with reduced velocity when the demountable full-walls are in place. It would be the responsibility of the user to ensure correct operation of the system. To assist the user an explanatory notice should be included on the theatre control panel.

7.138 A direct-reading gauge should be fitted in the theatre to show a representative pressure drop across the final filters. If the UCV control box is located out of the theatre and has a means of manually adjusting the return air-fan speed then it should also be fitted with a direct-reading differential pressure gauge. The means of adjusting the return-air fan speed should be lockable to prevent casual adjustment. The direct-reading gauges should be fitted with a means of indicating the correct operating pressure range.

7.139 The UCV-unit manufacturer's control box should be located in an accessible position preferably in the operating department adjacent to the operating theatre that it serves. A service corridor, if provided, is an ideal location. The control box should be clearly labelled with the identity of the operating theatre that it serves.

7.0 (c) Extract systems

7.140 Extracts may be provided for a variety of reasons including:

- simple odour control (for example in a WC or mortuary);
- to receive and remove moisture-laden air (for example, in a kitchen);
- as part of a combined supply/extract balanced system (for example, in an operating suite);
- to capture a hazardous substance at source (for example a safety cabinet).

7.141 Devices that use an inflow of air to control exposure of staff to hazardous substances are classified as Local Exhaust Ventilation (LEV) systems under the COSHH Regulations.

7.142 An LEV system may comprise a self-contained unit incorporating its own carbon filter such as a simple bench-top fume cupboard. Alternatively it may be a complete "ventilation system" comprising a make-up air supply, multiple-exhaust-protected work stations, branch and central extract ductwork, duplex extract fans and a high-level discharge terminal. It may also incorporate a special filtration system appropriate to the hazardous substance being controlled. Such systems could be required for workshops containing woodworking machinery or large centralised pathology laboratories housing multiple safety cabinets, dissection benches, fume cupboards and specimen stores.

7.143 It is important to recognise at the design stage whether an extract is being provided for comfort or as an LEV system. Typical systems in healthcare include:

- microbiological safety cabinets and Category 3 containment rooms;
- fume cupboards;
- welding-fume extracts;
- woodworking machinery duct collectors;
- battery-charging bay extracts;

- powered plaster and bone saws;
- pharmaceutical preparation cabinets and tablet machines;
- dissection benches, cut-up tables and some specimen stores;
- medium- and high-risk infectious disease isolation facilities;
- decontamination facilities;
- dental furnaces, grinders and polishers.

7.144 General design information and guidance for LEV systems is produced by the Health and Safety Executive (HSE) as HS(G)37. Information on the design and installation of microbiological safety cabinets is given in BS5726 and that for fume cupboards is given in BS EN 14175. Their recommendations should be closely followed.

7.145 LEV systems are statutory items that will be subject to an independent inspection every 14 months.

Hood extract systems

Special requirements

7.146 Extract canopies will be required over steam-and-heat-emitting appliances, for example sterilisers, catering and washing equipment; and for the extraction of toxic fumes over benches used for mixing, sifting and blending procedures.

7.147 Perimeter-drain gulleys and corrosion-proof grease eliminators should be provided on kitchen hoods.

Typical arrangements

7.148 The air-flow rate must be sufficient to ensure an adequate capture velocity in the vicinity of the process; typical values are as follows:

- evaporation of steam and like vapours 0.25 m/s to 0.5 m/s;
- chemical and solvent releases 1.0 m/s;
- vapour of gases 5 m/s to 6 m/s;
- light dusts 7 m/s to 10.0 m/s.

Excessive velocities will be wasteful of power and generate noise.

7.149 The lowest edge of the canopy should be 2m above finished floor level, with a minimum of 300mm overhang beyond the edge of the equipment on all sides.

7.150 A compact arrangement of equipment (but with access for maintenance) will minimise the canopy area, and hence reduce the air volume necessary to achieve the optimum capture velocity.

7.151 Hoods required for the control of heat gain and vapours may be connected to the general extract system when it is convenient to do so, but where non-corrosive ductwork materials are necessary, a separate discharge is preferred.

7.152 Lighting and internal divider plates are often required to be built into the perimeter of large canopies. However, built-in shelving systems are not recommended, as they interfere with the air-flow, and constitute a maintenance problem.

Control of hood extracts

7.153 Provided that it does not interfere with the operation of the department when not in use, the ventilation system for the hood extract and any associated supply can be shut down. To this end, local control should be provided.

Bench extract systems

Special requirements

7.154 Bench extract ventilation is required in departments such as pathology and mortuary, where activities involve the release of malodorous or toxic fumes that should not be inhaled. Where hazardous substances are being controlled, the system should be designated an LEV.

Typical arrangements

7.155 Each ventilated position will usually be accommodated in a continuous run of benching, which should not be more than 650mm from front to rear and which should be provided with a continuous upstand at the rear. Each position should have a 1200mm x 150mm linear extract grille mounted on a purpose-designed plenum box (incorporating guide vanes as necessary), with its face flush with the upstand. The bottom of the grille should be as close as practicable to the level of the working surface (usually 75mm above, to allow for cleaning). The minimum velocity across any part of the grille should be 1 m/s. The grille should be readily demountable to allow for cleaning.

Control of bench extract systems

7.156 Provided that it does not interfere with the operation of the department when not in use, the ventilation system for the bench extract and any associated make-up supply can be shut down. However, a run-on timer with a minimum setting of 30 minutes must be provided. To this end, local or automatic-use control should be provided.

7.157 Processes that produce hazardous vapours, fumes, dusts or noxious vapours should be enclosed or semi-enclosed in a suitable cabinet or exhaust protected workstation.

Safety cabinet and fume-cupboard extract systems

7.158 Safety cabinets and fume cupboards are devices that use an inflow of air to control exposure of staff to hazardous substances. The units, their exhaust

systems, filters, fans and discharge terminals are all classified as Local Exhaust Ventilation (LEV) systems under the COSHH Regulations. The make-up air system to a room that contains an LEV system should also be considered as an essential part of the system and be included in the LEV classification. Information on the design and installation of microbiological safety cabinets is given in BS5726 and that for fume cupboards is given in BS EN 14175. Their recommendations should be closely followed.

7.159 The Advisory Committee on Dangerous Pathogens (ACDP) publishes 'The Management, Design and Operation of Microbiological Containment Laboratories' covering the general environment in which they are used and operational considerations.

Special requirements

7.160 The supply-air system should not distort the unidirectional and stable air pattern required for fume cupboards and microbiological safety cabinets. In general, supply-air ceiling diffusers should not discharge directly towards fume cupboards or safety cabinets, unless the terminal velocity is such that the air-flow pattern of the cabinet is unaffected. The design should ensure that high air-change rates, and/or the opening and closing of doors do not have any adverse effect on the performance of safety cabinets or fume cupboards. A damped door-closure mechanism may help.

7.161 In order to safeguard the user, all safety cabinets and fume cupboards must be fitted with a clear indication that they are operating correctly. Direct-reading gauges or falling-ball indicators are preferred (in addition to electronic pressure indicators). The system should be set to alarm audibly if the face velocity falls below the minimum safe operating level.

Arrangements for safety cabinet installations

7.162 The manufacture and installation of microbiological safety cabinets must be in accordance with the relevant national standards and guidance issued by the Advisory Committee on Dangerous Pathogens (ACDP).

7.163 A Class 1 microbiological safety cabinet must be specified for routine work involving Group 3 pathogens. It should be housed in a Category 3 containment room. Specific design information on containment rooms is issued by ACDP in conjunction with the Health and Safety Commission.

7.164 Siting and installation of microbiological safety cabinets are of particular importance because:

- the protection afforded to the operator by the cabinet depends on a specific and stable unidirectional air flow through the open front;
- the protection to the environment by the cabinet depends on the high efficiency particulate air (HEPA) filters. The exhaust air should never be considered as totally free from microbiological hazard.

7.165 Microbiological safety cabinet is HEPA filtered prior to being discharged to outside. The extract ductwork should as far as practicable be kept under negative pressure while inside the building.

7.166 Current standards permit the installation of microbiological safety cabinets with integral fans, provided that the extract ductwork can be kept short (that is, less than 2m); such an installation however, is likely to be noisy and is not recommended for use in new buildings.

7.167 The discharge from the cabinet should be fitted with a back-draft damper. In multiple installations where several cabinets discharge into a common extract and discharge duct, it must be possible to isolate each cabinet from the system when not in use.

7.168 Roof-level discharge, wherever practicable, is preferred since it removes much of the uncertainty over air re-entering the building through ventilation inlets and/or windows. In such an installation, the extract fan should be situated separately from the cabinet and close to the discharge outlet, to maintain the duct within the building under negative pressure. The discharge point on a flat roof should be through a 3m high terminal. This is required to safeguard staff who may need to access the roof periodically for maintenance. This requirement will also be applicable to fume-cupboard discharges.

7.169 Where this is impracticable, discharge into the room via a double HEPA filter has been accepted. The preferred method, however, is to discharge 3m above the roofline in line with the similar standard for fume cupboard designs.

Arrangements for fume cupboard installations

7.170 The manufacture and installation of fume cupboards must be in accordance with the relevant national standards and associated guidance.

7.171 The primary factors that contribute to the effective performance of fume cupboards include:

- an adequate volume of supply air;
- an effective exhaust system to promote the safe dispersal of waste products to atmosphere.

7.172 The air velocities through sash openings must be sufficient to prevent hazardous materials from entering the laboratory while avoiding excess flow rates that interfere with the investigation process. Average face velocities should be between 0.5 and 1.0 m/s, with a minimum at any point within 20% of the average, the upper end of the range being applicable to the containment of materials of high toxicity. The design velocity must be maintained irrespective of whether the sash opening is varied, or whether doors or windows are open or closed. Variable Air Volume (VAV) cupboards are available which offer a reduction in energy use.

7.173 The possibility of a fire or explosion that may not be contained by a fume cupboard must always be considered. A fume cupboard should not, therefore,

be sited in a position where exit to an escape route will necessitate passing directly in front of it.

7.174 Fume-cupboard fans should be installed as near as possible to the termination of the duct, thus maintaining the maximum amount of ductwork at negative pressure.

7.175 Where there are adjacent buildings with opening windows, or where downdraughts occur, it may be necessary to increase the height of discharge ducts in order to achieve adequate dispersal. In complex locations, airflow modelling or wind tunnel tests may be required to determine the optimum height of the stack (see also Paragraph 7.167).

7.176 Fume-cupboards for certain processes must have separate extract systems. However, where appropriate, individual fume-cupboard exhaust systems may discharge via non-returning dampers into a single collection duct rather than having a large number of separate stacks. The collection duct should have a large cross-sectional area to minimise its effect on the individual exhaust systems; be open to atmosphere upstream of the first connection; and be designed to discharge a total air volume at least equal to the combined individual extract systems.

7.177 Individual fume-cupboard extract systems, discharging either directly to atmosphere or into a collection duct, do not require duplex fans. However, a collection duct designed to provide dispersal of effluent from a number of individual extracts, should have duplex fans with automatic changeover.

7.178 Some fumes are particularly corrosive, so the choice of material for the ductwork, and type of extract fan fitted should reflect the nature of the fume being conveyed.

Control of extract systems

7.179 It is desirable to provide local control of safety cabinets in order to maximise the life of the HEPA filter, and to permit the sealing of the cabinet and room for fumigation if spillage occurs.

7.180 To cope with the risk of an accident or spillage outside safety cabinets, a ‘panic button’ should be provided to switch off the supply to that area; and discharge all extracted air to atmosphere.

7.181 In pathology departments, it will be necessary to have one or more microbiological safety cabinets and one or more fume cupboards available for use at all times, including weekends, therefore, local overriding controls for all these items and any associated ventilation plant will be necessary.

7.0(d) Plantroom ventilation

General requirements

7.182 Plant rooms are required to be ventilated in order to maintain acceptable temperatures for satisfactory operation of the plant and controls, and for

maintenance activities. In the case of plant rooms housing combustion equipment, a secondary function of the ventilation is to provide make-up air for the combustion process.

7.183 The air required for these purposes should be introduced into the space through inlets positioned to minimise the discomfort to occupants; they should be unlikely to be blocked, closed deliberately (except in the case of fire shutters if required), or rendered inoperative by prevailing winds.

7.184 Plantroom ventilation air should not be used for any other purposes, such as make-up air for extract; and where the plantroom contains combustion equipment, the appliance pressure must not fall below the outside air pressure.

7.185 Specialised healthcare air handling equipment must not be located in a fire compartment that houses combustion equipment.

7.186 Statutory regulations for plantroom ventilation are contained in the Scottish Building Regulations, and further guidance is given in CIBSE Guides A & B.

Assessment of ventilation levels

7.187 Ventilation requirements must take into account all heat sources within a plantroom, and where there are large glazing areas, solar gains. The ventilation rate should limit the maximum temperature within the plantroom to 32°C.

7.188 As the level of equipment operating during mid-season and summer is often lower than the winter condition, and the cooling effect of the outside air is reduced, it is necessary to calculate the minimum volume for each season of operation, and the inlet and outlet grilles or fan sizes should be chosen to cater for the largest seasonal air volume.

7.189 Replacement air should not be drawn through pipe trenches or fuel service ducts. Where metal ducts penetrate walls and floors, effective sealing should be provided to confine the ventilation to the boiler room and to meet fire protection requirements. Penetration of fire barrier walls by ventilation ducts should be avoided if possible.

7.190 Fire dampers in plant room ventilation ducts should be electrically interlocked with the boiler plant.

7.191 Care must be taken to prevent any noise generated in the boiler room emerging from natural or mechanical ventilation openings to the detriment of the surrounding environment. Particular care is necessary with mechanical flue draughts and fan-diluted flue systems.

7.192 Information on required air volumes in contained in the CIBSE Guide A & B.

7.193 Where combustion plant is installed, the high-level (outlet) openings should be sized to cater for the total ventilating air quantity; and the low-level (supply) openings sized to cater for the total combined ventilating and combustion air quantity.

Choice of ventilation system

7.194 Ventilation air may be introduced and exhausted by either natural or mechanical means or a combination of both. However, natural systems are preferred where possible.

7.195 Generally, small installations at or above ground level should have their combustion and ventilation air provided by natural means, employing both high- and low-level openings.

7.196 Basement, internal and large installations at or above ground level will usually require a combination of natural and mechanical ventilation. If the airflow rate is difficult, both supply and extract may require mechanical means.

7.197 Whether natural or mechanical, the system should be designed to avoid both horizontal and vertical temperature gradients. Both inlet and outlet openings should be placed on opposite or adjacent sites of the building to reduce the effect of wind forces.

7.198 Where mechanical air supply is employed, electrical interlocks with the boiler plant should be provided to prevent damage in the event of failure of the supply fan(s) once the air volume is established.

7.199 The necessary free opening areas for a naturally ventilated plantroom may be calculated using either the method in A4 of the CIBSE Guide A or the table in section B13 of CIBSE Guide B.

7.200 A combined natural and mechanical ventilation system should allow for natural extract at high level, to take advantage of convective forces in the room, with mechanical supply at low level. The high level natural ventilators should be sized to cope with the total quantity of ventilation air, as above.

7.201 To prevent leakage of flue gases and to ensure that the flue draught is not impeded at any time, the air pressure in the boiler room must not exceed the prevailing outside pressure. Therefore, the fan duty should exceed the calculated total combined combustion and ventilation air quantity by at least 25%. Fan-powered inlets should be arranged to flow outside air into the space at a point where cross-ventilation will ensure pick-up of heat without causing discomfort to occupiers.

7.202 Where it is impractical to provide sufficient natural ventilation to remove the heat emitted by the plant, both mechanical supply and extract will be required.

7.203 The high-level extract should be sized to cater for the total ventilating air quantity and the low-level supply should exceed the total combined combustion and ventilating air quantity by at least 25%, as above.

7.0(e) Ventilation of hydrotherapy suites

General requirements

7.204 In a hydrotherapy suite heat recovery should be via heat pump.

7.205 The quantity of supply air should be calculated as 25 litres/sec/m^2 wetted surface, with the wetted surface taken as 110% of the pool water surface area.

7.206 A re-circulation plant is recommended, with a minimum of 20% fresh air.

7.207 As far as practicable, re-circulated pool air should be provided to the ancillary changing and recover accommodation, with the only extract from the toilets, laundry/utility room and pool hall.

7.208 Supply air to the pool hall should be introduced at high level and directed towards the perimeter to mitigate condensation, with extract air taken from directly over the pool. Dampers should not be located over the pool water.

Control of hydrotherapy pool installations

7.209 The supply and extract fans should be interlocked so that the supply fan does not operate until flow is established within the extract system.

7.210 Time-clock control should be provided, with a local override switch to extend the normal operating period as required.

7.211 Night setback temperature (in the range of 21°C -25°C) and high humidity control (in the range of 60-75% sat) should be provided to override the time clock in order to prevent condensation. The exact set points should be ascertained post-installation.

7.212 A remote indication panel should be provided in the pool hall, giving a visual display of the pool water and pool air temperature.

8. Validation of specialised ventilation systems

Definitions

Commissioning - Commissioning is the process of advancing a system from physical completion to an operating condition. It will normally be carried out by specialist commissioning contractors working in conjunction with equipment suppliers. Commissioning will normally be the responsibility of the main or mechanical services contractor.

Validation - A process of proving that the system is fit for purpose and achieves the operating performance originally specified. It will normally be a condition of contract that "*The system will be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life.*"

Note: Commissioning is often sub divided into sections e.g. air handling unit, automatic controls, airside balance, building fabric and fittings. Each section may be commissioned by its specialist installer and they are often accepted in isolation. Validation differs from commissioning in that its purpose is to look at the complete installation from air intake to extract discharge and assess its fitness for purpose as a whole. This involves examining the fabric of the building being served by the system and inspecting the ventilation equipment fitted as well as measuring the actual ventilation performance.

It is unlikely that 'in house' staff will possess the knowledge or equipment necessary to validate critical ventilation systems such as those serving operating suites, pharmacy clean rooms and local exhaust ventilation systems. Validation of these systems should therefore be carried out by a suitably qualified independent Authorised Person appointed by the NHS Board.

It is anticipated that training in the validation of specialised healthcare ventilation systems for independent Authorised Persons will become available during the life of this SHTM.

Commissioning general

8.1 Commissioning is an essential process for ventilation systems. It is therefore important that adequate provision for the process be made at the design stage of the project. Procedures for commissioning air-handling systems are given in CIBSE Commissioning Codes and BSRIA Application Guide Set COMPAK 1.

8.2 The duct-sizing procedure should take into account the requirements of system balancing, and the position and number of regulating dampers included in the design should be sufficient for this purpose.

Location of dampers and test holes

8.3 Balancing/commissioning dampers will be required in each branch of the distribution ductwork.

8.4 Test holes for the measurement of air-flow will be required at carefully selected points in main and all branch ducts. The number and spacing of holes are given in the BSRIA Application Guide Set COMPAK 1. Their positions must be identified at the design stage.

8.5 The test positions need to be accessible for commissioning to take place. They may also be required for subsequent annual verification of the system performance, so they should not be covered by permanent lagging.

8.6 The measurement point should be in a straight length of duct as far away as possible from any upstream bends, dampers or other elements that could cause disturbance to the airflow. The actual location should be:

- at least 1.5 duct diameters upstream of sources of turbulence such as dampers and bends;
- if this is not possible, 10 diameters downstream of dampers, bends or tees, and 5 diameters downstream of eccentric reducers;
- where there is enough space round the duct to insert the pitot tube and take readings;
- where the duct has a constant cross-sectional area.

8.7 Test holes for measuring total airflow from a fan should be located either 4 diameters upstream or 10 diameters downstream of the fan. Provision should also be made for measuring the speed of rotation.

Information to be provided

8.8 It is essential that the designer should pass on his intentions fully to the commissioning engineer by indicating which parts of the system are high, medium and low pressure, and by providing:

- relevant parts of the specification;
- schematic drawings indicating performance data as indicated in Table 8;
- equipment schedules;
- controller and regulator schedule;
- fan performance curves;
- wiring diagrams for electrical equipment, including interlock details.

Items in system	Information to be provided
Fans	Fan total pressure Volume flow rate at high and low speed Maximum motor current
Plant items	Type and identification numbers from equipment schedules Fluid and air volume flow rates Fluid and air side pressure losses Dry bulb temperatures Wet bulb temperatures Humidity
Dampers, including motorised and fire dampers	Identification numbers from equipment schedules Location Identification number Volume flow rate
Main and branch ducts	Dimensions Volume flow rates and velocities Identification numbers from equipment schedules
Terminal	Location Identification number Grille or diffuser factor Volume flow rate and neck velocity Operating static pressure
Test holes and access panels	Location Identification number
Controllers	Set points

Table 8: Information to be provided on schematic drawings

Notes: For Table 8

1. Fan total pressure is the difference between the total pressure (static pressure + velocity pressure) at the fan outlet and the total pressure at the fan inlet.

2. Where volume flow rates are variable, maximum and minimum values should be provided.

Commissioning personnel

8.9 As one individual is unlikely to possess all of the required commissioning skills, a commissioning team is therefore usually needed. The objective of commissioning is to ensure that the necessary performance and safety requirements are met.

8.10 During the commissioning process a great deal of information will be generated which will form an invaluable future source of reference about the plant. It is essential to ensure that it is collected together in the form of a commissioning manual and handed over to the client on completion of the contract together with the 'as fitted' drawings. This information should be both in hard copy and electronic format.

8.11 In order to be successful the commissioning process must start before achieving practical completion as many parts of the system will become progressively less accessible. The correct installation of those parts will need to be witnessed and leak-rate tests carried out as construction proceeds. Failure to establish responsibility for commissioning early enough will delay the completion of the project or lead to unsatisfactory plant performance.

Commissioning brief

8.12 The commissioning team will require a detailed brief from the system designer. This should include:

- a 'user' brief comprising a description of the installation and its intended mode of operation;
- the precise design requirements with regard to the scheme of air movement, room static pressures, supply and extract air-flow rates and acceptable tolerances;
- full details of the design conditions both inside and out, for winter and summer together with the control strategy;
- equipment manufacturer's type test data, commissioning, operation and maintenance recommendations;
- drawings showing the layout of the system, positions of air-flow measurement test points, dampers, regulating devices and filters within the duct runs, together with sizes of ducts and terminal fittings. It will save time if these drawings are annotated with the design volumes and static pressures required at each branch and outlet point;
- wiring diagrams for all electrical equipment associated with the air handling systems including motor control circuit details and any interlocking and safety devices such as emergency-stop buttons adjacent to the item of plant.

8.13 The CIBSE Commissioning Code, Series 'A' – "Air Distribution", provides full guidance on the information that will be required by the commissioning team.

8.14 The designer should include in the contract document instructions on verifying the accuracy of test instruments that should be supported by reference to relevant calibration certificates.

8.15 The system, on completion, should be operated by the contractor as a whole and subject to performance tests in accordance with the contract requirements. For critical systems, these may include independent validation of the system performance on behalf of the client.

8.16 Prior to dynamic commissioning, it is essential that builders' work in the area served by the system is complete, all rubbish and dust is removed, concealed plumbing (IPS-type) panels are in position and ceiling tiles are in place and clipped. Floors should be mopped and visible dust removed from all other surfaces.

8.17 Once the system is shown to meet the design intent the handover documentation should be completed. In the event of performance not being acceptable, the matter should be dealt with in accordance with the contract arrangements.

Pre-commissioning checks

8.18 The pre-commissioning checks consist of visual inspection, manual operation of equipment, static measurements and functional tests of individual components. They should be carried out prior to setting the system to work and undertaking the dynamic commissioning process set out in Paragraph 8.29 onwards of this guidance.

Standard of installation

8.19 During the installation of the system the following must be witnessed:

- that the plant and installations have been provided and installed in accordance with the design specification and drawings;
- that only approved sealants have been used in the installation;
- that all components function correctly;
- that the satisfactory sealing of access doors and viewing ports have been carried out;
- that air pressure tests and air-leakage tests on ventilation ducting have been carried out in accordance with the methods set out in the HVCA's DW/143: Ductwork Leakage Testing. It is usual to carry out these tests, a section at a time, as the ductwork is installed and before its insulation is applied. The results must be recorded in the commissioning manual;
- that gaps around doors and hatches are as specified in the design;
- that the correct operation of pressure stabilisers, control dampers, isolating and non-return dampers have been checked and installed in the correct orientation for air-flow;
- that test holes have been provided in their specified locations and are sealed with suitable grommets;
- that control dampers are secured and their quadrants fitted correctly;
- that any interlocks are operative and in accordance with specification;
- that the electric circuits are completed, tested and energised;
- that electric motors have been checked for correct direction of rotation both at full speed and set-back;
- that cooling and heating media are available at correct temperatures and pressures and in specified quantities;
- that the air-conditioning plant components and controls function correctly;
- that the air-conditioning plant interlocks and safety controls function correctly;

- that the plant is physically complete, insulation is applied and all ducts and pipework are identified as specified;
- that the building housing the ventilation plant is generally in a fit condition for commissioning and performance tests to commence, that is, windows, doors, partitions etc are completed, surfaces sealed and their final finish applied;
- that the areas containing the ventilation plant and those being served by it are clean;
- that access to all parts of the system is safe and satisfactory.

Cleanliness of installation

8.20 During installation it must be established that ductwork is being installed to the 'advanced level' as defined in the HVCA (2005) 'TR/19 – Guide to good practice: internal cleanliness of ventilation systems'. This specifically includes ensuring that ductwork sections arrive on site and are stored with their open ends sealed and that open ends remain sealed during installation to prevent the ingress of builders' dust.

8.21 Should any doubt exist whether the guidance has been observed, the ducts must be cleaned internally to restore them to this standard before being taken into use.

8.22 "Builders work" ducts of brick or concrete must be surface sealed to prevent the release of dust before being taken into use.

8.23 The area around the supply air intake must be free of vegetation, waste, rubbish, builders' debris or any other possible source of contamination.

Certification of equipment

8.24 The following test certificates should be assembled by the commissioning team and be available for inspection at any time during the contract period. They will form part of the handover information and should be placed in the commissioning manual:

- type-test performance certificates for fans;
- pressure-test certificates for:
  - heater-batteries;
  - cooling coils;
  - humidifiers (if appropriate);
- type-test certificates for attenuators;
- type-test certificates for primary and secondary filters;
- individual test certificates for high efficiency particulate air (HEPA) filters.

Equipment tests

8.25 Prior to setting the system to work, the checks in Paragraphs 8.26 - 8.28 should be witnessed, and proving tests should be carried out as detailed.

Filters

8.26 The quality of filter housing and in particular, the seals is a critical factor in maintaining the efficacy of the filtration system by ensuring that air does not bypass the filter panels. Therefore, the following checks should be made:

- filter seals should be fitted and in good condition;
- filters should be installed correctly with respect to air flow;
- bag filters should be installed so that the bags are vertical and their pockets free;
- HEPA filters should be installed in a sealed housing and their seals tested to DIN 1946 if specified;
- all filters should be checked to ensure they are free of visible damage;
- the differential pressure indicators should be checked for accuracy and that they are marked with the initial and final filter resistance.

Drainage arrangements

8.27 The drain should conform in all respects to the “Design considerations” of this SHTM. In addition the following must be proved:

- that the drain tray is easily removable;
- that a clear trap is fitted and is easily removable;
- that the drain has a clear air gap of at least 15mm;
- that the pipework is supported so that the air break cannot be reduced;
- that the drain system from each drain tray is independent up to the air break;
- that the operation of the drainage system is proved by introducing water into the duct at the drain tray and observing that it completely drains out. This check is to be repeated both at normal speed and set back once the fans have been commissioned. At this time the clear trap can be marked to indicate the normal water level with the fan running.

Fire dampers

8.28 The following must be witnessed and proving tests should be carried out as detailed:

- the operation of all fire dampers;
- the access provided to enable the dampers’ to be visually inspected and / or re-set should be sufficient for the purpose;

- indication should be provided of the dampers' position (open/tripped);
- indication of the fire dampers' location should be provided both on the ductwork and at a visible point on the building fabric if the ductwork is concealed.

Dynamic commissioning

Air-handling and distribution system

8.29 The fan drive, direction of rotation, speed and current drawn should be set in accordance with their manufacturer's instructions.

8.30 After the installation has been checked to ensure that it is in a satisfactory and safe condition for start-up, it should be set to work and regulated to enable the plant to meet its design specification. The proportional balancing method described in the CIBSE Commissioning Code "A" must be followed. The air-flow rates must be set within the tolerances laid down in the design brief. This will normally be the design airflow rate +10% -0%.

8.31 When combined supply and extract systems are to be balanced and the area that they serve is to be at or above atmospheric pressure then the supply should be balanced first with the extract fan switched off, and then the extract balanced with the supply fan(s) on.

8.32 For combined systems where the area that they serve is to be below atmospheric pressure then the extract should be balanced first with the supply fan switched off and then the supply balanced with the extract fan on.

8.33 On completion of the balance all volume air-flows in supply and extract ducts and from grilles and diffusers must be measured and recorded. The true air change rate can them be calculated from the data obtained.

8.34 The main supply and extract duct volume control dampers must be locked and their position marked.

8.35 All grille and diffuser volume control registers must be locked to prevent alteration and their final position marked.

Room air distribution

8.36 The pressure-relief dampers and pressure stabilisers must be set to achieve the specified room static pressures and locked. The grille direction control vanes and diffuser cones must be set to give the specified air-movement pattern. Visualisation techniques may need to be employed in order to prove that the required air-flow pattern is being achieved. This may be a potential requirement when commissioning LEV systems or rooms that contain them.

Air-conditioning plant

8.37 The specified flow rate and/or pressure drops must be set for all heater batteries, cooling coils and humidifiers. The methods described in the CIBSE

Commissioning Codes “W” and “R” should be followed. On completion their regulating devices must be locked to prevent alteration.

Control system

8.38 The control system should not be commissioned until both the air distribution system and air-conditioning equipment have been commissioned.

8.39 Because of the specialised nature of control systems and the fact that each manufacturer’s system will contain its own specialist components and settings, the commissioning should be completed by the supplier and witnessed by a representative of the user.

8.40 The location of all control and monitoring sensors should be checked and their accuracy proved.

8.41 The control system’s ability to carry out its specified functions must be proved.

8.42 If the plant is provided with a “user’s” control panel in addition to the one located in the plantroom then the operation of both must be proved. This will typically apply to operating departments and laboratory systems.

Specific performance standards

Air movement

8.43 The performance of the system should be measured and compared with information provided by the designer.

Plant capacity and control

8.44 When setting to work and proving the design, both the manufacturer of the air-handling plant and the control specialist should attend site together and jointly commission the system.

8.45 If any doubt exists as to the capacity of the installed system, then its ability to achieve the specified inside design conditions with the plant operating at winter and summer outside design conditions must be proved. Artificial loads will be required in order to simulate the internal gains/losses and the outside design conditions.

8.46 On completion of the plant performance test, recording thermo-hygrographs should be placed in each room/area served by the plant and also the supply air duct upstream of the frost battery. The plant should be run for 24 hours with all doors closed. During this period the inside conditions must stay within the tolerances specified. The BEMS should be used to obtain the information required wherever possible. Periodic tests will be required during the defects liability period.

Noise levels - general

8.47 The commissioning noise level is the level measured with a sound-level meter in the unoccupied room and taking account of the external noise together with the noise generated by the ventilation system. When occupied and in use this commissioning level will constitute a continuous background noise that will allow the overall noise level to be achieved. The ventilation plant design noise level is that generated by the plant alone with no other noise source being considered. The levels suggested make recognised allowance for the ingress of environmental noise.

8.48 The noise levels apply at the maximum velocity for which the system is designed to operate. Acoustic commissioning tests should be carried out with all plant and machinery running normally and achieving the design conditions of airflow, temperature and humidity.

8.49 An industrial-grade sound-level meter to BS3489 or IEC 651 Type 2 will normally be sufficient to check the noise level.

8.50 The noise level readings are to be taken at typical normal listening position 1.5m above floor level and at least 1m from any surface and not on any line of symmetry. In critical rooms the noise should be measured at the centre of the room and at the centre of each quarter. The mean of the 5 readings should then be calculated.

8.51 In the event of a contractual deficiency, a Type 1 precision-grade sound-level meter should be used and the noise level determined by the procedure given in Scottish Health Technical Memorandum 08-01 (2011).

Filter challenge

General ventilation filters

8.52 In-situ performance tests will not normally be required for primary and secondary filters and their housings. However the filters should be visually inspected for grade, tears, orientation and fit within their housing. Filters should be clean and a replacement set available. Bag filters should be installed so that their bags are vertical and spaced so that air can move through them freely. Any filter found to be wet should be replaced and the cause investigated.

HEPA filters (for exhaust protective enclosures and laboratories)

8.53 Pathogenic material may be discharged through damaged or badly installed HEPA terminal filters. The complete installation must be tested using the method set out in BS EN: 14644 ‘Method of Testing for the Determination of Filter Installation Leaks’.

8.54 The challenge tests may be carried out using either of the following techniques:

- use Dispersed Oil Generator (DOP) to provide the challenge and a photometer to detect leaks;

- use a Discrete Particle Counter (DPC) to detect leaks. (In order to obtain a sufficient challenge it may be necessary to remove temporarily the supply AHU secondary filters).

8.55 In both cases the upstream challenge should be measured. A measurement of particle penetration through a representative section of the HEPA filter media is then taken and used as the reference background level. These two readings enable the range of the detecting instrument to be set.

8.56 A challenge aerosol of inert particles of the type produced by a DOP generator should be introduced into the air, upstream of the HEPA filter. The downstream face of the filter, its mounting seal and housing would then be scanned for leakage using a photometer. A leak should be deemed to have occurred if a steady and repeatable reading on the photometer at any point exceeds 0.01% of the upstream reading.

8.57 Alternatively a Discrete Particle Counter (DPC) may be used. For the Discrete Particle Counter method the filter face is sampled at several points to establish the smallest non-penetrating particle size. If particles at or above this size are detected when subsequent scans of the filter face, its seal and housing are made, then there is deemed to be a significant leak at, or near, the test position.

8.58 Should the HEPA filter fail this test it must be replaced. Should the filter mounting seal or housing fail this test it may be repaired and the test repeated.

Bacteriological sampling

General ventilation systems

8.59 Bacteriological sampling will not normally be required for either general or local exhaust ventilation (LEV) systems unless otherwise specified.

Conventional operating rooms

8.60 The level of airborne bacteria introduced by the supply air can be checked by closing all doors and leaving the operating room empty with the ventilation system running for 15 minutes. An active air sampler set to 1 cubic metre and mounted on the operating table should then be activated remotely. Aerobic cultures on non-selective media should not exceed 10 bacterial and/or fungal colony forming units per cubic metre (CFU/m^3).

8.61 The results should be examined to establish the broad category of organisms present. A high preponderance of fungal organisms may be an indication of inadequate filtration for the particular installation. Precise guidance is inappropriate and will depend on local circumstances.

8.62 It may be appropriate to carry out a check of airborne bacteria during a surgical operation. If required this should be carried out as soon as possible after handover. Unless there are unusually high numbers of personnel or extensive activity in the room, the number of airborne bacterial and/or fungal CFU

averaged over any five-minute period, would be unlikely to exceed 180 per cubic metre.

8.63 Information on the additional validation testing of UCV Operating suites is given in Section 8.0(a).

Ventilation system commissioning/validation report

8.64 Following commissioning and/or validation a full report detailing the findings should be produced. The system will only be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life.

8.65 The report shall conclude with a clear statement as to whether the ventilation system achieved or did not achieve the required standard. A copy of the report should be lodged with the following groups:

- the user department;
- infection control (where required);
- estates and facilities.

8.0(a) Validation of UCV operating suites

General

8.66 Commissioning of a UCV terminal will normally be carried out by its supplier. Commissioning of the air-handling unit, fire dampers, distribution ductwork and control systems may be undertaken by different teams. It is therefore important to recognise that the UCV terminal is only one element of the specialised ventilation system serving the operating suite and it cannot be accepted in isolation.

8.67 In order to ensure that the complete system operates correctly it will be necessary to validate the system as a whole from the air intake through to the extract discharge. It is unlikely that “in house” staff will possess the knowledge or equipment necessary to undertake this process. Validation of Ultra-Clean operating theatre ventilation systems should therefore be carried out by a suitably qualified independent Authorised Person appointed by the client.

8.68 It is anticipated that training in the validation of specialised healthcare ventilation systems for independent Authorised Persons will become available during the life of this SHTM.

8.69 The following regime of inspection and testing should be applied to the validation of new installations designed to provide Ultra-Clean conditions in an Operating suite. The test regime has been devised to ensure that the system as installed fully achieves the design requirement for these systems as set out in Section 7.0(b) of this document.

Basic requirement

8.70 The operating suite to be validated should be physically complete with final finishes applied. All ventilation systems serving it should be operating correctly and delivering the design air-flow rates.

8.71 In order to avoid pre-loading the UCV terminal's recirculation ducts and HEPA filters, the Operating suite should be free of any obvious dust and at least "builders clean" before the recirculation fans are set to work.

8.72 The validation procedure for a conventional theatre suite should have been satisfactorily completed to the standard set out in Section 8 prior to attempting to validate the UCV unit. In particular:

- the supply AHU will have achieved the minimum standard;
- the operation of all fire dampers will have been proved;
- the supply and extract air-flow rates as measured in ducts and at room terminals will achieve their design values +10%; -0%;
- room differential pressures will be correct.

Evidence of the satisfactory achievement of the foregoing standard should be available for inspection and independently measured as necessary *prior to validating the UCV unit.*

UCV unit validation procedure

8.73 Tests to validate the suitability and performance of an ultra-clean operating suite should be undertaken in the order that they appear below. Should an item fail to meet the required standard it should be rectified and successfully retested before passing on to the next test.

Summary of test regime

- Challenge tests to ensure that:
  - the UCV terminal unit is correctly assembled and sealed so that no air will bypass the filters;
  - the terminal filters are correctly sealed in their housings;
  - the terminal filters are of the same grade, of uniform quality and undamaged.
- Air velocity measurements to ensure that
  - a sufficient quantity of air is being delivered by the terminal;
  - the terminal quadrants are in balance;
  - the air flow has sufficient velocity to reach the working plane.
- An entrainment test to ensure that contaminants arising outside of the UCV terminal footprint are not drawn into it.

- Visualisation techniques to gain an understanding of the overall system performance.
- Noise measurement to ensure that working conditions are satisfactory.
- Control system checks to ensure that the system operates as specified.
- Biological monitoring to determine how effective the system is in use.

Test and measuring conditions

8.74 While validating the UCV terminal, the conditions in the Operating room shall be stable and within the given ranges.

temperature: – 19°C - 23°C dry bulb.

humidity: – 30 – 65% relative humidity.

Test and measuring equipment

8.75 Any test or measuring equipment used should have a certificate to prove that it has been validated within the previous 12 months at a calibration facility using traceable national standards.

8.76 In the case of a noise meter, its “matched sound source” should have a certificate to prove that it has been validated within the previous 12 months at a calibration facility using traceable national standards. The noise meter should be calibrated to the sound source on each occasion that it is used.

Test grid – vertical units

8.77 A test grid should be constructed on the floor within the ultra-clean terminal footprint as projected by the inside dimensions of the sidewalls or boundary air curtain. A suitably marked test sheet will provide a consistent standard of test grid.

8.78 The test grid should comprise test squares of 280mm each side.

8.79 The test grid should be aligned along the centre lines of the terminal footprint with its centre under the centre point of the terminal.

8.80 Any test square with 80% of its area within the UCV footprint should be used as a test position.

8.81 An inner zone should be designated that is not less than 36% of the total footprint. It should be made up of a number of test squares distributed symmetrically about the terminal footprint centre line. Regardless of the shape of the terminal footprint, the inner zone should comprise a minimum grid of 6 x 6 test squares.

8.82 Unless specified otherwise, a test position should be in the geometric centre of a test square.

8.83 Test position 1 should be the leftmost test square in the row nearest to the operating room wall that houses the surgeon's panel.

(For an example of a grid for a 2.8 x 2.8 metre terminal see Figure 8)

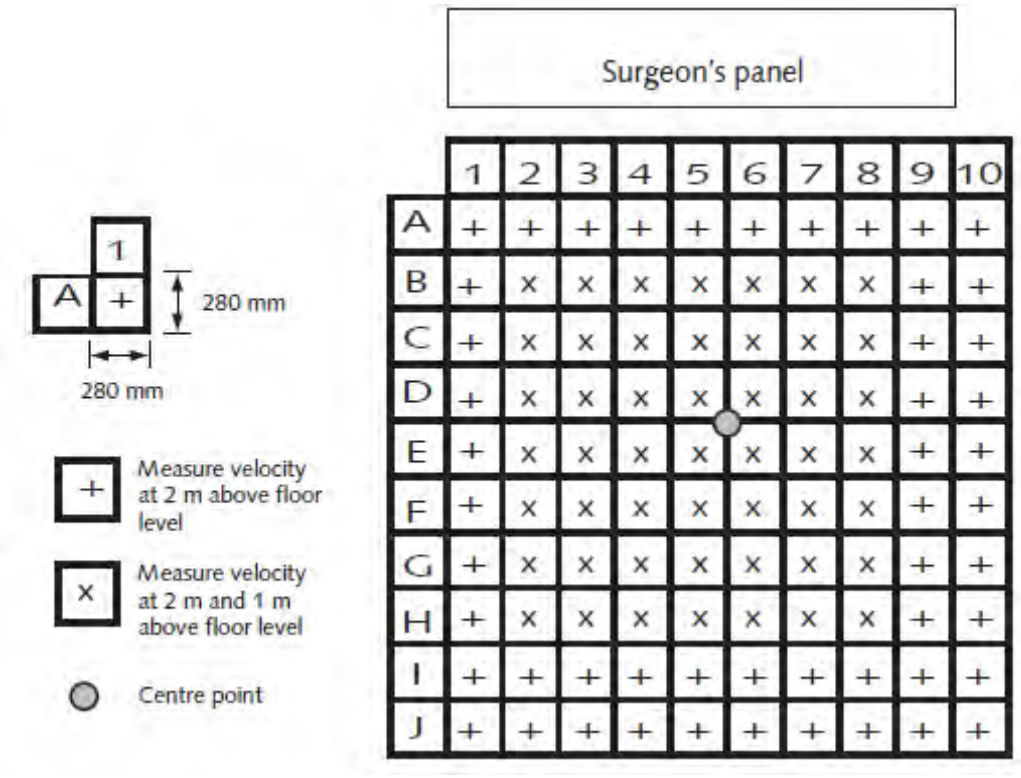

Figure 8: Example of a Test Grid for a 2.8m x 2.8m UCV Terminal

Test grid – horizontal units

8.84 A line of test positions should be marked on the floor 1m in front of the face of the UCV terminal.

8.85 A test position should be marked in the centre of the line. Additional test positions should be marked at 280mm spacing along the line either side of the centre position, up to the full-face width of the unit.

UCV terminal challenge tests (Vertical and horizontal systems)

8.86 The diffuser screen fitted below the face of the terminal HEPA filters should be lowered or removed while the challenge tests are being carried out.

8.87 The installed HEPA filters should be checked to ensure that their grade accords with the design specification and that their performance has been certified by the manufacturer.

8.88 The challenge tests may be carried out using either of the following techniques:

- use DOP to provide the challenge and a photometer to detect leaks;
- use a DPC to detect leaks. In order to obtain a sufficient challenge it may be necessary to remove temporarily the supply AHU secondary filters.

8.89 In both cases the upstream challenge should be measured. A measurement of particle penetration through a representative section of the HEPA filter media is then taken and used as the reference background level. These two readings enable the range of the detecting instrument to be set.

8.90 For the DOP test this should be set as the reference level and a leak will be declared significant if penetration greater than 0.01% of the range is detected. (See Paragraph 8.56 for details).

8.91 For the DPC method the filter face is scanned to establish the smallest non-penetrating particle size. If significant particles at or above this size are detected when subsequent scans are made then there is deemed to be a significant leak at, or near, the test position. (See Paragraph 8.57 for details)

UCV terminal unit clean zone leak test

8.92 This test will confirm that there is no unfiltered air bypassing the HEPA filter.

8.93 The joints and service penetration points under the UCV terminal within its side walls or boundary air curtain should be scanned to prove that there are no leaks.

8.94 A leak is defined as a significant rise above the background level.

Terminal HEPA filter seal leak test

8.95 The test will confirm that there is no unfiltered air bypassing the HEPA filter's seal.

8.96 Each HEPA filter's seal should be scanned to prove that there are no leaks.

8.97 A leak is defined as a significant rise above the background level.

Terminal HEPA filter media leak test

8.98 The test will confirm that the HEPA filters have not sustained damage while being installed.

8.99 The face of each HEPA filter should be scanned to prove that there are no leaks.

8.100 A leak is defined as a significant rise above the background level.

Vertical UCV terminal air velocity tests

Test set up

8.101 The terminal face diffuser screen should be in place for these tests.

8.102 Take spot readings to establish that the room is within the specified temperature and humidity test conditions.

8.103 Set out the test grid as described previously.

8.104 Swing the operating lamp arms and any other stem arms so that they align to present the least resistance to air flow, are perpendicular to the front edge of the test sheet and face the back edge. Any lamp and equipment heads should as far as practicable be outside of the UCV terminal footprint.

Test instrument

8.105 The measuring instrument should be a hot-wire anemometer with a digital read-out. The instrument resolution should be at least 0·01m/s, have a tolerance of ±0·015 m/s or 3% of that reading and be calibrated down to 0·15 m/s or lower. An alternative instrument may be used providing it is of no lesser specification.

Test method

8.106 The instrument should be mounted on a test stand and set to take a mean reading over a ten-second sample interval.

8.107 It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. Alternatively they could be downloaded to a computer or data logger at the end of the test.

8.108 The test stand to be positioned on each test point in turn and the reading taken when the instrument has stabilised.

8.109 When taking a reading the test person should not stand within the same quadrant as the test instrument.

8.110 Readings are to be taken at the test positions with the instrument probe facing the wall housing the surgeon's panel, commencing at the first test position. Readings are taken working along the row from left to right and back, or for all text positions in one quadrant at a time.

8.111 When all test positions under one half of the terminal have been covered, readings of temperature and humidity are then taken at the specified height in the centre of the terminal. The read-outs on the surgeon's panel should be recorded at the same time.

8.112 Having completed one half of the test grid, the operating lamp arms and any other stem arms should be swung round through 180º and the test stand reversed so that the wall housing the surgeon's panel is behind the test person. Readings are recommenced starting at the right of the test row and working from right to left a quadrant at a time, as above.

UCV high-level discharge velocity test

8.113 Measurements of air velocity are to be taken at every test position 2m above floor level and the results averaged.

8.114 The average of the total readings taken is to be not less than:

0.38 m/s for a partial-wall system;

0.30 m/s for a full-wall system.

The average air velocity for each quadrant should not exceed ±6% of the measured average velocity for the terminal

UCV low-level air velocity test

8.115 Measurements of air velocity are to be taken at each of the inner zone test position 1m above floor level.

8.116 The measured velocity at every test position in the inner (operating) zone shall be not less than 0·2 m/s.

Horizontal UCV terminal air velocity test

Test set up

8.117 Set out the line of test positions as described previously.

8.118 Swing the operating lamp arms and any other stem arms so that they align to present the least resistance to air flow and are perpendicular to the line of test positions.

Test instrument

8.119 See that specified for vertical systems (Paragraph 8.105 refers).

Test method

8.120 The instrument should be mounted on a test stand and set to take a mean reading over a ten-second sample interval.

8.121 It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. Alternatively, they could be downloaded to a computer or data-logger at the end of the test.

8.122 The test stand should be positioned on each test point in turn and the reading taken when the instrument has stabilised.

8.123 When taking readings the test person should stand well downstream of the instrument.

8.124 Readings are to be taken at the test positions with the instrument probe facing the UCV terminal, commencing at the first test position on the left and working along the row from left to right at the specified height.

8.125 The instrument should be reset to the next specified height and the test repeated and so on.

8.126 Readings of temperature and humidity should be taken at the specified height in the centre of the terminal. The read-outs on the surgeon's panel should be recorded at the same time.

UCV discharge velocity test

8.127 Measurements of air velocity are to be taken at all test positions at 1m, 1·5m and 2m above floor level.

8.128 The average of the total readings taken should be no less than 0·4 m/s.

UCV entrainment test (Vertical systems only)

Rationale for the entrainment test

8.129 The performance of UCV systems may be compromised by room air being drawn into the ultra-clean airflow, a phenomenon known as “entrainment.” Significant levels of entrainment could lead to microbial contamination of items left exposed on instrument trolleys laid out beneath the canopy.

8.130 UCV systems having permanently fitted full sidewalls do not need to be tested, as the sidewalls physically prevent entrainment.

Principle of the test

8.131 A source of particles is produced outside of the UCV terminal and is used to challenge the system. A detector is placed within the ultra-clean airflow and used to determine the percentage penetration of the test particles at predefined locations under the UCV terminal footprint. The source and detector are moved in tandem around the UCV canopy and pairs of readings taken, from which the percentage penetration at specified locations is calculated. The degree of penetration should be below specified maximum limits if entrainment is to be declared not significant.

8.132 The entrainment test may be carried out using either of the following techniques:

- use DOPs to provide the challenge source at the specified release position and a photometer to measure the entrainment; or
- duct non-HEPA-filtered air to the specified release position and use a DPC to measure the entrainment.

Test set-up

8.133 The terminal face diffuser screen should be in place for these tests.

8.134 The test should be performed without any equipment in place beneath or closely adjacent to the UCV terminal.

8.135 The theatre lights should be moved to a central position beneath the terminal and raised to 2m above floor level, so as not to interfere with the peripheral airflows.

8.136 Take spot readings at the centre of the canopy, one metre from floor level, to establish that the room is within the specified temperature and humidity test conditions.

8.137 Set out the test grid as described previously.

8.138 For either of the following entrainment tests, a measurement of particle penetration through a representative section of the HEPA filter media is to be taken and used as the reference background level.

Test equipment, challenge source, measuring instrument and detector head

8.139 The challenge and detector equipment should be chosen so that:

- the tracer particles are mainly within the size range 0.3 to 5 microns and thus capable of remaining airborne for a substantial time;
- the particles used should not be able to penetrate the terminal filters in sufficient numbers to cause a background count that is more than 0.1% of the challenge count;
- the choice of particle and detector will enable a minimum of a three-logarithm (1,000-fold) range of counts to be recorded between the highest (that is, source) and lowest (that is, background) readings expected. (A concentration of approximately 10^5 particles per cubic metre of source air has been shown to be adequate.)

Source – Dispersed Oil Particles (D.O.P.)

8.140 The DOP generator should be able to produce a cloud of test particles in the form of a visible smoke. The test smoke should be delivered via an aperture so that it flows vertically downward from the lowermost edge of the partial wall, on the outside of the UCV canopy.

8.141 The test smoke is to be delivered via an aperture.

Note 4: To prevent undue contamination of the theatre and filters with deposits of oil, DOP should only be released for the minimum amount of time necessary to complete the test.

Challenge source – natural particles

8.142 The source unit should be a fan/blower or other method that takes non-HEPA-filtered air and expels it via a delivery head at the specified release position to provide the particle challenge. The challenge air should be delivered vertically downwards from the lowermost edge of the partial wall, on the outside of the UCV canopy, parallel to the airflow coming from the diffusers. The challenge air velocity should be the same as the measured average velocity at 2m from the terminal under test.

Note 5: The use of DOP for testing is gradually being phased out and replaced by a natural challenge measured with a DPC. At the time of writing research is under way to define more precisely a challenge source unit for natural particles. It is anticipated that such a unit, together with a matching test methodology, will become available during the life of this Scottish Health Technical Memorandum.

The detector (defined in terms of range and resolution)

8.143 This may be a photometer or a DPC. It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. The instrument should be capable of sampling a minimum a 28.3 litres of air per minute and in the case of the DPC, provide readings for particle size ranges from 0.3 microns to 5.0 microns and greater. The instrument should be compliant with the requirements of BS EN ISO 14644-1. An alternative instrument may be used providing it is of no lesser specification.

Test positions and orientation of source and detector

8.144 The test positions should be at the centre of each test square, as defined for the velocity test.

8.145 For rectangular UCV terminals, measurements of penetration are to be taken at the four corner test squares of the test grid and at intermediate positions along the line of test squares between the corners. The number of intermediate test positions will be as equally spaced as possible around the periphery with no fewer than 3 and no more than 5 complete test squares between test positions.

8.146 A further series of measurements are to be obtained around the periphery of the inner zone. Measurements of penetration are to be taken at the four corner test squares of the inner zone of the test grid and if necessary at intermediate positions along the line of test squares between the corners as equally spaced as possible, with no fewer than 3 and no more than 5 complete test squares between test positions.

8.147 A single measurement should be taken at the geometrical centre of the UCV terminal footprint. The centre measurement will be taken with the detector head mounted vertically upwards 1 metre above floor level.

8.148 The centre of the challenge particle source should be aligned with the centre of the designated test square, with its longer edge against the outer edge of the partial wall and delivering the challenge from the lower edge of the partial wall. The air containing challenge particles is directed vertically downwards from the lower edge of the partial wall, in a plane parallel to the adjacent partial wall. Where there is physical interference due to obstructions such as gas pendants, the source will be moved to the next available non-obstructed test-square location nearest to the stipulated sampling position. The detector should then also be moved to remain opposite the source.

8.149 In the case of non-rectangular terminals, an interpretation of the above strategy should be adopted that will yield a no less searching examination of the unit's ability to control entrainment.

Test method

8.150 The sampling head of the detector instrument is mounted on a test stand with its sampling orifice facing outwards horizontally from the centre of the UCV canopy, 1m above floor level. The sampling head should be orientated at right angles to the partial wall when sampling along the sides of the test grid but will be set to bisect the angle when measuring at the corner test positions (Figure 88 illustrates the challenge and detector orientations when evaluating a 2.8m x 2.8m UCV terminal).

8.151 The test will commence at the first test position, this being designated the leftmost corner of the test grid when facing the wall housing the surgeon's panel. The penetration will also be measured at the corresponding test point on the inner zone commencing at the corner nearest to the first test position. When these tests have been completed, the source and detector equipment should be moved to the next test positions, working around the test grid in a clockwise direction.

8.152 The test stand should be positioned on each test point in turn and a pair of readings (challenge, then penetration) taken when the instrument has stabilised. The detector should be set to take a reading over a 15 second sample interval.

8.153 When taking a reading the test person should stand within the UCV terminal footprint but not in the same quadrant as the detector head.

Analysis and interpretation

8.154 The following standard is to be achieved:

- penetration to be not greater than 10% of the challenge at each test position in the outer zone;
- penetration to be no greater than 1% of the challenge at each test position in the inner zone;
- penetration to be no greater than 0·1% of the challenge at the centre of the test grid.

If a result is close to, or above the given limits, then a further reading must be obtained using a longer time base (1 minute) and the penetration must not exceed the given limit.

Basis of the test

8.155 Whyte W, Shaw BH, Freeman MAR. An evaluation of a partial-walled laminar-flow operating room. *J Hyg Camb* 1974; 73: 61 – 75.

Whyte W, Lidwell OM, Lowbury EJL, Blowers R. Suggested bacteriological standards for air in ultraclean operating rooms. *J Hosp Infect* 1983; 4: 133 – 139.

UCV visualisation

8.156 The use of smoke to gain an understanding of the overall performance of the system may prove useful at this stage in the validation process but cannot be relied on to produce a contractually definitive measure of performance.

UCV noise level

8.157 An industrial-grade sound-level meter to BS EN 61672 Type 2 fitted with a muff should be used to check the noise level. The instrument should be calibrated using a matched sound source prior to each set of readings.

Vertical systems

8.158 The noise level readings should be taken at typical normal listening positions 1·5m above floor level and at least 1m from any surface and not on any line of symmetry. Measurements should be taken under the centre of each quadrant of the UCV terminal and the four readings averaged.

Horizontal systems

8.159 The noise level readings are to be taken at typical normal listening positions 1·5m above floor level on the test line. The width of the unit should be divided in two and a measurement taken in the centre of each half but avoiding any line of symmetry. The two readings should be averaged.

8.160 Measurements should also be taken in each room of the suite.

8.161 In the event of a contractual deficiency a Type 1 precision-grade sound-level meter complying with BS EN 61672 should be used. Readings should be taken at the positions specified above and in each case the logarithmic mean of the results should be calculated in order to determine the noise level. Further information can be found in SHTM 08-01 (2011).

8.162 For vertical or horizontal systems, the noise level shall not exceed:

- 50NR [55dB(A)] – for UCV operating rooms and spaces without doors that open directly on to it (for example the scrub);
- 40NR [45dB(A)] – for all other peripheral rooms of the suite.

UCV control system checks

Temperature

8.163 The readings of temperature taken under or in front of the UCV unit should be within ±1 K of each other and the read-out on the surgeon's panel.

Humidity

8.164 The readings of humidity taken under or in front of the UCV unit should be within ±5% of each other and the read-out on the surgeon's panel.

Direct-reading differential pressure gauges

8.165 The differential pressure across the terminal filter(s) should be measured to confirm the accuracy of the indicated reading of any gauge.

Control functions

8.166 The operation of all control functions provided on the surgeon's panel should be proved for conformity with the design specification.

8.167 If an auxiliary panel has been fitted then its interlocking with the main surgeon's panel control functions must be proved to conform to the design specification.

Panel indicator lights

8.168 The panel indicator lights should illuminate as appropriate when the control functions are selected or warning levels are reached

BEMS interface

8.169 The operation, monitoring and alarm functions must be proved to conform to those set out in the design specification.

UCV theatre microbiological tests

8.170 There is little value in performing microbiological sampling in a new theatre supplied with ultra-clean ventilation. The foregoing filter challenge tests, air velocity measurements and entrainment test should have proved that the system operates satisfactorily and achieves the contracted level of performance. The HEPA filters will remove bacteria-sized particles from the air supplied through the UCV terminal. Therefore there will be an insignificant number of bacterial and/or fungal CFUs present until the Theatre is actually used.

8.171 Once the theatre has been taken into use, microbial sampling during a surgical procedure should help to confirm the satisfactory performance of the system and discipline of the users. Before commencing bacteriological testing, the room and its ventilation system should have achieved a steady state condition: (see also Paragraph 8.74)

8.172 The installation should be tested during surgical procedure at intervals between the time of the first incision and final closure of the wound. On average, the air sampled within 300mm of the wound should not contain more than 10 CFU/m^3.

UCV validation report

8.173 Following validation a full report detailing the findings should be produced. The report shall conclude with a clear statement as to whether the UCV theatre suite achieved or did not achieve the standard set out above.

8.174 A copy of the report should be lodged with the following groups:

- operating department;
- infection control;
- estates and facilities.

Dirty	Service corridor Disposal room	0 -5 or 0	- -	f 0.41 or 0.10

Table A2

Notes (applicable to Table A2):

a. Nominal room pressures are given to facilitate setting up of pressure relief dampers, the calculation process, and the sizing of transfer devices. In practice, the resultant pressures are not critical, provided the desired airflow rates and movement are achieved.

b. An open or semi-open bay is considered to be part of the operating room; provided air movement is satisfactory, no specific extract is required. However if the layout means that air movement is poor, a local extract may be required to control local condensation on the building surfaces, which can result in mould growth.

c. For design purposes, anaesthetic should be assumed to be at 14Pa. When commissioning 10Pa is considered suitable.

d. 15 ac/hr are considered necessary for the control of anaesthetic gas pollution.

e. Supply airflow rate necessary to make up 7 ac/hr after taking into account secondary air from cleaner areas.

f. No dilution requirement. Temperature control requirements only.

Type	Pressure difference - Pa						
	5	10	15	20	25	30	40
Single door (CDB Size 2.4.3.2.6.)	.03	.05	.06	.06	.07	.07	.08
Double door (CDB)	.04	.08	.10	.11	.12	.13	.14
High permanent length of 3mm gap	.004	.008	.010	.011	.012	.012	.013

Table A3: Leakage flows in m^3/s through closed door gaps

Note: CDB = Component Data Base

It should be noted that many doors are now fitted with cold smoke seals as standard. These will significantly reduce the door leakage rate when new and undamaged. It is therefore recommended that provision for the design leakage is factored into the sizing of the appropriate transfer grille or pressure stabiliser. Failure to do this will result in air gap whistles and doors being held partially open by air pressure.

Factory-assembled door-sets with a steel frame and pre-hung leaves have become common. There is effectively no leakage across these doors when closed. Therefore, when this type of door assembly is fitted, the door leakage can be ignored and the design airflow into the room reduced accordingly. The design airflow would then become that required either (i) for open door protection, or (ii) to achieve the specified air-change rate - whichever is the greater.

Room class		Dirty	Transitional	Clean	Sterile
Sterile	Hatch	0.3	0.24	0.18	
	Single door	0.47	0.39	0.28	0 or 0.28 a
	Double door	0.95	0.75	0.57	0 or 0.57 a
Clean	Single door	0.39	0.28	0 or 0.28 a	
	Double door	0.75	0.57	0 or 0.57 a	
Transitional	Single door	0.28	0 or 0.28 a		
	Double door	0.57	0 or 0.57 a		
Dirty	Single door	0	Open single door = 0.80m x 2.01m high		
	Double door	0	Open double door = 1.80m x 2.01m high		

Table A4: Recommended air flow rates in m^3/s through a doorway between rooms of different cleanliness to control cross-contamination

Designer's Notes:

a. The degree of protection required at an open doorway between rooms is dependent upon the degree of difference in cleanliness between them.

b. Flow rate required between rooms within the same class tends to zero as class reduces.

c. If two rooms are of equal cleanliness, no flow is required (in practice there will be an interchange in either direction) and the design of the air movement will assume zero air-flow. In certain cases, however, interchange is not permitted and protection airflow of 0.28 is assumed in the design, for example, in the case of a preparation room used as a "lay up".

		Effect on other rooms	
Door open between	Resultant pressure in these rooms (Pa)	Room	Pressure (Pa)
Operating room and corridor or Scrub bay and corridor	0	Anaesthetic Preparation – lay up Disposal Preparation – sterile pack store	0 12 -6 5
Operating room and anaesthetic room (or other series room with double doors)	17	Preparation – lay up Disposal Preparation – sterile pack store	26 -9 22
Operating room and disposal room or Operating room and preparation room	25	No change	
Anaesthetic room and corridor (or other series room with double doors)	0	Preparation – lay-up Disposal Operating room Preparation – sterile pack store	30 -6 20 25
Preparation room – corridor Disposal room & corridor	0	No change	
Disposal room & outer corridor	0	No change	

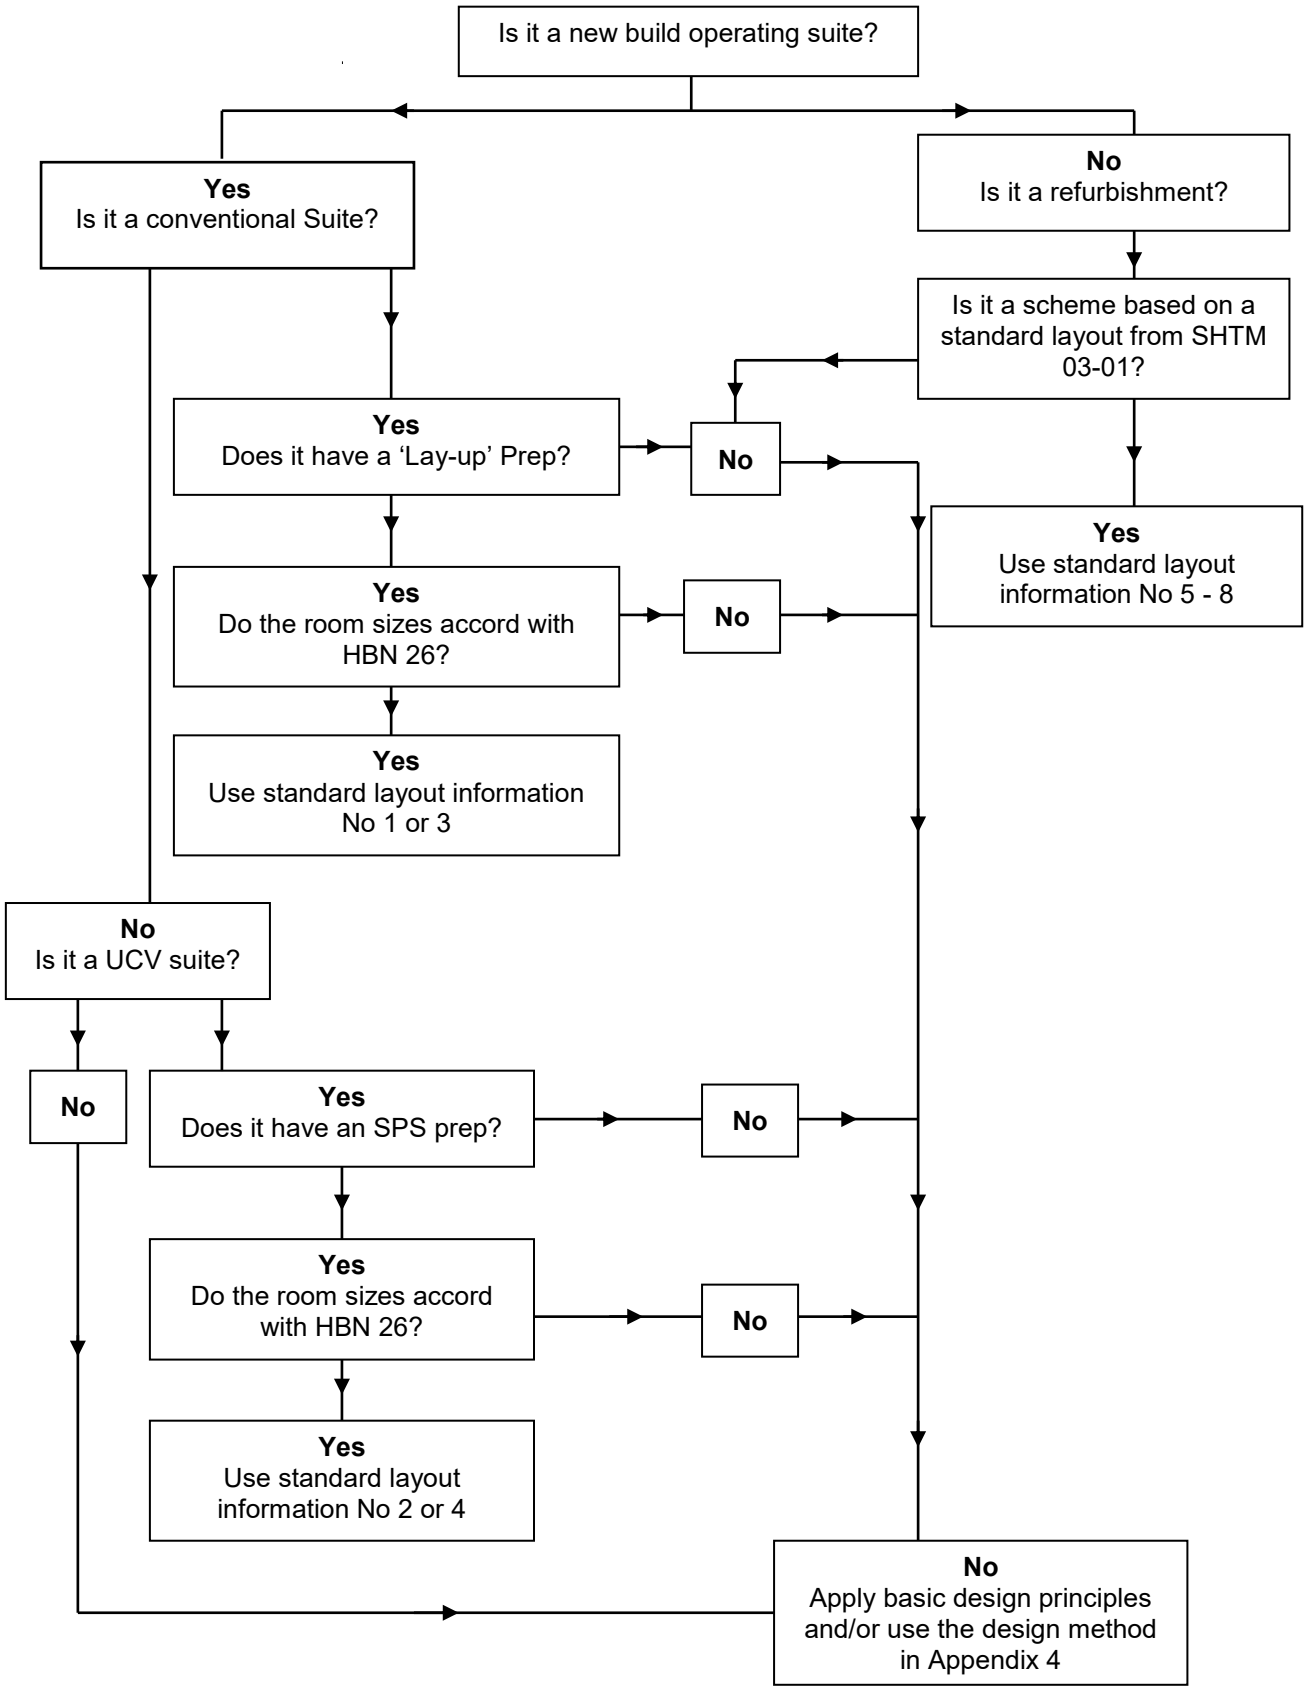
Table A5: Typical pressures in an operating suite when a given door is open

Notes: 1. The room differential pressure protects against reverse flows when the door is closed.

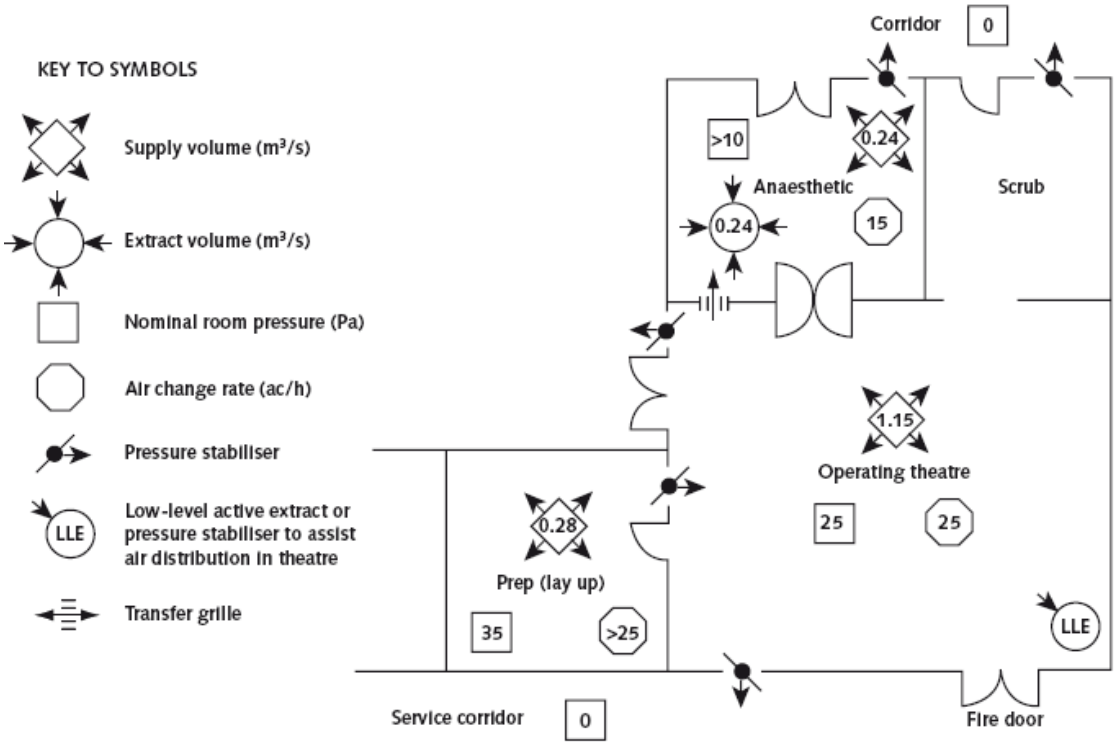
2. The flow of air through a doorway protects against reverse airflow when the door is open.

3. Pressure stabilisers control flow and ensure a known air-flow path between rooms when doors are closed and reduce back-flow between rooms when doors to other rooms are open.

Appendix 3: Operating suite design logic



New Standard Layout N° 1 - Suitable for a typical conventional theatre suite (Room sizes as specified in HBN 26)



Room	Size m³ Derived from HBN26	Air-Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	165	25	25	1.15
Anaesthetic	57	15	>10	0.24
Lay-Up-Prep	36	>25	35	0.28**
Scrub	*	-	25	-

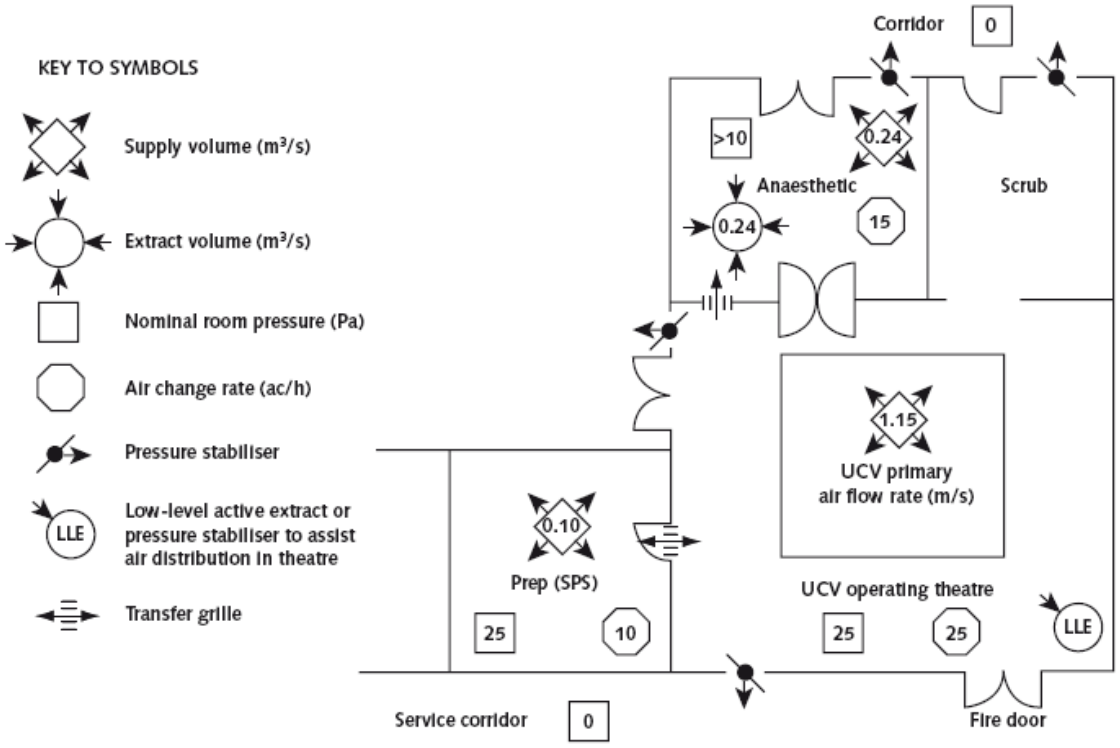
*This is a separate scrub and is not considered as being part of the theatre volume.

**Interchange is not permitted between the theatre and lay-up prep; therefore an airflow protection of 0.28 + 0.06 closed-door airflow is required as a minimum.

The volume of air to be extracted from the theatre should be determined by subtracting the airflow required for door protection at the exits from the total air entering the theatre space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilisers or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space.

New standard layout N° 2 - Suitable for a typical UCV theatre suite (Room sizes as specified in HBN 26)



Room	Size m³ Derived from HBN26	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	165	25	25	1.15**
Anaesthetic	57	15	>10	0.24
Sterile Prep	36	25	25	0.10
Scrub	*	-	25	-

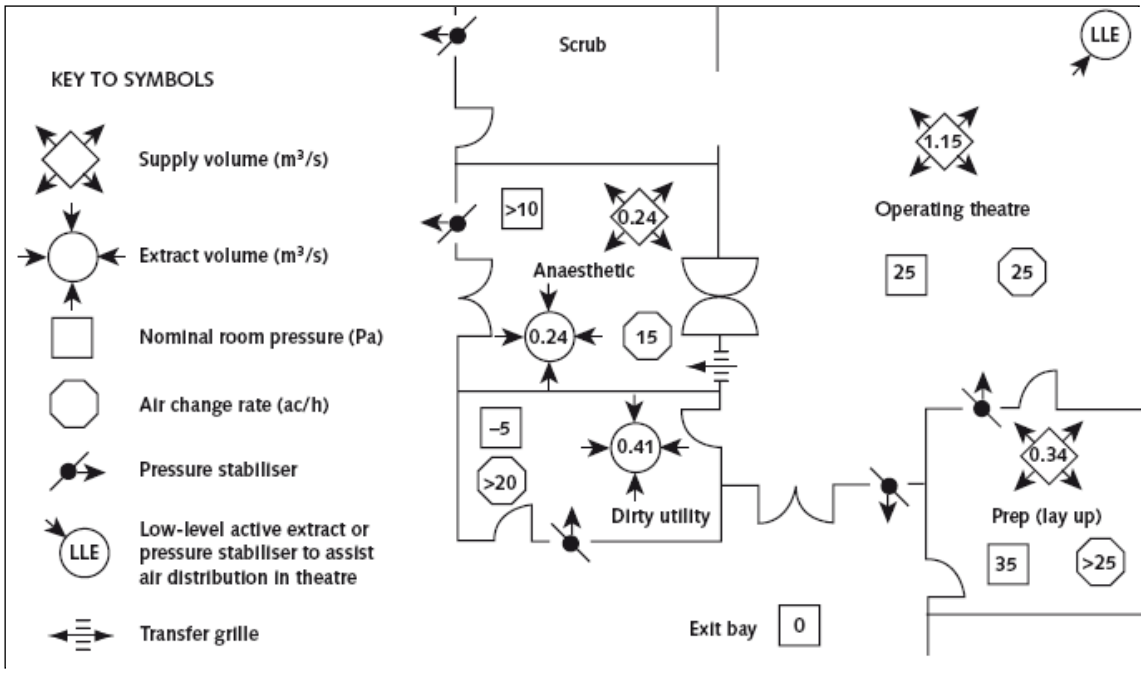
*Separate scrub and not considered as part of theatre volume

**Primary Fresh air Volume Only

The volume of air to be extracted from the theatre should be determined by subtracting the airflow required for door protection at the exits from the total air entering the theatre space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilizers or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space.

New standard layout N° 3 - Suitable for a typical Conventional theatre suite (Layout and room sizes are as illustrated in HBN 26)



Room	Size m³ Derived from HBN26	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	165	25	25	1.15
Anaesthetic	57	15	14	0.24
Lay-Up Prep	36	>25	35	0.34**
Scrub	*	-	25	-
Dirty Utility	36	-	-5	0.41

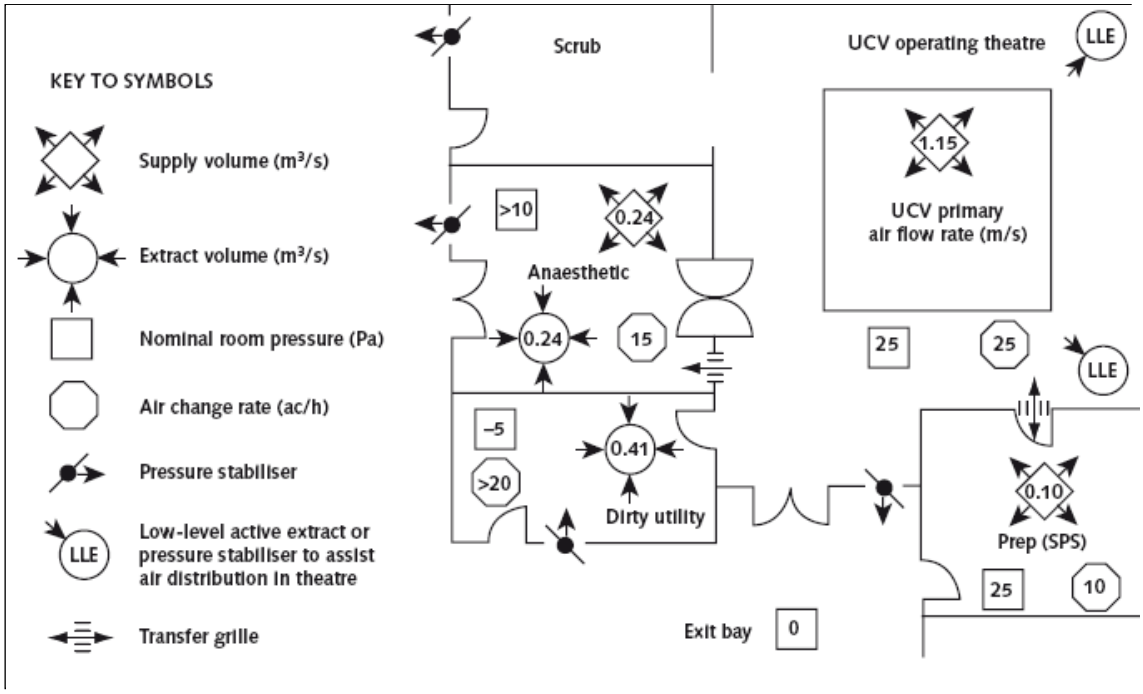
*Separate scrub not considered part of theatre volume.

**Interchange is not permitted between the theatre and lay up prep therefore as Table 4 an airflow protection of 0.28 + 0.06 closed door air flow is required as a minimum.

The volume of air to be extracted from the theatre should be determined by subtracting the airflow required for door protection at the exits from the total air entering the theatre space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilizers or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space.

New standard layout N° 4 - Suitable for a typical UCV theatre suite (Layout and room sizes are as illustrated in HBN 26)



Room	Size m³ Derived from HBN26	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	165	25	25	1.15**
Anaesthetic	57	15	>10	0.24
Sterile Pack Prep	36	10	25	0.10
Scrub	*	-	25	-
Dirty Utility	36	-	-5	0.41

* Separate scrub not considered part of theatre volume

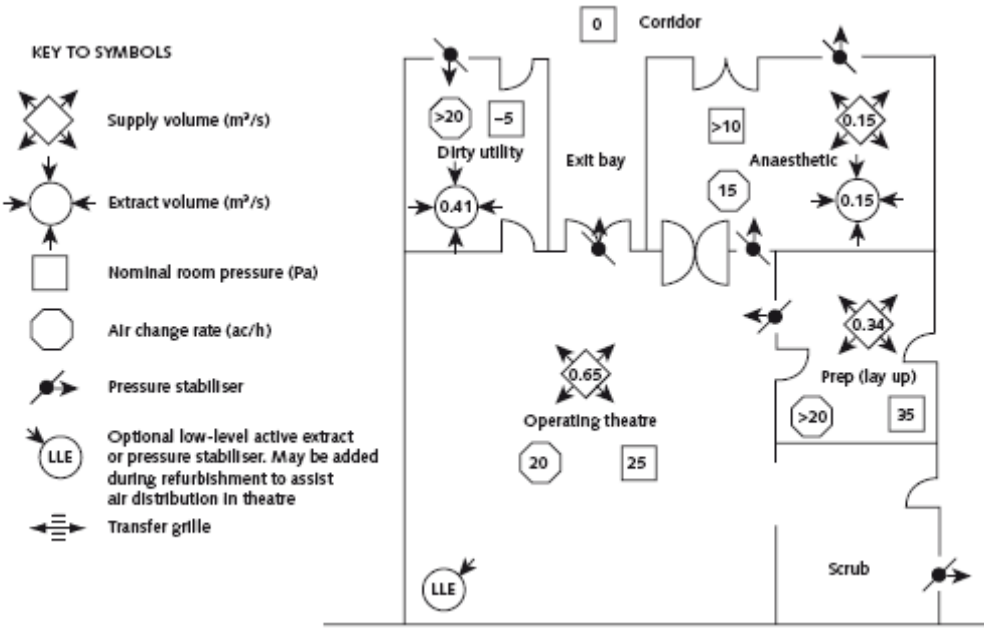
**Primary Fresh air Volume Only

The volume of air to be extracted from the theatre should be determined by subtracting the airflow required for door protection at the exits from the total air entering the theatre space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilizers or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space.

New standard layout N° 5 - SHTM 2025 Existing standard plan '1b' typical layout for a conventional theatre suite

This layout and data is for historical purposes only. The information is to be used for the evaluating of existing systems or rebalancing following ventilation system cleaning.

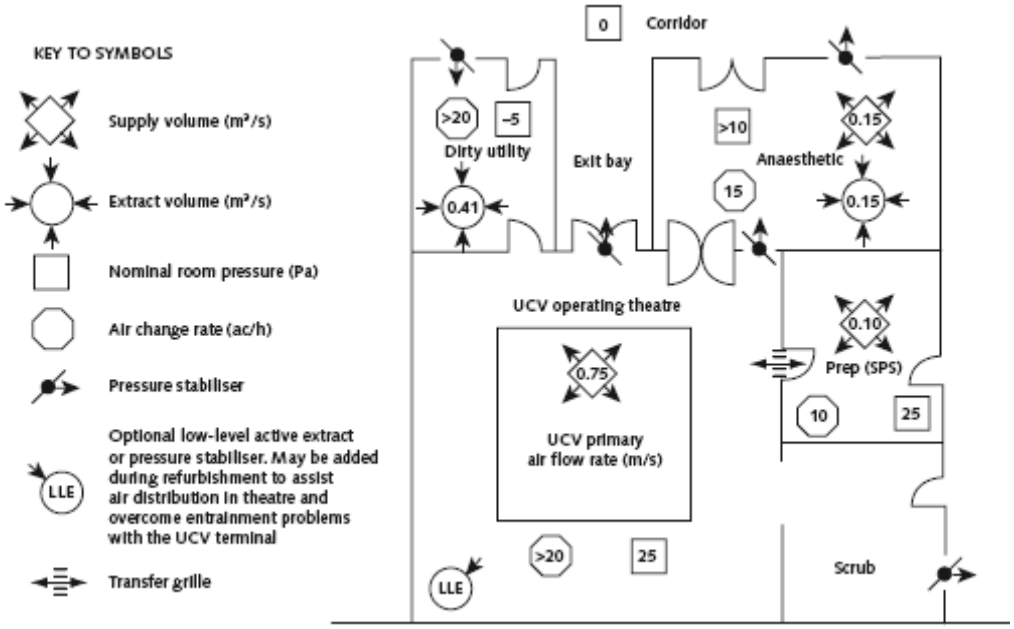


Room	Size m³	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	Existing Theatre Suite to Be measured on site	20	25	0.65
Anaesthetic		15	14	0.15
Lay-Up Prep		-	35	0.34
Scrub		-	25	Included within theatre
Disposal		-	-5	0.41

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor.

Standard layout No 6 - SHTM 2025 Existing standard Plan '1a' Typical layout for a UCV theatre suite

This layout and data is for historical purposes only. The information is to be used for the evaluating of existing systems or rebalancing following ventilation system cleaning.



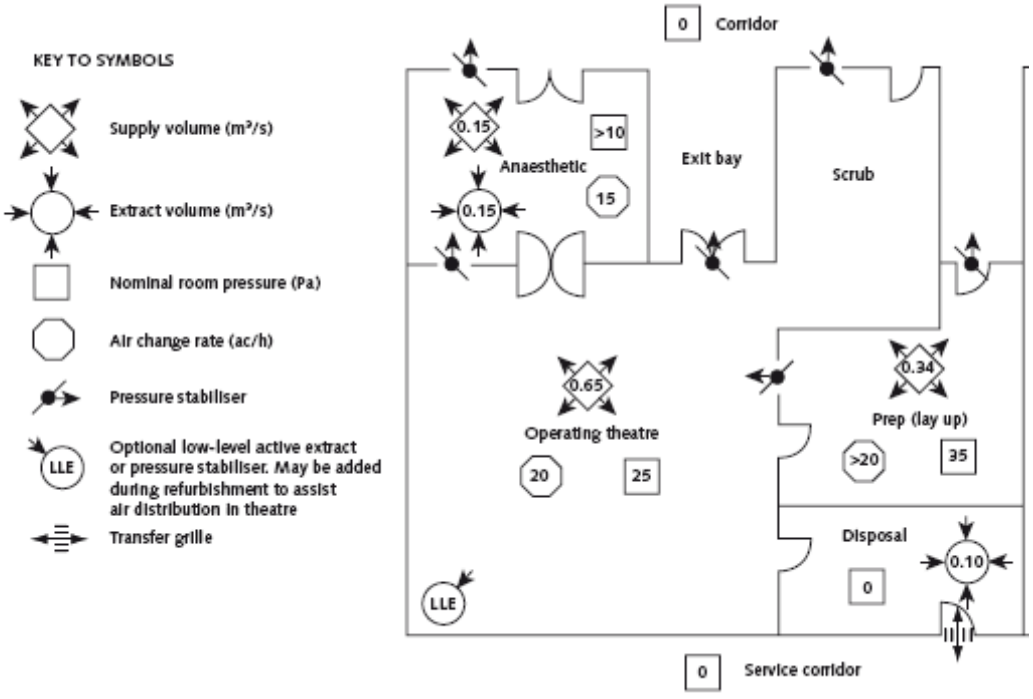
Room	Size m^3	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m^3/s
Theatre	Existing Theatre Suite to be measured on site	20	25	0.75*
Anaesthetic		15	>10	0.15
Sterile Pack Prep		10	25	0.1
Scrub		-	25	Included within theatre
Disposal		-	-5	0.41

*Primary fresh airflow volume

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor.

Standard layout N° 7 - SHTM 2025 Existing standard Plan '5b' Typical layout for a conventional theatre suite

This layout and data is for historical purposes only. The information is to be used for the evaluating of existing systems or rebalancing following ventilation system cleaning.

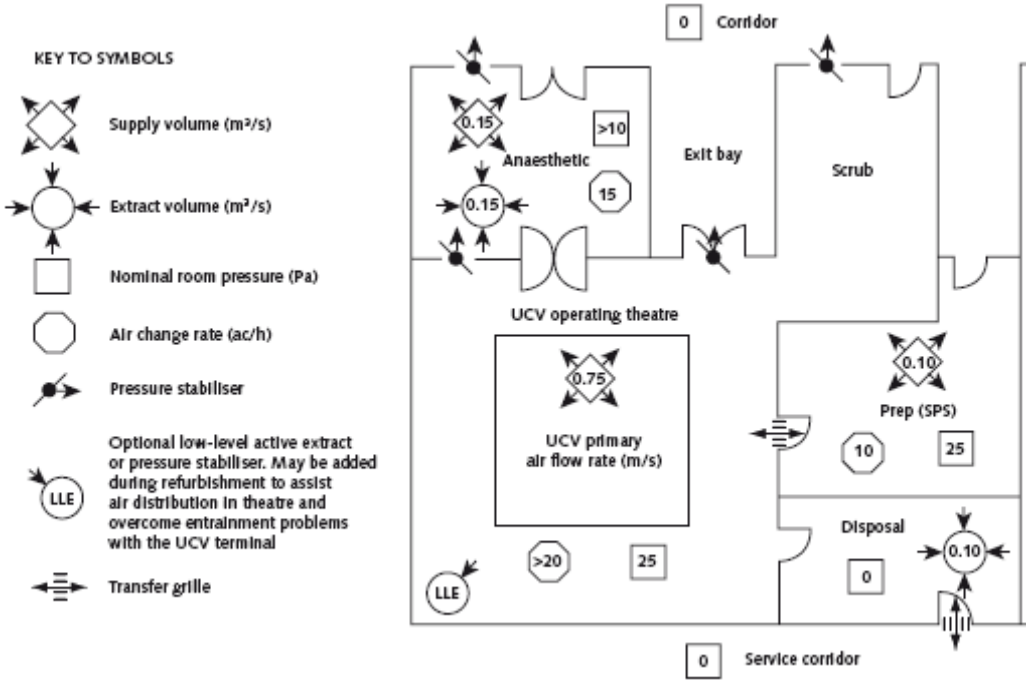


Room	Size m³	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	Existing Theatre Suite to be measured on site	20	25	0.65
Anaesthetic		15	>10	0.15
Lay-Up Prep		>20	35	0.34
Scrub		-	25	Included within theatre
Disposal		-	0	0.1

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor. Alternatively the disposal room could be omitted and replaced with a disposal hatch between the theatre and corridor.

Standard layout N° 8 - SHTM 2025 Existing standard Plan '5a' Typical layout for a UCV theatre suite

This layout and data is for historical purposes only. The information is to be used for the evaluating of existing systems or rebalancing following ventilation system cleaning.



Room	Size m³	Air Change Rate per hour	Nominal Pressure Pa	Flowrate m³/s
Theatre	Existing Theatre Suite to be measured on site	20	25	0.75*
Anaesthetic		15	>10	0.15
Sterile Prep		10	25	0.1
Scrub		-	25	Included within theatre
Disposal		-	0	0.1

*Primary fresh air-flow volume only

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor. Alternatively the disposal room could be omitted and replaced with a disposal hatch between the theatre and corridor.

Appendix 4: Design of air-movement control schemes for operating theatres.

General

A4.1 Standard operating suite design solutions are given in Appendix 3. If these standard solutions cannot be used, the following procedure should be adopted, which will result in an acceptable design. Note that the method employed can equally be used to provide a design solution to a ventilated suite of rooms for any application.

A4.2 The method is concerned with the calculation of airflow rates to ensure that correct air movement occurs between rooms when any one door is open. Under most circumstances, the air quantities required for air-movement control will approximate to those for either temperature control or bacterial contaminant dilution. This flow rate is sufficient to control the effects of any slight reverse flows occurring when a door is opened.

A4.3 The progression through the design procedure is shown in the airflow design procedure chart (Figure A4/3) and is supported by worksheets WS1 to WS7 described in Paragraph A4.4. It is recommended that a plan of the suite and an airflow network be made (Figure A4/2) to collate all information. Flow rates, air-transfer devices etc should be entered as required. The remainder of this Appendix may be treated as reference data to assist in the various steps. The following symbols are used:

S_S – supply airflow rate for summer temperature control;

S_W – supply airflow rate for winter temperature control;

S_D – supply airflow rate for dilution of bacterial contaminants;

S_L – supply airflow rate for heat loss;

S_G – supply airflow rate for heat gain;

E_D – extract airflow rate for dilution of bacterial contaminants;

S_F – final supply airflow rates;

E_F – final extract flow rates;

S_{AMC} – air-supply flow rate for air-movement control;

E_{AMC} – air-extract flow for air-movement control;

L_{OUT} – leakage airflow rate outward;

L_{IN} – leakage airflow rate inward;

$\sum_{OUT}$ – total airflow rate outward;

$\sum_{IN}$ – total airflow rate inward.

A4.4 To simplify the procedure, standard worksheets (WS1 to WS7) have been devised. For each operating suite, a set is required comprising one each of WS1, WS3, WS5, WS6a, WS6b and WS7, one WS4 for each corridor and one WS2 to cover each peripheral room. WS2 has five versions:

- WS2a single flow;
- WS2b parallel/series multi-flow;
- WS2c parallel multi-flow or series multi-flow (unbalanced);
- WS2d series multi-flow (balanced); and
- WS2e bay (semi-open).

Peripheral room type

A4.5 The rooms in the operating suite other than the operating room and corridor are referred to as peripheral rooms. Peripheral rooms have been classified according to the flows in and out. These room classifications are defined below in Paragraphs A4.6 – A4.11.

Single flow

A4.6 This is a room with only one door and a net surplus of supply or extract air.

Parallel multi-flow

A4.7 This is a room with two or more doors through each of which the air-flows either outwards (high-pressure) or inwards (low-pressure) (for example the Prep (lay-up) in standard layout 5).

Parallel/series multi-flow

A4.8 This is a room having a net surplus of supply or extract and with two or more doors. One or more doors will be to an area of equal cleanliness and need not be protected; hence, the flow may vary between inwards and outwards, the remaining door being to an area of greater or lesser cleanliness (for example the Prep (SPS) in standard layout 6).

Series multi-flow (unbalanced)

A4.9 This is a room having a net surplus of supply or extract and with two or more doors. Air flows inwards through one or more doors and outwards through one or more doors.

Series multi-flow (balanced)

A4.10 This is a room as in Paragraph A4.9 above, but having either no mechanical ventilation or no net surplus of supply or extract. (for example an anaesthetic room).

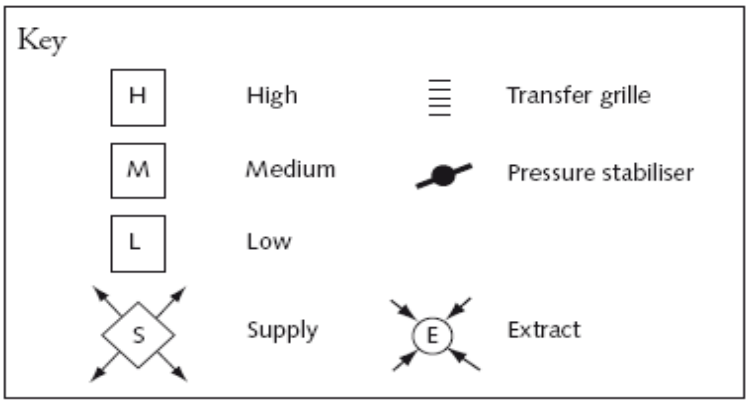
Bay

A4.11 A room that has a permanent opening to the operating room may be considered as a bay off the latter (for example a scrub). Two categories exist:

- open bay – the opening is larger than a normal single door opening. The bay may be considered as part of the main room;
- semi-open bay – the opening is no larger than a normal single door opening. In this case it is possible to protect the bay from the main room by provision of air supply or extract in the bay, or by passing air to or from another area.

Air-movement control in peripheral rooms

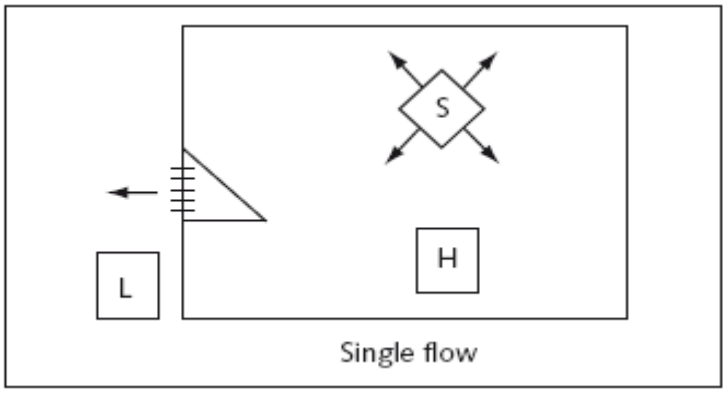
A4.12 For the design of air-movement control, two types of air-transfer device are considered. These are transfer grilles and pressure stabilisers. Each has a particular field of application within the design, as described in Paragraphs A4.34 – A4.43. Air movement is controlled in each of the different room types described in Paragraphs A4.13 – A4.31.



Note: This key applies to each diagram in A4.13 - A4.27.

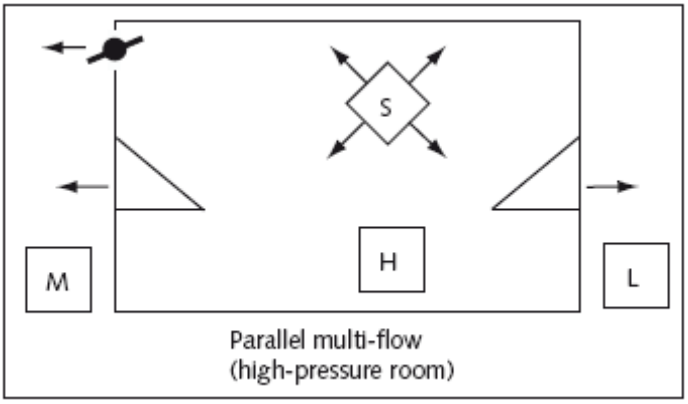
Single flow rooms

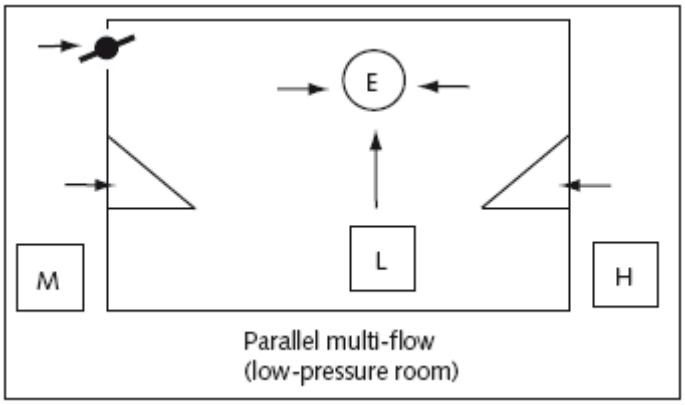
A4.13 An appropriately sized transfer grille should be located in or adjacent to the door of each single flow room to relieve the pressure differences across the door when closed.



Parallel multi-flow rooms

A4.14 The pressure difference across the closed doors must be relieved, but transfer grilles are not appropriate where two doors lead to areas of different pressures, because reverse flow could occur when the other door is open. For this reason, pressure stabilisers are used.



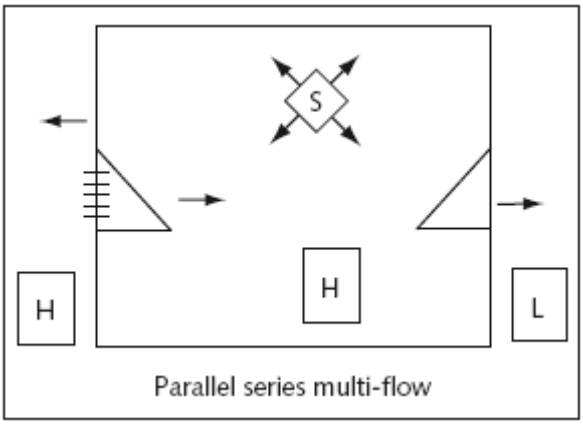


A4.15 These rooms will be either high-pressure or low-pressure with respect to the adjacent areas (see preparation lay-up room and disposal room, respectively, in standard layout 5). The pressure-relief damper is always situated between the room and area, which results in the smaller differential pressure to ensure best use of air.

A4.16 Just as reverse flow can occur if transfer grilles are used, it can similarly occur via door gaps when the other door is opened. It is not possible to avoid this, except by using air locks, but due to the low flow rates and short durations involved, this is not considered to be of importance.

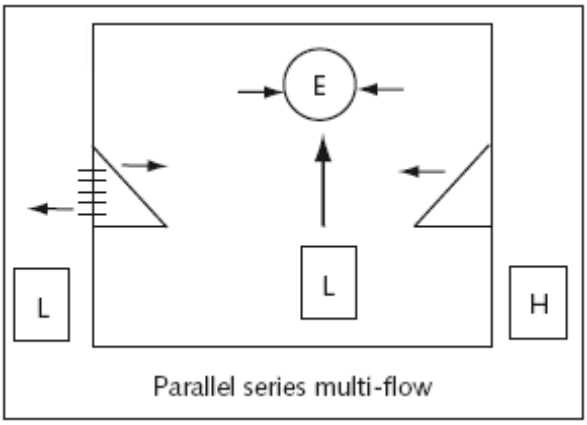
Parallel-series multi-flow rooms

A4.17 These rooms are similar to those in Paragraph A4.14 above, but because the room is of equal cleanliness to one of the adjacent rooms the nominal pressures will be equal and air may flow through the adjoining doorway in either direction. (for example the Prep (SPS) in standard layout 6).



Parallel series multi-flow

A4.18 Where the nominal room pressure equals that of the higher-pressure adjacent room, the best use of air is by supplying air required for bacterial dilution only and allowing this to exhaust via a transfer grille to the area of equal cleanliness. The doorway to the lower pressure area is protected by the combination of the supply air and the air that will flow inwards through the transfer grille from the area of equal cleanliness.

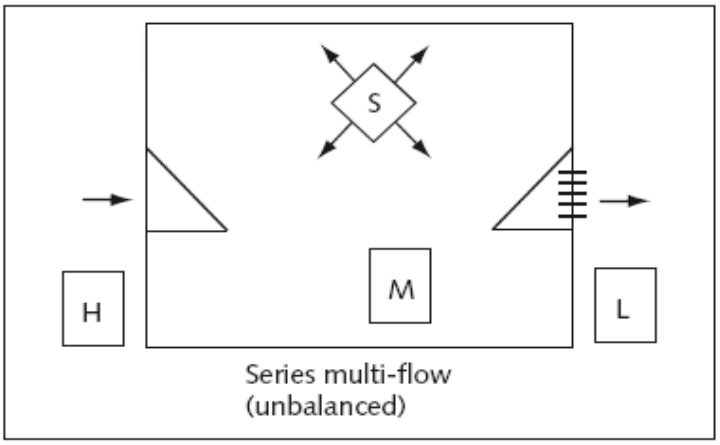


Parallel series multi-flow

A4.19 Conversely, where the nominal pressure equals that of the lower-pressure adjacent room, extract ventilation and a transfer grille to the lower pressure adjacent room should be provided. (for example, the disposal room in standard layout 8).

Series multi-flow (unbalanced)

A4.20 These rooms are somewhat similar to those in Paragraph A4.15 above, but because the pressure lies between that of the rooms on either side, the back-flow problem does not exist.



Series multi-flow (unbalanced)

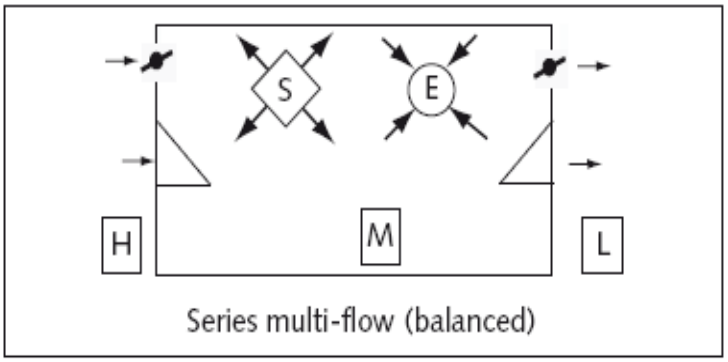
A4.21 Where the room has a net surplus of mechanical supply air, a transfer grille should be located in or adjacent to the door through which air flows outwards, and the mechanical supply flow rate to the room should be chosen to give protection when this door is open.

A4.22 Where the room has a net surplus of mechanical extract air, a transfer grille should be located adjacent to the door through which the air flows inwards, and the mechanical extract flow rate to the room should be chosen to give protection when this door is open.

A4.23 The grille must be sized for the protection requirement of the opposing door when open. When the room on the high-pressure side depressurises, there is a possibility of back-flow through gaps around the door, but this problem may be ignored.

Series multi-flow (balanced)

A4.24 In these rooms, a transfer device adjacent to each doorway is required in order to provide a flow path for the air required to protect the opposing door when opened.



Series multi-flow (balanced)

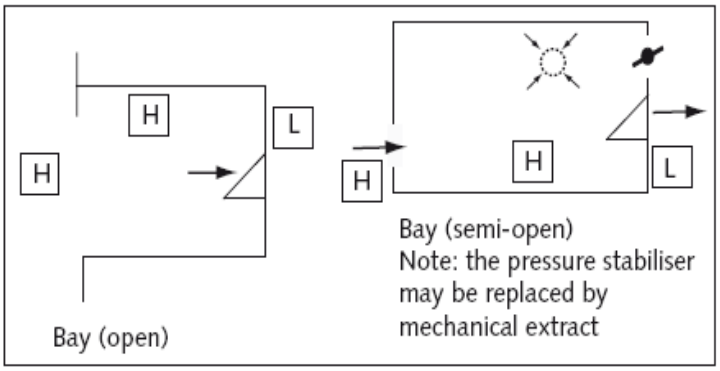
A4.25 These transfer devices will normally be pressure stabilisers, although transfer grilles may be used where a large amount of excess air is to be exhausted from the operating room when all doors are closed. (for example, anaesthetic rooms).

A4.26 The calculation procedure is to assume that pressure stabilisers are being used; then (if there is sufficient excess air) change to transfer grilles as described in Paragraph A4.50.

Bay

Open bay

A4.27 A bay of the open type (for example scrub-up) is considered to be part of the operating room. Provided air movement is satisfactory, no specific extract is required.



Semi-open bay

A4.28 In a bay of the semi-open type, protection of one area from the other is possible. (For example scrub-up).

A4.29 As stated previously, the need for protection between operating room and scrub-room is not very great. Better use of air can therefore be achieved in this case by installing a pressure stabiliser between the scrub-room and clean corridor. This will allow a flow of air through the scrub-room at all times, except when a door is opened elsewhere in the suite. The pressure stabiliser will then close and the air will be diverted to the other door. When it is considered necessary to protect the scrub-room at all times, either a transfer grille to the corridor or mechanical extract in the scrub-room should be provided.

Operating room

A4.30 Once the peripheral rooms have been considered, the operating room requirements may then be decided and the supply flow rate required for air-movement control calculated. This flow rate should be such that, with any one door open, the correct air movement directions are maintained. There will be one door in the suite that will require the largest supply flow rate to the operating room for protection when open. This is called the “key door” and is discussed separately in Paragraph A4.33. Use of this concept avoids repetitive

calculations for each door in turn. Having established the required supply flow rate, a relief route must be provided to the clean corridor for any excess air when the doors are closed. This would be via transfer grilles or pressure stabilisers through a series-flow room or via pressure stabilisers to the clean corridor directly.

Corridors

A4.31 All surplus air from the suite, except that lost through structure leakage and any passing to the outer corridor, will arrive in the patient/staff corridor. Should this air be insufficient to achieve the required air-change rate (see Appendices 1 and 2), some additional air supply should be provided. (The air balance should take account of structural leakage.)

Door opening

A4.32 Whereas the resulting pressures are dependent on ductwork layout, room relationships and characteristics of the fan, the generalisations shown in Appendix 2 can be used to estimate the change in room pressure when a door is opened.

A4.33 The “key door” will be the open double door which leaves the operating room at the highest pressure, and/or requires the largest air flow. This should be determined using the procedure in worksheet WS3.

Transfer grilles

A4.34 These may be used to limit the pressure differences across the closed door of a single-flow room or, in some instances, for protection of a series-flow or parallel-series-flow room. They allow airflow in both directions and may not be suitable for all applications.

A4.35 The free area of a grille is calculated from the following equation:

$$A = \frac{Q}{0.84\sqrt{\Delta P}}$$

where:

A is free area (m^2)

Q is flow rate (m^3/s)

P is pressure difference (Pa).

A4.36 The flow through a grille at a different pressure may be found from the following equation:

$$Q_2 = Q_1\sqrt{\frac{\Delta P_1}{\Delta P_2}}$$

where:

Q_1 and P_1 are original flow and differential pressure

Q_2 and P_2 are new flow and differential pressure.

A4.37 The transfer grille may be replaced by carefully proportioned door undercuts of the equivalent free area.

A4.38 The function of the transfer grille is to provide a means of airflow control by which the volume and pressure loss can be established. If a grille is used, it should have an easily removable core to facilitate cleaning.

Pressure-relief dampers

A4.39 The functions of a pressure-relief damper are now carried out by pressure stabilisers. Accordingly, all further mention of them has been removed from this document.

Pressure stabilisers

A4.40 Pressure stabilisers can be adjusted to hold the pressure constant over a wide range of flow rates. They are used where requirements exist for accurate room-pressure control or rapid shut-off on pressure fall.

A4.41 The installation of a grille or baffle in association with a stabiliser will alter the operating characteristics. It is recommended that a location be chosen to avoid the need for visual screening, for example, at high level. The location should be chosen to minimise the likelihood of damage.

A4.42 The stabilisers used should be virtually silent in operation, adjustable on site, maintenance-free and of a type that cannot be wrongly inserted. They should not be used in external walls or where the pressure difference is less than 5 Pa. The required size of a pressure stabiliser is dependent on the design pressure difference across it and flow rate through it. The manufacturer should provide data relating pressure difference to mean velocity (or flow rate per unit area). From this, the required area can be calculated and then rounded-up to the nearest size manufactured or nearest combination of smaller sizes.

A4.43 It is sometimes possible to arrange for a pressure stabiliser to perform two tasks. In an anaesthetic room, for example, the two pressure stabilisers may be made to pass the open door protection air, and also control the operating and anaesthetic room pressures with the door closed. To achieve this, the stabilisers are sized for the flow rate required with one of the doors open, but

the pressure setting is adjusted to be the value required with the doors closed. This is shown in Figure A4/1.

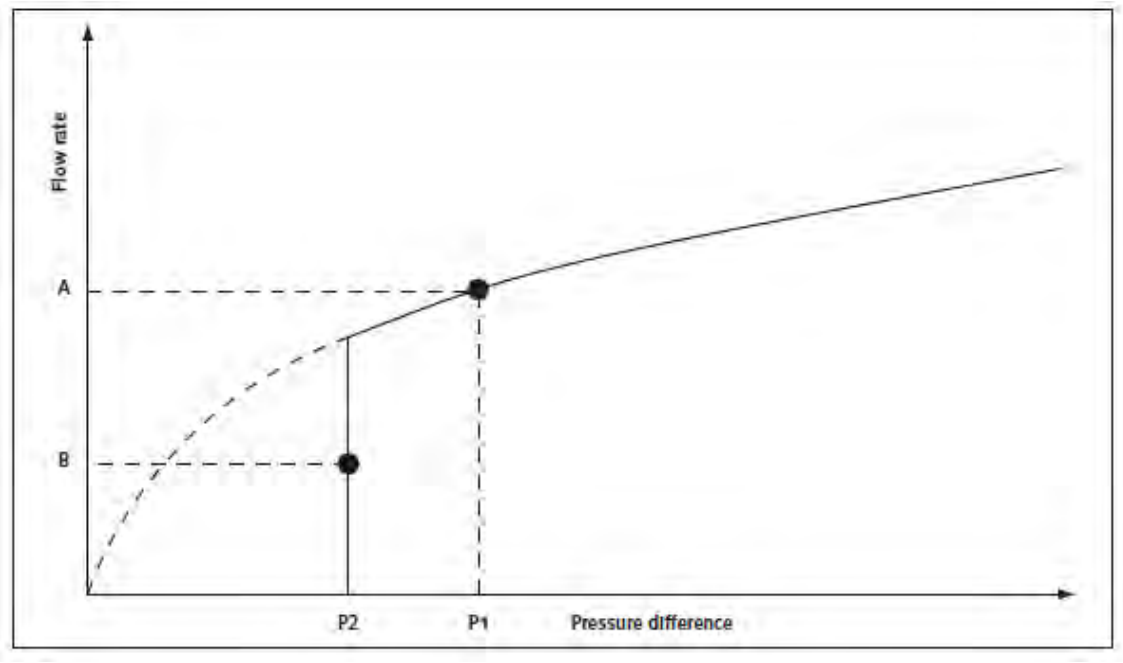


Figure A4/1

Door leakage flows

A4.44 For an air-movement control scheme to work satisfactorily, it is essential that the estimates of door-gap leakage made at the design stage are closely related to those which are achieved in practice. The calculation of gap-flows is complicated by the fact that such flows generally fall into the transition region between laminar and turbulent flow and hence do not follow the normal flow equations. The gaps assumed are 4mm along the bottom, 3mm at the top and sides, and 2mm between double leaves. Doors should not have wider gaps than these. Tighter gaps would result in lower flow-rate requirements and hence lower fan power, but care should be taken to ensure that all doors in the suite have similar gap dimensions. It may be possible to ignore the door leakage and so reduce the airflow requirement (see the notes in Appendix 3).

Room temperature estimation

A4.45 The air-flow rate required to prevent back-flow through an open door is dependent on the temperature difference across the door. The design figures shown in Appendix 3 are based on the temperature differences that will normally occur in practice, assuming heat gains and losses in accordance with Appendix 2.

A4.46 In accordance with the airflow design process, the temperature differences across the doors of all rooms classed as “sterile” is calculated. Worksheet WS6 is recommended for the calculations, using the following criteria:

- assume that the operating room is being controlled at 20°C and calculate the incoming air-supply temperature as shown on worksheet WS6;

- the calculation should be repeated for both summer and winter conditions, with an operation in progress;
- assume all doors are closed;
- use the room supply flow rates from WS1;
- use the inward air flows through air-transfer devices and closed door leakages from WS2a to WS2e;
- the formula used in worksheet WS6 is as follows:

$$T = \frac{(t_1Q_1 + t_2Q_2 + \cdots + t_nQ_n) + 0.828H}{(Q_1 + Q_2 + \cdots Q_n)}$$

where:

Q = flow rate from source (m^3/s)

t = the temperature of source (°C)

H = the room heat gain (kW).

A4.47 If the evaluated temperature differences between rooms do not exceed 2°C, the solution is satisfactory; otherwise proceed as follows:

- check the assumption on which the heat gains are based;
- take steps to reduce the heat gains;
- if the door is to a corridor, the flow through the open door will be larger than the value given in Appendix 2. Calculate on WS3, assuming it is the “key door” with door-flow unknown, and the supply as known;
- if the door leads to a room with mechanical supply, install a trimmer heater in the supply to the room controlled by either a differential thermostat or a thermostat slaved to the operating room thermostat to ensure that T is minimized.
- If the door leads to a room with no mechanical supply, increase the door protection flow as follows:

$$Q_{new} = Q_{old}\left[\frac{\Delta T + 1}{2}\right]$$

A4.48 These options should be considered in the above order, and the first three should be investigated thoroughly before proceeding to the latter two. The mechanical supply may need to be increased in order to achieve the desired air-change rates.

Relief of excess air from operating room when all doors are closed

A4.49 As the mechanical supply to the operating room is sized to provide an appropriate flow outward through any door that is opened, it follows that when all doors are closed, there will be more air supplied to the operating room than

can exit from it via leaks etc. This “excess” air can be relieved by either of the two methods described in Paragraphs A4.50 - 4.54.

By transfer devices via the anaesthetic room

A4.50 For door protection, the transfer devices in the anaesthetic room are typically designed to pass 0.47 m^3/s at a differential pressure of 14 Pa. When the doors are closed, the differential pressure will change to 11 Pa between theatre and anaesthetic room, and 14 Pa between anaesthetic room and corridor; the volume of air passed by the transfer devices will be modified as shown in the following formula:

$$Q = Q_1\left(\frac{\Delta P_1}{\Delta P_2}\right)^{1/2}$$

$$= 0.47\left(\frac{11}{14}\right)^{1/2}$$

$$= 0.42\ m^3/s$$

where:

Q = “excess” air to be vented with doors closed;

Q_1 = air-flow required for door protection through transfer device;

ΔP_1 = nominal differential pressure with door to operating room closed and door to corridor closed;

ΔP_2 = nominal differential pressure between either the anaesthetic room and corridor when the operating room door is open, or the anaesthetic room and operating room when the corridor is open. This differential pressure is used when selecting size of both devices.

A4.51 If the “excess” air is less than 0.42 m^3/s, a pressure stabiliser is required to ensure that the correct protection airflow is available to pass through the door.

A4.52 If the “excess” air is greater than 0.42 m^3/s, a transfer grille is acceptable because at all times the airflow will exceed the flow required for door protection.

By pressure stabilisers to the corridor

A4.53 If it is undesirable to pass operating room air through the anaesthetic room, it may be passed directly to a corridor via a separate pressure stabiliser.

A4.54 If there is sufficient “excess” air, the transfer grille solution at Paragraph A4.52 should be adopted, as it provides the simplest solution and, once set up, will require no further maintenance. With less excess air, it is recommended that the air be passed through the anaesthetic room via the pressure stabilisers as at Paragraph A4.51, thus keeping the number of pressure stabilisers to a minimum. Both these solutions increase the air-change rate in the anaesthetic

room, but care should be taken to avoid passing excessive amounts through that would cause discomfort to the occupants.

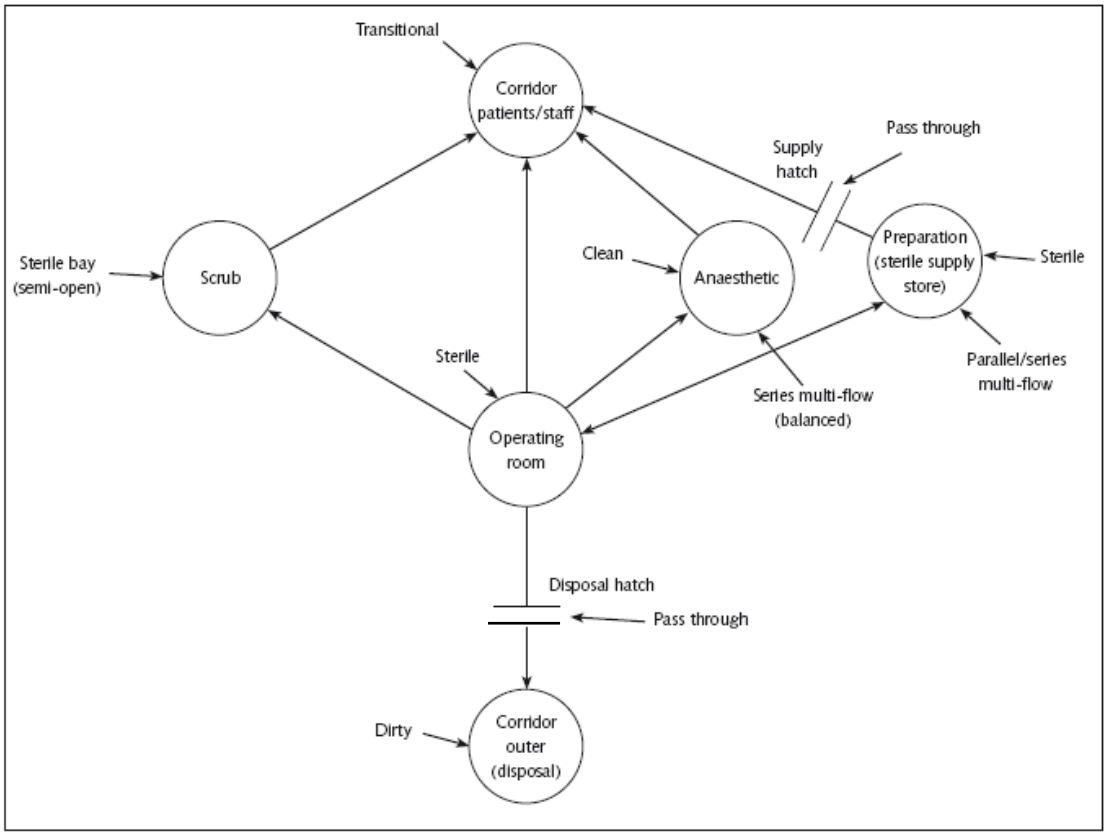

Figure A4/2: An example of an airflow network

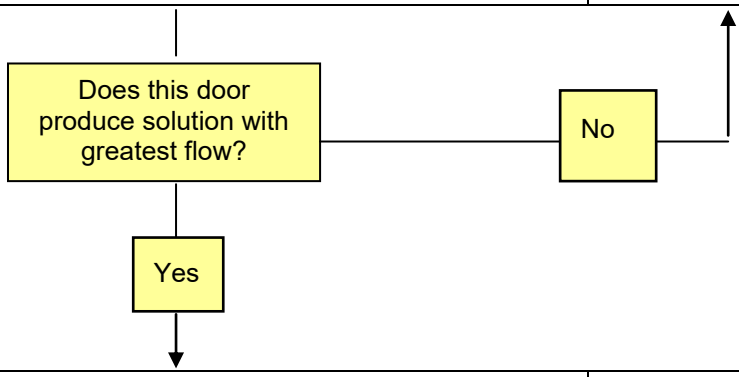
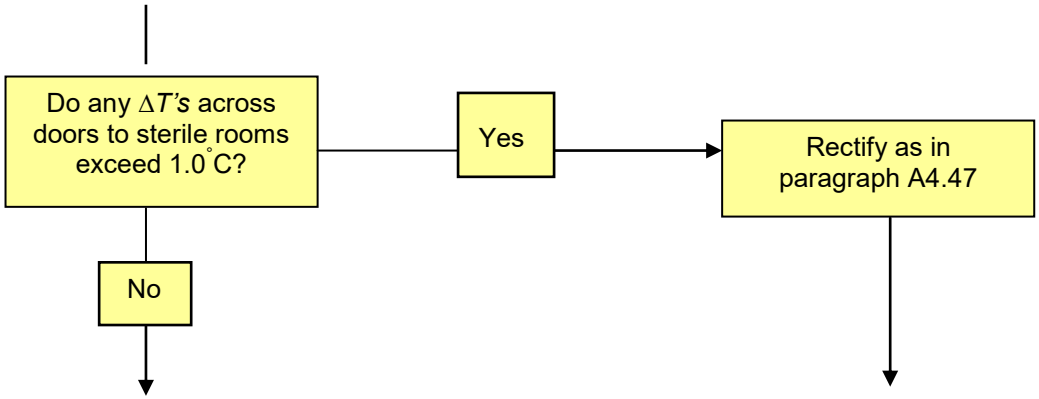
Step	Description	Worksheet
1	Show nominal room pressures and air flow directions on the plan of the theatre suite and WS1	WS1
2	Enter heat/loss/gain data and calculate supply airflow rates for temperature control only. Categorise room types e.g. sterile, clean etc.	WS1
3	Enter airflows required for bacterial contamination control or air change rate whichever is the greater, add supply and extract volumes (S_D, E_D) on the plan.	WS1
4	Define peripheral room types, see paragraphs A4.5 - A4.11, and select appropriate worksheets.	Select from WS2a - WS2e
5	Locate air transfer devices, enter details on worksheets and locate on the plan and Figure A4/2	Selected worksheets from WS2a - WS2e
6	For each peripheral room, determine air flows through doors when open and calculate mechanical supply or extract and transfer device flows	As above
7	Select "Key Door" and calculate air supply for operating room	WS3



8	Transfer to WS1 and select final rate S_F and E_F	WS1. WS3
9	Make provision for relief of excess air with doors closed	Selected Worksheets and WS3
10	Calculate supply and extract flow rates for corridor(s)	WS4, WS5
11	Calculate room temperatures (all doors closed) and ΔT's	WS4, WS5



12	Make summary of flows	WS6a and WS6b
13	Size transfer devices, size ductwork, central plant etc	WS7
14	Design ductwork layout, control plant etc	

Figure A4/3: Airflow design procedures

Note: In the following worksheets WS1, WS2a-e, WS3, WS4, WS5, WS6a&b and WS7 it has been necessary to reduce the font size to 8pt instead of the usual 10pt in order to set out the complete tabular information for each within a single page for ease of use.

Health Building Note 04-01
Supplement 1
Isolation facilities for infectious patients in acute settings

A46676816

Health Building Note 04-01 Supplement 1
Isolation facilities for infectious patients in acute settings

Preface

About Health Building Notes

Health Building Notes give "best practice" guidance on the design and planning of new healthcare buildings and on the adaptation/extension of existing facilities.

They provide information to support the briefing and design processes for individual projects in the NHS building programme.

The Health Building Note suite

Healthcare delivery is constantly changing, and so too are the boundaries between primary, secondary and tertiary care. The focus now is on delivering healthcare closer to people's homes.

The Health Building Note framework (shown below) is based on the patient's experience across the spectrum of care from home to healthcare setting and back, using the national service frameworks (NSFs) as a model.

Health Building Note structure

The Health Building Notes have been organised into a suite of 17 core subjects.

Care-group-based Health Building Notes provide information about a specific care group or pathway but cross-refer to Health Building Notes on **generic (clinical) activities** or **support systems** as appropriate.

Core subjects are subdivided into specific topics and classified by a two-digit suffix (-01, -02 etc), and may be further subdivided into Supplements A, B etc.

All Health Building Notes are supported by the overarching Health Building Note 00 in which the key areas of design and building are dealt with.

Example

The Health Building Note on accommodation for adult in-patients is represented as follows:

> "Health Building Note 04-01: Adult in-patient facilities"

The supplement to Health Building Note 04-01 on isolation facilities is represented as follows:

> "Health Building Note 04-01: Supplement 1 – Isolation facilities for infectious patients in acute settings"

Health Building Note number and series title	Type of Health Building Note
Health Building Note 00 – Core elements	Support-system-based
Health Building Note 01 – Cardiac care	Care-group-based
Health Building Note 02 – Cancer care	Care-group-based
Health Building Note 03 – Mental health	Care-group-based
Health Building Note 04 – In-patient care	Generic-activity-based
Health Building Note 05 – Older people	Care-group-based
Health Building Note 06 – Diagnostics	Generic-activity-based
Health Building Note 07 – Renal care	Care-group-based
Health Building Note 08 – Long-term conditions/long-stay care	Care-group-based
Health Building Note 09 – Children, young people and maternity services	Care-group-based
Health Building Note 10 – Surgery	Generic-activity-based
Health Building Note 11 – Community care	Generic-activity-based
Health Building Note 12 – Out-patient care	Generic-activity-based
Health Building Note 13 – Decontamination	Support-system-based
Health Building Note 14 – Medicines management	Support-system-based
Health Building Note 15 – Emergency care	Care-group-based
Health Building Note 16 – Pathology	Support-system-based

Other resources in the DH Estates and Facilities knowledge series

Health Technical Memoranda

Health Technical Memoranda give comprehensive advice and guidance on the design, installation and operation of specialised building and engineering technology used in the delivery of healthcare (for example medical gas pipeline systems, and ventilation systems).

They are applicable to new and existing sites, and are for use at various stages during the inception, design, construction, refurbishment and maintenance of a building.

All Health Building Notes should be read in conjunction with the relevant parts of the Health Technical Memorandum series.

Activity DataBase (ADB)

The Activity DataBase (ADB) data and software assists project teams with the briefing and design of the healthcare environment. Data is based on guidance given in the Health Building Notes, Health Technical Memoranda and Health Technical Memorandum Building Component series.

1. Room data sheets provide an activity-based approach to building design and include data on personnel, planning relationships, environmental considerations, design character, space requirements and graphical layouts.
2. Schedules of equipment/components are included for each room, which may be grouped into ergonomically arranged assemblies.
3. Schedules of equipment can also be obtained at department and project level.
4. Fully loaded drawings may be produced from the database.
5. Reference data is supplied with ADB that may be adapted and modified to suit the users' project-specific needs.

Note

The sequence of numbering within each subject area does not necessarily indicate the order in which the Health Building Notes were or will be published/printed. However, the overall structure/number format will be maintained as described.

Executive summary

This Health Building Note sets out practical guidance on how to provide safe, effective isolation facilities for infectious patients (source isolation) that are simple to use and meet the needs of most patients on acute general wards.

This guidance describes:

- how a single-bed room with en-suite sanitary facilities can be used to provide effective isolation for patients with non-airborne diseases;
- how a ventilated single-bed room with en-suite facilities can provide an isolation room for patients who have an infection that can be spread by the airborne route.

It can be used for both new-build schemes and the upgrading of existing accommodation.

Room layouts are included as illustrative examples; other room configurations are possible.

It is advised that this Health Buulding Note be read in conjunction with:

- 'Infection control in the built environment' (DH, 2002), which provides information about how good design can prevent cross-infection in healthcare premises generally;
- Health Building Note 04-01 – 'Adult in-patient accommodation', which covers the planning and design of in-patient facilities for adults and includes space standards for bed areas (including isolation rooms and lobbies).
- 'Single-bed room: design manual', in Health Building Note 00-03 – 'Clinical and clinical support spaces', which provides detailed design information and layouts for single-bed rooms.

This document part supersedes Health Building Note 04-01 Supplement 1 (2005), specifically the guidance therein that relates to rooms used for source isolation. It does not supersede the guidance on protective isolation.

Contents

1 Introduction

1.1 The key to effective isolation on acute general wards is the provision of single-bed rooms with en-suite sanitary facilities. Single-bed rooms reduce the risk of cross-infection for non-airborne diseases and help to lower the incidence of healthcare¬associated infections. Most patients requiring isolation on acute general wards can be isolated in single-bed rooms with en-suite facilities. All single-bed rooms in new-build hospitals and wards should have en-suite facilities so that they can be used to isolate patients, among other reasons. It is the Department of Health's policy that any new build or major reconfiguration should have as a minimum 50% single-bed rooms.

1.2 The infection control team should be closely involved with all aspects of planning for, and determining the provision of, isolation facilities. When undertaking a project, a multi-disciplinary approach should involve the:

- infection control team and clinical team;
- architect and designer;
- building contractor and mechanical/electrical maintenance service providers;
- in-house estates team.

1.3 In accordance with 'The Code of Practice on the the prevention and control of infections and related guidance' (2010), it is recommended that all registered providers put in place systems to manage and monitor the prevention and control of infection. These systems use risk assessments and consider how susceptible patients are and any risks that their environment and other users may pose to them.

1.4 The provision of isolation rooms that are switchable from positive to negative air pressure is not recommended because of the risk to people inside and outside the room in the event of the setting being incorrect.

1.5 The guidance on PPVL and negative pressure isolation suites in this document is based on a model that was validated by the Building Services Research and Information Association (BSRIA) and the University of Leeds. The complete validation process and results obtained will be available from BSRIA (see link in References section).

Exclusions

1.6 This Health Building Note does not describe the specialist facilities required in high security infectious disease units, isolation wards for cohorting groups of infectious patients, protective isolation for severely immuno-compromised patients, critical care areas and special care baby units. It focuses on single occupancy isolation rooms only.

2 Options for provision

2.1 This chapter describes:

- how a single-bed room with en-suite sanitary facilities can be used to provide effective isolation for patients with non-airborne diseases (see paragraph 2.2);
- how a ventilated single-bed room with en-suite sanitary facilities can provide an isolation room for patients who have an infection that can be spread by the airborne route (see paragraph 2.9).

Single-bed room

2.2 A single-bed room with en-suite sanitary facilities is a simple, cost-effective way to provide isolation, and will meet the needs of most patients on general wards. An example layout for a new-build single-bed room with en-suite facilities is shown in sheet 1 (Appendix 1).

2.3 Detailed design guidance and space standards are given in Health Building Note 04-01 – 'Adult in-patient accommodation' and 'Single-bed room' in Health Building Note 00-03 – 'Clinical and clinical support spaces'. Key considerations are the inclusion of:

- en-suite sanitary facilities;
- optional lobby – if a lobby is not provided, space is needed for personal protective equipment and its disposal;
- clinical wash-hand basin in the room and in the lobby, if provided;
- good patient observation facilities;
- design features that enhance patient comfort (for example, ability to see out of the room).

2.4 Openable exterior windows and suspended tiled ceilings are optional.

2.5 See also Health Facilities Note 30 – 'Infection control in the built environment'.

2.6 Some patients with infections need to stay in isolation in hospital for long periods. The number of visitors they receive and the length of time they can spend with them may be restricted. This means that patients who are already vulnerable, but not necessarily physically severely incapacitated, will be confined to the room for sometimes several weeks and can experience long periods of boredom.

2.7 Accommodation for these patients should be stimulating and as comfortable as possible. Designers should try to achieve a balance between the need for a clean environment and the comfort of patients. A number of publications describe in detail evidence that supports the concept that a therapeutic environment has a positive effect on a patient's general feeling of well-being; reduces the length of stay for many patients; reduces depression, confusion and aggressive episodes; and significantly increases a patient's level of satisfaction with the overall quality of their care (see Health Building Note 04-01 – 'Adult in-patient accommodation').

2.8 If patients are to stay in an isolation room, it is important that they are able to see staff from their beds. This reduces the psychological problems of isolation. Staff should also be able to see the patient in case of emergency. Observation windows should have integral privacy blinds or glass that can be obscured electronically, which can be controlled by both staff and patients. The sense of containment can also be reduced by providing outside views using windows with low sills.

Options for preventing the spread of pathogens that are transmitted by the airborne route

Note

The isolation room should be physically constructed so that undesirable air flow in or out is restricted. This is described as the "permeability" of the room, which in simple terms is a measure of how leaky it is. If air can leak between an isolation room and an adjacent area in either direction, then this presents a route for the transmission of an airborne infection (see also Appendix 2).

2.9 A ventilated single-bed room with en-suite facilities can provide an isolation room for patients who have an infection that can be spread by the airborne route. This includes chickenpox, measles and some cases of pulmonary tuberculosis. It is for local clinical risk assessment to decide which patients will need to be nursed in these facilities.

2.10 The two options are:

- a room with negative pressure ventilation (see paragraph 2.11) or;
- neutral pressure room with a positive pressure ventilated lobby (PPVL – see paragraph 2.21).

Negative pressure room

2.11 This room is at negative pressure to the corridor and other adjacent areas (except for its en-suite).

2.12 The robust direction of air flow is more important than the numerical value of the pressure differential (see paragraph 2.15, 'Basic design parameters').

2.13 The inflow of air into the room (negative pressure) prevents the escape of contaminated air to surrounding areas; the ventilation in the room dilutes airborne pathogens.

Room criteria

- A sealed solid integrated ceiling should be installed.
- Windows to the exterior should be unopenable and well-sealed.
- Service penetrations should be minimised to support the room being well-sealed.
- A transfer grille to en-suite facility should be provided.
- Doors are a critical part of the design. The door from the corridor to the patient's room should be well hung and open into the patient's room. It should be fitted with a door closer to ensure that the pressure regime is maintained. The door between the patient's room and en-suite should be well hung and swing both ways. It may be "undercut" or fitted with a transfer grille in its lower half in order to promote an inflow of air to the en-suite.

2.14 For space requirements, see Health Building Note 04-01 – 'Adult in-patient accommodation'.

Basic design parameters

2.15 The patient's room should have around 10 air changes per hour and should be compatible with patient comfort. Air flow should be fully mixed to ensure good dilution and removal of airborne pathogens from the room space. The pressure differential to surrounding areas should indicate a definite inward flow of air. Any value in excess of 5 pascals should be sufficient to achieve and maintain this condition. An extract should be provided in the patient's room.

Note

Careful positioning of the extract should be considered. If supply and extract are adjacent to each other, short-circuiting of air flow will occur and although the room may seem to have a suitable air change rate and pressure regime, it will be inefficiently ventilated and not well-mixed.

2.16 To be effective, the extract in the en-suite should be sized to handle approximately two-thirds of the total isolation room's extract requirements.

2.17 The en-suite facility should be sized according to the recommendations given in Health Building Note 04-01 – 'Adult in-patient accommodation'.

2.18 If the room has both mechanically supplied and extracted air, these should be interlocked so that, should the extract fail, the supply will cut out (otherwise the room would be under positive pressure). Appropriate standby provision should be identified (for example connection to the essential power supply or uninterruptible power supplies) to enable continuity of supply should a mains power failure occur (see Health Technical Memorandum 06-01 – 'Electrical services supply and distribution').

Monitoring and record keeping

2.19 The pressure differential between the patient room and corridor should be monitored continuously (for example, by using a differential pressure sensor). Failure to maintain a negative pressure should activate an alarm at a designated nurse station as well as in the estates department via a building management system. There should be a delay on the alarm to allow doors to be opened, resulting in a temporary zero pressure differential, to allow the transfer of a bed into and out of the room. Note that when the bed is moved into or out of the room, the patient is NOT in isolation.

2.20 A magnehelic pressure gauge should show the pressure differential between the patient room and the corridor. It should be mounted at eye level on the corridor wall adjacent to the entry door. The gauge should be clearly marked to identify the isolation room to which it refers.

Positive pressure ventilated lobby (PPVL) room

2.21 This is a single-bed room with a PPVL and en-suite sanitary facilities with extract ventilation (see sheet 2 of Appendix 1 for an example layout).

Room criteria

- One or more pressure stabilisers should be installed above the door between the lobby and the patient's room.
- A suitable extract system to the en-suite facility should be provided.
- A transfer grille in the lower section of the en-suite door should be installed.
- To support the room being well-sealed, the detail of the construction joints between elements of the building and service penetrations will be critical to achieving the air-leakage standard demanded. The joints should be carefully sealed as construction progresses and service penetrations minimised, as they will be inaccessible once the inner finish is applied (see Appendix 2 on air leakage).
- The door between the corridor and the lobby should open into the lobby and be fitted with a door closer. The door between the lobby and patient's room should open back into the lobby and be fitted with a door closer. This is to ensure that the closure of both doors is aided by the lobby pressure, thus maintaining the air flow direction and pressure regime of the suite.
- If bed entry to the suite is through the lobby, one-and-a-half-leaf door sets will need to be fitted. Space constraints may make it necessary to hang the half-leaf from parliament hinges so that it can be opened back against the corridor or the wall of the patient's room (see Appendix 1, sheets 2, 5 and 6). Once the bed has passed through the lobby, the half-leaf should be latched shut. Entry for personnel will be via the single door leaf. An oversized door should not be used in place of the one-and-a-half-leaf door set.

2.22 For space requirements, see Health Building Note 04-01 – 'Adult in-patient accommodation'.

Basic design parameters

2.23 The patient's room is to have 10 air changes per hour mechanical air change rate. The entry lobby should have a positive pressure of between 8 and 12 pascals with respect to the corridor. The en-suite facility is to have at least 10 air changes per hour and be at a negative pressure with respect to the patient's room. Table 1 gives nominal design values calculated for rooms of the size stated.

2.24 Modifying or failing to provide one element of the system will jeopardise the performance of the system as a whole.

2.25 An extract terminal should be fitted at high level in the en-suite facility.

2.26 A transfer grille should be fitted at low level in the door between the patient's room and the en-suite facility.

2.27 A pressure stabiliser of the balanced blade type, set to operate at 10 pascals, should be fitted above the door between the lobby and the patient's room. The stabiliser should be visible so that its correct operation can be seen. It should be of a style that will operate silently, and be correctly sized and positioned so that it does not cause a draught that would be uncomfortable for patients.

Note

It is critical to the correct function of this design concept that the stabiliser be fitted as described and the transfer grille in the en-suite door also be fitted as described. This will set up a cyclonic circulation in the patient's room and provide the desired dilution protection levels.

Table 1 PPVL isolation suite – ventilation parameters

Room	Parameter	Nominal design values
Lobby	Room volume Bed access lobby (5 m^2 × 2.7 m) Personnel access lobby (4 m^2 × 2.7 m)	13.5 m^3 10.8 m^3
	Pressure differential to corridor	Nominally 10 pascals
	Supply air flow (see Note 3)	Bed access lobby – 238 L/s Personnel access lobby – 208 L/s
	Air change rate	Bed access lobby – 63 per hour Personnel access lobby – 69 per hour
Isolation room	Room volume (19 m^2 × 3 m)	57 m^3
	Pressure differential to corridor	Nominally zero
	Room air flow	158 L/s
	Air change rate	10 per hour
En-suite	Room volume (6 m^2 × 2.7 m)	16.2 m^3
	Pressure differential to isolation room	Negative
	Extract air flow	158 L/s (if extract is fitted in the isolation room this reduces to approximately 100 L/s in the en-suite with approximately 58 L/s extract in the isolation room)
	Air change rate	At least 10 per hour

Notes

1. In this example, the design parameters are based on Health Building Note 04-01 – 'Adult in-patient accommodation'. The en-suite is sized to comply with BS 8300 accessibility requirements.
2. The air flow rates quoted do not include any allowance for construction leakage. Airtightness specifications are given in Approved Document L of the Building Regulations (2010). See also the Air Tightness Testing & Measurement Association's (ATTMA) 'Technical Standard L2: Measuring air permeability of building envelopes (non-dwellings)' (see Appendix 2).
3. These are typical values based on standard room sizes. The actual volume of air required will be the sum of the air required to provide 10 air changes per hour in the patient's room + the air leakage through the door between the lobby and corridor at a differential pressure of 10 pascals. (See Appendix 4 in Health Technical Memorandum 03-01 Part A for leakage rate for single and double doors at 10 pascals.)

2.28 A direct reading gauge showing the pressure in the lobby with respect to the corridor should be mounted at eye level on the corridor wall adjacent to the lobby entry door. The gauge and lobby entry door should be clearly marked to identify the isolation room to which they refer.

2.29 Door undercuts are not recommended.

Supply ventilation for PPVL rooms

2.30 The supply air handling unit (AHU) and distribution ductwork should be clearly marked to identify the isolation suite that they serve. Service, maintenance, cleaning and filter change of the system will be subject to a permit to work.

2.31 A G3 pre-filter and a final filter to at least F7 standard should be fitted in the AHU.

2.32 In order to future-proof the system, the supply terminal in the lobby should be of a type that can accept a HEPA filter.

Monitoring and record keeping 14371

2.33 A record of pressure differentials, observed and recorded once per nursing shift, should be made. Ward staff should be made aware of what to do if the readings are out of specification.

Extract ventilation – negative pressure and PPVL rooms

2.34 The extract fan unit should preferably be located outside the building so that all ductwork within the building is under negative pressure. Access and cleaning hatches should only be fitted where absolutely necessary. If fitted they should be of the

sealed type and marked with a biohazard symbol. If the fan has to be located inside the building, it should be as close as practicable to the outside. The extract fan motor should be mounted out of the air stream and should be capable of being changed without withdrawing the impeller or opening up the ductwork. The extract fan should draw its power from the essential electrical system.

2.35 Extract filters will not be required provided that the fan can discharge in a safe location 3000 mm above the building height. If extract filters are fitted, they should be in a "safe change housing" outside the building on the suction side of the fan. Extract filters, where fitted, should be of HEPA grade. Even if filtered, extract air should not be recirculated.

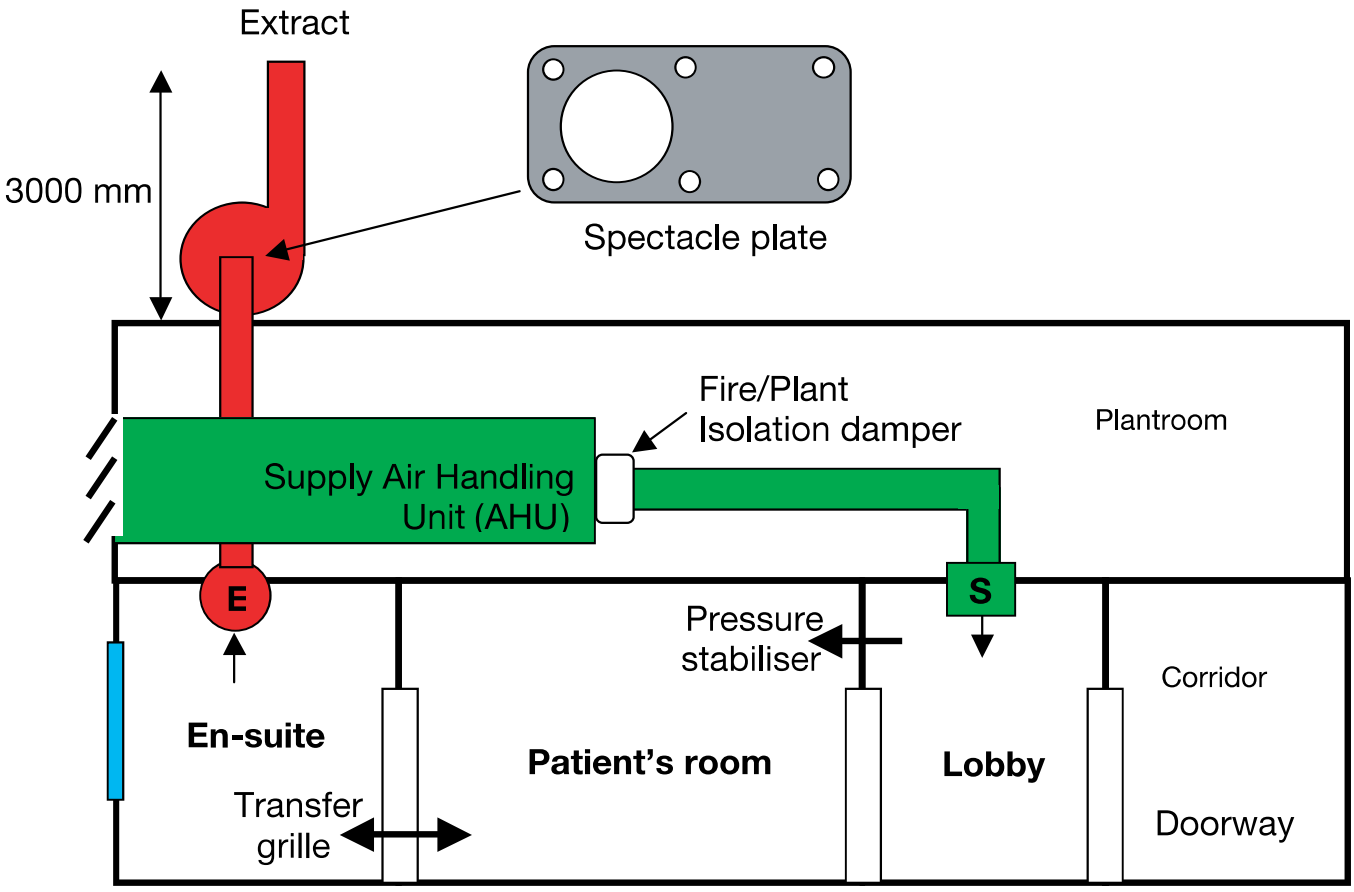
2.36 Extract ductwork, the fan and discharge stack should be clearly marked to identify the isolation suite that they serve. Service, maintenance, cleaning and filter change of the system will be subject to a permit to work.

2.37 Ideally each isolation suite should have its own dedicated supply and extract system. If two or more suites share a ventilation system, there will be an inevitable increase in the complexity of the system and a corresponding reduction in reliability and serviceability. Routine maintenance or breakdown of the ventilation system will result in failure of all suites that it serves; therefore, ideally each such isolation suite should have its own dedicated AHU.

2.38 In a high-rise building, a common supply and extract system may be the only feasible solution. In this case, run and standby fans would be required for the extract, and a duplicate supply unit may be considered necessary. The common supply and extract systems will need to be controlled to ensure a constant volume in each isolation suite branch regardless of the number in use.

2.39 Ductwork should be kept as direct and simple as possible.

Figure 1 Extract ventilation – negative pressure and PPVL rooms



Documentation

2.40 A logbook retained by the estates department will be required for each isolation room/suite. It should contain the following information:

- a schematic layout of the isolation room/suite and ventilation system serving it;
- information on the ventilation design parameters;
- a record of the actual ventilation performance at initial validation;
- records of the annual validations;
- records of any routine service and maintenance activities;
- records of any repairs or modifications.

3 Converting existing facilities

Note

Air permeability tests should be carried out during and following all refurbishment work.

3.1 En-suite single-bed rooms and isolation suites can be provided by converting bays and adapting existing single-bed room accommodation. The layout of existing facilities may impose constraints on design, however, and planning teams will sometimes have to resolve the conflict between what is desirable and what is achievable.

3.2 When converting existing accommodation into isolation facilities, the easiest and least expensive option is to adapt existing en-suite single-bed rooms. However, where existing single-bed rooms do not have en-suite facilities, the accommodation will need to be reconfigured (see below).

Converting an en-suite single-bed room

3.3 A typical layout for converting an existing en-suite single-bed room is shown in example layout sheet 3 of Appendix 1.

Converting a single-bed room without en-suite facilities

3.4 In an existing building, it may be possible to modify three adjacent single-bed rooms into two single-bed rooms each with en-suite facilities – see sheet 4 of Appendix 1.

3.5 The requirements for disabled access, as set out in Approved Document M of the Building Regulations 2010 and the Equality Act 2010, should be met.

Creating an en-suite single-bed room with ventilated lobby

3.6 When converting a single-bed room into an en-suite single-bed room with ventilated lobby, any suspended ceiling should be replaced with a sealed solid ceiling. If a single-bed room has a suspended ceiling to permit access to overhead services, a sealed ceiling with sealable access hatches could be installed or the services moved.

3.7 Access is through a single door via the lobby. The existing door-and-a-half for bed access only should be kept locked and have seals to minimise air transfer.

3.8 An option for reconfiguring two existing single-bed rooms to provide one en-suite single-bed room with ventilated lobby, with bed access through the lobby, is shown in sheet 5 of Appendix 1.

3.9 Where space restrictions mean that bed access through the lobby is not possible, an alternative layout gives bed access directly to the patient's room from the corridor – see sheet 6 of Appendix 1.

Converting a multi-bed bay

3.10 An existing four-bed bay may be converted to provide two en-suite single-bed rooms (see sheet 7 of Appendix 1).

3.11 In this configuration it is not possible to provide a normal observation window. As observation is critical, however, one option would be to provide fully-glazed lobby and bedroom doors, with integral privacy blinds, to enable observation from the corridor and to provide a view out for the patient.

4 Fire safety

4.1 Where isolation rooms/suites are provided for the purposes of preventing the risk of spreading healthcare-associated infections to other parts of a ward, the normal fire safety precautions for single-bed room accommodation apply.

4.2 In the case of an isolation room with a PPVL, the ventilation system should comply with Health Technical Memorandum 03-01 – 'Specialised ventilation for healthcare premises'. Where the ventilation system passes through a compartment wall, sub-compartment wall or cavity barrier, it should be fitted with fire and or smoke dampers in accordance with Figure 10 of Health Technical Memorandum 05-02 – 'Guidance in support of functional provisions for healthcare premises'. If the ductwork is fire-rated, the system only requires a fire damper at its junction with the AHU as shown in the diagram in Figure 1, 'Extract ventilation – negative pressure and PPVL rooms'.

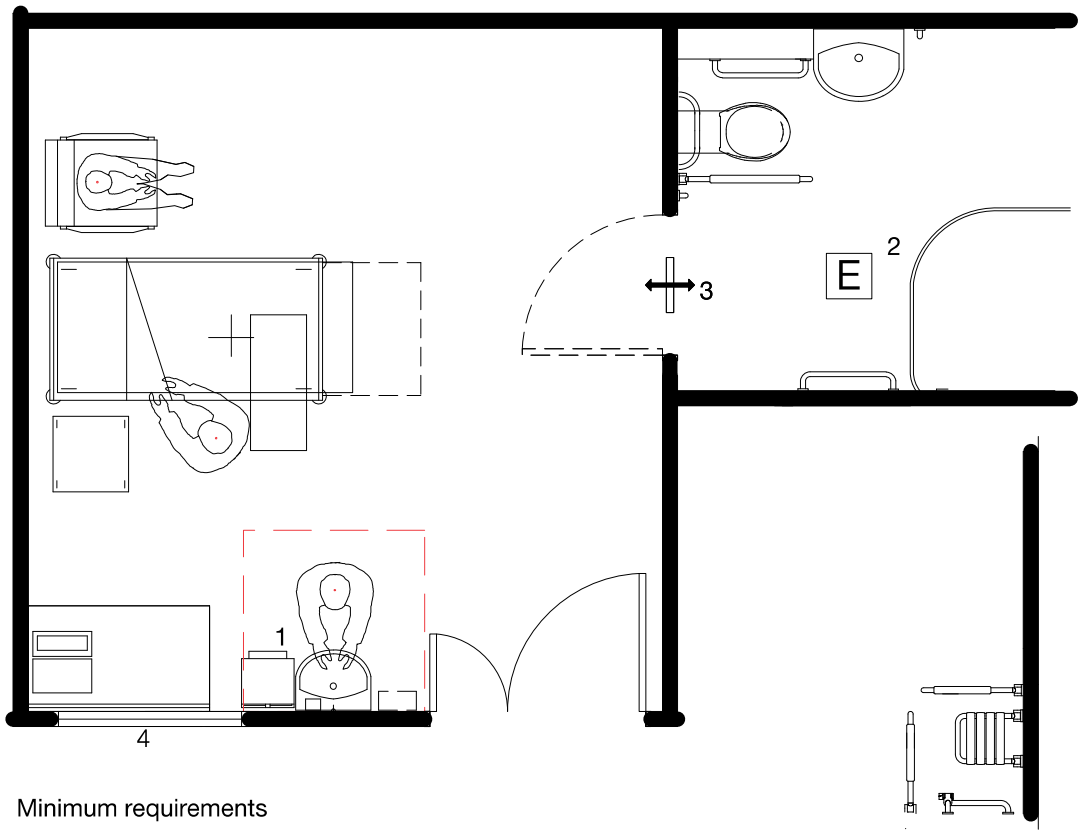
4.3 It is recommended that any discussions on fire safety should be discussed with the healthcare organisation's fire safety adviser, the building control authority and the local fire-and-rescue service.

Appendix 1 – Example room layouts

A1.1 The room layouts in this appendix are examples and are intended as a guide. Other room configurations are possible. Refer to 'Health Building Note 04-01 – Adult in-patient accommodation' and 'Single-bed room' in Health Building Note 00-03 – 'Clinical and clinical support spaces', which give definitive design guidance and space standards for multi-bed rooms and single-bed rooms with en-suite facilities.

A1.2 For guidance on the sanitary assemblies used in these layouts, see Health Building Note 00-10 Part C – 'Sanitary assemblies'.

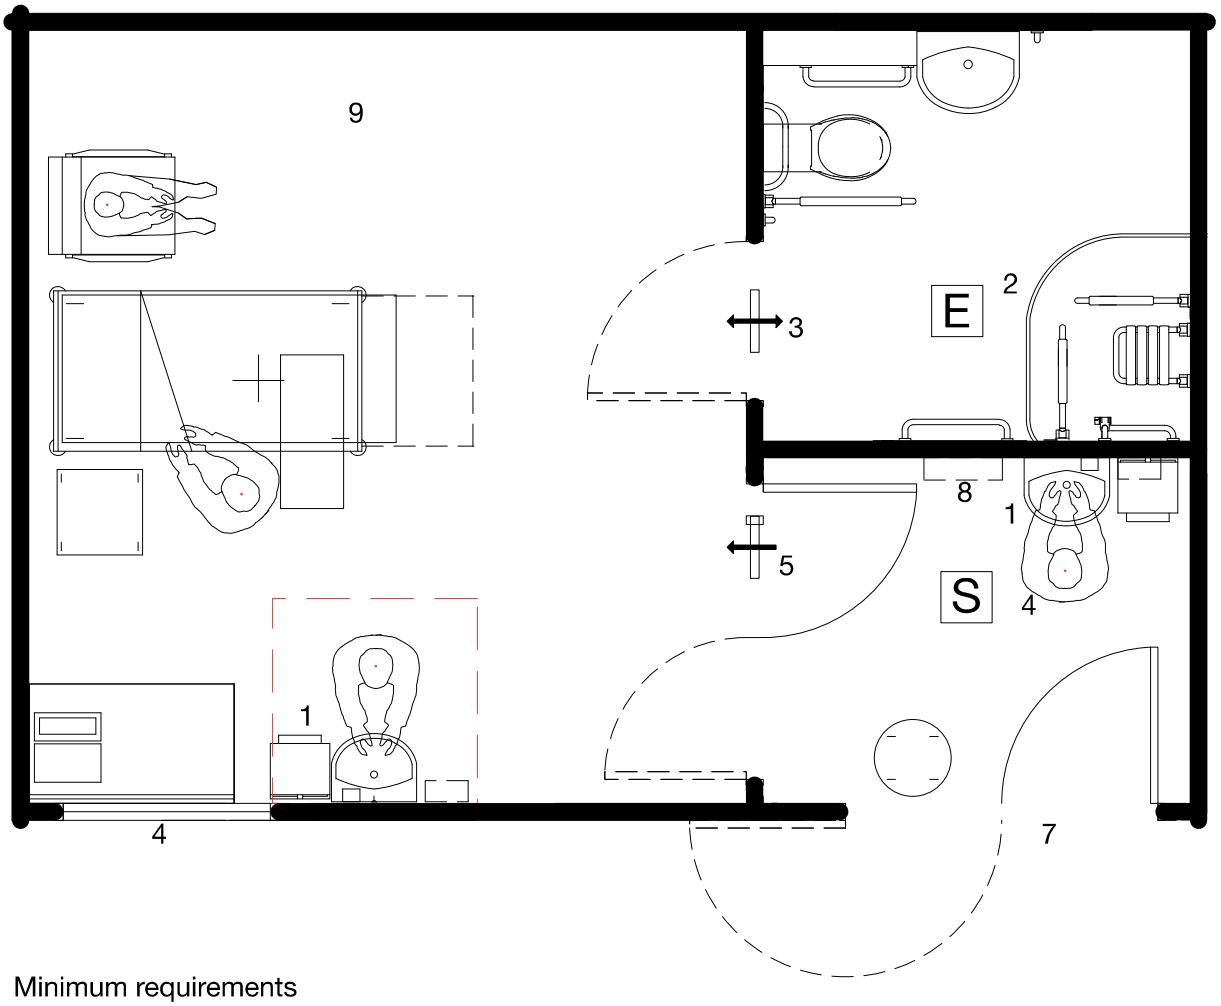
Sheet 1: New build single room with en-suite facilities



Minimum requirements

1. Clinical wash-hand basin
2. Provide suitable extract fan
3. Transfer grille to en-suite door
4. Observation window in corridor wall with integral privacy blinds to allow for staff observation and patient views out

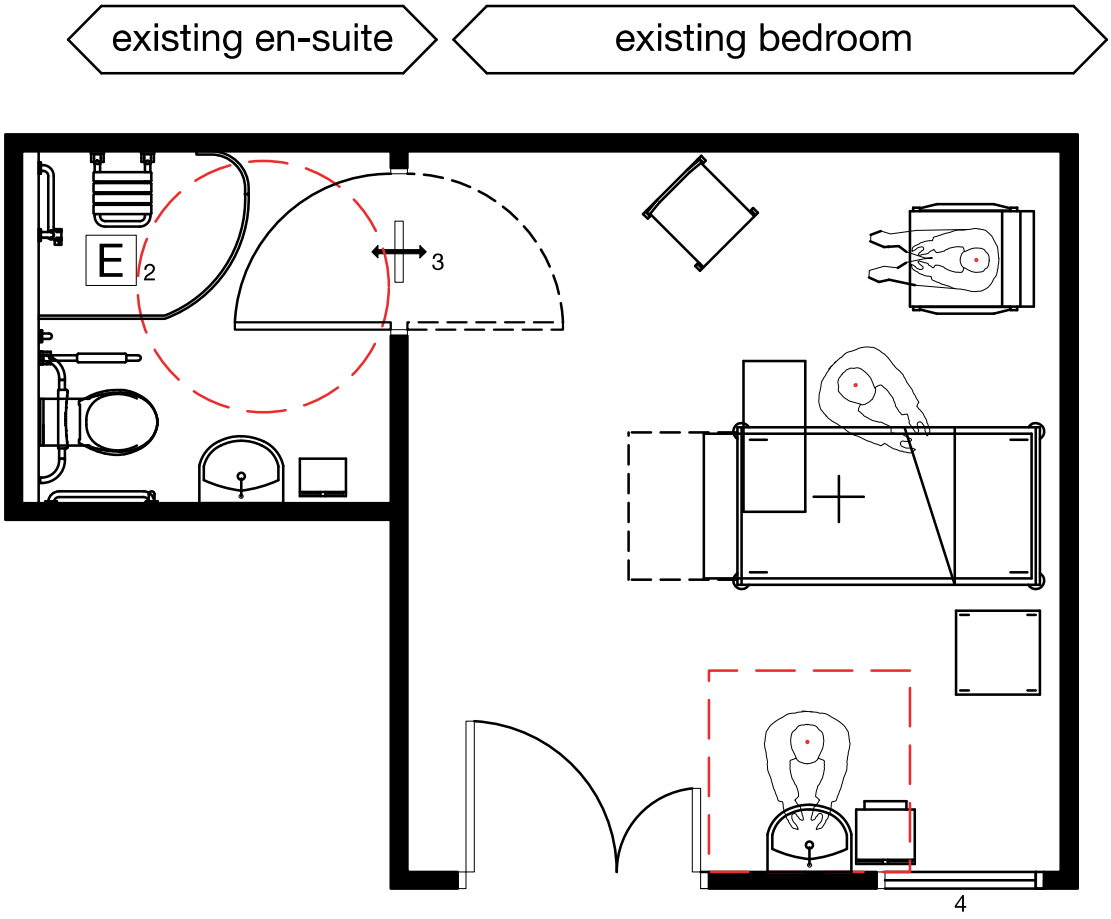
Sheet 2: New build single room with en-suite facilities and lobby



Minimum requirements

1. Clinical wash-hand basin
2. Provide suitable extract fan
3. Install transfer grille to en-suite door
4. Supply air
5. Pressure stabiliser
6. Observation window in corridor wall with integral privacy blinds to allow for staff observation and patient views out
7. Double door for personnel and bed access
8. Disposable apron dispenser
9. Ceiling to be sealed solid construction, external window to be sealed

Sheet 3: Existing single-bed room with en-suite facilities



Minimum requirements to upgrade existing facilities

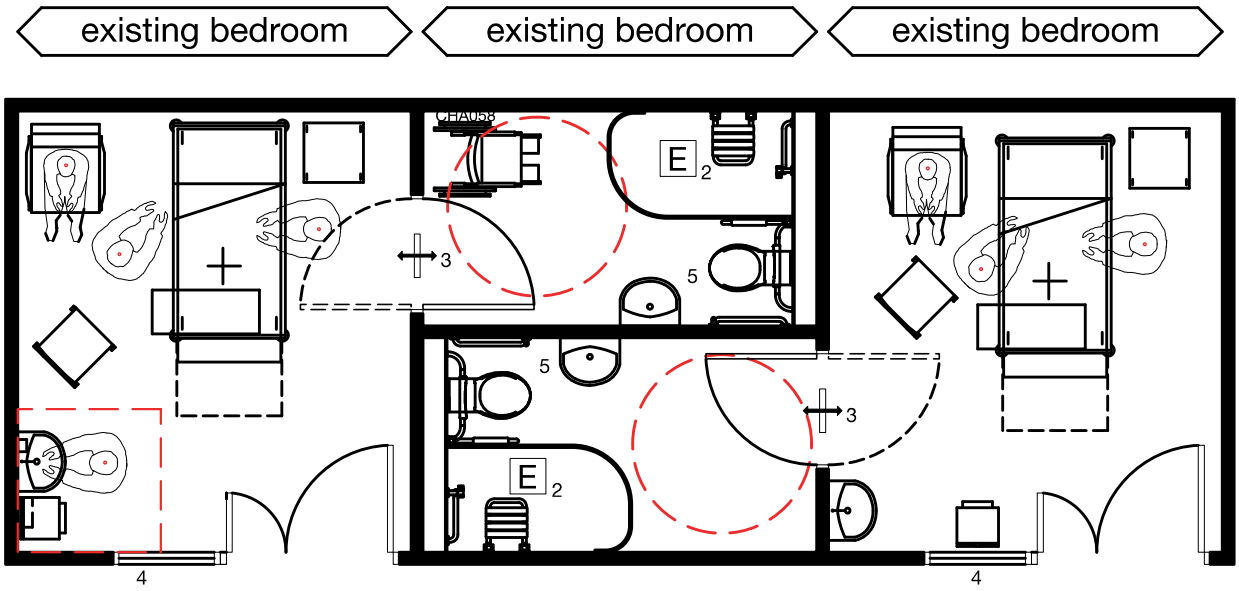
1. Add clinical wash-hand basin

2. Upgrade existing extract fan

3. Install transfer grille to en-suite door

4. Observation window in corridor wall with integral privacy blinds to allow for staff observation and patient views out

Sheet 4: Single-bed rooms without en-suite facility.
Upgrading three existing single-bed rooms to provide two single-bed rooms with en-suite facilities



Minimum requirements to upgrade existing facilities

1. Add clinical wash-hand basin

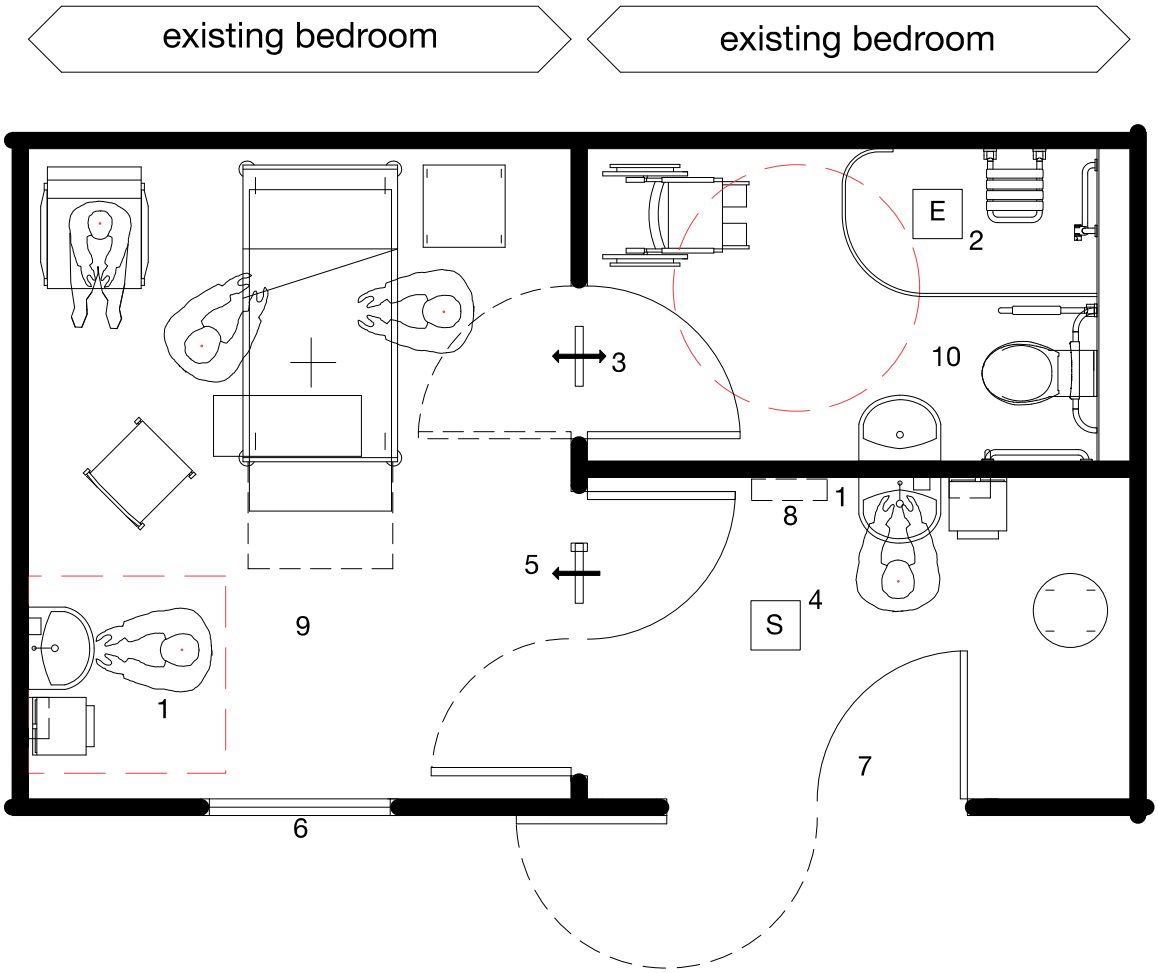
2. Provide suitable extract fan

3. Install transfer grille to en-suite door

4. Observation window in corridor wall with integral privacy blinds to allow for staff observation and patient views out

5. En-suite facility

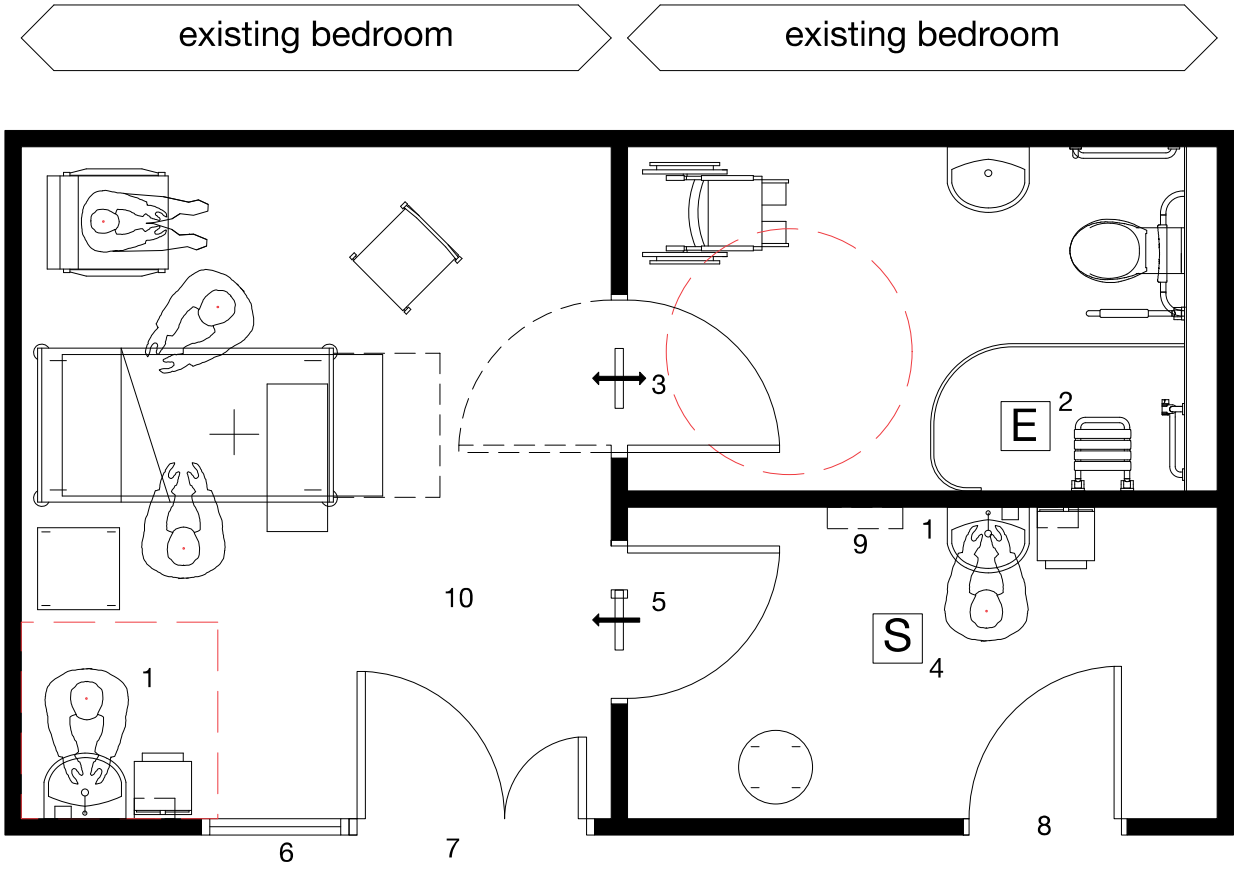
Sheet 5: Single-bed rooms without en-suite facility.
Upgrading two existing single-bed rooms to provide one single-bed room with en-suite facilities and alternative lobby



Minimum requirements to upgrade existing facilities

1. Add clinical wash-hand basin
2. Provide suitable extract fan
3. Install transfer grille to en-suite door
4. Supply air
5. Pressure stabiliser
6. Observation window in corridor wall with integral privacy blinds to allow staff observation and patients views out
7. Double door for personnel and bed access
8. Disposable apron dispenser
9. Upgrade ceiling to sealed solid construction, external windows to be sealed
10. En-suite facility

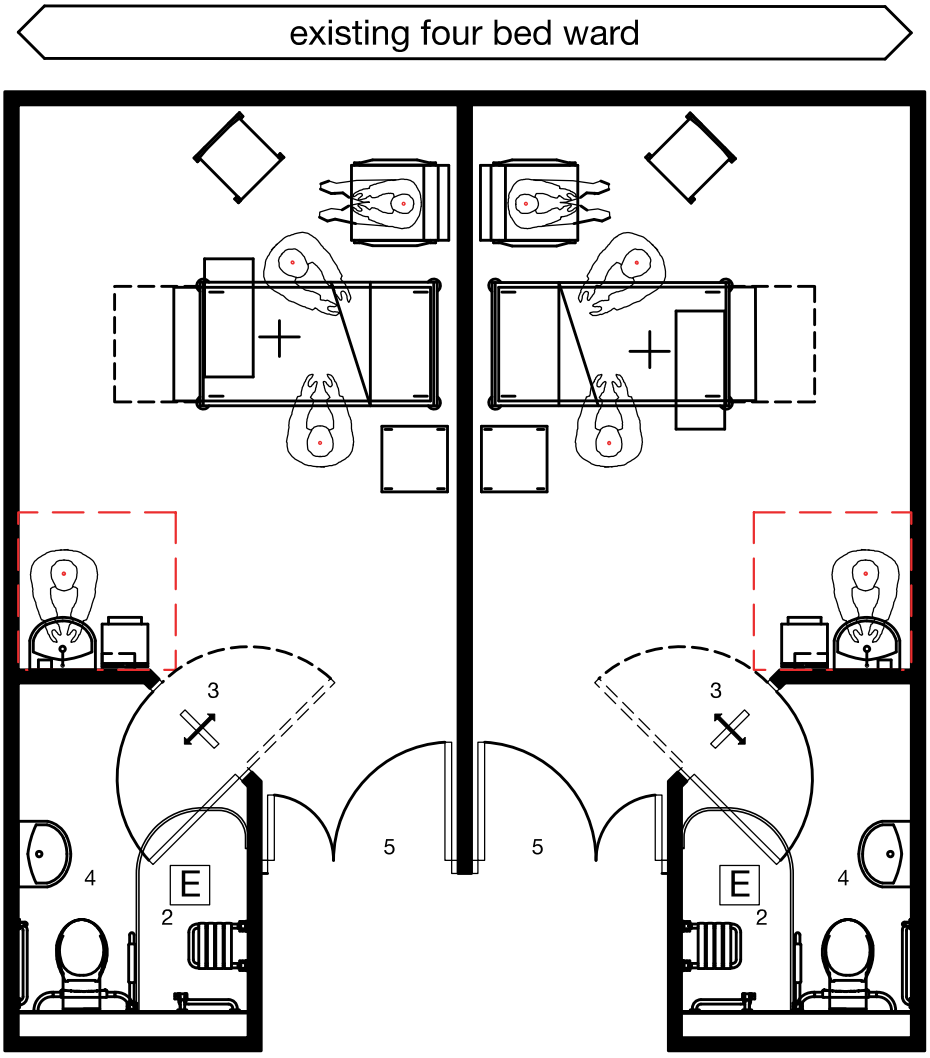
Sheet 6: Single-bed rooms without en-suite facility.
Upgrading two existing single-bed rooms to provide
one single-bed room with en-suite facilities and lobby



Minimum requirements to upgrade existing facilities

1. Add clinical wash-hand basin
2. Provide suitable extract fan
3. Install transfer grille to en-suite door
4. Supply air
5. Pressure stabiliser
6. Observation window in corridor wall with integral privacy blinds to allow for staff observation and patient views out
7. Existing door and a half for bed access only must be kept locked and have seals to minimise air transfer
8. Single door access via lobby
9. Disposable apron dispenser
10. Upgrade ceiling to sealed solid construction, external windows to be sealed

Sheet 7: Upgrading existing four-bed ward to provide two single-bed rooms with en-suite facilities



Minimum requirements

1. Clinical wash-hand basin
2. Provide suitable extract fan
3. Transfer grille to en-suite door
4. En-suite facility
5. Doors to be fully glazed, with integral privacy blinds, to allow staff observation and patients views out

Appendix 2 – Acceptance testing of isolation rooms/suites

Definitions

Isolation suite

A2.1 Includes the entry lobby, patient's room, en-suite facility and any storage or other area directly accessible from the patient's room or en-suite facility.

Isolation room envelope

A2.2 The isolation room bounded by a solid floor, solid ceiling and full-height walls that separate it from any other adjoining space or the outside.

Validation – isolation room air permeability

A2.3 Assessment of room envelope air leakage involves establishing a pressure differential across the envelope and measuring the air flow required to achieve that differential.

A2.4 Air permeability specifications are given in Approved Document L2A of the Building Regulations (2010). The standard for measuring air permeability is ATTMA's 'Technical Standard L2: Measuring air permeability of building envelopes (non-dwellings)' (see paragraph A2.XX 'Air permeability tests').

(Rationale: To ensure effective isolation, it is important that air leakage to or from adjacent areas is kept to a minimum. Construction gaps should be minimised and service penetrations sealed before the room is tested. There should be NO temporary seals other than those permitted (i.e. supply and extract ducts). The test pressures are significantly more than would be achieved under a ventilation fault condition within the isolation room. When in operation, the patient's room and en-suite are designed to be at a neutral or slightly negative pressure so the actual leakage between adjoining spaces should be insignificant.)

Validation and annual revalidation

Filtration test standards

A2.5 General and fine filter grades to BS EN 779 should be visually inspected to ensure that they are free from tears or other damage at the time of installation. They should be a good fit in their housing, with no obvious gaps that could allow air bypass.

A2.6 High efficiency particulate air (HEPA) filters, where fitted, should be certified by their manufacturer for conformity to BS EN 1822. When installed, their performance should be checked with a particle counter using the method set out in BS EN 1822.

Air permeability tests

A2.7 Air permeability tests should be carried out by an independent testing company that is a member of ATTMA. Air sealers should not test their own work. The report should be as described in ATTMA Technical Standard L2. See also CIBSE's 'Testing buildings for air leakage' (TM23, 2000).

A2.8 These tests should be carried out before initial commissioning and as necessary thereafter following works of refurbishment or when there is any doubt as to the actual performance standard of the room.

A2.9 As a minimum requirement, the air permeability should be no worse than that required by Approved Document L2A of the Building Regulations for the entire building. (This is a variable value with a minimum required air permeability of less than 10 $m^3.h^{-1}.m^{-2}$ at a reference pressure of 50 pascals.)

A2.10 Further clarification, specifications and test procedures can be obtained from BSRIA Test Standard BTS3 'Air permeability testing of isolation facilities' (forthcoming).

A2.11 Other tests may be necessary to check particular aspects of the specific installation. Where this is

necessary, reference should be made to Approved Document L2A of the Building Regulations.

System operating standard

A2.12 The room will be considered fit for purpose if, with the ventilation system operating and all doors closed, the following parameters are achieved:

- the patient's room has an air change rate of at least 10 per hour;
- the en-suite facility is at a negative pressure with respect to the patient's room;
- a failure of either the supply or extract fan will be indicated at a designated nurse station and the estates department.
- there is a positive pressure of between 8 and 12 pascals between the entry lobby and the corridor;

A2.13 For a PPVL:

- there is a positive pressure of between 8 and 12 pascals between the entry lobby and the corridor.

A2.14 For a negative pressure room:

- there is a negative pressure cascade from the corridor to the room.

A2.15 The room should be tested following initial commissioning and thereafter re-tested at least annually for conformity with this operating standard.

A2.16 These tests should include any pressure stabilisers and air pressure sensors. BSRIA Test Standard BTS2 'Test method for pressure stabilisers' (forthcoming) specifies a test procedure.

Record-keeping

A2.17 In addition to the commissioning and annual validation records, accurate and detailed monitoring records should also be kept.

Preface

About Health Technical Memoranda

Engineering Health Technical Memoranda (HTMs) give comprehensive advice and guidance on the design, installation and operation of specialised building and engineering technology used in the delivery of healthcare.

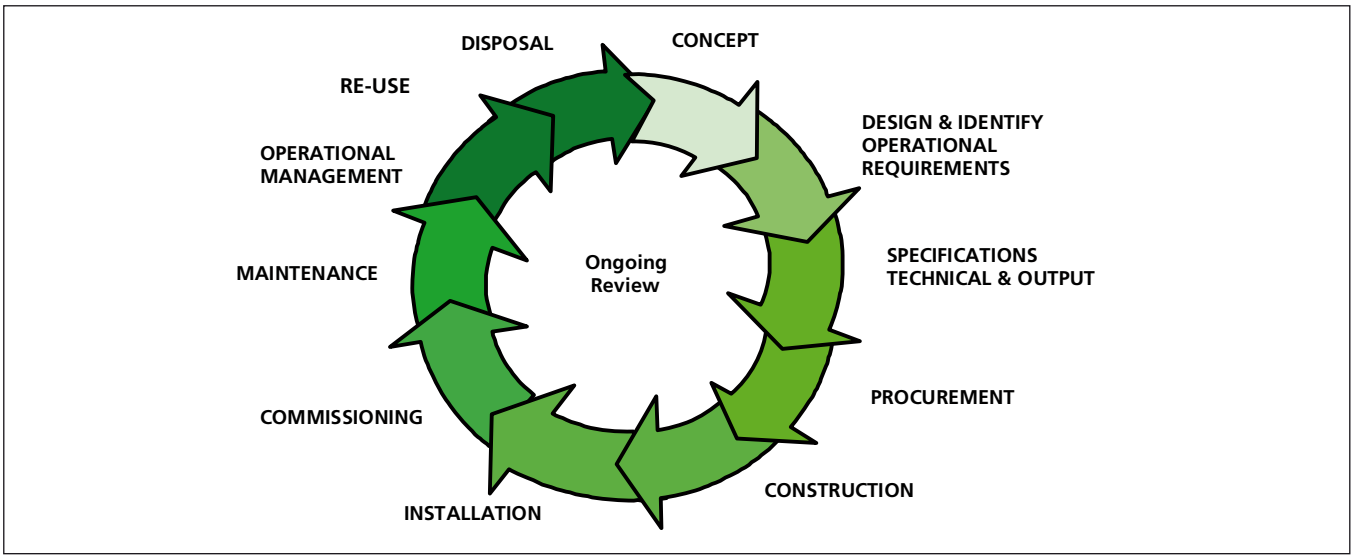
The focus of Health Technical Memorandum guidance remains on healthcare-specific elements of standards, policies and up-to-date established best practice. They are applicable to new and existing sites, and are for use at various stages during the whole building lifecycle.

main source of specific healthcare-related guidance for estates and facilities professionals.

The core suite of nine subject areas provides access to guidance which:

- is more streamlined and accessible;
- encapsulates the latest standards and best practice in healthcare engineering;
- provides a structured reference for healthcare engineering.

Figure 1 Healthcare building life-cycle



Healthcare providers have a duty of care to ensure that appropriate engineering governance arrangements are in place and are managed effectively. The Engineering Health Technical Memorandum series provides best practice engineering standards and policy to enable management of this duty of care.

It is not the intention within this suite of documents to unnecessarily repeat international or European standards, industry standards or UK Government legislation. Where appropriate, these will be referenced.

Healthcare-specific technical engineering guidance is a vital tool in the safe and efficient operation of healthcare facilities. Health Technical Memorandum guidance is the

Structure of the Health Technical Memorandum suite

The series of engineering-specific guidance contains a suite of nine core subjects:

Health Technical Memorandum 00
: Policies and principles (applicable to all Health Technical Memoranda in this series)

Health Technical Memorandum 01
: Decontamination

Health Technical Memorandum 02
: Medical gases

Health Technical Memorandum 03
Heating and ventilation systems

Health Technical Memorandum 04
Water systems

Health Technical Memorandum 05
Fire safety

Health Technical Memorandum 06
Electrical services

Health Technical Memorandum 07
Environment and sustainability

Health Technical Memorandum 08
Specialist services

Some subject areas may be further developed into topics shown as -01, -02 etc and further referenced into Parts A, B etc.

Example: Health Technical Memorandum 06-02 Part A will represent:

Electrical Services – Electrical safety guidance for low voltage systems

In a similar way Health Technical Memorandum 07-02 will simply represent:

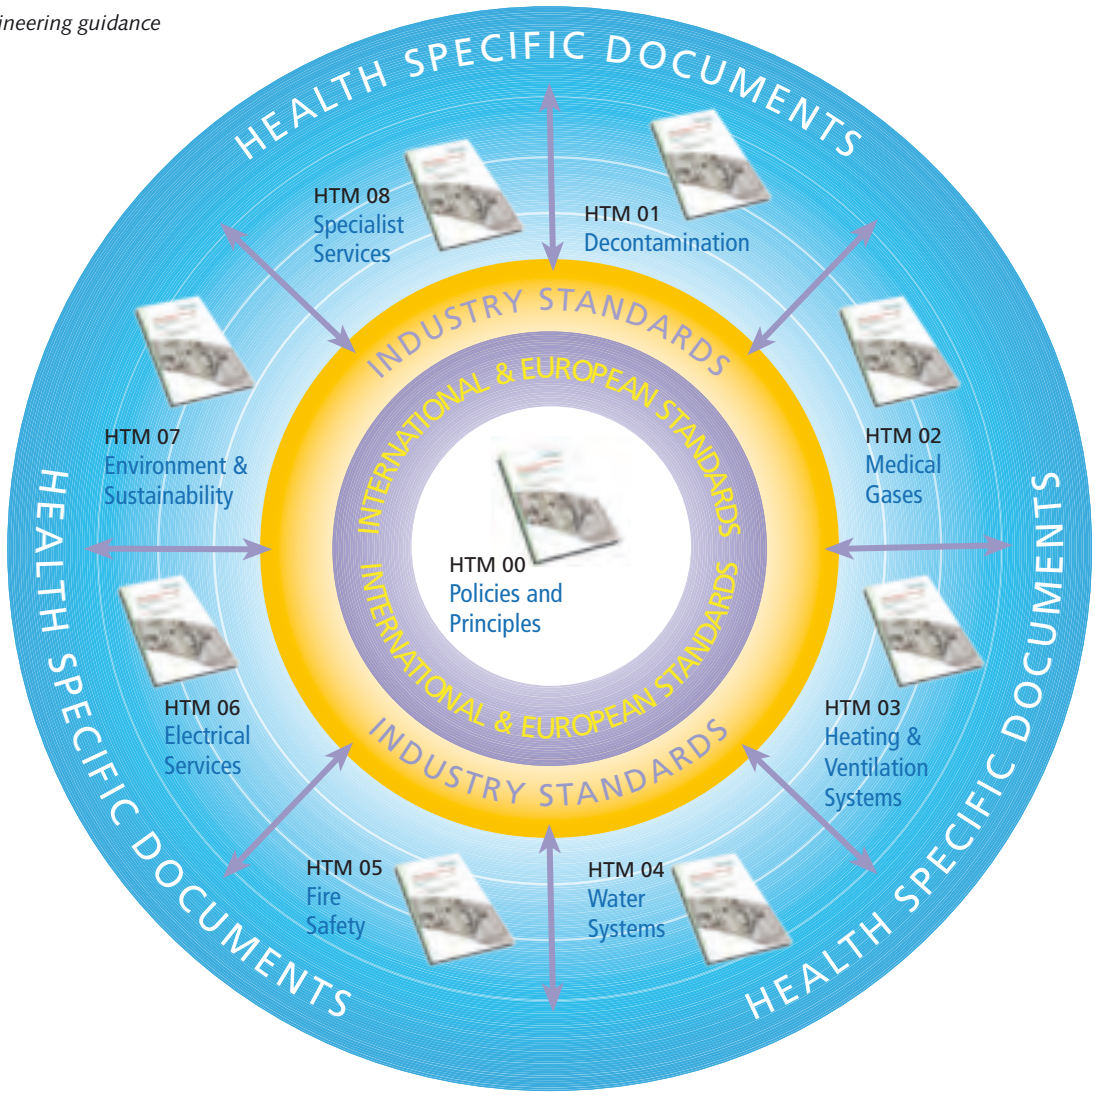
Environment and Sustainability – EnCO_2de.

All Health Technical Memoranda are supported by the initial document Health Technical Memorandum 00 which embraces the management and operational policies from previous documents and explores risk management issues.

Some variation in style and structure is reflected by the topic and approach of the different review working groups.

DH Estates and Facilities Division wishes to acknowledge the contribution made by professional bodies, engineering consultants, healthcare specialists and NHS staff who have contributed to the review.

Figure 2 Engineering guidance



Executive summary

Preamble

Health Technical Memorandum 03-01 – 'Specialised ventilation in healthcare premises' is published in two parts: Part A deals with the design and installation of ventilation systems; Part B covers operational management.

The document gives comprehensive advice and guidance on the legal requirements, design implications, maintenance and operation of specialised ventilation in all types of healthcare premises.

The guidance contained in this Health Technical Memorandum applies to new installations and major refurbishments of existing installations.

Health Technical Memorandum 03-01 supersedes all previous versions of Health Technical Memorandum 2025 – 'Ventilation in healthcare premises'.

Who should use this guidance?

This document is aimed at healthcare management, design engineers, estates managers and operations managers.

Main changes from Health Technical Memorandum 2025

This Health Technical Memorandum has been revised to reflect the current guidance on theatre suite layout and room sizes given in Health Building Note 26, Volume 1 – 'Facilities for surgical procedures', including the recommended air-change rates.

Other key issues

- It addresses the issues relating to patient comfort and the prevention and control of healthcare-associated infections. Specialised ventilation systems play a central role in these important areas.
- It looks at the methods of controlling the casual exposure of staff to anaesthetic substances.
- It outlines the design and acceptance testing of general and ultra-clean ventilation (UCV) systems.
- It sets out the minimum requirements for the design of air-handling units with regard to the control of *Legionella* and safe access for routine inspection and maintenance.

1 Introduction

Preamble

1.1 Health Technical Memorandum 03-01 – 'Specialised ventilation in healthcare premises' is published in two parts: Part A deals with the design and installation of ventilation systems; Part B covers operational management.

1.2 The document gives comprehensive advice and guidance to healthcare management, design engineers, estates managers and operations managers on the legal requirements, design implications, maintenance and operation of specialised ventilation in all types of healthcare premises.

1.3 The guidance contained in this Health Technical Memorandum applies to new installations and major refurbishments of existing installations.

1.4 Health Technical Memorandum 03-01 supersedes all previous versions of Health Technical Memorandum 2025 – 'Ventilation in healthcare premises'.

Ventilation in healthcare premises

1.5 Ventilation is used extensively in all types of healthcare premises to provide a safe and comfortable environment for patients and staff. More specialised ventilation is provided in primary patient treatment areas such as operating departments, critical care areas and isolation units.

1.6 It is also installed to ensure compliance with quality assurance of processed items in pharmacy and sterile services departments, and to protect staff from harmful organisms and toxic substances (for example in laboratories).

1.7 The sophistication of ventilation in healthcare premises is increasing. Patients and staff have a right to expect that it will be designed, installed, operated and maintained to standards that will enable it to fulfil its desired functions reliably and safely.

Reasons for ventilation

The Building Regulations require that all enclosed workspaces be ventilated by either natural or mechanical means. The following are some of the factors that determine the ventilation requirements of a workspace:

- human habitation (minimum fresh-air requirement);
- the activities of the department, that is, extraction of odours, aerosols, gases, vapours, fumes and dust – some of which may be toxic, infectious, corrosive, flammable, or otherwise hazardous (see the Control of Substances Hazardous to Health (COSHH) Regulations);
- dilution and control of airborne pathogenic material;
- thermal comfort;
- the removal of heat generated by equipment (for example catering, wash-up, sterilizing areas, electrical switchrooms, and some laboratory areas);
- the reduction of the effects of solar heat gains;
- the reduction of excessive moisture levels to prevent condensation (for example hydrotherapy pools);
- combustion requirements for fuel burning appliances;
- "make-up supply air" where local exhaust ventilation (LEV) etc is installed.

Mechanical ventilation systems are expensive in terms of capital and running costs, and planning solutions should be sought which take advantage of natural ventilation, provided the above criteria are met.

Ventilation – application examples

Requirement	Reason	Application
Statutory	Health and Safety at Work etc Act	Operating departments
	COSHH Regulations	Laboratories
	Local exhaust ventilation (LEV)	Pharmacies
		Areas containing identified biological or chemical hazards
		Areas containing oxygen-displacing gases
		Enclosed workspaces
		Workshops
Functional	Comfort	Situations where the quality of the environment for staff and patients is critical to their general performance and well-being
Clinical	Reduction of surgical site infection	Ultra-clean operating suites, conventional operating suites and treatment rooms used for all types of surgical procedures
		Obstetrics and maternity procedures
	Source and protective isolation	Isolation units for patients who present a biological, chemical or radiation hazard to others
		Isolation units for patients with a reduced immune system

Statutory requirements

Increased health risks to patients will occur if ventilation systems do not achieve and maintain the required standards. The link between surgical site infection and theatre air quality has been well established. Plants serving a conventional operating department, for instance, will be required to ensure the separation of areas within the suite by maintaining a specific direction of air flow between rooms, even when doors are opened. They will also maintain the selected operating department's environmental conditions regardless of changes in outside air conditions or activities within the space.

In addition, ultra-clean ventilation systems (which are designed to provide a zone around the patient that is effectively free of bacteria-carrying airborne particles while the operation is in progress) have been shown to significantly reduce surgical site infection in patients undergoing large joint replacement surgery. Their use for other forms of surgery may well be indicated.

Health and Safety at Work etc Act 1974

1.8 The Health and Safety at Work etc Act 1974 is the core legislation that applies to ventilation installations. As these installations are intended to prevent contamination, closely control the environment, dilute contaminants or contain hazards, their very presence indicates that potential risks to health have been identified.

COSHH

1.9 The Control of Substances Hazardous to Health (COSHH) Regulations 2002 place upon management an obligation to ensure that suitable measures are in place to protect their staff and others affected by the work activity. These methods may include both safe systems of work and the provision of a specialised ventilation system. In laboratories the requirements are often met by the provision of fume cupboards and microbiological safety cabinets.

1.10 The requirements to provide ventilation, implicit under the Health and Safety at Work etc Act 1974 and COSHH, have been made explicit by the Management of Health and Safety at Work Regulations 1999, the Workplace (Health, Safety and Welfare) Regulations 1992 and the Provision and Use of Work Equipment Regulations 1998, all issued as a result of European Directives.

1.11 Where specialised ventilation plant is provided as part of the protection measures, there is a statutory requirement that it be correctly designed, installed,

commissioned, operated and maintained. The local exhaust ventilation (LEV) section of COSHH requires that the plant be inspected and tested at least every 14 months by a competent person and that management maintain comprehensive records of its performance, repair and maintenance.

1.12 Certain substances have workplace exposure limits (WELs) set out in the Health and Safety Executive's (2005) Guidance Note EH40 – 'Workplace exposure limits: containing the list of workplace exposure limits for use with the Control of Substances Hazardous to Health Regulations 2002 (as amended)'. If specialised ventilation systems are provided in order to achieve these standards, they will be subject to the COSHH Regulations as above.

Fire regulations

1.13 The fire regulations require that, if ventilation ductwork penetrates the compartment or subcompartment of a building, it should be designed and installed so as to contain the spread of fire (see Health Technical Memorandum 05-02 – 'Guidance in support of functional provisions for healthcare premises' for further guidance).

Plants installed in units manufacturing medicinal products

1.14 Plants installed in units manufacturing medicinal products to the standards set out in the current European guide to good manufacturing practice (http://ec.europa.eu/enterprise/pharmaceuticals/eudralex/homev4.htm) may also be subject to particular legislation with regard to their operation in addition to that mentioned above.

1.15 Records should be kept of equipment design and commissioning information. The Health and Safety Executive, Medicines Inspectorate and other interested bodies have a statutory right to inspect them at any time. All records should be kept for at least five years.

Plants installed in laboratories

1.16 Specialised ventilation plants installed in laboratories dealing with research, development or testing, whether involving drugs, animals or genetically modified organisms, may be subject to particular legislation with regard to their operation in addition to that mentioned above. Further information is given by the Health & Safety Commission's Health Services Advisory Committee in:

- 'Safe working and the prevention of infection in clinical laboratories and similar facilities';
- 'The management, design and operation of microbiological containment laboratories'.

Note

If the ventilation plant has been installed to dilute or contain harmful substances (the definition of which now includes microorganisms), its failure may expose people to unacceptable levels of hazard. Proven failures can give rise to a civil suit against the designers and operators by the individuals who have been affected. This would be in addition to the actions brought as a result of breaching the statutory requirements.

Codes of practice and other guidance

1.17 All ventilation systems should conform to the principles set out in the Health and Safety Commission's Approved Code of Practice and guidance document 'Legionnaires' disease: the control of *Legionella* bacteria in water systems' (commonly known as L8), and Health Technical Memorandum 04-01 – 'The control of *Legionella*, hygiene, "safe" hot water, cold water and drinking water systems'.

1.18 The Department of Health publication 'The Health Act 2006: code of practice for the prevention and control of healthcare associated infections' is a code of practice that has been brought out to help NHS bodies to plan and implement how they can prevent and control healthcare-associated infections. It sets out criteria by which managers of NHS organisations are to ensure that patients are cared for in a clean environment and where the risk of healthcare-associated infections is kept as low as possible. Specialised ventilation systems often play a central role in achieving this objective.

This document deals with the healthcare-specific aspects of ventilation. Basic information on the design, installation, commissioning and testing of ventilation systems is contained in documents produced by the following (see the References section):

- the Chartered Institute of Building Services Engineers (CIBSE);

- International and British Standards (ISO and BS EN);
- the Building Services Research and Information Association (BSRIA);
- trade associations such as the Heating and Ventilating Contractors' Association (HVCA).

Design and validation process

1.19 It is essential, when undertaking the design of a specialised ventilation system, that the project be considered as a whole. The process model set out in Table 1 should ensure that all relevant factors are considered.

Table 1 Design and validation process model

Step	Question	Design statement and information required	Comment
1	Why is the system required?	Healthcare applications Statutory elements Non-healthcare applications	
2	What is the required system performance?	Room air-flow pattern Air-change rate Differential pressures Air quality Room air-condition Noise limits	
3	What are the constraints on the distribution system?	Ducts: Location, size, materials Dampers, access, insulation Fire considerations Room terminals	
4	What are the minimum requirements for the air-handling units (AHUs)?	Intake/discharge positions Legionella, health and safety Access, fire, electrical safety Leaks, insulation, cleanliness Filtration, drainage	
5	What control functions are required?	User control requirements Estates control functions Energy management Environmental conditions Control sequence logic Run, set-back, Off philosophy	
6	How will the system performance be validated?	Validation methodology Instruments used Design information required: • design air-flow rates • design air velocities • pressure differentials • noise levels • air quality • installation standard	
7	The system will only be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life.		
8	Handover to client[1]	Basic design information Commissioning results Validation report	

Note: 1. When new ventilation systems are accepted for use, full information as to their designed mode of operation together with recommended maintenance procedures should be provided as part of the handover procedure

Ventilation – terms in use

1.20 The terms "ventilation" and "air-conditioning" are often used interchangeably to describe the same equipment. A general explanation of the terms is given below.

Ventilation

1.21 Ventilation is a means of removing and replacing the air in a space. In its simplest form this may be achieved by opening windows and doors.

1.22 Mechanical ventilation systems provide a more controllable method. Basic systems consist of a fan and collection or distribution ductwork; more complex systems may include the ability to heat and filter the air passing through them.

1.23 Ventilating equipment may be required in order to remove smells, dilute contaminants and ensure that a supply of fresh air enters a space.

Air-conditioning

1.24 Air-conditioning is the ability to heat, cool, dehumidify and filter air. For full air-conditioning, humidification may also be provided. This means that the climate within a space being supplied by an air-conditioning plant can be maintained at a specific level regardless of changes in outside air conditions or the activities within the space. Air-conditioning equipment may be required in order to provide close control of "comfort conditions" within a space.

Specialised ventilation

1.25 In healthcare premises, certain activities will necessitate the provision of ventilation equipment with additional special features in order to achieve and maintain specific conditions. These may be needed in order to assist with the treatment of patients or maintain the health and safety of staff. The precise reason for providing specialised ventilation will depend upon the intended application. The list below indicates some of the more typical reasons:

a. to remove, contain or dilute specific contaminants and fumes;

b. to ensure the isolation of one space from another;

c. to preserve a desired air-flow path from a clean to a less clean area;

d. to provide control of the cleanliness of a space;

e. to provide close control of temperature;

f. to provide close control of humidity.

1.26 The following departments will usually have specialised ventilation requirements, either for a single room or throughout a suite of rooms:

a. operating department;

b. laser surgery unit;

c. operative imaging unit;

d. intensive treatment unit;

e. infectious diseases isolation unit;

f. wards housing immunocompromised patients;

g. manufacturing pharmacy;

h. specialised imaging, X-ray and scanning unit;

j. pathology containment laboratories;

k. mortuary and dissection suite;

m. research laboratories;

n. sterile services department;

p. emerging treatment technologies, including gene therapy and stem cell units.

1.27 Ventilation may be provided in a wide variety of ways. These will include:

- extensive purpose-built air-handling units housed in their own plantrooms;
- proprietary "packaged" systems often sited outside on a roof; or
- wall-mounted electric fans located at the point of use.

1.28 A fixed volume of air may be supplied, often expressed in terms of the resulting number of air changes per hour (ac/h), within the space being ventilated. Alternatively the volume of air supplied may be varied in order to maintain a specific pressure relationship between the area supplied and other surrounding areas. In some situations a combination of both methods may be adopted.

1.29 Modern plants should be fitted with the means to recover energy from the extract air without causing contamination of the incoming supply air.

1.30 Ultra-clean systems use the same basic plant and equipment as standard air-conditioning systems, but are in addition fitted with a terminal device that supplies the air in a unidirectional manner to the working area. Their standard of filtration will

be capable of delivering air with a very low particle count to the space that they serve.

Local exhaust ventilation

1.31 Local exhaust ventilation (LEV) is a term used to describe systems installed to prevent hazardous substances from entering the general atmosphere of the room in which they are being used. Their primary function is to protect staff from the effects of their work activity.

1.32 Simple LEV systems comprise a receptor or capture hood, extract ductwork and a fan. These are used to contain industrial types of hazard such as fumes from welding processes, gas discharges from standby battery banks and dust from woodworking machinery.

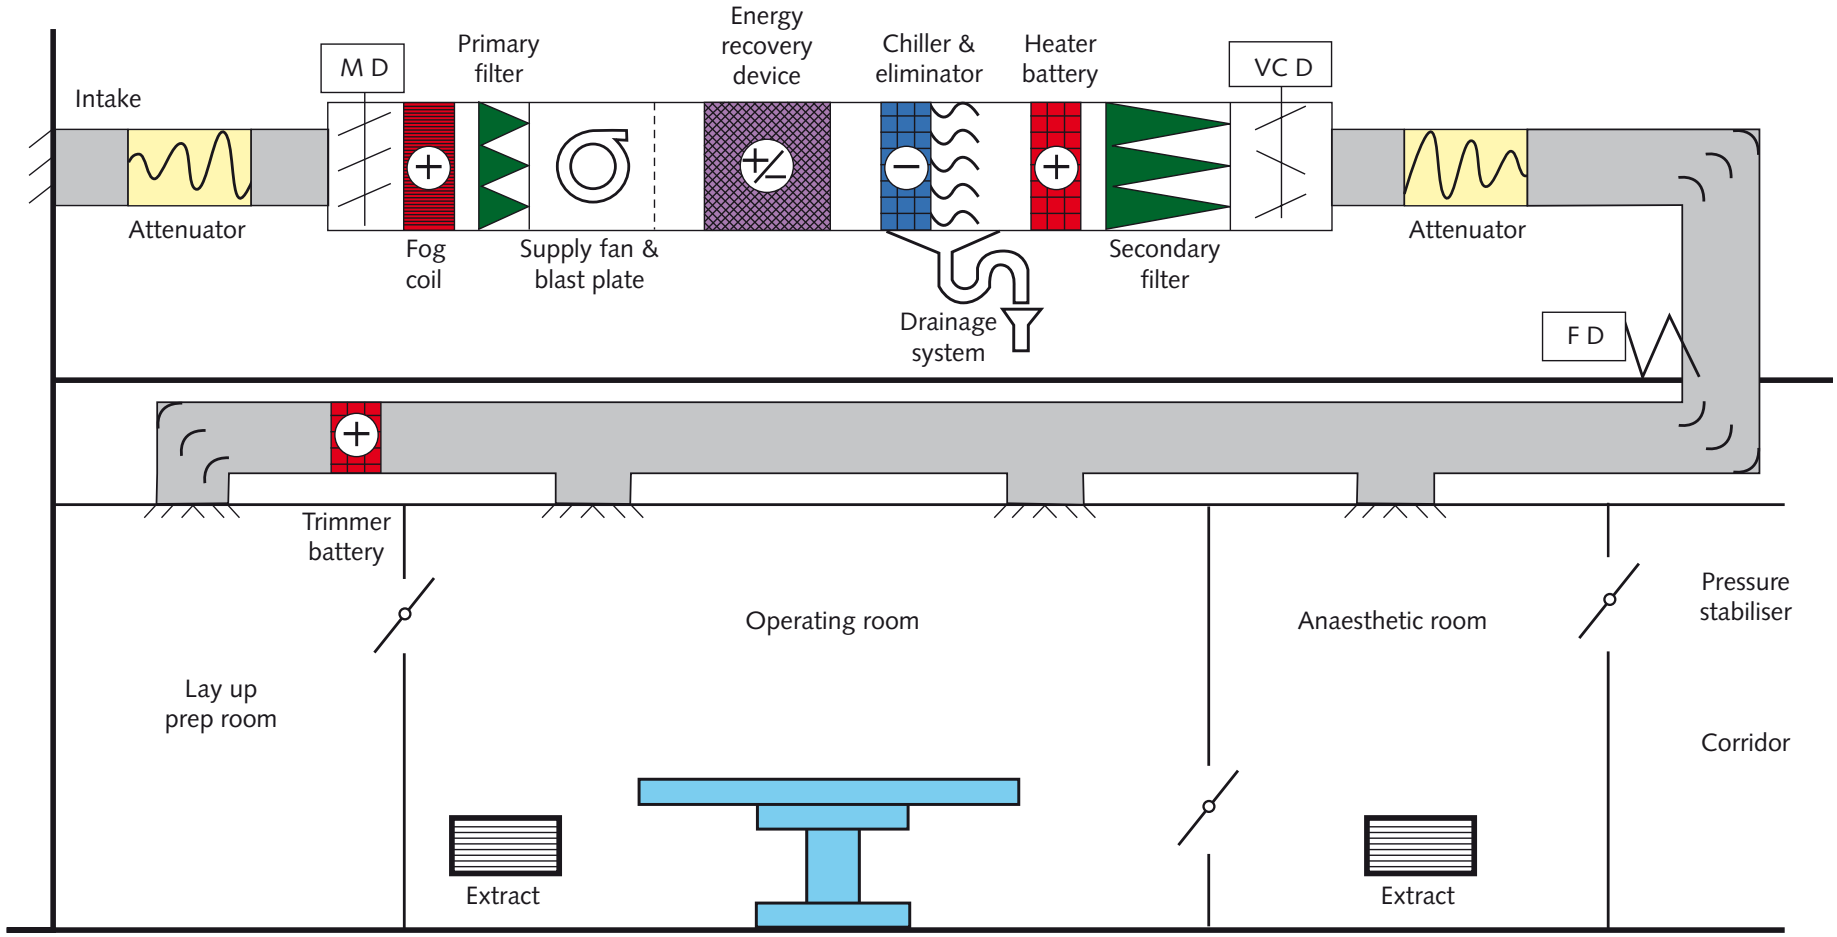
1.33 The vapour given off when large quantities of chemicals are decanted into ready-use containers and fumes from X-ray film processing units are examples of chemical hazards often controlled by LEV systems.

1.34 In laboratories, pharmaceutical manufacturing facilities and operating suites, LEV systems usually take the form of semi-open-fronted cabinets within which the hazardous substance is manipulated. These cabinets either have their own filtered air supply or are fed with air from the room. The air extracted from the cabinet is passed through a high-efficiency filter before being discharged either to the atmosphere or back into the room. Microbiological safety cabinets, laboratory fume cupboards, cytotoxic drug cabinets and fixed or mobile disinfection enclosures are all examples of this type of facility.

1.35 Mortuaries and dissection suites may have LEV systems incorporated within the dissection table, specimen bench and bone saw.

1.36 The layout of a typical plant that conforms to the regulations for healthcare applications is shown in Figure 1. For an explanation of the equipment used in the diagram, see Appendix 1.

Figure 1 Example of a typical operating theatre ventilation system



2 Provision of ventilation in healthcare buildings

2.1 Planning constraints caused by a building's shape and/or the functional relationships of specific areas will invariably result in some measure of deep planning, thus reducing the opportunity for natural ventilation.

2.2 However, ventilation costs can be minimised by ensuring that, where practicable, core areas are reserved for those rooms that need to have mechanical ventilation. Examples are:

- sanitary facilities, dirty utilities and those rooms where clinical or functional requirements have specific environmental needs; and
- those rooms where – for reasons of privacy, absence of solar gain etc – windowless accommodation is acceptable.

2.3 Other spaces appropriate to core areas are those which have only transient occupation and therefore require little or no mechanical ventilation (for example circulation and storage areas).

Natural ventilation

2.4 Natural ventilation is usually created by the effects of wind pressure. It will also occur if there is a temperature difference between the inside and the outside of a building. The "thermo-convective" effect frequently predominates when the wind speed is low, and will be enhanced if there is a difference in height between inlet and outlet openings.

2.5 Ventilation induced by wind pressures can induce high air-change rates through a building, provided air is allowed to move freely within the space from the windward to the leeward side. However, in most healthcare applications, internal subdivisions will restrict or prevent this effect.

2.6 It is almost impossible to maintain consistent flow rates and ensure that minimum ventilation rates will be achieved at all times. However, this variability is normally acceptable in such areas as office accommodation, staff areas, library/seminar rooms and dining rooms, where opening windows (of a design that facilitates natural ventilation) should be provided.

Note

If natural ventilation is "single-sided", it will usually only be effective for a three-metre depth within the space. Beyond that it will need to be supplemented by mixed-mode or forced ventilation.

2.7 Current guidance restricts the opening of windows for safety reasons; also, as many designs are top-hung, their ability to permit natural ventilation is limited. It may therefore be necessary to provide dedicated ventilation openings in the fabric of the building to allow a sufficient natural flow of air into and out of the space.

2.8 In all cases, excessive heat gain, indoor air-quality requirements or external noise may limit or preclude the use of natural ventilation.

2.9 Detailed guidance on natural ventilation can be found in CIBSE's (2005) Applications Manual AM10 – 'Natural ventilation in non-domestic buildings'.

Extract ventilation systems

2.10 Extract ventilation is required in sanitary facilities, dirty utilities and rooms where odorous but non-toxic fumes are likely; this is to ensure air movement into the space. A single fan/motor unit should be provided to meet this need. There is no healthcare requirement to provide a separate foul/dirty extract system.

2.11 WCs should have an extract rate as set out in Approved Document F of the Building Regulations. Where WCs are located in shower and bathroom spaces, the ventilation required for the WC will normally be adequate for the whole space.

Supply-only ventilation

2.12 Mechanical supply ventilation is required in areas where it is important to maintain a positive

pressure in order to prevent the ingress of less clean air (for example in units caring for immuno-compromised patients, aseptic suites in pharmacies, packing rooms in sterile services departments, operating theatres and theatre preparation rooms; air-change rates are given in Appendix 2).

Supply and extract ventilation

2.13 Mechanical supply and extract ventilation should be provided in rooms where there is a need to control room pressure in relation to adjacent spaces. Critical care areas, isolation suites and treatment areas are typical applications.

Comfort cooling

2.14 Cooling is very expensive in terms of energy costs and should be provided only where necessary to maintain a comfortable environment for staff and patient, or to ensure satisfactory operation of equipment. The imaging department in particular may require cooling to offset the equipment load.

2.15 Calculations and thermal modelling should be undertaken to ensure that, during the summertime, internal temperatures in patient areas do not exceed 28°C (dry bulb) for more than 50 hours per year.

2.16 Certain non-patient areas may also require cooling (for example laboratories and other areas that are subject to high heat gains from equipment).

2.17 Where deep planning of other continuously occupied spaces (for example offices) is unavoidable, there will also be occasions when acceptable levels of comfort can only be maintained by cooling.

2.18 Refrigeration plant should be of sufficient capacity to offset heat gains and maintain areas at a temperature that does not exceed the external design shade temperatures by more than about 3 K, taking into account the level of design risk for the application.

Air-conditioning

2.19 Owing to capital and running costs, full air-conditioning should be used only in essential areas. These include operating departments, critical care areas, manufacturing pharmacies and areas with particularly sensitive equipment.

Specialised ventilation

2.20 Owing to the nature and extent of activities carried out in healthcare buildings, there will be a need for a wide range of specialised ventilation systems. Information on systems for individual departments is given in Chapter 7.

Local exhaust ventilation

2.21 Wherever the escape of chemicals, toxic fumes, biological materials or quantities of dust into the general area would present a hazard to the occupants, LEV must be provided. This is a statutory requirement under COSHH.

Ventilation for general areas

2.22 Appendix 2 provides recommended air-change rates, temperatures and pressures for general areas requiring mechanical ventilation in healthcare buildings.

Acceptable methods

Use of natural ventilation

2.23 The airtightness of new buildings has improved to the point that infiltration through building leakage can no longer be relied upon to provide sufficient air flow. Attention must therefore be given to the provision of purpose-made ventilation openings to achieve the necessary flow rates. The air entering the openings may need to be controlled by motorised dampers linked to temperature and/or occupancy sensors in the ventilated space.

2.24 Internal partitions, fire compartment walls and closed doorways can often impede the flow path; when this happens, the process will be more dependent on single-sided ventilation. Nevertheless, even with this degree of compartmentation, acceptable ventilation may still be achieved without window openings, which would prejudice safety, security or comfort.

2.25 Some types of window (for example vertical sliding) can enhance single-sided air change by temperature difference, and these will improve the overall rate of natural ventilation in protected or sheltered areas where the effect of wind pressure is likely to be minimal.

2.26 Natural cross-flow ventilation is able to give reasonable air distribution for a distance of up to 6 metres inwards from the external facade, provided

that reasonably clear air paths are maintained. Beyond this distance – in areas where clear air paths cannot be maintained and in areas where high minimum air-change rates are specified – mechanical ventilation should be provided.

2.27 Further information can be found in Health Technical Memorandum 55 – 'Windows', BS 5925 and CIBSE's (2005) Applications Manual AM10 – 'Natural ventilation in non-domestic buildings'.

Mixed mode ventilation

2.28 Mixed mode ventilation is an assisted form of natural ventilation. Fans are fitted in purpose-made damper-controlled ventilation openings. Alternatively, a separate draw- or blow-through ventilation unit may be installed. In both cases the dampers and fans are controlled by temperature and occupancy sensors to ensure a minimum air-flow rate while taking advantage of natural ventilation effects when present.

2.29 Where natural or mixed mode ventilation is adopted with complex air paths, the designer should produce an air-flow diagram in order to ensure correct provision of air-transfer devices. CIBSE's (2000) Applications Manual AM13 – 'Mixed mode ventilation' gives guidance.

Mechanical extract ventilation

2.30 General extract systems can vary in complexity from a single wall-mounted fan to a ducted air system with dual extract fans.

2.31 Replacement air either is provided by a central supply system or enters the building through gaps in the structure or purpose-made openings. Unless special precautions are taken, the latter may result in an unacceptable level of draughts occurring in winter, and possible risk of unacceptable levels of noise transmission.

2.32 If individual systems are used, the ventilation can be operated intermittently, provided it continues to run for at least 15 minutes after the room is vacated (as with light-switch-operated fans in individual toilets).

2.33 If general exhaust systems are used, filtered and tempered replacement air should be provided via a central supply plant to adjoining lobbies or corridors, to prevent the risk of discomfort caused by the ingress of cold air. Fire compartmentation requirements must be maintained.

2.34 Information on specialised extract systems is given in Chapter 7.

Mechanical supply systems

2.35 Where mechanical supply systems are required, the fresh air should be tempered and filtered before being delivered to the space in order to avoid discomfort.

2.36 The air should be heated using a constant or variable temperature source, but generally only to the space air temperature. In most instances, the low pressure hot water (LPHW) heating system should offset any fabric loss so that set-back room temperatures can be maintained during unoccupied periods without the need for the ventilation system to operate.

Balanced ventilation

2.37 A balanced ventilation system is a combination of both a supply and an extract system of equal volume; either a single space or a whole building may be considered to be balanced.

2.38 A balanced system is necessary in instances where it is essential to maintain consistent air movement within an area (for example treatment rooms).

Cascade ventilation

2.39 In operating departments, it is normal practice to supply air to the operating room and allow it to flow through less clean areas – corridors, utility rooms etc (from where it is eventually extracted).

Recirculation systems

2.40 Air recirculation systems are normally used in HEPA-filtered clean rooms where the extract air is significantly cleaner than the outside supply and where odour levels are not significant.

2.41 Recirculation is also routinely used in the canopy section of ultra-clean operating theatre ventilation systems.

2.42 Where the designer is considering the installation of an air recirculation system, due account must be taken of:

a. minimum fresh-air-supply volume required by the Building Regulations Part F – Non-domestic Buildings;

b. prevention of contamination of supply air from vitiated air in extract systems;

c. prevention of stratification occurring within plenum chambers and mixing boxes, which may result in freezing of downstream coils;

d. ensuring sufficient velocities through control dampers (ideally 5–6 m/s) to provide suitable authority and good shut-off;

e. modulating control of mixing to provide optimum on-plant conditions;

f. use of "free cooling" by cycling the dampers to minimum fresh air when the enthalpy of the outside air is greater than that of the extract air under conditions when cooling is required.

Chilled beams

2.43 The use of chilled beams for the provision of heating, cooling and ventilation is increasingly common in healthcare premises.

2.44 Active chilled beams providing tempered, filtered air to the room can provide effective local control of environmental conditions.

2.45 Care should be taken in positioning chilled beams to ensure that cold draughts are avoided, particularly when used in the cooling mode. The control settings should ensure that the external elements of the beam are always above dew-point. Manufacturers of these devices are able to provide specific advice on the siting and design limits of their equipment.

2.46 Chilled beam units should be easily accessible for cleaning and maintenance.

Split comfort air-conditioners

2.47 Split comfort air-conditioners, room conditioners or cassette units are used increasingly where there is a small local requirement for cooling for operational purposes. They can provide an effective economic solution to cooling needs where a central refrigeration system is not practicable.

2.48 A fresh-air make-up system to the standard required by the Building Regulations Part F – Non-domestic Buildings must be provided.

2.49 Split units may be used for single applications or as multiple linked units that can independently provide either heating or cooling – all served by a single outdoor unit. These systems help to maintain a more precise temperature control across multiple rooms, with maximum energy efficiency.

2.50 Whether single or multiple systems are used, it is essential that the designer give due consideration to the source of electrical supply, location of the heat rejection unit, environmental effects to the refrigerant used and drainage provision for the cooling-coil condensate.

2.51 Recirculated room air affects indoor air quality and may increase the risk of healthcare-associated infection (HCAI). Split units should therefore not be used in critical care areas.

2.52 The units should be easily accessible for cleaning and maintenance.

Dilution ventilation and clean air-flow paths

2.53 Dilution ventilation has been used to control levels of hazardous substances in a space. This approach in itself is no longer considered acceptable. COSHH requires that known hazardous substances should be substituted for safe alternatives. If this is not possible, they should be controlled at source by using a closed system (such as an anaesthetic gas scavenging unit) or a protective enclosure (such as a fume cupboard). A good level of background ventilation will assist in diluting any casual release of the substance.

2.54 The exposure of staff to casual spillages of substances such as medical gases in anaesthetic rooms should in the first instance be dealt with by establishing a clean air-flow path. Air should be supplied at high level and extracted at low level directly behind the anaesthetic equipment position. The philosophy of establishing a clean air-flow path – from the air-supply point, to the staff, on to the patient, and out via a low-level extract – would also apply in recovery rooms and birthing rooms. A suitable air-change rate will provide background dilution ventilation as an additional safeguard. This approach ensures that "all reasonable steps are taken to prevent or control exposure (of staff) to the hazardous substance" as required by COSHH.

2.55 In operating theatres, patients will be on a closed breathing circuit in a room with a high air-change rate. Under these circumstances, the dilution effect would be considered sufficient to control any casual exposure to anaesthetic gases.

Mechanical ventilation systems

System selection

2.56 Natural ventilation is always the preferred solution for a space, provided that the quantity and quality of air required, and consistency of control to suit the requirements of the space, are achievable. If this is not the case, a mechanical ventilation system will be required.

Choice of central/local plant

2.57 Mechanical ventilation is expensive to operate – it should therefore be used only when the space being served requires ventilation. In addition, loads on air-conditioning plant are rarely constant owing to changes in solar gain, occupancy, the use of heat-generating equipment and lights. Therefore control of the supply-air temperature is critical.

2.58 If the ventilation loads throughout a department or building are in phase, or are not significant, a central plant with single zone control can be adopted. However, this is rarely the case, so the condition or quantity of supply air to different areas or zones of the building must be varied accordingly. This can be achieved by either providing individual plants to each zone or providing separate controls for each zone such as provided by a variable air volume (VAV) system. Where there is a high density of rooms with similar ventilation requirements in an area of a building or department, it is usually economical to combine them into a central system.

2.59 In large buildings, a choice between a single distribution system and multiple smaller systems may arise. Large distribution systems and their plant can have the advantage of lower operating costs, but require more space for vertical shafts. In general, very long runs of ducting should be avoided to prevent undue heat losses or gains, excessive leakage, and difficulties in balancing during commissioning. As the pressure losses in the long runs will be greater and a higher initial static pressure will be required, this will lead to a more expensive class of ductwork.

2.60 Multiple smaller distribution systems may be more expensive in capital and operating costs but they avoid long runs, large ducts and vertical shafts, and this may reduce overall building costs. They also provide a more robust service, as the failure of an individual system does not prevent the use of the rest of the building.

Zoning of the building

2.61 The efficiency and effectiveness of any ventilation or air-conditioning installation depends largely on the zoning and control of the installation. The factors to consider when determining the zoning of a ventilation system for a building or department are:

a. periods of occupancy;

b. fresh-air/ventilation requirements;

c. smoke control.

2.62 Where the ventilation system is not merely tempering the air, but also providing the heating and/or cooling requirements, the following additional factors will need to be considered:

a. internal or peripheral location;

b. orientation of windows;

c. variation in internal loads;

d. level of control required.

2.63 For single-zone plant in staff areas, local control (with a run-on-timer if required) is recommended, as the system can be turned off when the space is not in use, thus saving both thermal and electrical energy. Most supply and extract systems, conversely, are required to operate continuously while the department is occupied; thus some form of time or use control is necessary.

2.64 The control of individual plant items is covered in Chapter 4, with examples of typical control strategies in Chapter 5. For control of particular specialised ventilation and air-conditioning systems, see Chapter 7.

2.65 On rare occasions a duplicate standby air-handling plant may be justified. If installed, it must be provided with a gas-tight damper at its junction with the supply distribution duct so that no back-flow can occur. Standby plants can become sources of contamination if warm moist air is allowed to dwell within them. Their design and control system must ensure that this cannot happen.

3 Assessment of service requirement

Selection of design criteria

External design conditions

3.1 The most accurate data that is available for the summer and winter conditions at the site should be used. The Met Office can supply data for the United Kingdom (www.metoffice.gov.uk).

3.2 Healthcare ventilation systems will normally be "full fresh air".

3.3 Local adjustments, such as for height above sea level, exposure factor or other climate peculiarities, should be made as appropriate.

Internal design conditions

3.4 The design conditions selected within patient areas must strike a balance between the comfort requirements of staff and patients, who often have very different levels of clothing and activity.

3.5 Recommendations for the dry resultant temperature and humidity of individual spaces are shown on Activity DataBase A-sheets. Appendix 2 gives a summary.

Minimum fresh-air requirements

3.6 The dilution of body odours is the critical factor in determining ventilation requirements. Where natural ventilation or full fresh-air systems are used, all ventilation air will be fresh.

3.7 Where odour dilution is the overriding factor, it is recommended that 10 litres per second per person should be taken as the minimum ventilation rate.

3.8 In non-standard applications such as laboratories, aseptic suites, operating departments etc, the particular requirements for each area should be considered independently in order to determine the overriding minimum requirement for ventilation.

Limiting supply air conditions

3.9 For most applications in healthcare buildings, it is the temperature differential between the supply and room air, rather than the actual temperature of the supply air, which is the critical factor. The maximum recommended supply-to-room-air temperature differential is:

- summer cooling: –7 K
- winter heating: +10 K.

3.10 In areas that have high heat gains from equipment (for example critical care areas), the summer cooling temperature differential limit given above may result in excessive air-change rates. A differential of up to –10 K is acceptable in these circumstances, providing the supply-air diffusers are of a type that provide good mixing.

3.11 If a humidifier is fitted, it is necessary to keep supply-air humidity below 70% during winter in order to minimise the risk of condensation on cold surfaces.

Air purity

3.12 In healthcare premises, the standard of filtration will depend on the activities within the occupied spaces. With the exception of specialist areas (for example manufacturing pharmacies), aerobiological requirements are not stringent, and filtration is only required to:

a. maintain hygienic conditions for the health and welfare of occupants, or for processes such as food preparation;

b. protect finishes, fabrics and furnishings in order to reduce redecoration costs;

c. protect equipment either within the supply air system (that is, to prevent blocking of coils), or in the space itself to prevent dust build-up.

3.13 Given that almost all viable particles originate from the occupants of a space and not from the incoming air, dilution is the more important factor aerobiologically. Therefore, for general areas a G4 filter is suitable. More critical areas will require an F7 filter. High-efficiency particulate air (HEPA)

filters are required only in ultra-clean systems (information on filter grades is given in Chapter 4).

Humidity control requirements

3.14 Providing humidification is expensive in terms of plant, running costs and maintenance, and therefore its use should be restricted to where it is necessary for physiological or operational reasons.

3.15 Humidification was originally required for some healthcare applications (for example operating theatres) in order to control the risk associated with the use of flammable anaesthetic gases. The use of such gases has now ceased. Humidification is therefore no longer required unless there is a very specific application requirement.

Noise levels

3.16 Noise will be generated by fans, ductwork fittings, dampers and grilles. The specified maximum noise level will depend on the activities within the occupied spaces.

3.17 Attention must be given to the reduction of tonal components. High tonal components from air diffusers etc can seriously disturb concentration over longer periods even when the overall noise level is low. Broadband noise causes less annoyance.

3.18 Attenuation should be incorporated into the ductwork system or plant arrangement as necessary to reduce noise from fans and plant items in order to achieve acceptable limits within rooms at the design air flows.

3.19 The designer must also consider noise escaping to the external environment, and this must not be unacceptable to occupants of adjacent areas or buildings.

3.20 The overall noise levels should not exceed the values given in Health Technical Memorandum 08-01 – 'Acoustics'.

3.21 Plant noise is subject to the Control of Noise at Work Regulations 2005 and should not exceed 80 dB(A) within a plantroom. It should be reduced to lower levels where the plant is near to departments sensitive to noise.

Calculation of building loads

Air infiltration

3.22 CIBSE's (2006) Guide A – 'Environmental design' provides information and formulae for the calculation of air infiltration. Pressure testing enables the true infiltration rate to be established. In all cases the requirements of the appropriate section of the Building Regulations Part L2 must be met.

Summertime temperatures

3.23 The calculation method for determining the summertime temperature is described in CIBSE's Guide A. It is very important to select the time of day and time of year of peak loadings for the calculations. These will be dependent on the building orientation and proportion of solar to total heat gain. In establishing design values, the design risk – having regard to the function and occupancy of the building – should be considered.

3.24 Calculations and thermal modelling should be undertaken to see whether, during the summertime, internal temperatures in patient areas will exceed 28ºC dry bulb for more than 50 hours per year. It can generally be assumed that for a naturally ventilated building, the internal temperature will be approximately 3 K above the external shade temperature. For a building with simple mechanical ventilation, the internal temperature can never be less than the external shade temperature and will invariably be higher. The relationship between preferred indoor temperatures and mean outside temperature is discussed in CIBSE's Guide A.

3.25 Where calculations indicate that internal temperatures will exceed the selected design for a period that exceeds the building design risk, methods of reducing temperature rise should be implemented. Options include:

- reducing solar and casual gains;
- the use of chilled beams or ceilings;
- increasing ventilation rates; or
- providing mechanical cooling.

3.26 In some situations it may be possible to alter the thermal mass of the structure to "move" the peak temperature event time so that it occurs outside of the occupancy period.

Peak heating load

3.27 Peak heating local calculations are necessary on all mechanical supply systems to establish the size of heater-batteries and subsequently the central plant.

3.28 Where ventilation systems provide tempered air to spaces that have supplementary LPHW to offset the building fabric losses, the plant's heating load should be based on the design values of the external winter temperature and internal air temperature, and the calculated total air volume (including a suitable allowance for leakage).

3.29 Where the ventilation system is the only means of heating a space, an increase in load equivalent to the calculated fabric heat losses from the space should be added to the ventilation load. A check of supply temperature difference should be made. If it exceeds 10 K, the ventilation supply volume should be increased to suit.

Condensation risk

3.30 A check should be made to ensure that the selected air condition will not lead to surface condensation on low-temperature elements of the ventilated space.

3.31 Where there are local sources of moisture that would require excessive levels of ventilation to avoid condensation, the designer should consider the capture and removal of moisture at the source of the evaporation via an exhaust hood or similar device.

3.32 In intermittently heated buildings, it is necessary to consider the condensation risk at night set-back conditions as well as during normal operation. Calculation methods for this assessment are given in CIBSE's Guide A.

Peak cooling load

3.33 In addition to the base data of air-flow rates and temperatures, when calculating cooling loads, the designer must take into account:

a. solar cooling loads;

b. surface conduction cooling loads;

c. internal gain cooling loads;

d. cooling loads due to high-level humidity control;

e. method of control of internal conditions;

f. fluctuations in internal temperatures.

3.34 When the peak internal loads have been assessed and a suitable allowance made for non-coincidence, the supply temperature can be calculated.

3.35 Once the lowest required supply temperature of the air-handling unit (AHU) has been established, and an allowance made for temperature rise through the fan and ductwork (usually 1 K for low-pressure systems), the off-plant enthalpy can be established from a psychrometric chart or table.

3.36 The cooling loads for all plants on the chilled water system should be calculated at each of the individual peak times in order to accurately establish the required (diversified) capacity of the chiller.

Annual energy consumption

3.37 Annual energy consumptions of heating-only ventilation systems are simple to calculate, based on supply-to-external air temperature rise, and frequency of occurrence of external temperature data (see CIBSE's Guide A).

3.38 Minimum air volumes are usually fixed by the room loads or fresh-air requirements; however, the designer may increase air flow to some rooms or zones in order to balance loads (as detailed in paragraphs 3.42–3.71).

3.39 The method of zoning and control can significantly influence energy consumption.

3.40 The concept of load and plant operation charts is outlined in CIBSE's Guide A. The method requires the designer to establish the minimum and maximum loads on all zones across the range of external temperatures between winter and summer design conditions. Once the load chart is complete, the plant chart converts the loads to supply temperatures, which are then superimposed on external air temperatures.

3.41 When all temperatures for all zones are plotted on the plant operation chart, set-points and resetting schedules can be established. From this information, the outputs of individual heaters, coolers and humidifiers can be established at any given external temperature. When those loads are computed against annual frequency of occurrence of external temperatures (as given in CIBSE's Guide A), the annual energy consumption of individual elements, and thus the air-conditioning system, can be established.

Calculation of plant requirements

Air-supply volumes

3.42 The minimum air supply volume for a room is determined by the greater of the following three criteria:

a. the minimum fresh-air requirement;

b. the minimum supply volume for the room load as determined by the maximum heating or cooling supply temperature differential;

c. the desired air-change rate.

Plant sizing

3.43 Once the design air flow has been established, the cross-sectional area of the AHU can be calculated based on a maximum coil face velocity of 2.0 m/s.

3.44 In order to establish the length of the AHU, it will be necessary to refer to manufacturers' literature, ensuring all necessary access panels and components are included as detailed in Chapter 4.

3.45 The fan duty should be calculated by adding the resistances of all elements that contribute to the pressure drop of the index circuit.

3.46 The main elements that must be considered are:

a. inlet or discharge louvres;

b. plant entry and discharge;

c. attenuators;

d. components within the AHU;

e. duct-mounted heaters and filters (including a dust allowance);

f. ductwork distribution;

g. ductwork fittings including: fire dampers, volume control dampers, bends and sets, tees, changes of section;

h. air terminal device;

j. discharge velocity.

3.47 Where packaged AHUs are installed, the fan pressure drop is usually quoted as external plant resistance, and thus the designer does not need to calculate the resistances of individual plant items. The designer should, however, ensure that an allowance has been made for "dirty filter" conditions, and confirm whether the fan pressure quoted is fan total or static pressure.

3.48 Resistances of ductwork and fittings may be obtained from CIBSE's Guide A; however, the designer should exercise some care when using tabulated pressure loss information for fittings that are relatively close together.

3.49 Upon completion of the resistance calculation exercise, the designer should make allowances for calculation and construction tolerances as indicated in Table 2.

Table 2 Typical fan volume and pressure margins

Criteria	Low-pressure systems	Medium/high-pressure systems
Volume flow rate margin for leaking and balancing requirements	+5%	+5%
Total pressure loss margin: a. for increase in volume flow rate (above)	+5%	+5%
b. for uncertainties in calculation	+5%	+10%
Combined total pressure loss margin	+10%	+15%

Plantroom size and location

3.50 The ventilation plant and associated equipment should be positioned to give maximum reduction of noise and vibration transmitted to sensitive departments; and at the same time, achieve an economic solution for the distribution of services.

3.51 It is not recommended that noise and vibration generating plant be housed either directly above or below sensitive areas (for example operating or anaesthetic rooms) unless there is no alternative, in which case additional care and attention must be given to the control measures.

3.52 The plant must also be located so that it is remote from possible sources of contamination, heat gains and adverse weather conditions. The design should ensure that wind speed and direction have a minimal effect on plant throughput.

3.53 Safe access to and around plant is essential to facilitate inspection, routine maintenance, repair and plant replacement.

Provision of primary services

3.54 Where more than one air-handling plant requires cooling, remote central cooling plants with piped chilled water are preferred. In the case of a single

plant, a multi-stage direct expansion cooling coil with refrigerant piped from an adjacent compressor/condensing plant could be considered. If this option is selected, a refrigerant gas detector mounted in the base of the duct and an alarm system audible to the end-user will also need to be provided (as dictated by the COSHH Regulations).

3.55 Clean, dry steam is preferred for humidification, provided that the boiler water treatment does not render the steam unusable for direct humidification.

3.56 If a suitable supply of steam cannot be obtained from the steam main, a steam generator should be provided locally, or a self-generating humidifier installed. The location of a local steam generator is critical if condensate is to drain back into it.

Inlet and discharge sizing and location

3.57 Air intakes and discharge points should preferably be located at high level, to minimise the risks of noise nuisance to surrounding buildings, contamination and vandalism.

3.58 Intakes and discharges should be designed and located so that wind speed and direction have a minimal effect on the plant throughput.

3.59 Helicopter landing pads in the vicinity of ventilation intakes and discharges can result in large short-term pressure changes. This can cause pressure surges in supply systems and reverse air flows in extracts. Exhaust fumes from the helicopter may also be drawn into intakes.

3.60 Intake points should be situated away from cooling towers, boiler flues, vents from oil storage tanks, fume cupboards and other discharges of contaminated air, vapours and gases, and places where vehicle exhaust gases may be drawn in.

3.61 Where intakes have necessarily to be sited at or near ground level, the area around them should be paved or concreted to prevent soil or vegetation being drawn in. They should also be caged or located within a compound to prevent rubbish being left in the vicinity. The likely proximity of vehicle exhausts should be taken into account when determining the protected area around the intake.

3.62 The discharge from a general extract system must be located so that vitiated air cannot be drawn back into the supply-air intake or any other fresh-air inlet. Ideally, the extract discharge will be located on a different face of the building from the supply intake(s). In any event, there must be a minimum separation of 4 m between them, with the discharge mounted at a higher level than the intake.

3.63 Discharges from LEV systems should preferably be vertical and usually not less than 3 m above roof level. They should not be fitted with a cowl that could cause the discharge to be deflected downwards.

3.64 Each intake and discharge point should be fitted with corrosion-resistant weatherproof louvres or cowls to protect the system from driving rain (BS EN 13030, Class B).

3.65 It is recommended that louvres be sized based on a maximum face velocity of 2 m/s in order to prevent excessive noise generation and pressure loss.

3.66 The inside of the louvres should be fitted with a mesh of not less than 6 mm and not more than 12 mm to prevent leaves being drawn in and infestation by vermin.

3.67 The duct behind a louvre should be self-draining. If this is not practicable, it should be tanked and provided with a drainage system.

3.68 Cleaning access must be provided either from the outside via hinged louvres or by access doors in the plenum behind the louvre. Where a common plenum is provided, cleaning access should be via a walk-in door.

Heat-rejection devices

3.69 The design conditions given in Chapter 2 make no allowance for the elevated temperatures that can occur on the roof of buildings. Refrigeration condensers and cooling towers should, if practicable, be shaded from direct solar radiation, or the design should be adjusted to take account of the gain.

3.70 Air-cooled condensers should be the first choice for heat rejection from any refrigeration plant.

3.71 Evaporative cooling systems should not be used in healthcare premises unless limitations of space mean that they are the only way that the cooling load can be met. If they are used, guidance on preventing and controlling legionellae must be closely followed (see Health Technical Memorandum 04-01 – 'The control of *Legionella*, hygiene, "safe" hot water, cold water and drinking water systems'; and the Health and Safety Commission's Approved Code of Practice and guidance document 'Legionnaires' disease: the control of *Legionella* bacteria in water systems' (commonly known as L8)).

4 Air-handling unit design and specification guidance

General requirements

Location and access

4.1 AHUs should be located in an accessible area secured from unauthorised entry. Siting units in ceiling voids above occupied spaces is not appropriate.

4.2 Units located on roofs should have a safe means of access together with suitable precautions to prevent personnel or equipment falling or being blown off during maintenance activities.

4.3 Units located at ground level should be secured within a compound to prevent unauthorised access. Measures should be taken to exclude vehicles from the vicinity to ensure that exhaust fumes will not be drawn into intakes.

4.4 Units may have a working life of 25 to 30 years. It can be anticipated that over this period there will be a need to access every element within the unit for deep cleaning. It is also quite possible that the main fan and individual heater and chiller batteries will need replacement. Suitably positioned service connection joints and adequate spacing should permit these items to be withdrawn without the need to dismantle other installed plant or equipment. Batteries that are significantly wider than 1 m should be split to permit withdrawal from both sides.

4.5 It is essential that AHUs are positioned so that all parts are easily and safely accessible for routine inspection and service. If a unit is located against a wall or backs onto another unit, access to all parts must be available from the front. Units greater than 1 m wide should preferably have access from both sides or have access doors large enough to permit the full and safe entry of maintenance personnel.

4.6 The area around the unit should be tanked to prevent water penetration to adjacent areas, and should be adequately drained.

4.7 Fire precautions should be incorporated in accordance with Firecode (the Health Technical Memorandum 05 series). See also Chapter 3.

4.8 Combustion equipment must not be located in a fire compartment that houses air-handling equipment.

Technical requirements

4.9 The basic technical requirements of the whole of the ventilation system should meet the relevant clauses of Model Engineering Specification C04 – 'Mechanical ventilation and air-conditioning systems'. This document contains a menu of clauses that cover a wide range of applications, so it is important to select only those that are relevant to the specific application.

Note

At the time of writing, Model Engineering Specification C04 was due for revision in order to bring it into line with the revised standards set out in this Health Technical Memorandum. Where conflicts in specification arise, the Health Technical Memorandum takes precedence.

4.10 It is essential that the main plant/ductwork is located far enough from the floor to permit the correct installation of drainage systems for cooling coils, humidifiers and heat-recovery systems. Easy access for maintenance of drainage systems and their associated pipework must be provided.

4.11 Organic materials or substances that can support the growth of microorganisms must not be used in the construction of the plant or its distribution system. The Water Regulations Advisory Scheme's (WRAS) (2005) 'Water Fittings and Materials Directory' lists suitable materials for sealants and gaskets.

4.12 The plant and its distribution system must not contain any material or substance that could cause or support combustion.

4.13 Plants should have a high standard of airtightness. The double-skin method of construction with insulation sandwiched between two metal faces is recommended. The panels may be available in a variety of colours at no additional cost. This can aid identification by colour-coding of units in a plantroom (for example green for general ventilation; blue for theatres; red for laboratories and isolation facilities; grey for extract etc).

4.14 The inside of the plant should be as smooth as possible. Channels, rolled angles or formed sections that could trap or hold moisture should be kept to a minimum. If stiffeners are required, they should be fitted externally. If internal bracing has to be fitted, it must be of a design that will not trap or hold moisture.

4.15 Air flow across air treatment components such as filters, heat exchangers and humidifiers will be influenced by the pattern of the approaching air stream. If unsatisfactory conditions are created, the performance of the component will be reduced.

4.16 Access to items that require routine service such as filters, fog coils and chiller batteries should be via hinged doors. The doors should be large enough (for example 500 mm minimum) to allow easy access. Items requiring infrequent access, such as attenuators, may be via bolted-on, lift-off panels. All doors and panels should be close-fitting and without leaks.

4.17 Care should be taken during installation to ensure that electrical and mechanical services are not installed in positions that will reduce or impede access.

4.18 It can be difficult to turn off AHUs in order to inspect filters and drainage trays. Viewing ports and internal illumination will therefore facilitate routine patrol inspection of such items. Viewing ports should be at a convenient height. In double-stacked units, placing the viewing ports at the bottom of the access doors of the upper unit will remove the need to use temporary ladders or steps when carrying out patrol inspections.

4.19 Internal illumination should be provided by fittings to at least IP55 rating. Fittings should be positioned so that they provide both illumination for inspection and task lighting. All lights in a unit should be operated by a single switch.

4.20 Access to AHUs and items in the distribution system such as filters or heater/chiller batteries should be via fixed ladders and platforms or pulpit-style movable steps. The installation of distribution ductwork and other electrical or mechanical services should provide sufficient clearance to allow the pulpit steps to be easily wheeled into position.

AHU drainage system

4.21 All items of plant that could produce moisture must be provided with a drainage system. The system will comprise a drainage tray, glass trap, air break and associated drainage pipework.

4.22 The drainage tray should be constructed of a corrosion-resistant material – stainless steel is preferred – and be so arranged that it will completely drain. To prevent "pooling", it is essential that the drain connection should not have an up-stand and that a slope of approximately 1 in 20 in all directions should be incorporated to the drain outlet position. The tray must be completely accessible or, for smaller units, easily removable for inspection and cleaning.

Removable drainage tray

4.23 Each drainage tray should be provided with its own drain trap. The drain trap should be of the clear (borosilicate) glass type. This permits the colour of the water seal to be observed, thus giving an early indication of corrosion, biological activity or contamination within the duct. The trap should have a means for filling and incorporate couplings to facilitate removal for cleaning. It should be located in an easily visible position where it will not be subject to casual knocks. The pipework

connecting it to the drainage tray should have a continuous fall of not less than 1 in 20.

4.24 Traps fitted to plant located outside or in unheated plantrooms may need to be trace-heated in winter. The trace-heating must not raise the temperature of water in the trap above 5ºC.

4.25 Water from each trap must discharge via a clear air gap of at least 15 mm above the unrestricted spill-over level of either an open tundish connected to a foul drainage stack by way of a second trap, or a floor gully (or channel). A support should be provided to ensure that the air gap cannot be reduced. More than one drain trap may discharge into the tundish providing each has its own air break.

4.26 Drainage pipework may be thermoplastic, copper or stainless steel. Glass should not be used. The pipework should be a minimum diameter of 22 mm and have a fall of at least 1 in 60 in the direction of flow. It should be well supported and located so as not to inhibit access to the AHU.

Layout of AHU

4.27 The AHU should be arranged so that most items are under positive pressure. Any item of plant requiring a drain should be on the positive pressure side of the fan. A recommended layout is given in Figure 1.

4.28 A separate extract unit will generally be required for the area served by each supply unit.

4.29 An energy recovery system will normally be fitted between the supply and extract units.

Provision of dampers

4.30 Fire- or smoke-actuated dampers should be provided at the locations required by Health Technical Memorandum 05-02 – 'Guidance in support of functional provisions for healthcare premises' (see also paragraph 5(c) in Appendix 1 and paragraph 6.21).

4.31 Motorised low-leakage shut-off dampers should be located immediately behind the intake and discharge of each supply and extract system respectively. They should be of the opposed-blade type, opening through a full 90 degrees, and must close automatically in the event of power failure or plant shut-down to prevent any reversal of the system air flow.

4.32 The quality of motorised dampers is critical. They should:

- be rigid;
- have square connections fitted with end and edge seals of a flexible material; and
- have minimal play in linkages.

The leakage on shut-off should be less than 2%.

4.33 A manually operated isolating damper should be installed between the main AHU and its distribution system to enable the unit to be isolated when cleaning is in progress.

4.34 Some systems will require the fitting of a main volume control damper so that the design air-flow rate can be set at commissioning. The damper should be lockable in any position. If it will also be used for plant isolation, it should be capable of being reset to give the design air flow without the need for remeasurement.

4.35 Internal plant-isolating dampers are not required. Neither is the provision of fittings for shut-off plates between items within a unit.

Vibration

4.36 Vibration from a remote plantroom can be transmitted by the structure of the building, may be regenerated and may sometimes be magnified many times. Units should be selected to have the minimum vibration generation and to be installed on suitable anti-vibration mounts. Pipe and ductwork should incorporate anti-vibration couplings, preferably in two planes at right angles, as close to the vibration source as possible. Consideration should be given to the use of anti-vibration pipe hangers and supports.

Sequence of components

4.37 The following arrangement of plant components is typical, although in many instances not all elements will be required:

a. fresh-air intake;

b. motorised isolation/smoke damper;

c. frost/fog coil;

d. prefilter;

e. energy-recovery device;

f. attenuator (these may be located in the intake and discharge duct if they are of a suitable type – see also paragraph 4.166);

g. fan;

h. blast plate;

j. attenuator (see (f));

k. chiller battery;

m. eliminator;

n. heater-battery;

p. humidifier;

q. final filter;

r. manual isolation/volume control damper.

4.38 There may be instances where this arrangement is not appropriate, and the plant arrangement should be planned accordingly.

Fans

General requirements

4.39 The fan should be selected for efficiency and minimum noise level, but the overriding factor should be the selection of a fan characteristic such that the air quantity is not greatly affected by system pressure changes due to filters becoming dirty or due to external wind effects.

Acceptable types

4.40 Fans can be of the axial, centrifugal, cross-flow, mixed-flow or propeller type, depending on the requirements of the system.

4.41 Where used, centrifugal fans should preferably be of the backward-blade type. Alternatively, where noise levels are more critical and pressure requirements are lower, forward-curved blade fans are acceptable. For high-power applications, aerofoil-blade fans are appropriate.

4.42 In all cases the fan power performance requirements of the Building Regulations Part L2 must be met.

Selection

4.43 Generally, large ventilation systems will use centrifugal fans due to their efficiency, non-overloading characteristics and developed pressures.

4.44 Axial flow or propeller fans are generally only used in local through-the-wall systems or systems with very low-pressure requirements.

4.45 Cross-flow fans have very low operating efficiencies, and thus their use is restricted to applications such as fan-coil units.

Location and connection

4.46 Fans are normally positioned to “blow through” the central plant so that the cooling coil and humidifier drains will be under positive pressure.

4.47 The fan performance figures given by manufacturers in their catalogue data are based on tests carried out under ideal conditions, which include long uniform ducts on the fan inlet/outlet. These standard test connections are unlikely to occur in practice; the designer should therefore ensure as far as is practical that the fan performance will not be significantly de-rated by the system. This objective can be approached by ensuring that the fan inlet flow conditions comprise uniform axial flow velocities with low levels of turbulence.

4.48 Where the outlet duct is larger than the fan discharge connections, there should be a gradual transition, with a following section of straight duct having a length equivalent to three duct diameters.

4.49 The design of the fan inlet connection must be carefully considered to avoid swirl in the air stream. When the air spins in the same direction as the impeller, the performance and power consumption of the fan are reduced. When the air spins in the opposite direction to the impeller, power consumption and noise will increase with hardly any pressure increase. Air-stream swirl is usually induced by large variations across the fan’s inlet eye, caused by the air passing round a tight bend immediately before the eye.

4.50 Where a centrifugal fan is located with a free inlet, the clear distance between the suction opening and the nearest wall should be not less than half the diameter of the inlet. If two fans with free inlets are positioned within the same chamber, their adjacent suction openings should be at least one (inlet) diameter apart.

4.51 Airtight flexible joints should be provided at the fan’s inlet and outlet connections. They should be equal in cross-section to the points of connection, and be neither longer than 200 mm nor shorter than 100 mm.

4.52 For centrifugal fans, a diffuser screen/blast plate should be fitted immediately downstream of their discharge.

Supply fan drive arrangements

4.53 Where the fan drive is via a motor-driven belt and pulley, it should be external to the air stream. This arrangement has the following advantages:

a. the fire risk is reduced;

b. the drive is visible, so it is simple to check that the belt is still there;

c. particles shed from the drive belt are outside of the air stream;

d. if the belt slips, the "burning rubber smell" is not transmitted down into occupied areas of the premises;

e. noise generated by the motor and drive will not be transmitted along the ductwork;

f. waste heat is excluded from the system;

g. the drive may be through a V-belt or toothed belt and pulley. The latter has the advantage of eliminating belt squeal on start-up and has a longer service life. It is particularly suitable where the fan's drive motor is fitted with a soft start.

4.54 The drive train should be easily visible without the need to remove access covers. Protecting the drive train with a mesh guard is the preferred option. For weatherproof units designed to be located outside, the fan drive will be external to the duct, but enclosed. It should be easily visible through a viewing port with internal illumination and be accessible via a lockable hinged door.

4.55 For direct-coupled fan and motor units, the motor may be within the air stream, provided the motor windings are protected from over-temperature by a thermister and lockout relay.

4.56 For induction-drive "plug" motor arrangements (where the motor is fitted within the fan and is integral to it) and in-line axial fans with a pod motor, the fan/motor combination may be within the air stream, provided the motor windings are protected from over-temperature by a thermister and lockout relay.

Extract fan drive arrangements

4.57 Where the fan drive is via a motor-driven belt-and-pulley arrangement, it should be located external to the air stream.

4.58 The fan drive and motor may be located inside the duct within the air stream, provided the motor windings are protected from over-temperature by a thermister and lockout. The drive train should be easily visible through a viewing port, have internal illumination, and be accessible via a lockable hinged door.

4.59 Where the system air is explosive, aggressive or has a high moisture content, the extract fan motor must be located outside the air stream. This is generally achieved with axial fans by using a bifurcated unit.

Control

4.60 Fans in healthcare applications are generally either single- or two-speed. Where there is a requirement for two-speed operation, this is generally via a local user control (for example in a hood-extract system to provide a boost facility) or via a time schedule for energy saving during unoccupied periods.

4.61 Normally, only a single motor is required with a standby motor available for fitting as necessary, or fitted, but not belted. Twin, run and standby motors – with the standby being jockeyed around – are not required.

4.62 Where there is a specified requirement for standby fans, the system should incorporate an automatic changeover facility activated via an air-flow sensor. Fault indication should be provided.

4.63 In terms of start-up and operation, fans are increasingly becoming computer-controlled. Inverter-drive, variable-speed and soft-start systems are becoming a standard approach. Most healthcare applications require known amounts of air to be delivered while the system is in use. Constant-volume systems that deliver specified air-change rates are therefore the norm. Duct- or room-pressure-controlled, variable-speed systems have a very limited application in healthcare.

4.64 It is necessary to ensure that – should the computer control system or its software develop a fault – the fan can be switched to a direct-start, fixed-speed manual operation. This is particularly important for critical care systems serving operating suites, high-dependency care units of any type, isolation

facilities, laboratories and pharmaceutical production suites. Off-site software support is not a substitute for the ability of on-site staff to override automatic controls and keep the system operating in an emergency. Under these circumstances, actions that may shorten the life of the plant are considered of secondary importance to that of preserving the health and safety of patients and staff.

Heater-batteries

General requirements

4.65 Fog/frost heating coils are installed to protect the downstream filters from low-temperature, high-humidity intake air conditions. As they handle unfiltered air, they should be constructed of plain tubing without fins and be as near to the outside as possible to minimise condensation during cold weather. Access for cleaning will need to be provided to both sides of the coil.

4.66 Where steam coils are used for a fog/frost battery, they may be constructed using spiral-finned copper tube. As they will be prone to fouling, the tube layout and spacing should permit easy access for regular cleaning.

4.67 Main and branch heater-batteries should be constructed of solid-drawn copper-tube coils with copper fins, generally connected in parallel.

4.68 Where there is a wet heating system in the areas served, the main heater-battery should be sized for the ventilation requirements only, and not for the fabric loss.

4.69 Access for cleaning must be provided to both sides of all fog coils and heater-batteries.

Acceptable types

4.70 Electric, water or steam heater-batteries may be considered; however, electric heater-batteries are expensive to operate and, where there are alternatives, their use should be restricted to low-power use (for example trimming control).

4.71 Where steam-supplied heater-batteries are used, their control, venting and trapping systems should be designed so that a vacuum cannot occur within the coil. The condensate drainage arrangements should not allow pressure to build in the main, resulting in a back-up of condensate in the coil.

Location

4.72 Where possible, wet-trimmer heater-batteries should be located in plant areas.

4.73 Where it is necessary to locate auxiliary heater-batteries in false ceilings, consideration should be given to the use of electric heaters. If this is not practicable, a catch tray should be installed under both the battery and the control-valve assembly to protect the ceiling from leaks. A moisture sensor and alarm should be fitted in the tray. In any event, to facilitate maintenance access, auxiliary wet heater-batteries should be located above corridors or other non-critical areas and not above patient-occupied spaces.

4.74 Auxiliary fan-coil units should not be installed in the ceiling above an occupied space. They should be accessible for routine maintenance and cleaning without the need to cause significant disruption to the operation of the department that they serve.

Control

4.75 LPHW fog/frost coils should be controlled by an off-coil temperature sensor operating a motorised valve to provide a minimum plant "on temperature" of between 2ºC and 5ºC. The off-coil temperature of the frost coil is generally sensed by a serpentine thermostat downstream of the coil or upstream of the next plant item. This thermostat will shut the fan down if any part of the air stream is below the minimum set-point.

4.76 Steam-supplied fog/frost coils should be fitted with an on/off control operated by a temperature sensor mounted upstream of the battery. These are normally set to fully open the control valve when the outside temperature drops to +1ºC. This will ensure that there is no standing condensate in the base of the coil.

4.77 The main heater-battery should be controlled in the same manner under the dictates of either an off-coil temperature sensor or a room temperature sensor, depending on the plant configuration and method of control. Trimmer heater-batteries are generally controlled by one or more averaging temperature sensors within the room or rooms in the zone.

4.78 Heater-battery control valves should automatically close on system shut-down or fan failure. The control system should then automatically set to provide frost protection.

Cooling coils

General requirements

4.79 Cooling coils will need to be periodically cleaned or decontaminated. They must have good access both up- and downstream. Hinged access doors with viewing ports and illumination inside the duct should be provided both sides of the coil.

4.80 An eliminator will be required downstream of all cooling coils. The eliminator may take the form of an extension of the coil fins or be a separate device. If a separate device, it should be removable as a unit to permit cleaning of the coil face.

4.81 All cooling coils must be fitted with their own independent drainage system as specified above. A baffle or similar device must be provided in the drain tray to prevent air bypassing the coil. The tray should be large enough to capture the moisture from the eliminator, bends and headers.

4.82 Where coils are greater than 1 m high, intermediate drain trays are needed.

Selection

4.83 Cooling coils supplied with chilled water are the preferred option. For small loads or where chilled water is not available, direct expansion coils may be used.

4.84 Care must be taken to minimise electrolytic action resulting from condensation on the air side. Coils constructed from copper tubes with copper fins extended on the downstream side in the form of an eliminator, and electro-tinned after manufacture, are preferred. Aluminium fins should only be used if vinyl-coated.

4.85 All parts of the coil and its associated ductwork in contact with moisture must be manufactured from corrosion-resistant materials. Pressed-steel coil headers, even if treated, have been shown to be prone to corrosion over time and should not be used. Steel mounting frames and casings present similar problems, so stainless steel is preferred.

Location

4.86 Cooling coils in AHUs should be located upstream of the final filter.

4.87 Auxiliary fan-coil units should not be installed in the ceiling above an occupied space. They should be accessible for routine maintenance and cleaning without the need to cause significant disruption to the operation of the department that they serve. The drainage of such items is often problematic. If a suitable fall in the drain line cannot be achieved, a pump-out system must be provided.

4.88 Where any cooling coil has to be located above a ceiling, an external catch tray should be installed under the unit and its control valve assembly to protect the ceiling from leaks. A moisture sensor and alarm should be fitted in the catch tray. To facilitate maintenance access, coils should be located above corridors or other non-critical areas, but not above patient-occupied spaces.

Control

4.89 There are three basic methods of control for cooling coils:

a. **Temperature control.** A room or duct temperature sensor controls the cooling coil and heater-battery in sequence to maintain the desired room temperature. This is used where close control of room humidity is not required. If a suite of rooms is served by the same unit, the control sensor may be located in a common extract duct to achieve an "average" condition.

b. **Temperature and humidity control.** Room temperature and humidity sensors control the cooling coil, heater-battery and humidifier in sequence. The room temperature and humidity are kept within an acceptable range, with temperature taking precedence over humidity. It is usual to interlock the cooling coil and humidifier so that they cannot be on together.

c. **Full temperature and humidity control.** Room temperature and humidity sensors control the heater-battery, humidifier, cooling coil and a re-heater-battery in sequence to maintain a specific room condition regardless of the room load. This is very expensive in energy and can rarely be justified. In healthcare it is only likely to be considered for specialised research facilities.

4.90 It is usual to isolate the cooling coil upon selection of set-back operation. In addition, on system shut-down, low air flow or fan failure, the cooling coil must be isolated.

Humidifiers

Design need

4.91 Humidification was originally required for some healthcare applications in order to control the risk associated with the use of flammable anaesthetic gases. The use of such gases has now ceased. Humidification is therefore no longer required unless there is a very specific application requirement.

4.92 Operating-theatre AHUs do not generally require humidifiers, but provision for their retrofitting in terms of space provision and a capped drainage system should be provided.

4.93 Where humidification is required, it will be subject to the specific requirements set out below. These are intended to ensure that the unit will operate safely and not become a source of contamination.

General requirements

4.94 The most important requirement for a humidifier is to create complete mixing of the steam with the air. The manufacturers' instructions should be closely followed regarding minimum distances, which should be allowed before bends or other components. This is particularly important with respect to a filter mounted downstream. If it becomes saturated by the humidifier, organisms can grow through the filter and be released into the duct. These may then be carried on the air stream into an occupied space.

4.95 The section of ductwork containing the humidifier may need to be periodically cleaned. Hinged access doors with viewing ports and internal illumination should be provided. A label warning that the device emits live steam and should be isolated prior to opening should be affixed to the access door.

4.96 All parts of the humidifier and its associated ductwork in contact with moisture must be manufactured from corrosion-resistant materials; stainless steel is preferred.

4.97 The electrodes of self-generating electrode-boiler humidifiers should be stainless steel.

4.98 All humidifiers must be fitted with their own independent drainage systems as detailed above.

4.99 For self- and locally-generated steam humidifiers, the cleanliness of the water supply is essential for their safe operation. The water supply should be derived from a potable source. Chemical treatments must not be added to the water supply to humidifier units.

4.100 If the quality of the water supply to a self-generating humidifier unit cannot be assured, an ultraviolet (UV) system to control microbiological growth could be installed. However, given the limitations of UV systems, this will require high-quality water filtration to ensure the effective exposure of organisms to the UV irradiation. As with all water-treatment systems, the unit should be of proven efficacy and incorporate UV monitors so that any loss of transmission can be detected.

4.101 Provision should be made for draining down supply pipework and break tanks serving self-generating humidifiers during the seasons when they are not required in service. Isolation of the water supply should be at its junction with the "running" main to prevent the creation of a dead-leg. All parts of the system should be capable of being cleaned and/or disinfected as necessary.

Acceptable types

4.102 Only steam-injection manifold-type humidifiers are suitable for use within air-conditioning systems in healthcare facilities. Water-curtain, spray or mist humidifiers of any type should not be used.

4.103 Steam may be derived from the central steam supply provided that it does not contain any treatment carry-over, or may be generated locally either within or adjacent to the humidifier.

4.104 The introduction of steam should be by an appliance specifically designed to discharge dry steam into the air-conditioning system without objectionable noise or carry-over of moisture.

4.105 During the design stage, consideration should be given to the proposed methods for the regular cleansing of the humidifier(s) and their components.

Selection

4.106 The number and length of steam-injection manifolds to be used is dependent on various factors such as duct cross-sectional area, air velocity, dry-bulb temperature and manifold design. Guidance from the manufacturer should be closely followed.

4.107 A mains steam humidifier can be noisy and will be difficult to control if it is operated at an excessive steam pressure. It should be sized for an operating pressure of approximately 1 bar. The pipework

supplying it should be provided with a dirt pocket, pressure-reducing valve and steam trap installed as close as practicable to the humidifier so that the steam condition at entry is as dry as possible. A temperature switch on the condensate line (or equivalent design provision by the humidifier manufacturer) should be incorporated to prevent "spitting" on start-up.

4.108 Most operational problems with mains steam humidifiers arise because of back-pressure in the condensate discharge line, which will result in flooding into the duct. Unless the condensate from the device can be discharged and collected at atmospheric pressure, it should be discharged directly to drain.

4.109 Some steam generators incorporate a heated tank that requires regular cleaning and descaling. The design must allow the steam-supply manifold to be physically isolated from the air duct in order to prevent contamination of the air stream by cleaning agents while this is taking place.

Location

4.110 Careful siting of the humidifier lance is required to prevent the steam impinging onto the side(s) of the duct, condensing and generating excess moisture.

Control

4.111 Accurate humidity control can only be provided on single-zone systems or multi-zone systems with zonal humidifiers. In the former, humidity sensors control the humidifier for low-level humidity control and override the temperature controls to open the cooling-coil valve for high-level humidity control.

4.112 Multi-zone systems are more usually controlled by a minimum humidity sensor located in the supply duct(s) following the last heater-battery.

4.113 Overriding controls separate from the normal plant humidistat should be installed. Their purpose is to prevent excessive condensation in the conditioned space when starting up. A time delay should be incorporated into the humidifier control system such that the humidifier does not start until 30 minutes after the ventilation/plant start-up. In addition, a high-limit humidistat should be installed to limit the output of the humidifier so that the saturation in the duct does not exceed 70%. This humidistat is to control the added moisture; it is not necessary to install a dehumidifier to reduce the humidity of the incoming air if it already exceeds 70%. The humidifier control system should ensure that the humidifier is switched off when the fan is not running.

4.114 It is usual to isolate the humidifier upon selection of set-back operation. In addition, on system shut-down, low air flow or fan failure, the humidifier should be isolated.

4.115 If a water-supplied local steam generator is unused for a period exceeding 48 hours, it must automatically self-drain (that is, all water content must drain out – including that contained in the supply pipework – all the way back to the running main) and remain empty.

Filtration

General requirements

4.116 The purpose of filtration is to reduce the level of airborne contamination in an air stream. It is generally carried out in stages.

4.117 Filters must be securely housed and sealed in well-fitting frames that minimise air bypass. Air bypass significantly reduces filtration efficiency: the higher the filter grade, the greater the effect. Mounting frames should be designed so that the air flow pushes the filter into its housing to help minimise air bypass. Mounting frames that withdraw so that the filter can be changed without having to reach into the unit are preferred.

4.118 Neither the filter media nor any material used in the construction of the filters should be capable of sustaining combustion. The filter media should be such that particles of it do not detach and become carried away by the air flow.

4.119 Filters need to be readily accessible for replacement; therefore, a hinged access door should be provided. The upstream side of the filter should be visible for inspection through a viewing port with internal illumination.

4.120 All filters should be provided with a means of visually checking the differential pressure across them. Direct-reading dial-type gauges marked with clean and dirty sectors are preferred.

4.121 A complete spare set of filters must be provided to the client at handover.

Definition of filter terms

4.122 Particulate air filters are divided into four categories:

a. general ventilation filters graded G1 to G4;

b. fine filters graded F5 to F9;

c. HEPA filters graded H10 to H14;

d. ultra-low particulate air filters (ULPA) graded U15 to U17.

4.123 General filters are graded in terms of their "synthetic dust weight arrestance". This represents the percentage of a test dust captured by a filter. "Arrestance" provides a good indication of a filter's ability to remove the larger, heavier particles found in outdoor air. These are of a size to block finned batteries and large enough to settle out in the air distribution system (see Table 3).

Table 3 General filters

BS EN 779 grade (Eurovent grade)	% Arrestance	Notes and typical healthcare applications
G1 (EU1)	<65	Metal-mesh grease filter
G2 (EU2)	65 to <80	Coarse primary filter
G3 (EU3)	80 to <90	Primary air intake; Return air; Energy-recovery device protection
G4 (EU4)	>90	General-purpose tempered air supply

4.124 Fine filters are graded in terms of their "atmospheric dust spot efficiency". This is a measure of the filter's ability to remove the very fine staining particles found in outdoor air. It will indicate how "visibly" clean a filter will keep a ventilated space. The staining particles are approximately the same size as most common bacteria so it is also a rough measure of the filters' ability to remove them (see Table 4).

Table 4 Fine filters

BS EN 779 grade (Eurovent grade)	% Efficiency	Notes and typical healthcare applications
F5 (EU5)	40 to <60	General-purpose panel/bag filter
F6 (EU6)	60 to <80	Basic grade bag filter
F7 (EU7)	80 to <90	Medium grade bag or pleated paper Conventional operating theatre supply air
F8 (EU8)	90 to <95	High grade bag or pleated paper
F9 (EU9)	>95	Basic HEPA filter – level 8 clean rooms

4.125 High-efficiency filters (HEPA and ULPA) are graded in terms of their ability to capture their "most penetrating particle size" (MPPS).

4.126 High-efficiency filters self-select the particle that they are least able to trap, hence the MPPS. They are then tested against that size of particle.

4.127 These filters are designed to provide very high-efficiency filtration of particles in the sub-micron size range (see Table 5).

Table 5 High efficiency (HEPA) filters

BS EN 1822 grade (Eurovent grade)	% Efficiency at most penetrating particle size (MPPS)	Notes and typical healthcare applications
H10 (EU10)	85	Ultra-clean theatre terminal
H11 (EU11)	95	
H12 (EU12)	99.5	
H13 (EU13)	99.95	
H14 (EU14)	99.995	Pharmacy aseptic suite Category 3 room extract
U15–U17	–	Not generally used in healthcare

Selection

Primary filters

4.128 All filters should be of the dry type.

4.129 Panel filters are cheap and disposable with relatively low dust-holding capacity. They are generally used as prefilters to eliminate large particles which would otherwise clog or cause damage to the fan and finned heating and cooling batteries. Stainless steel frames that hold disposable pre-cut filter pads are more economic, create less waste and are therefore the preferred option.

4.130 General ventilation supply plant should incorporate primary air filters of grade G3, sized for a maximum face velocity of 2 m/s. Additional coarse prefilters may be justified where the intake air is exceptionally polluted. They are sometimes fitted as a temporary measure when building work is being carried out in the vicinity of the air intake.

Secondary filters

4.131 Where a higher standard of filtration is required, secondary bag or pleated-paper panel filters can be used. Rigid frame filters incorporating pleated-paper elements are preferred over bag filters for critical care applications such as operating theatres.

4.132 In urban or other areas of high atmospheric pollution, a higher standard of filtration may be justified to reduce the level of staining to internal finishes.

Extract air filters

4.133 Extract filtration will generally only be required where heat-recovery devices are installed. There are a very limited number of specialised applications (microbiological safety cabinets and similar LEV systems) where contaminated air is required to be filtered prior to discharge to atmosphere. If it is safe for staff to work in a room without wearing respiratory protective equipment, it is safe to discharge the room air to atmosphere without filtration.

Return-air filters

4.134 Return-air filters are used to reduce the load on HEPA filters in recirculating applications such as ultra-clean operating suite ventilation canopies and pharmacy aseptic suites.

High-efficiency filters – HEPA and ULPA

4.135 HEPA filters are expensive. Therefore, their use should be kept to a minimum. Applications requiring HEPA filters include the air supply to aseptic suites in manufacturing pharmacies and the discharges from microbiological safety cabinets.

4.136 If used, HEPA filters should be of the replaceable-panel type with leak-proof seals. They should be installed in a manner that permits on-site validation of the filter and its housing. This may involve the release of a dispersed oil particle (DOP) challenge smoke through an injection point upstream of the filter plus measurement of the DOP penetration across the downstream face. Alternatively, a particle-counting method may be used.

4.137 HEPA filters are sometimes fitted in extract systems to capture hazardous substances or organisms. Design provision must be made for the subsequent safe handling of contaminated filters by maintenance staff. This may be achieved by:

- sealing the hazardous substance into the filter before it is removed;
- providing a system to fumigate the filter to kill any organisms;
- housing it in a ”safe change” unit that permits the filter to be ejected into a bag and sealed without staff having to come into direct contact with it.

4.138 In view of the costs and problems associated with placing HEPA filters in extracts, it is recommended that a full risk assessment be carried out at the design stage. This should include defining the need for HEPA filters in an extract; validation of its performance at installation; the method of safely changing a contaminated filter; and its subsequent disposal.

4.139 ULPA filters are very expensive and are designed to remove particles below a size that are either surgically or aerobiologically significant. There would have to be exceptional circumstances in order to justify their use in healthcare ventilation systems.

Activated carbon filters

4.140 Activated carbon filters are able to remove gases and vapours from the air stream and are graded according to the range of substances they can

remove. They are not normally fitted in air-conditioning supply systems.

4.141 They are occasionally fitted retrospectively because the main air intake has been poorly sited and is drawing in traffic fumes. Where used, they must be protected by a particulate air filter.

4.142 Activated carbon filters are more commonly used in specialised fume-extraction systems when the location of the discharge means that dilution cannot be relied upon to disperse noxious fumes.

Location

4.143 The primary filter should be positioned on the inlet side of the supply fan, downstream of the frost coil. The secondary filter, when fitted, should be on the positive-pressure side of the fan. This will prevent air being drawn into the system after the filter and capture any particles shed by items of equipment within the AHU.

4.144 The filter installation must be arranged to provide easy access to filter media for cleaning, removal or replacement, with side or front withdrawal as required.

Control

4.145 Differential-pressure transducers should be provided to remotely monitor and alarm on excessive filter pressure drop. In critical care areas, dirty-filter indication lights should be provided at the point of use.

Energy recovery

General requirements

4.146 Energy recovery must be fitted to all healthcare ventilation systems. It may be omitted only where it would clearly be uneconomic (for example to a single WC extract system).

4.147 For systems in healthcare premises, a plate heat exchanger or "run-around coil" system is suitable. Thermal wheels may be used providing they are fitted with a purge sector. The small amounts of air leakage across these devices are not considered significant. Other systems such as heat pumps or heat pipes are also suitable. Selection should be based on the relative locations of the supply and extract units, ease of maintenance and practicality. Cleaning access will be required to both sides of any energy-recovery device.

4.148 The following are the minimum energy transfer efficiencies required for devices handling equal air volumes:

- run-around coil – 45%;
- plate heat exchanger – 50%;
- thermal wheel – 65%;
- any other energy-recovery device – 50%.

4.149 If a plate heat exchanger is chosen, the plates should be constructed of metal. An internal bypass is not always required but, if fitted, plastic should not be used for the internal dampers and drive gears.

4.150 Whichever energy-recovery device is chosen, the extract side will need to be protected by a G3 filter and provided with a drainage system (as described above) to remove condensate.

Location

4.151 Energy-recovery devices should be located downstream of the fog coil and prefilter, prior to the cooling coil or main heater-battery on the supply side. If heat pipes are selected, it may be possible to use them to replace the fog coil.

Control

4.152 It is essential to consider the control of both the energy-recovery device and the fog/frost coil when assessing the economics of recovery, as all energy provided by the frost coil will directly reduce the heat exchange of the recovery device. To this end, the off-coil setting of the frost coil should be the minimum possible to protect the primary filter (for example +2ºC).

4.153 The control of the energy-recovery device should be fully integrated with that of the main plant to ensure maximum economic benefit.

4.154 Plate heat exchangers and heat pipes can be self-controlling in the sense that energy will transfer across the device from the extract to the supply at winter design values and from the intake to the extract discharge at summer design values, thus obviating the need for a bypass and sophisticated control system.

Attenuation

General requirements

4.155 Noise is generated in an air distribution system by the fan, plant items and air flow. The ductwork is a very effective transmitter of this noise; hence, there is generally a need to limit the noise transmission to meet the requirements of the building. This normally involves the provision of sound attenuation treatment as part of the overall ductwork system design.

4.156 A thorough assessment of the design should be made to assess the noise impact. This should take into account the following primary factors:

- fan- and plant-noise generation;
- air-flow-generated noise in ductwork fittings and dampers;
- noise generated at grilles, diffusers and other terminals;
- noise break-in and break-out of ductwork;
- cross-talk and similar interference;
- the noise limitations for the building and surrounding areas;
- external noise generation.

4.157 A method of assessment of these factors and the sound attenuation requirements of ductwork systems is given in CIBSE's Guide B.

4.158 The fan is usually the main source of system noise. The sound power that it generates varies as the square of the fan pressure, and thus to limit the fan noise level the system resistance should be kept as low as economically possible. As a general rule, the selected fan should operate close to its point of maximum efficiency to minimise its noise generation. Where there is disturbance to the air flow at the fan inlet, the manufacturer's stated fan noise levels should be increased by up to 5 dB(A). More precise guidance on this aspect may be available from the manufacturers.

4.159 Fans radiate noise through both the inlet and outlet connections, and it may be necessary to provide attenuation to limit the noise from both of these connections. It is always preferable and more economic to control noise and vibration at source, or as close to source as possible. It should be noted that attenuators offer a resistance to air flow. The resistance must be included in the fan and ductwork calculations.

4.160 Provided care is taken in the design and construction of low-pressure systems to avoid significant noise generation in the ductwork, attenuation should only be needed to absorb fan noise.

4.161 Noise break-out from all equipment housed in the plantroom must be taken into consideration if control is to be satisfactory. Any ductwork within the plantroom after the silencer should be acoustically insulated to prevent noise break-in.

4.162 There is no complete means of control over external noise generation from sources such as road traffic, aircraft, factory and community noise. Consideration must be given to this at the design and planning stage.

Acceptable types and location

4.163 The noise levels produced by ventilation and other plant should be reduced by either lining the inside of the duct with sound-absorbing material or fitting bespoke attenuator units.

4.164 In supply systems, sound-absorbing material should not be applied to the inside surface of a duct system downstream of the final filter, owing to the risk of mechanical damage and the subsequent dispersal of the media into the ventilation system.

4.165 In supply and extract systems, sound-absorbing material should not be applied to the inside of a duct within 1 m of a fire damper. The material should be non-particle-shedding and fire-resistant (see Health Technical Memorandum 05-02). Where sound-absorbing material is applied in a section of duct that will be routinely exposed during maintenance activities, it should be protected from mechanical damage.

4.166 Bespoke attenuator units with a sound-absorbing in-fill suitable for the quality of air being handled and protected by a perforated sheet metal casing are the preferred option for critical systems. Absorption of moisture, dirt and corrosive substances into the "in-fill" and the release of fibrous particles into the air stream should be prevented by the use of a membrane. The membrane material should have a declared service life of at least 25 years. If these conditions can be met, the attenuator may be located in the supply ductwork downstream of the final filter. When so located, cleaning access should be provided at both ends of the attenuator unit.

5 Air distribution system

Air distribution arrangements

Ductwork distribution systems

5.1 Ductwork systems for ventilating and air-conditioning applications are referred to by their velocity or pressure category, that is, as low, medium or high velocity (or pressure) systems. HVCA limits are up to:

- 10 m/s or 1000 Pa in the case of conventional low-pressure systems;
- 20 m/s or 1750 Pa in the case of conventional medium-pressure systems; and
- 40 m/s or 3250 Pa in the case of high-pressure systems.

Note

High-pressure systems are disappearing because of the constraints of the Building Regulations, but existing systems may sometimes need to be altered or extended.

5.2 For normal applications in healthcare buildings, low-velocity systems are recommended; the use of higher velocities than those recommended may not be economical. Future trends are for even lower optimum duct velocities; however, velocities below 2 m/s are unlikely to be justified.

5.3 The site will often dictate the main routing of ductwork systems but, in general, the design should seek to make the layout as symmetrical as possible; that is, the pressure loss in each branch should be as nearly equal as possible. This will aid regulation and may reduce the number and variety of duct fittings that are needed.

5.4 Main distribution ductwork should not be routed above sleeping areas. Where there is no alternative route, additional acoustic insulation is required.

5.5 Where auxiliary air-conditioning units, fans, filters or trimming devices are installed in the distribution system, they must be independently supported and fitted with a suitable drainage system, where appropriate. If they are a source of vibration, they should be linked to the distribution ductwork via flexible connections.

5.6 The fan of an LEV system provided under the COSHH Regulations should be located outside the building so that all ductwork within the building is under negative pressure. Where the fan has to be within the building, it should be located as close as practicable to the outside, with an absolute minimum run of discharge ductwork within the building. This discharge ductwork will be under positive pressure, so it must not be penetrated by test holes or inspection hatches.

Ductwork materials and construction

5.7 The choice of duct material should take account of the nature of the air or gas being conveyed and the environment in which the duct will be placed.

5.8 Galvanised-sheet-steel ductwork is the most suitable and economical choice for normal ventilating and air-conditioning applications. Its inherent mechanical strength renders it resistant to casual damage both during the construction phase and throughout its service life when mechanical and electrical services around it are altered. It also readily withstands the impacts sustained when rotary equipment is used to clean it internally.

5.9 In instances where moisture levels and/or corrosive elements in the air being conveyed are very high, aluminium, stainless steel, PVC or GRP (glass-reinforced plastic) ducts should be used. Stainless or black steel are the only suitable materials for high-temperature ductwork.

5.10 In inherently wet areas, such as the base of fresh-air inlet ducts and some extract systems, the ductwork may require draining to prevent a build-up of standing water. The layout of the drains should be as specified in Chapter 4.

5.11 Where builders' work ducts or plenum chambers are used, these may be constructed of various materials. However, all such ducts must be

rendered and sealed to prevent dust-shedding. A greater allowance may need to be made for leakage.

5.12 Galvanised, black and stainless steel ductwork should be manufactured and installed to the current HVCA specification for sheet metal ductwork DW144, but excluding the use of bolt-through supports.

5.13 GRP and PVC ductwork should be manufactured and installed to the current HVCA specification for plastic ductwork DW154.

5.14 Flexible ductwork is unsuitable for air distribution in healthcare applications. It should only be used to make the final connection to a terminal (see paragraphs 5.53–5.54).

5.15 Where phenolic-board ductwork is considered, care should be taken to ensure that it is fabricated to a quality standard and installed strictly in accordance with the manufacturers' instructions. Its pressure rating and degree of support should be suitable for the application, and the duct should be fitted with mechanical protection where required.

5.16 The inside of the ductwork should be free from structural projections and as smooth as possible. Flanged gasketed joints between sections are preferred.

Fire aspects, damper types and locations

5.17 It is essential that all relevant fire aspects of ducting systems are agreed with the fire officer before the design is finalised.

5.18 Ductwork must be fire-stopped where it penetrates fire compartment walls, floors and enclosures, cavity barriers and subcompartment walls or enclosures, and must be provided with weatherproof collars where roofs or external walls are penetrated.

5.19 Fusible-link and automatically controlled fire dampers should be provided at the locations required by Health Technical Memorandum 05-02. The fire-damper mounting frame must be securely attached to the building fabric. Where a fire damper is not mounted directly in a fire compartment wall, it must be correctly supported and the ductwork between it and the firewall must possess the same fire rating as the firewall that it penetrates. The fire-rated portion of ductwork must not be penetrated by test holes or inspection hatches.

5.20 An access hatch should be provided adjacent to each fire damper so that its correct operation can be directly observed. The hatch must be suitably sized to permit inspection, testing and maintenance.

5.21 Smoke-diverting dampers must be provided on recirculation air systems to automatically divert any smoke-contaminated return air to the outside of the building in the event of a fire. It should be arranged such that the normal open smoke-diverting damper on the return-air branch to the input unit closes and all the return air is exhausted through the extract fan. Guidance is available in Health Technical Memorandum 05-02 and BS 5588-9.

Duct sections

5.22 Ducting is generally available in rectangular, circular and flat oval sections, although other sections may be manufactured for particular situations.

5.23 Rectangular ducting is most common on low-pressure systems for the following reasons:

- it can be readily adapted to fit into the space available;
- fittings are cheaper than those for circular or flat oval ductwork;
- it can be readily joined to such component items as heating and cooling coils, and filters.

5.24 When sizing ductwork, the designer should take into account:

- installation and operating costs;
- space limitations imposed by the structure and other services;
- operating noise levels;
- requirements of regulation at the commissioning stage.

5.25 For overall economy and performance, the aspect ratio should be as close to 1:1 as possible, since high aspect ratios increase the pressure loss, heat gains or losses and overall cost (for example, changing the aspect ratio from 1:1 to 1:4 can typically increase the installed cost of the ductwork by 40% and add 25% to the heat gains or losses).

5.26 Circular ducting is preferable for high-pressure systems and for systems operating at high negative pressures. In the latter case, additional stiffening rings may be necessary. Machine-formed spirally-

wound ducting and a standard range of pressed and fabricated fittings can sometimes make circular ducting more economical, particularly in low-pressure systems having a relatively low proportion of fittings.

5.27 Flat oval ducting provides an alternative to circular ducting, principally where there is a limitation on one of the dimensions in the space available for the duct run.

5.28 Other sections may be used, such as triangular sections to pass through roof trusses. Such sections present difficulties in the provision of fittings and connections to standard plant items, and are likely to be more expensive than traditional sections.

Standard ductwork fittings

5.29 All fittings should conform to current HVCA specification DW144. Wherever possible, long radius bends, large radius main branches, sub-branches with angles no greater than 45 degrees, and long-taper transformations should be used.

5.30 Fittings should be arranged with vanes in sub-branches connected directly to grilles and diffusers, and turning vanes in square bends (when used). When vanes are used, additional cleaning access will be required.

5.31 The number of duct fittings should be kept to a minimum, and there should be a conscious attempt to achieve some standardisation of types and sizes. Increasing the number and variety of fittings in a system can markedly increase its overall cost.

5.32 Bad design in relation to air flow can lead to vibrating flat duct surfaces, increases in duct-generated noise and pressure loss, unpredictable behaviour in branch fittings and terminals, and adverse effects on the performance of installed plant items (such as trimmer batteries).

Branches

5.33 There are many designs of branch and junction in use. The important features are that the flow should be divided (or combined) with the minimum interference and disturbance. Changes in duct sizes should not be made at the branch but at a short distance downstream (or upstream). A good dividing-branch design cannot be effective if the flow entering the branch is not uniform across the section.

Changes of section

5.34 The expansion of a duct section should be formed with sides having a total included angle of no more than 30 degrees, and preferably less than 20 degrees. If the angle of expansion is greater, the flow is not likely to remain attached to the walls of the duct, and large eddies will be formed with flow reversal at the walls. This leads not only to a high-pressure loss, but also to non-uniform velocity pattern at the outlet. Where there is insufficient space for a gentle expansion and a greater angle is necessary, internal splitters should be used.

5.35 A contraction in a duct section is less critical, but the total included angle of the taper should not exceed 40 degrees (or 20 degrees where the contraction is made on one side of the duct only).

5.36 The most economical way to change the section of a rectangular duct is to restrict the change of duct size to one side only. If the calculated reduction or increase to the side dimension is 50 mm or less, it is usually not economical to change the size at the position. The minimum size of a rectangular duct should be 150 mm × 100 mm.

Other fittings

5.37 Fittings that have abrupt changes in direction and sharp edges should be avoided, as this will increase turbulence, thus increasing pressure loss and causing noise generation. If the fitting leads to the flow preferentially attaching to one side of the outlet, a significant length of straight downstream duct is necessary before the next branch or fitting; this length should be greater than five equivalent diameters.

Thermal insulation

5.38 Thermal insulation is applied to ductwork to reduce heat exchange and to prevent condensation.

5.39 In a duct system, the air-temperature changes can be significant, especially when passing through untreated space, and these have the effect of reducing the heating or cooling capacity of the air and of increasing the energy input to the system. The heat transmission to and from the surrounding space can be reduced by effective insulation of the ducts.

5.40 Condensation can arise in ductwork systems conveying cooled air and, apart from creating conditions conducive to corrosion of ductwork, condensation affects the heat and vapour-resisting

properties of insulating materials themselves, which may induce further condensation.

5.41 In normal circumstances, the insulation thickness for heat resistance is sufficient to prevent surface condensation, but in extreme conditions the insulation thickness for vapour resistance may be greater than that for heat resistance. When cold ducts pass through areas that have a high dew-point, carefully selected vapour barriers should be applied externally to the insulation.

Noise generation within the ductwork

5.42 Noise is generated in ductwork at sharp edges, and by tie rods, damper blades, duct obstructions and sharp bends. This air-flow-generated noise becomes an important factor if it is about the same or greater level than the upstream noise level. (Air-flow-generated noise is often referred to as "regenerated noise".)

5.43 The noise level generated by the air flow in ductwork is very sensitive to the velocity. The sound power of this noise is approximately proportional to the sixth power of the velocity; that is, a doubling of the duct velocity will increase the sound power by a factor of 64. The duct velocities should therefore be kept as low as possible. In general, duct fittings that have lower pressure-loss factors in similar flow conditions will generate less noise.

5.44 Ductwork serving quiet areas should not be routed through noisy areas, where noise break-in can occur and increase the noise level in the ductwork.

5.45 Grille register and louvre noise should be kept to a minimum by selecting types that:

- have low noise-producing characteristics; and
- are without high tonal noise.

They should be fitted with acoustically-treated external inlet and outlet louvres.

5.46 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where confidentiality is required. They will normally be of the "through-the-ceiling, up-and-over" type, and may include a fire damper if required.

Volume control damper locations

5.47 Manually-operated balancing dampers are needed generally:

a. in the main duct downstream of the fan;

b. in branches of zone ducts;

c. in sub-branch ducts serving four or more terminals;

d. at terminals not covered by (c) above.

5.48 Dampers integral with terminals should only be used for final trimming of air volumes; otherwise noise and air distribution problems may ensue.

5.49 Dampers in rectangular ducts should be single-bladed when the longer side is up to 450 mm, but be of the opposed-blade multi-leaf type when above this size. In circular ducts, iris-type dampers are recommended. Dampers must be accessible, and incorporate a position indicator and means of locking in the commissioned position. Dampers should be located as far away as possible from adjacent branches or plant items.

Cleaning and access door locations

5.50 Cleaning and access doors are required to facilitate access to plant items and ductwork components for inspection, maintenance, cleaning and replacement. They must be of sufficient size to permit safe access for the required functions. Consideration should also be given to the number of doors to be provided.

5.51 Recommended locations for access doors are given in current HVCA specification DW144. They are generally provided to give access to:

- every regulating damper;
- every fire and motorised damper;
- filters (to facilitate filter withdrawal);
- both sides of cooling/heating coils;
- humidifiers;
- fans; and
- motors and impellers.

5.52 Care should be taken when siting cleaning and access doors to ensure that no other services to be installed will prevent reasonable access.

Flexible ducting

5.53 Flexible ductwork may be used for final connections to grilles and diffusers, provided it is constructed to meet the fire precautions recommended in BS 8313. It must not pass through fire compartment or subcompartment enclosures, or through cavity barriers.

5.54 Flexible ducting will cause a significant frictional loss and may be difficult to clean without damage. It should never be used in lieu of a bend. Where installed, it should take the most direct route and be as short as possible, never exceeding 1 m in length.

Diffuser and grille selection and sizing

5.55 The effectiveness of all ventilation and air-conditioning systems depends on the methods by which air is introduced to, and vitiated air is removed from, the space. The usual results of poor air-terminal selection and/or positioning are:

- draughts;
- stagnation;
- poor air quality;
- large temperature gradients; and
- excessive noise.

5.56 Air can be supplied to a space in a number of ways, although any device can be broadly placed into one of two categories:

a. that producing a diffused supply; or

b. that producing a perpendicular jet.

Diffusers may be radial or linear, and normally utilise the Coanda effect (that is, adhesion of the air stream to an adjacent surface) to reduce the risk of excessive room-air movement. A perpendicular jet is formed by discharging air through grilles, louvres or nozzles, which are generally adjustable.

5.57 Supply air terminals can be incorporated into any room surface (for example floors, walls (high or low level) and desktop).

5.58 As they operate on the jet principle, the use of side-wall and linear grilles is restricted to areas where air-change rates are fewer than ten per hour. Perforated rectangular diffusers can provide acceptable conditions within the occupied zone at up to 15 air changes per hour. In areas where a higher air-change rate is required, square or circular ceiling-mounted diffusers should be used.

5.59 The performance of supply air-terminal devices is based on three criteria:

a. **throw** – defined as perpendicular or parallel distance from the terminal to the point at which the air velocity is 0.5 m/s isovel;

b. **spread** – defined as the width of the 0.5 m/s isovel; and

c. **drop** – defined as the vertical distance from the centre line of the terminal to the bottom edge of the 0.25 m/s isovel.

5.60 It is necessary to consider each of these parameters in both summer and winter conditions to ensure satisfactory operation of the air-terminal device, as warm jets behave very differently from cold jets.

5.61 A warm jet tends to rise until it attaches itself to a horizontal surface, while a cold jet falls. Care must be taken to ensure that this does not lead to unacceptable temperature gradients in winter, or excessive air velocities in the occupied zone in summer.

5.62 In order to ensure satisfactory air movement within a space, it is necessary to consider interaction between air movement from adjacent terminals and ceiling-mounted fixtures (light fittings etc), as well as interaction between air movement and room surfaces.

5.63 If the supply and extract terminals are too close, short-circuiting may occur; if they are too far apart, stagnant zones may be formed. Where two opposing air streams meet, the individual velocities must not be greater than 0.25 m/s.

5.64 Supply and extract grilles and diffusers should be fitted with opposed-blade dampers for fine balancing purposes.

5.65 Further guidance on the selection of grilles and diffusers is given in CIBSE's Guide B.

5.66 In operating theatres, supply terminals must be able to produce a down-flow movement of air in the operating zone, 1 m above floor level. The following supply terminals are acceptable:

- ceiling-mounted diffusers with fixed directional vanes that provide a downward turbulent air flow are the preferred option;
- plenum boxes fitted with perforated screens that produce a parallel downward flow;
- linear ceiling-mounted diffusers that provide a downward air curtain around the operating zone (additional supply terminals may be located within the area bounded by the linear diffusers to provide ventilation within the air-curtained zone).

5.67 Nozzles or jets of any type are not acceptable in an operating theatre. Side-wall-mounted linear

diffusers that utilise the Coanda effect to send air across the ceiling and "drop" it into the operating zone are not suitable.

Transfer grille – size and location

5.68 Air-transfer grilles in walls, partitions or doors form an integral part of the building's air distribution system. Modern doorsets have very low leakage rates, so cannot be relied upon to permit even quite small air flows. Failure to make adequate provision for air to move from room to room will result in excessive pressure differentials and "door whistle".

5.69 Transfer grilles are required in locations where there is a significant imbalance between the supply and extract rates in a room. They will relieve any pressure differential that may affect the operation of the spaces and/or the ventilation system, and permit air flow in a known direction.

5.70 Care needs to be taken to ensure that the positioning of transfer grilles does not interfere with the fire or smoke integrity of the building. In general, air-transfer grilles should not be installed within fire-resisting boundaries, although if this is unavoidable, they should be fitted with fire or smoke dampers.

5.71 Where installed, transfer grilles should be of the non-vision type and sized for a maximum face velocity of 1.5 m/s.

5.72 In photographic darkrooms, lightproof transfer grilles are recommended.

5.73 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where confidentiality is required (see also paragraphs 5.42–5.46).

Pressure stabilisers – size and location

5.74 Pressure stabilisers are required in lieu of air-transfer grilles in areas where it is necessary to maintain pressure differentials between adjacent rooms to prevent reversal of air flows (for example in operating suites, isolation facilities and clean rooms (see also Chapter 7)).

5.75 Fire precautions for pressure stabilisers are the same as for transfer grilles. For sizing criteria, see Chapter 7.

5.76 Pressure stabilisers should be of the balanced-blade type, with the facility to make fine adjustments to the pressure setting. They should be silent in operation and give a seal as tight as practicable when closed. The materials of construction and method of assembly should allow for cleaning and disinfection.

5.77 Pressure stabilisers should be installed in a visible location so that their operation can be readily observed.

5.78 Cross-talk attenuators may be necessary where noise intrusion between adjacent spaces can arise and where confidentiality is required. In these cases, the pressure stabiliser and cross-talk attenuator should be mounted in a short length of ductwork within the ceiling void.

5.79 Pressure stabilisers may need to be fitted with a stand-off baffle on their discharge side to prevent a sight line in situations where a laser will be used. Baffles may also be required to preserve privacy or to prevent discharge air causing draughts or disturbing the air-distribution pattern in an adjoining room. They are also useful in low-level locations to prevent the air-flow path being obstructed by portable equipment.

Pressure stabiliser with stand-off cage

6 Automatic controls

6.1 Various options for control of single and multi-zone air-conditioning systems are given in CIBSE Guide B.

General requirements

6.2 The basic requirements for an automatic control system are as follows:

- facilities to start, set-back and stop the plant;
- facilities to control the volumetric air flow;
- facilities to control the system or room pressure;
- temperature control and indication;
- humidity control and indication;
- devices to monitor and indicate the plant's operating state;
- alarms to indicate plant failure, low air flow and filter state.

6.3 The control functions provided will depend on the purpose of the ventilation system.

6.4 There will also be a need to determine the control strategy in the event of a fire either within the zone being served or within an adjoining zone.

6.5 Designers should consider whether it is necessary for the supply and extract fans to be interlocked – either so that the supply fan will not operate unless air flow is established within the extract system, or vice-versa depending on the required pressures within the rooms being served.

6.6 The sequence switching of units in order to prevent transient reverse air flows will be particularly important in laboratories and pharmacies that contain fume cupboards, safety cabinets and other LEV systems.

6.7 Alarms should be provided to show "filter fault" and "low air flow". The "filter fault" alarm should be initiated by a predetermined increase of pressure differentials across the filter. The "low air flow" alarm should be initiated when the supply-air quantity falls to 80% of the design value.

Objectives of the control system

6.8 The primary objective of a ventilation or air-conditioning plant control system is to keep the space served within the required environmental control limits, at the appropriate times – regardless of external conditions or internal loads – and with the minimum energy consumption.

6.9 Control of most systems will be via a building management system (BMS). This will enable the operating conditions and control tolerances to be set and monitored. Often, it is not possible to accurately predict building load variation at the design stage. Information provided by monitoring the operation of the plant via a BMS will enable optimum set-points to be established and energy consumption reduced. The BMS may also be set to log the actual energy consumed by the system together with that recovered by the energy-recovery device. This will provide a useful check on overall operating efficiency and provide evidence that energy targets are being achieved.

6.10 A BMS incorporating self-adaptive control algorithms that automatically adjust the set-point to suit the usage and load is preferred. The provision of movement sensors within the controlled space in order to determine the actual occupancy will facilitate this process.

6.11 The failure of specialised ventilation systems can have grave consequences for the delivery of healthcare. Control systems should therefore be simple, robust and reliable.

6.12 Computer-software-driven control systems are becoming the norm in building services. However, healthcare ventilation systems need to be available for operation outside of normal working periods when software support is not available. Should the software fail, it will be left to site staff, who may have little knowledge of the control algorithms, to restart the ventilation system. It is therefore essential to ensure that a simple means of restarting critical systems in the event of a software failure is provided (see also paragraphs 4.62–4.63).

Location of controls

6.13 Whether within the plant, duct or room, sensors should be located to provide accurate measurement of the condition of the air being monitored.

6.14 Sensors and control items such as control valves should be located close to the element being sensed or plant item being controlled in order to minimise time lags within the system, which may create over-shoot of conditions beyond the design envelope and result in additional energy consumption.

6.15 There are practical advantages in locating all control valves for an AHU in a bank (at a convenient height) at one end of the unit. (This should not result in an additional control lag.)

6.16 Some applications require intermittent mechanical ventilation, frequently at a high air-change rate (for example in bathrooms and treatment rooms). Local controls to facilitate this mode of operation should be placed in a prominent position to encourage economical use.

6.17 Local controls that enable the user to select more than one mode of operation should be clearly labelled to identify the particular mode selected. Where the system allows different room pressures to be selected, a direct-reading pressure gauge should be fitted within the eye line of the users to provide an independent confirmation of the resultant mode of operation. A clear description of the selectable modes of operation should be mounted adjacent to the control switch.

Fire aspects

6.18 A fire control panel should be mounted at the entrance of the area that the ventilation serves. Access to the panel should be restricted to the fire officer and include independent on/off controls and an indication of the supply and extract systems.

6.19 In certain critical care areas, it is preferable to maintain the supply ventilation in case of a fire within the area. For example, in an operating department, while undergoing surgery, the patient cannot always be easily moved without significant risk. In the event of a fire in a staff or support area of the department, or adjoining zone, the continued supply of air to a theatre will maintain it at a positive pressure and protect the patient and staff from the effects of smoke. This will allow time for the patient to be stabilised so that he/she can be safely evacuated if necessary.

6.20 In all critical care areas, the ventilation system should continue to operate unless smoke starts to enter the AHU. A notice should be affixed to the fire control panel stressing the need to liaise with departmental staff before switching off fan units.

6.21 All supply AHUs should have a smoke sensor mounted in the main supply duct immediately downstream of the AHU. In the event of a fire in the AHU or smoke being drawn into the system from an outside source, it should cause the supply-air fire damper to close and shut down the AHU.

Time switching

6.22 Facilities to start, set-back and stop the plant should be provided in the plantroom. Remote start and set-back control and indication, if required, should be provided at a manned staff location (for example at the reception or staff base).

6.23 Many ventilation systems may be completely shut down when the area served is not in active use (for example operating theatres). Alternatively, where there is a need to maintain a background condition, the ventilation output can be reduced by "setting back" the system. This will significantly reduce energy consumption and extend the life of filters and other system components.

Start-up control

6.24 The plant's start control should contain a control logic that will start the plant in the sequence set out in the algorithms in Figures 2–5.

Set-back control

6.25 Where variable-speed controls are installed, the set-back facility for each plant should depress the control temperature to around 15°C; exclude any humidification and cooling from the system; and reduce the supply and extract air volumes to around 50%. The extract fan can also be turned off as long as the desired direction of air movement from clean to less clean will be maintained.

Use control

6.26 The installation of movement detectors allows for "use control" of ventilation systems. A simple control logic that reduces the system to a "set-back" condition if there has been no movement detected in the space for, say, 30 minutes and that switches the system "off" if no movement is detected for one hour is recommended for many applications,

Figure 2 Typical plant control algorithm – normal start-up sequence

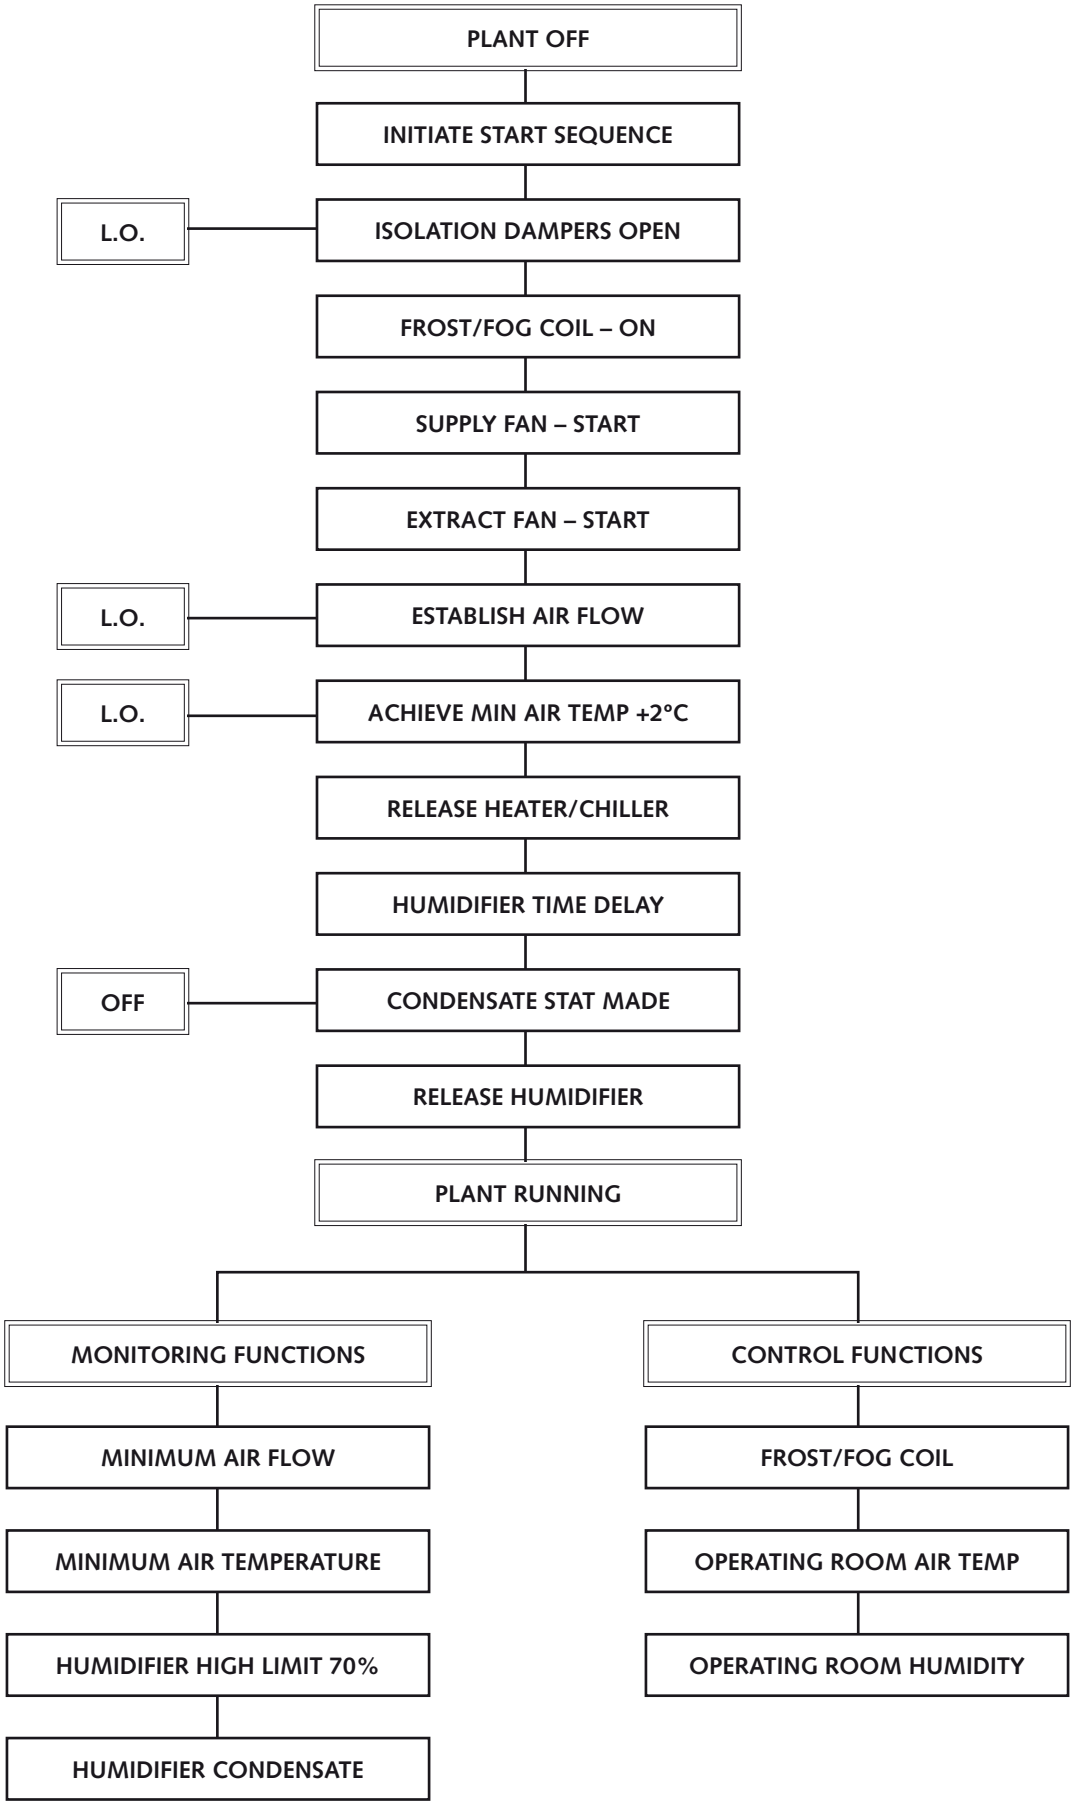


Figure 3 Plant control algorithm – normal shut-down sequence

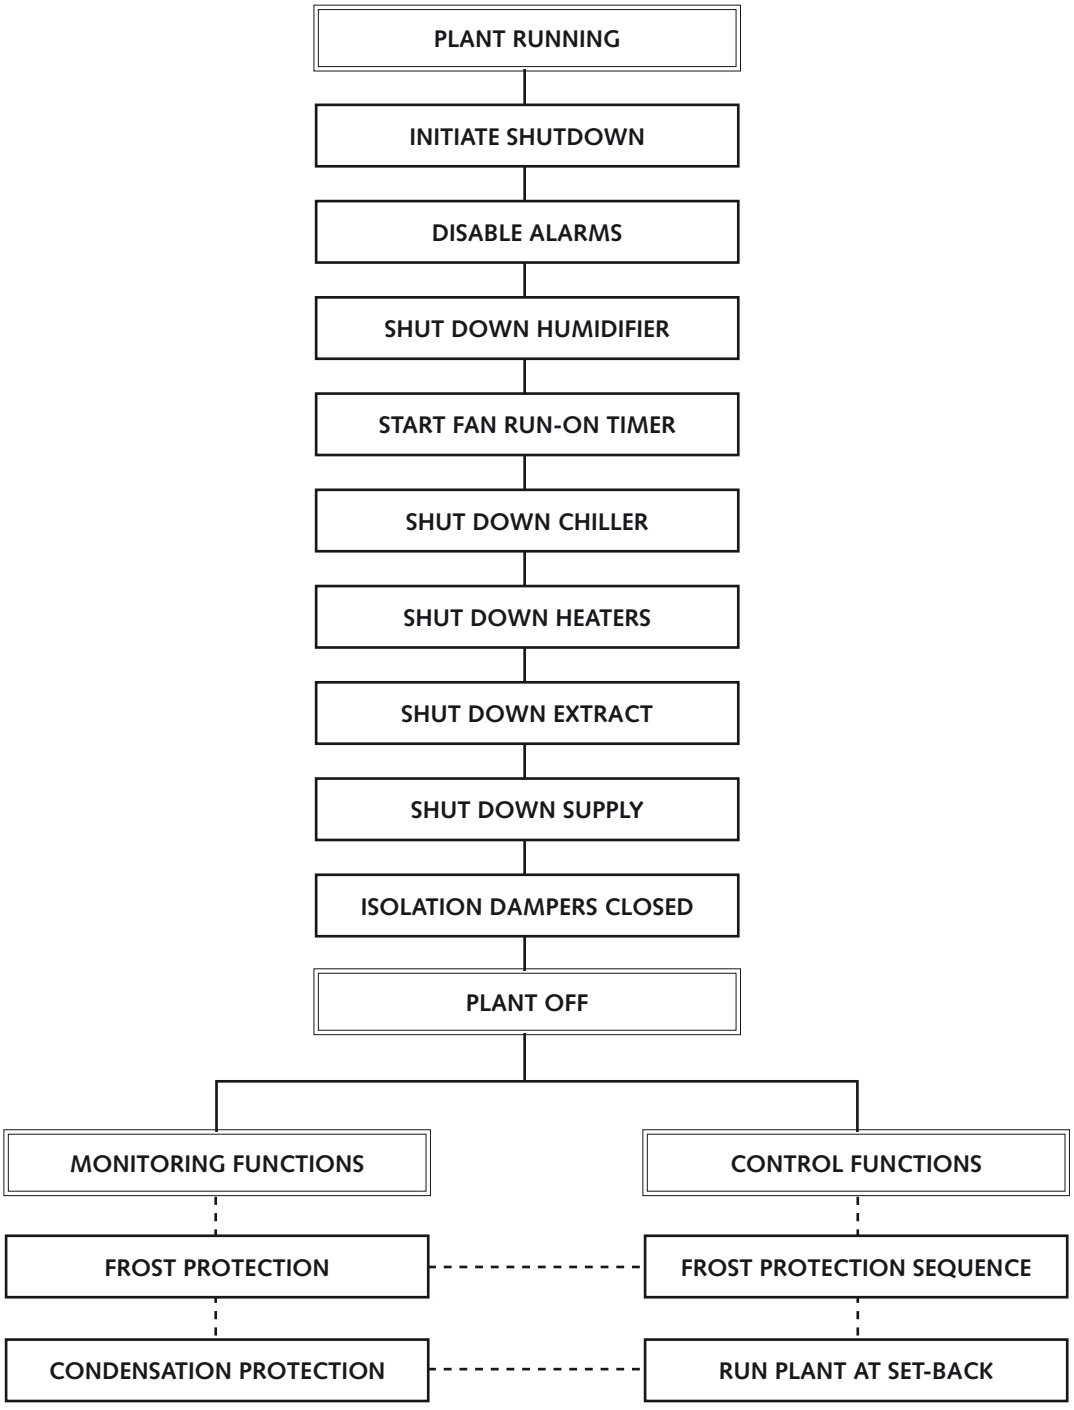

Figure 4 Plant control algorithm – set-back sequence

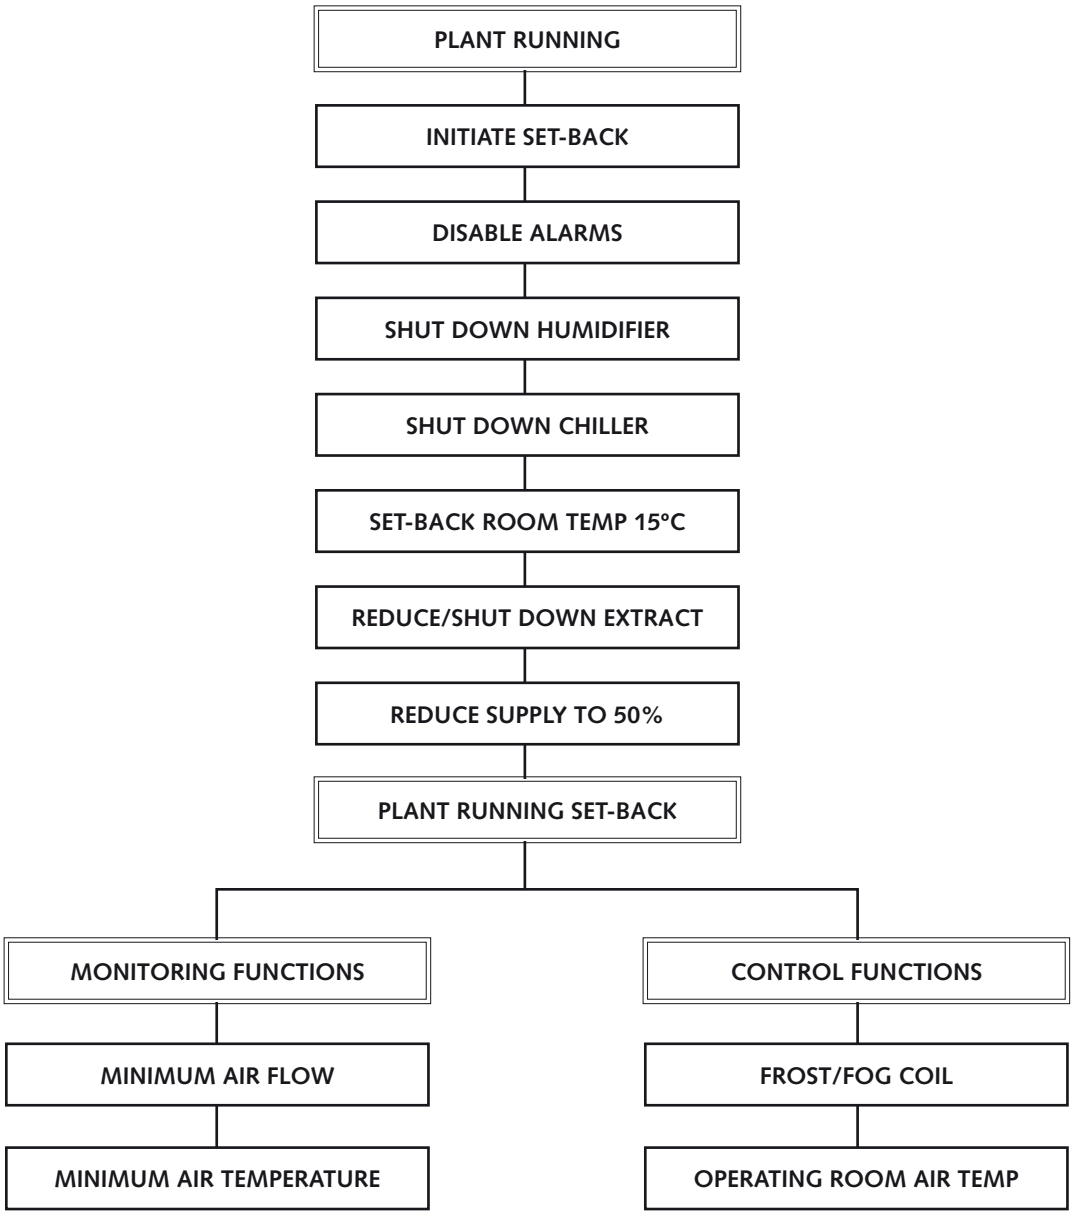

Figure 5 Plant control algorithm – restart from set-back

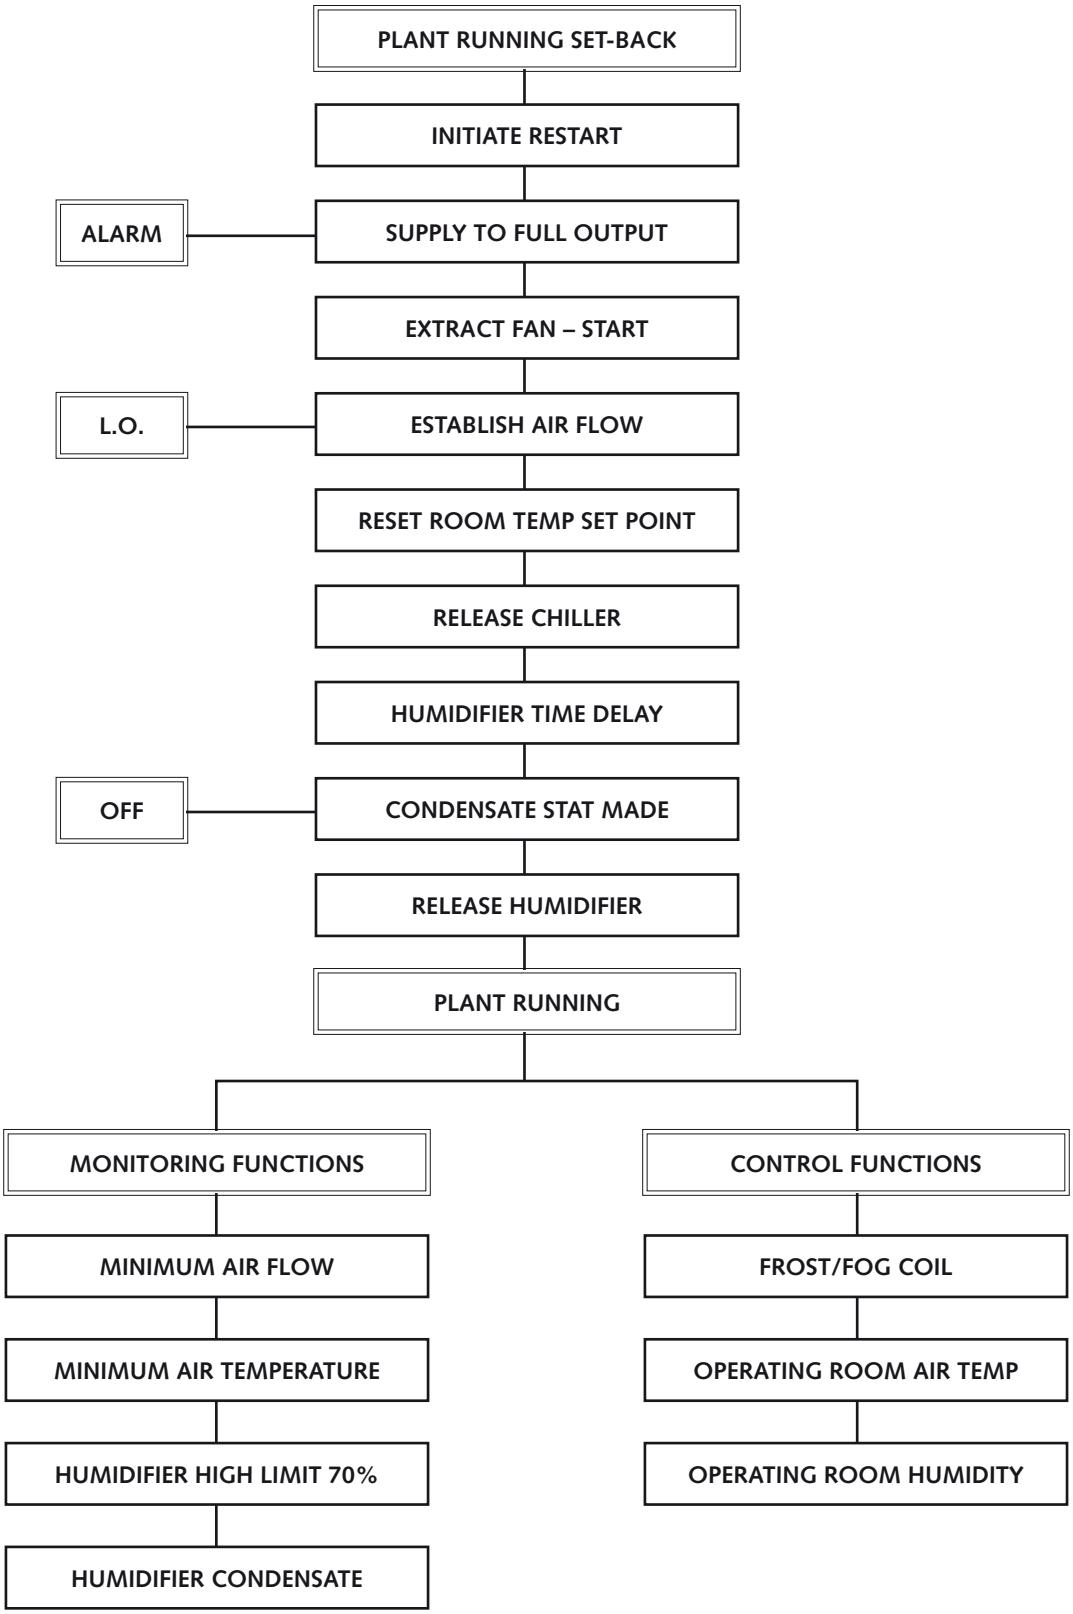


including operating suites (see paragraphs 7.31–7.90).

6.27 A variation on this can be provided by linking ventilation controls to the lighting. For example, in an operating theatre, the system may be off outside of working hours, could run at set-back when the general lighting is switched on, and increase to full speed when the operating lamp is switched on. As with movement detection, a 30-minute run-on should be provided at each stage when the lights are turned off.

6.28 Either of the above control strategies may be refined by linking to the BMS to provide a control logic related to normal working hours and associated "real-time" movement within the zone being controlled. This should result in significant energy savings.

Environmental control

Temperature control methods and application

General

6.29 All control valves must fail-safe, that is, close in the event of power or air-flow failure, with the exception of the fog/frost battery control valve, which should open upon power or air-flow failure.

6.30 Control valves should be located in an accessible position. Isolation valves should be provided to enable the control valve to be removed for service without the need to drain-down the system.

6.31 Care should be taken to ensure that the installation of control valves and their associated pipework do not obstruct access to the AHU inspection doors and hatches.

Room temperature control

6.32 The limits for room temperature set-point are generally between 16°C and 25°C depending on the particular application, and in some specialised instances (for example operating departments) are adjustable within a predetermined range by the user.

6.33 The selection of temperature set-point for each room or zone may be by a control facility in the room/zone or be carried out remotely at the control panel or BMS. Where the control device is mounted within the room/zone and is adjustable by the user, it should be marked either "raise" and "lower" or "+" and "–". It should control within a specified temperature range to suit the user requirement with a control tolerance of ±1 K. All other control set-points should be selectable either on the control panel or at the BMS interface.

6.34 Where local control is provided, an indication of temperature will be required locally or at a staff base (if appropriate) using an analogue or digital indicator. The indicator should be large enough to be read from the normal working position (for example at the operating table in a theatre). This may be mounted in a supervisory control panel, with the signal repeated on the main system control panel or BMS. It is important that this indicator displays the actual measured temperature and not the selected temperature.

Frost coil control

6.35 Steam-supplied fog/frost batteries must be operated as on/off devices with their sensor mounted upstream of the battery. This will give "open loop" control. A set-point of +1°C is recommended.

6.36 LPHW-supplied frost batteries should be controlled using the proportional mode. Their sensor should be located downstream of the battery to give "closed loop" control. A set-point of between 2°C and 5°C is recommended.

6.37 If the temperature downstream of the frost battery, as sensed by a serpentine thermostat, falls below the required set-point over any part of the coil, the plant must automatically shut down in order to prevent damage to the other batteries. The serpentine thermostat must not be in direct contact with the coil.

Off-plant control

6.38 The control logic must prevent the chiller and pre-heater being on at the same time.

Humidity control methods and application

6.39 In order to prevent excessive condensation when starting up from a total plant shut-down, a time delay should be incorporated into the control system such that the humidifier does not start until 30 minutes after the ventilation plant starts up.

6.40 Irrespective of the method of control, a high-limit humidistat should be installed to ensure that when the humidifier operates, the condition of the air in the duct does not exceed 70% saturated, particularly during plant start-up.

6.41 With certain types of steam humidifier, it may be necessary to install a thermostat in the condensate line from the humidifier's steam supply, to ensure that the steam at the control valve is as dry as possible before it is injected into the air supply.

6.42 The humidifier and cooling-coil control must be interlocked so that they cannot be on at the same time.

6.43 The humidifier control system should ensure that it is switched off with the fan. It is preferable to design the control system so that the humidifier is isolated for an adequate time before the fan is turned off so as to purge humid air from the system.

6.44 All control valves must fail-safe (that is, close in the event of power failure), and the humidifier must be interlocked with the low air-flow switch.

Multi-zone control methods and application.

6.45 Close control of all air-conditioning parameters may be difficult to achieve with multi-zone systems, since each zone will in theory require a reheater and humidifier to give total control of humidity, if that is what is required. In reality, such close control is rarely required. It is therefore usual with multi-zone systems to provide control of zonal temperature only, with humidity control, where fitted, being based on average conditions within all zones, or minimum conditions within one zone.

6.46 Where there is a requirement for close control of air-conditioning parameters in a number of zones (for example an operating department), separate plants should be provided for each zone in order to avoid the need for expensive over-cooling and reheating of individual zones.

6.47 The control of most multi-zone systems within healthcare premises is based on off-coil control within the central plant, with trimmer heater-batteries on individual zones.

Alarms and indication

6.48 Supply and extract systems should include indicator lamps on the control panels to confirm the operational status of each system. Where the usage is on a regular daily pattern, time control with a user-operated, timed manual override should be provided.

6.49 Where a system is provided for a particular space, the indicator should be in, or immediately adjacent to, that space, and local controls should be provided with labels clearly defining their function (for example isolation suites).

6.50 The "plant failure" and "low air flow" alarm should be initiated by a paddle switch or other device located in the main air-supply duct. This should operate when the air quantity fails to reach or falls to around 80% of the design value and will give indication of fan failure, closed damper, left-open access door, or any other eventuality that could cause a reduction of air quantity. Monitoring the current drawn by the fan motor is not a substitute for a sensing device that is directly affected by the air flow.

6.51 The "filter fault alarm" should be initiated by a predetermined increase of pressure differential across the filters, thereby indicating a dirty filter.

6.52 Direct-reading gauges or manometers should be installed across filters to give maintenance staff an indication of their condition.

6.53 Visual indication should be provided at a manned staff location (for example the reception or staff base), on the main control panel and on the BMS to show "plant failure" and "low air flow".

7 Specialised ventilation systems

7.1 This section contains design information for a range of healthcare ventilation applications.

7.2 The following departments will require a degree of specialised ventilation:

a. Operating departments:
   (i) treatment rooms;
   (ii) endoscopy, day-case and minimum invasive suites;
   (iii) cardiology and operative imaging suites;
   (iv) conventional operating theatres;
   (v) ultra-clean ventilation (UCV) operating theatres;
   (vi) barn theatres;
   (vii) recovery and ancillary areas.

b. Obstetrics:
   (i) maternity theatres;
   (ii) birthing rooms.

c. Critical areas and high dependency units of any type.

d. Isolation facilities:
   (i) infectious diseases units;
   (ii) bone marrow and other transplant units;
   (iii) chemotherapy and oncology units.

e. Sterile services departments:
   (i) wash rooms;
   (ii) inspection and packing rooms;
   (iii) storage rooms.

f. Pharmacy departments:
   (i) aseptic suites;
   (ii) extemporaneous preparation areas;
   (iii) radio pharmacies.

g. Pathology departments:
   (i) laboratories;
   (ii) Category 3 and 4 rooms.

h. Mortuary and post-mortem rooms:
   (i) mortuaries;
   (ii) post-mortem rooms;
   (iii) specimen stores.

j. Hydrotherapy units.

k. Burns units:
   (i) burns theatres;
   (ii) treatment rooms;
   (iii) isolation rooms;
   (iv) tissue banks.

m. Emerging specialties:
   (i) gene therapy units;
   (ii) stem-cell laboratories.

n. Infrastructure:
   (i) plantrooms housing combustion equipment;
   (ii) welding facilities;
   (iii) woodworking workshops;
   (iv) electric-vehicle charging areas.

7.3 Design information for many of these applications is given in this chapter and also in Appendix 2.

General information

7.4 The section on operating theatre suites is the most extensive and contains much information that is common to other applications. Where no specific guidance is given, the principles set out below should be followed:

a. The foregoing sections of the document contain general information on healthcare-specific

aspects of ventilation system design and specification.

b. A set of standard solutions for the design of general operating theatre suites to conform to past and new standards is given in paragraphs 7.31–7.90, and those for UCV theatres in paragraphs 7.91–7.147.

c. The CIBSE guides A and B contain basic information on ventilation design, which can be applied to most applications.

d. Where a British or European standard exists that is specific to the application (for example a clean room), it should be used as the basis of the design requirement.

e. Air should always move from clean to less clean areas. A hierarchy of room cleanliness is given in Appendix 3.

f. Differential pressure will prevent contamination between areas when doors are closed. Information on air leakage through closed doors and hatches for a range of differential pressures is given in Appendix 4.

g. The flow of air will prevent contamination between areas when doors are open. Information on air leakage through open doors and hatches for a range of differential pressures is given in Appendix 6.

h. If anaesthetic gases are used, 15 air changes per hour will be required.

j. A methodology for calculating a design solution for a non-standard suite of operating rooms is given in Appendix 8. This may be adapted as necessary to suit other less complex applications where air is required to cascade from clean to less clean areas.

7.5 The supply of air to a room has four main functions:

a. to dilute airborne contamination;

b. to control air movement such that the transfer of airborne contaminants from less clean to cleaner areas is minimised;

c. to control the temperature and, if necessary, the humidity of the space;

d. to assist the removal of, and dilute, waste gases where used.

7.6 Because of the complexities of controlling air-movement patterns, much design effort will be required for this aspect. It is important that the design makes the best possible use of the air available, as excessive supply air flows for the control of air movement should not be used. The amount of air supplied will be determined by the number of doors and desired air-change rate.

7.7 Airborne contaminants may enter a room via the following routes:

a. through the supply air;

b. shed directly by the room occupants;

c. as a result of work activities;

d. transferred from adjacent spaces.

7.8 Particles entering with the supply air can be controlled by the selection of suitable filter grades.

7.9 Particles shed directly by the room occupants can be controlled by:

a. restricting access to essential persons only;

b. the choice of the occupants' clothing;

c. the room's air-change rate.

7.10 Particles arising as a result of the work activity can be controlled by:

a. enclosing, semi-enclosing, or otherwise, the work-based source;

b. the room air-change rate.

7.11 The transfer of particles from adjacent spaces can be controlled by:

a. differential pressure;

b. clean air-flow paths.

7.12 Air-change rates are given in Appendix 2. These figures have been found to give sufficient dilution of airborne contaminants, provided the mixing of room air is reasonably uniform.

7.13 Downward-displacement turbulent air distribution is generally preferred. The supply and extract diffusers should be positioned to ensure that all parts of the room are actively ventilated and that, where necessary, staff will be in a clean air-flow path (see Chapter 5 for additional guidance on supply terminals).

7.14 Horizontal-flow room-air distribution with or without a Coanda effect can be a source of draughts and difficult to set up correctly. Its use should be confined to non-critical areas.

Air-movement control

7.15 The design of the system should seek to minimise the movement of contaminated air from less clean to cleaner areas. Transfer grilles enable air to pass in either direction between rooms of equal class and pressure. Pressure stabilisers operate in one direction only; they allow excess air to be directed to the area desired and assist in maintaining room-pressure differentials. When closed, they prevent significant reverse air flow.

7.16 The relative locations of supply and extract terminals and their design air-volume rates will determine the basic air flow between adjacent spaces. Transfer grilles and pressure stabilisers will permit and control the flow of air between spaces, ensuring a flow from the clean to less clean areas. Failure to provide such devices will lead to uncontrolled air flows when personnel move between rooms. It may also result in doors being held partially open by air pressure.

Temperature and humidity control

7.17 To achieve the required room conditions, supply flow rates are calculated conventionally, taking account of all heat and moisture gains and losses, and of maximum permissible temperature differences between the room and supply air. In most applications, the base heating load will be provided by a heating system. In critical systems, the room or suite being considered will be within the heated building envelope so the ventilation will be sized to suit the casual gains or losses.

7.18 Temperature differences of up to 10 K for winter heating and 7 K for summer cooling should not be exceeded (see paragraph 3.10).

7.19 It is acceptable for supply-air humidity to swing uncontrolled between 35% and 70% saturation.

Removal and dilution of waste anaesthetic gases

7.20 Anaesthetic gases are subject to workplace exposure limits. Waste anaesthetic gases must be contained and removed by a suitable gas-scavenging system. Some leakage from anaesthetic equipment and the patient's breathing circuit will occur with all systems, particularly during connection and disconnection, and from the interface with the patient. The air-movement scheme should ensure that this leakage is diluted and removed from the room. Anaesthetic agents are heavier than air; therefore, placing the supply terminal at high level with an extract at low level, adjacent to the anaesthetic-gas terminal units, will ensure that staff are in a clean air-flow path.

7.21 In birthing rooms, the use of anaesthetic gas is controlled on demand by the patient. This may result in significant leakage that – in order to reduce staff exposure – will need to be controlled by establishing a clean air-flow path. A supply at high level at the foot-end of the bed with extract at low level at the head-end will provide such a path.

Fire aspects

7.22 When considering the overall air-flow movement, careful thought needs to be given to the operation of the ventilation system, to limit smoke spread in the event of a fire.

Door protection

7.23 Air should flow from the cleaner to the less clean areas as shown in Appendix 3. There are several factors that affect the likelihood of reverse air flow through doorways:

- when a person passes through a doorway, both the passage of the person and the movement of the door flap cause a transfer of air between the areas separated by the door;
- when a door is left open, there is a transfer of air between the two areas separated by the doorway. This is caused by air turbulence, but is greatly increased by any temperature differential between the areas (a 1.4 m wide doorway may allow the transfer of 0.19 m^3/s of air in each direction when there is no temperature difference, but when the temperature differential increases to 2 K, the volume transferred may increase to 0.24 m^3/s).

7.24 In order to reduce the likelihood of contamination of a clean area by reverse air flow from a less clean area, two methods of door protection are used:

a. closed door protection – a pressure differential is created across a closed door so that any air leakage is from the clean to the less clean area. Appendix 4 gives details of closed-door leakage rates for a range of differential pressures;

b. open door protection – the pressure differential drops (see Appendix 6) and is effectively replaced by a flow of air through the doorway from the clean to the less clean area. The flow of air needs to be sufficiently large to ensure that significant reverse air flow cannot occur, and

will be related to the relative cleanliness of the areas being considered. Appendix 5 gives air-flow rates for open-door protection related to door/opening size and classification of the adjoining areas.

7.25 Pressure stabilisers enable the room's differential pressure to be set when the doors are shut, thus providing closed-door protection. When a door is opened, the stabilisers will close, forcing air to be directed through the doorway, thus providing open-door protection.

7.26 The recommended air-flow rates to achieve this are given in Appendix 4. Provided that the dilution criteria in Appendix 2 are met, the occasional small back-flows created (when two doors are opened simultaneously or when there is a high temperature difference across an open door) will have little effect on the overall air cleanliness of the affected room.

7.27 In applications where it is critical to maintain a specific air flow and/or pressure regime (for example isolation rooms), all windows in the zone should be locked shut or sealed. Trickle vents, if fitted, should also be sealed.

Systems design

7.28 The design of the ventilation system for an area depends on the overall configuration of the department. Where the department is served by more than one AHU, the control of the units may need to be interlocked so that reverse air-flow patterns do not occur.

7.29 Dual-duct high-velocity systems have advantages, but are noisy, costly, and may give rise to unacceptable values of humidity. Single-duct, low-velocity/pressure systems are preferred.

7.30 Extract grilles should be sited and balanced to promote air movement in the desired direction.

Operating department ventilation systems

7.31 The information given in this section relates to general operating suites. It is also applicable to other types of theatre suite such as maternity, burns, cardiac etc. The standard values given may need to be adjusted to reflect non-standard room sizes, pressure regimes and air-change rates.

7.32 A method of obtaining a design solution for non-standard theatres is given in Appendix 8.

Additional information for UCV theatres is given in paragraphs 7.91–7.147.

General

7.33 The supply of air to an operating room has four main functions:

a. to dilute airborne contamination;

b. to control air movement within the suite such that the transfer of airborne contaminants from less clean to cleaner areas is minimised;

c. to control the temperature and, if necessary, the humidity of the space;

d. to assist the removal of, and dilute, waste anaesthetic gases.

7.34 Because of the complexities of controlling air-movement patterns, much design effort will be required for this aspect. It is important that the design makes the best possible use of the air available, as excessive supply air flows for the control of air movement should not be used. The amount of air supplied to the operating room will be determined by the number of doors and desired air-change rate.

7.35 The detailed considerations upon which the supply air-flow rate is based are as follows.

Dilution of airborne bacterial contaminants

7.36 Airborne contaminants may enter an operating room via the following routes:

a. through the supply air;

b. shed by operating staff;

c. through surgical activities;

d. transferred from adjacent spaces.

7.37 Supply flow rates for the main rooms of the operating suite are given in Appendix 7. For the other areas where room sizes and activities vary from site to site, air-change rates are given in Appendix 2. These figures have been found to give sufficient dilution of airborne bacterial contaminants, provided the mixing of room air is reasonably uniform.

7.38 Downward-displacement air distribution is preferred, and may be either turbulent or parallel downward flow. For turbulent flow, supply-air diffusers should be positioned either in the centre of each quadrant of the ceiling or along a line between the centres of each quadrant. This should

ensure that all parts of the room are actively ventilated and that there will be adequate air movement at the operating table. Parallel downward flow is provided by a perforated plenum terminal centred above the operating table (see Chapter 5 for additional guidance on supply terminals).

7.39 Suspended, articulated pendants in theatres require significant structural steelwork in the ceiling void to cater for the loads imposed by the resulting bending moments. It is important to ensure that the void is deep enough to accommodate both the steelwork and the ventilation ducts. However, the location of the steelwork must not prevent a suitable layout of the ventilation ductwork and the appropriate positioning of supply air terminals – the correct ventilation of an operating theatre plays a significant role in controlling healthcare-associated infections and should not therefore be compromised by the need to facilitate the movement of equipment.

7.40 Horizontal-flow distribution with or without a Coanda effect can be difficult to set up correctly and is unlikely to be as effective in theatre applications. It should not be used in new installations; however, space constraints may force its retention or replacement when refurbishing existing installations. Where fitted, the supply grilles will require a means of directional adjustment.

7.45 For general operating theatres, the air supply is filtered in the AHU. Terminal or HEPA filters are not generally required.

Control of air movement within the suite

7.46 The design of the system should seek to minimise the movement of contaminated air from less clean to cleaner areas. Transfer grilles enable air to pass in either direction between rooms of equal class and pressure. Pressure stabilisers operate in one direction only; they allow excess air to be directed to the area desired and assist in maintaining room-pressure differentials.

7.47 The relative locations of supply and extract terminals and their design air-volume rates will determine the basic air flow between adjacent spaces. Transfer grilles and pressure stabilisers will permit and control the flow of air between spaces, ensuring a flow from the clean to less clean areas of the suite. Failure to provide such devices will lead to uncontrolled air flows when personnel move between rooms and doors are held partially open by air pressure.

Temperature and humidity control

7.48 Supply flow rates to achieve the required room conditions are calculated conventionally, taking account of all heat and moisture gains and losses, and of maximum permissible temperature differences between the room and supply air. In most applications the base heating load will be provided by a heating system, or the room being considered will be within the heated building envelope.

7.49 Temperature differences of up to 10 K for winter heating and 7 K for summer cooling must not be exceeded.

7.50 It is acceptable for the humidity to swing uncontrolled between 35% and 60% saturation.

Removal and dilution of waste anaesthetic gases

7.51 Anaesthetic gases are subject to workplace exposure limits. The air-movement scheme should ensure that staff are in a clean air-flow path (see paragraphs 7.20–7.21).

7.52 Air extracted from operating suites should not be recirculated, as it may contain malodorous contaminants; however, an energy-recovery system must be fitted in the extract in order to reduce the plant's energy consumption (see paragraphs 4.146–4.154).

Fire aspects

7.53 When considering overall air-flow movement, careful thought needs to be given to the operation of the ventilation system in order to limit smoke spread in the event of a fire. However, this is a highly staffed department with a low fire risk/load status, and these factors need to be recognised when developing the fire strategy. It is considered satisfactory to treat the complete operating department as a single fire compartment providing there are at least two exits from it. Over-compartmentalisation can lead to difficulties in establishing clean air-flow paths and room-air dilution rates, which in turn may lead to an increased risk of healthcare-associated infections. Staff areas within the department should be treated as a subcompartment (see paragraphs 6.19–6.21).

Door protection

7.54 Air should flow from the cleaner to the less clean areas as shown in Appendix 3. The factors that affect the likelihood of a reverse air flow through doorways are discussed in paragraphs 7.24–7.26.

7.55 It is not possible to design an air-movement scheme, within the restraints of the amount of air available, that will protect the operating room when two doors are simultaneously opened. The design process that has been used considers that each door is opened in turn and ensures that the direction and rate of air flow through any open doorway is sufficient to prevent any serious back-flow of air to a cleaner area.

7.56 Provided that the air-change rates in Appendix 2 are met, dilution will be sufficient to ensure that the occasional small back-flows created (when two doors are opened simultaneously or when there is a high temperature difference across an open door) will have little effect on the overall air cleanliness of the affected room.

7.57 The following general points should be taken into consideration during the design of operating suites:

- Number of exits – the fewer the number of rooms (and therefore doorways) leading from the operating room, the better, as traffic is reduced and less complicated air-movement control schemes are required.
- Scrub and hand-wash facilities – these may be a part of the operating room, often in a bay. The bay would count as a part of the operating room volume and should have a low-level active or passive extract to remove the moisture-laden air. Should a separate room be required for the scrub area, a door between the scrub-up room and the operating room is an inconvenience to scrubbed staff, and could be replaced by an opening that is wider than a normal single doorway. In this case, the scrub would not be considered a part of the operating room volume.
- If a shared scrub is provided for a pair of theatres, it should have an active extract to ensure that air flow is always into it from either theatre.
- If an alcohol scrub regime is employed, individual theatre scrubs may not be required and would be replaced by a common departmental pre-/post-operation scrub position in the corridor. This would require local extract to prevent a build-up of moisture.
- Preparation room "sterile pack store" (SPS) – if it is intended to lay-up instruments in the operating room, the preparation room will simply be used as a sterile pack store. The nominal room pressure can therefore be the same as that of the operating room and the air flow between the two rooms in either direction. Air supplied to the preparation room may be directed into the operating room either through a door-mounted transfer grille, or if no door is fitted, through the opening. Alternatively, stock ready-use sterile items can be located in a bay within the theatre. In this case a portion of the total theatre supply air should be provided in the bay to ensure it is actively ventilated.
- Preparation room "lay-up" – when the preparation room is used as an instrument "lay-up" room, it should be regarded as being of greater cleanliness than the operating room, and the design should minimise the transfer of air from the operating room to the preparation room. Air supplied to the room may be directed to the operating room through a pressure stabiliser, taking care not to compromise the air-flow pattern in the operating room. The air may also be directed into a corridor.
- Shared preparation rooms – if the preparation room is to be shared between two theatres, it should be at a higher pressure (35 Pa) than either of the theatres – even if it is only to be used as a sterile pack store. The doors to the theatres should be interlocked to prevent them both being open at the same time, and the stabilisers should be positioned to discharge into the corridor.
- Service corridor – if materials to be disposed of are placed in impervious material for transportation, it is not necessary to have a separate corridor for this purpose. However, a service corridor has many operational advantages in terms of the flow of materials through the theatre suite. It also permits routine service and maintenance access without compromising the use of adjacent theatre suites.

Standard air-movement control schemes

7.58 In previous versions of this guidance, standard air-movement control schemes were given that provided a range of design solutions to typical

operating-suite layouts. These were satisfactory design solutions for "standard" sized rooms within the suite, but were never intended to be universal for any sized room or suite. Health Building Note 26 – 'Facilities for surgical procedures' increased the recommended size of the operating room from approximately 35 m^2 to 55 m^2. Ancillary room sizes and air-change rates also increased. This meant that the original standard solutions were no longer appropriate for new-build installations.

7.59 Because of the resulting increase in the volume of air supplied to the theatre, provision needs to be made to either actively remove it or allow it to passively escape through pressure stabilisers. The increase in room size has also made the number and position of air-supply terminals critical to the effective ventilation of the room.

7.60 Four new standard solutions have been developed to reflect the current guidance on theatre suite layout and room sizes given in Health Building Note 26, as well as the general increase in air-change rates.

7.61 The most commonly used original standard solutions have been revised and updated. They have been retained in this guidance, as they will remain applicable to older theatre suites that are being refurbished to their original performance standards or are being converted from conventional to UCV theatres. They will also be applicable in existing operating departments where space constraints do not permit a complete upgrade to the latest standard of performance or where a pre-built "shell" is being fitted out.

7.62 It is important to recognise that in any situation where a non-standard room size or theatre suite layout is being considered, the designer must return to first principles when developing a solution. Examples of non-standard configurations are:

- cardiac theatres that typically have an operating room 50% larger than a normal theatre, a perfusion laboratory and no anaesthetic room;
- operating departments served by a central instrument lay-up preparation area rather than individual preparation rooms;
- balanced-flow theatres for infectious cases.

7.63 Appendix 8 contains a methodology for assisting the designer to arrive at a suitable solution.

7.64 The new and revised standard design solutions are as follows:

1 Typical conventional theatre – room sizes as Health Building Note 26.

2 Typical UCV theatre – room sizes as Health Building Note 26.

3 Health Building Note 26 illustrated conventional theatre.

4 Health Building Note 26 illustrated theatre with UCV terminal fitted.

5 Pre-2006 conventional theatre, single corridor (Health Technical Memorandum 2025; 1b).

6 Pre-2006 UCV theatre, single corridor (Health Technical Memorandum 2025; 1a).

7 Pre-2006 conventional theatre, two corridors (Health Technical Memorandum 2025; 5b).

8 Pre-2006 UCV theatre, two corridors (Health Technical Memorandum 2025; 5a).

7.65 Details of these standard solutions are given in Appendix 7, which contains diagrams showing the relationship of rooms and the various doors and transfer devices between them, **but these should not be regarded as architectural layouts**. The schemes have been developed using the calculation procedure described in Appendix 8. Important features of the solutions are:

- Zone trimmer heaters – a trimmer heater-battery is advocated when calculations indicate that the temperature differential between rooms may be greater than 2 K. Generally this will only be the case in the preparation room when designated as a lay-up, although they are sometimes required for anaesthetic rooms.
- The preparation room (sterile pack store)/operating room interface – these rooms are deemed to be of equal cleanliness, and thus a transfer grille is required between them, or the door can be replaced with an opening wider than a standard door.
- Preparation room (lay-up)/operating room interface – pressure stabilisers are recommended here to provide an air path when doors are closed, while preventing back-flow when a door is opened elsewhere.
- Operating room/anaesthetic room interface – pressure stabilisers, or in some cases carefully sized transfer grilles, are recommended here and also between the anaesthetic room and corridor. The amount of air being passed through the

anaesthetic room should not be so great as to cause an unacceptable draught.

- Operating room/clean and service corridors interface – pressure stabilisers combined with low-level active or passive extracts appropriately spaced to ensure air movement in all parts of the operating room.
- Operating room/scrub room interface – an opening is provided between these rooms. The flow of air through the opening provides protection and gives bacterial dilution within the scrub room; the air is then exhausted to the corridor via a pressure stabiliser.

7.66 Mechanical supply or extract ventilation is not normally provided in the scrub room; thus, when a door is opened elsewhere in the suite, the stabiliser will close, allowing the air to be redirected in order to help protect the doorway. If the scrub is a bay within the theatre or if its configuration is liable to cause (in air-movement terms) "dead areas", a combination of a suitably positioned pressure stabiliser and/or active extract should be provided to ensure air movement and to prevent a local build-up of moisture.

7.67 Any other scheme may be used and the standard solutions applied if the following conditions are met:

- room relationships in air network terms are as shown in the plans;
- door-gap measurements approximate to those given in Health Technical Memorandum 58 – 'Internal doorsets' (but see also Appendix 4);
- casual heat gains are accounted for;
- a trimmer battery is installed in the air-supply system to the preparation room;
- leakage through the structure is kept to a minimum.

7.68 It is recommended that every effort should be made to adopt one of the schemes described above.

Air terminals and air distribution within rooms

7.69 The selection and sighting of air diffusers is critical in establishing an efficient pattern of mixing. To this end, the diffusers selected must be fit for purpose. Diffuser designs that provide a downward-displacement turbulent air flow are the preferred option, for example:

a. ceiling-mounted circular "air-master"-style diffusers; and

b. square "four-way-blow" diffusers; or

c. similar designs to those in (a) and (b) (see paragraph 5.68).

7.70 Plenum-type laminar-flow-style diffusers with a footprint that encompasses the operating site are acceptable but may be prone to buoyancy effects as a result of temperature difference. Manufacturers' type-test data should be consulted to ensure that the terminal will achieve the required performance envelope. Note that these are not true laminar-flow systems in the strict sense of the word, but produce downward-displacement parallel-flow air distribution.

7.71 The diffuser equipment chosen should not cause "dumping", and it should provide a velocity 1 m above floor level at the operating position of between 0.2 m/s and 0.3 m/s.

7.72 In the operating room, the supply air terminals must be at high level and should all be adjustable for rate of flow, as well as being easily cleaned and silent in operation.

7.73 In order to ensure that all parts of the operating room are actively ventilated, there should be an air-out path on each face or in each corner of the theatre. This may be provided by a pressure stabiliser, transfer grille, or active or passive extract terminal. A minimum of three, but preferably four, air-out paths – approximately equally spaced – should be provided.

Automatic control

7.74 The automatic control of ventilation in operating suites needs to be simple and robust. Over-reliance on complex room pressure and flow relationships linked to automatic fan speed control are unnecessary and in the long term have been shown to be unreliable. Complex software algorithms that can only be accessed and interpreted by off-site specialists should not be used. Whichever control strategy is chosen, it is important that on-site staff have the facility to override the control system and keep the ventilation operating at least until the surgical procedure is complete (see also paragraph 6.12).

7.75 Theatre air-conditioning control sensors should be actively ventilated. They would typically be located in a sampling duct mounted in the surgeon's panel

and be accessible for cleaning and the removal of fluff and lint.

7.76 Wall-mounted passive-temperature and humidity sensors are not recommended.

7.77 Controls should be provided to enable operating department ventilation plants to be closed down when the operating suites are unoccupied (see also paragraphs 6.26–6.28).

7.78 When in the "off" mode, the control system should ensure that the ventilation plant is automatically reinstated if the space temperature falls below 15°C.

7.79 The theatre's control panel should include:

- plant status indication;
- clearly-readable temperature and humidity gauges; and
- a means of adjusting the set-point for temperature (see paragraphs 6.32–6.34).

The theatre's ventilation-plant status indication should also be located at the staff control base.

7.80 Where it is considered necessary to fit a humidifier, it should be selected to humidify to 40% saturation at 20°C during external winter design conditions. The cooling coil should be able to remove sufficient moisture so that 60% saturation at 20°C is not exceeded during external summer design conditions.

7.81 Each operating suite should be served by an independent supply and extract plant.

Ventilation of operating department ancillary areas

General

7.82 There are advantages in providing mechanical ventilation to all areas of the department. Maintaining operating-suite air-flow patterns is simpler; grilles and diffusers can be sited to eliminate condensation on windows. Where radiators or embedded wall or ceiling panels are installed, they should be confined to the corridors and staff-only areas of the department.

Ventilation requirements

7.83 Appendix 3 gives guidance on the operating department areas in descending order of cleanliness, and this should be considered in the overall design of the department ventilation systems. The specified flow rates of air through doors given in Appendix 5 for the operating suite are not necessary for other areas of the department; however, air-flow directions must be maintained from the clean to the less clean areas.

7.84 All windows in the department should be double-glazed and hermetically-sealed in order to ensure that the desired air-flow pattern is maintained under all external environmental conditions and to avoid infestation. Trickle vents, if fitted, should be sealed.

Systems design

7.85 The design of the ventilation system for ancillary rooms depends on the overall configuration of the department. The ancillary rooms' plant may need to be interlocked to the theatre suite's plants so that reverse air-flow patterns do not occur.

7.86 Extract grilles should be sited and balanced to promote air movement along the clean and access corridors towards the reception/transfer areas. This should not affect the air distribution in the operating suite(s).

Reception

7.87 The aim in these areas is to provide comfortable conditions, having regard to the movement-control requirements of the department as a whole. The number of air changes will depend on the particular design.

Sterile pack bulk store

7.88 The store needs to be maintained at a positive pressure in order to preserve the cleanliness of the outside of the packs; six air changes are recommended.

Recovery

7.89 The air-change rate in the recovery room will be rather higher than that needed merely to provide clean, comfortable conditions, as it is necessary to control the level of anaesthetic gas pollution; 15 air changes are recommended, with a balanced air flow.

7.90 The supply air terminals should be ceiling-mounted above the foot-end of the bed. Extract should be at low level (bed height or below) behind the bedhead or in the corners. This will establish a clean air-flow path so that all reasonable steps are taken to reduce the risk of staff inhaling anaesthetic gases exhaled by recovering patients.

Ultra-clean ventilation systems

General requirements

7.91 The design philosophy of a conventionally ventilated operating suite is based on the need to dilute contaminants and control both the condition and movement of air in an operating suite. Ultra-clean ventilation (UCV) is a means of significantly increasing the dilution effect by providing a large volume of clean filtered air to the zone in which an operation is performed and sterile items are exposed. Air is discharged above the operating zone and, while not truly laminar, its downward displacement purges the clean zone of any contaminants and particles generated within it. The air flow in and around the clean zone also serves to prevent particles originating outside the zone from entering. The resulting reduction in contaminants has been shown to significantly reduce post-operative sepsis following certain orthopaedic procedures.

7.92 The number of bacteria that are present in the air at the wound site and exposed surgical items is dependent on the operating team, their procedural discipline, choice of clothing and the type of UCV system. Ultra-clean air is defined as that containing not more than 10 CFU/m^3.

7.93 UCV systems are very successful in reducing contaminants at the wound site, so it is often considered that there is no need for complex air-movement control schemes in the rest of the suite. However, when designing the ventilation scheme, it should be noted that the users may switch the UCV terminal to set-back when non-orthopaedic surgery is taking place. This is because the high air-flow rate can cause increased moisture evaporation of exposed tissue, which may be detrimental to the surgical outcome. In recognition of this, the ventilation scheme should be capable of providing operating conditions to at least a conventional theatre standard throughout the suite with the UCV in set-back mode. It should also be remembered that suitable levels of ventilation will always be required in the peripheral rooms.

7.94 UCV systems can be designed and built from first principles; or a range of bespoke modular units of varying shapes and sizes are available, each manufacturer having a slightly different approach to UCV design. Some systems are fitted with partial or full walls to delineate the clean zone and direct a laminar or exponential downflow of air within it. Other designs utilise slotted linear supply terminals to produce an air curtain around the clean zone together with laminar-flow diffusers to provide a downward-displacement supply within it. **Notwithstanding any variation in the design philosophy, all UCV systems will be required to completely achieve the performance standards set out in Chapter 8.**

7.95 As with conventional theatres, each UCV operating suite should have its own dedicated AHU to the standard set out in Chapter 4.

7.96 To ensure operational flexibility and permit routine maintenance, AHUs should not be shared between suites.

7.97 In retrofit installations, site conditions may preclude individual AHUs for each suite. In these circumstances, an AHU may be shared between not more than two operating suites, providing each suite has its own control of temperature.

7.98 An accessible air-flow measurement test-point should be provided in the branch supply duct to each theatre so that the primary air volume to each UCV canopy can be determined.

7.99 In addition, the branch supply and extract should be capable of being physically isolated and the main air-flow rate reduced so that either suite can be taken out of use without detriment to operating conditions in the other.

7.100 An inherent feature of a UCV system is its large air flow, so it is essential to recirculate the air supplied to the operating theatre and/or to recover its energy in order to optimise operating costs.

7.101 The primary fresh-air volume supplied to a UCV suite will be the same as in a conventional suite, and it should be dispersed to the rooms in the suite in the same manner. This is an important aspect of the design. Requests by UCV suppliers for increased primary air-supply volumes should be resisted.

7.102 Laying-up in the clean zone is preferable for infection control reasons. Where a preparation room/sterile pack store is provided, a transfer grille should be installed in the preparation room/theatre door.

7.103 If the preparation room is intended to be used for laying-up instruments, a pressure stabiliser will be required between the preparation room and theatre. It should be fitted with a stand-off baffle

to prevent air transfer disturbing the ultra-clean air-flow distribution.

7.104 Separate scrub-up or disposal facilities are not necessary for air cleanliness, although operational policy may prefer such a provision. However, a separate anaesthetic room should be provided.

7.105 There is no aerobiological reason why two or more UCV systems should not be installed in a common area as long as adequate spacing is provided. This type of arrangement is known as a "barn theatre" and requires special design considerations and operational discipline.

7.106 The relative positions of the UCV units, temperature control range and location of doors and openings to other areas will all significantly affect the air flow at the operating positions.

Types of UCV system

Remote plant systems

7.107 In a remote plant system, all air-conditioning equipment is located outside of the operating room, except for the unidirectional air-flow terminal, terminal filter, air diffuser and the return-air grilles (see Figure 6).

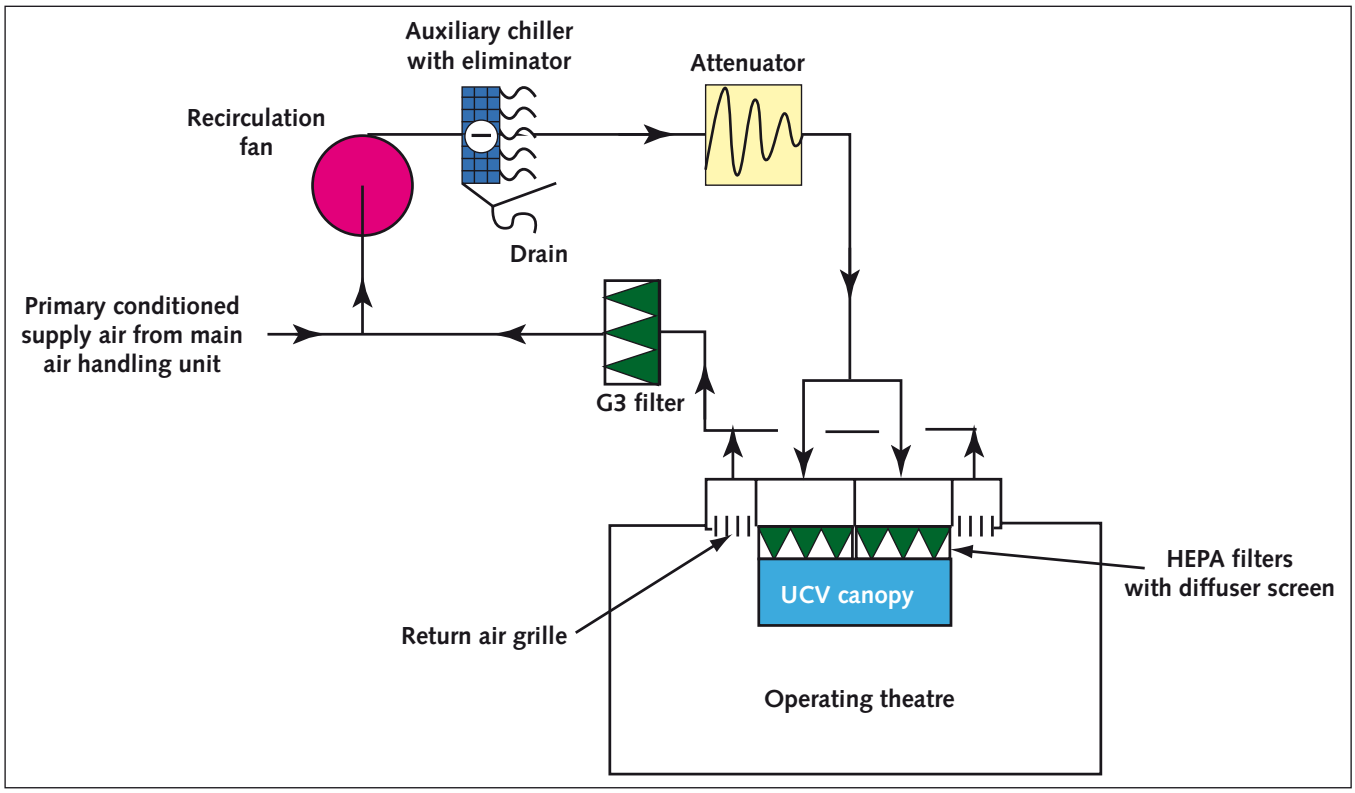
7.108 This arrangement is the preferred option for new installations as it has the following advantages:

- recirculation fans are located outside the theatre, thus reducing noise. Multiple recirculation fans can be replaced by a single fan unit with its drive out of the air stream;
- casual heat gains from recirculation fan(s), canopy lights, equipment and people within the theatre can be removed by a chiller battery in the return air stream. This will prevent heat build-up in the theatre;
- return-air filters can be changed without needing access to the theatre, making routine maintenance more feasible;
- the opportunity exists to locate HEPA filters in the primary supply duct rather than the theatre terminal. This will reduce the number of filters required and allow them to be changed without entering the theatre.

Modular systems

7.109 Modular systems are frequently used in retrofit applications. Vertical or horizontal units are available.

Figure 6 UCV theatre with remote air recirculation



7.110 Vertical-flow modular units comprise a ceiling-mounted air-terminal module containing return-air filters, return-air fans, final filter and air diffuser. Primary air is supplied by a remote air-conditioning unit at the volume and to the standard required for a conventional operating suite (see Figure 7).

7.111 Horizontal- or cross-flow modular units comprise a wall-mounted air-terminal module standing vertically to produce a horizontal flow of air and containing final filter/diffuser, return-air filters and fans. The module may incorporate a full air-conditioning unit or be supplied with fresh air from a separate primary air-conditioning system.

Vertical-flow UCV systems

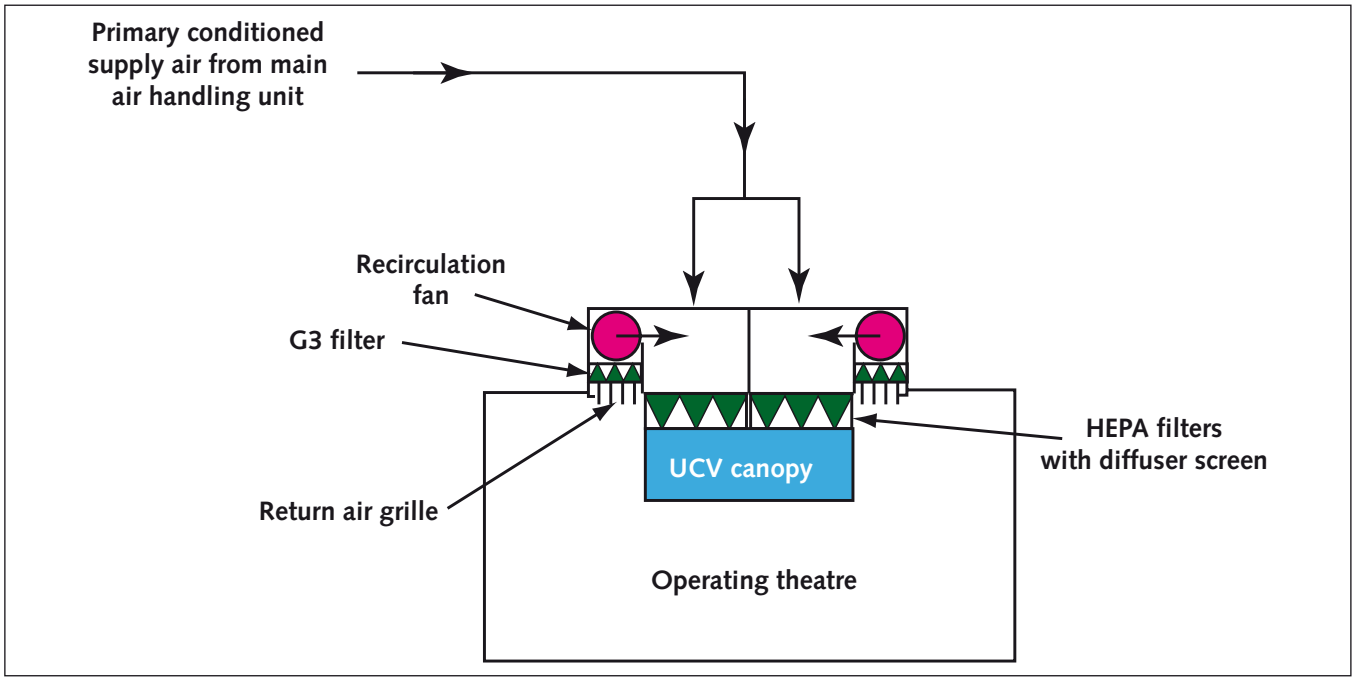
7.112 Vertical-flow systems have a superior performance and are more effective at reducing infection risks. Air-curtain or partial-wall systems are acceptable, but are known to be more susceptible to problems arising from performance deterioration, poor operating-team discipline and high occupancy rates than is the case with full-wall systems. A full wall is considered to be any wall terminating not more than 1 m above the finished floor level.

7.113 Because of the large volume of air being moved in a relatively small space, the siting of the return-air grilles can cause short-circuiting of the air discharged through the UCV terminal. If the return-air grilles are positioned at high level, partial walls should be provided to control short-circuiting. For a 2.8 m × 2.8 m terminal, the partial walls should be not less than 1 m from the operating room walls. The clearance should be increased proportionally for larger terminals (that is, 1.15 m for 3.2 m × 3.2 m units; and 1.25 m for 3.5 m × 3.5 m units). In all cases, the side walls should terminate at 2 m above floor level.

7.114 Siting the return-air grilles around the periphery of the theatre at low level will eliminate short-circuiting, remove the need for partial walls and give an improved air-flow path. In any event, there should be an air-out path on each face or in each corner of the theatre. These may be provided by combination of pressure stabilisers and passive or active low-level extract grilles. Failure to provide air-out paths on all faces of the theatre may result in the surplus air causing entrainment into the clean zone.

7.115 Vertical systems should have a clean zone large enough to encompass the operating site and all of the instrument trays likely to be needed for the surgical procedures to be undertaken. Ophthalmic and minor hand surgery would typically require a 1.4 m circular or rectangular terminal. For major orthopaedic procedures, a minimum size of 2.8 m × 2.8 m will be required. This is the area projected on the floor under the supply air terminal within the partial walls, full walls or air curtain. Any air outside this zone cannot be guaranteed to be ultra-

Figure 7 UCV theatre with modular system



clean although – given the dilution factor – the level of microbiological contamination will be much lower than the general level in a conventional operating room. The use of lines or a coloured area on the floor delineating the extent of the clean zone will assist staff and is therefore essential.

7.116 When upgrading an existing conventional theatre to an ultra-clean standard, the only solution may be the installation of a modular system. In these units, the heat gains from the return-air fans and terminal lights may warrant the inclusion of supplementary cooling within the module. However, issues of cooling-coil drainage, condensate removal and maintenance access within the space constraints of the module may make this option impracticable. The additional cooling load should then be accommodated by conditioning the primary air to compensate.

7.117 If an existing AHU is to be retained, it may require modification to ensure that it achieves the minimum standards set out in Chapter 4. The fan may need re-rating to accommodate the change in system resistance. The cooling coil may also need to be upgraded to cater for the increased load resulting from the return-air fans and terminal lights. Failure to make adequate provision for this may make the theatre unusable during prolonged warm spells.

7.118 A factor affecting air-flow pattern is the supply-air and room-air temperature difference. When the supply-air temperature is significantly above room temperature, buoyancy effects will reduce the volume of air reaching the operating zone. If it is anticipated at design stage that this will be a regular occurrence, a system incorporating full walls should be used. Demountable extensions that convert a partial wall to a full-wall unit are available.

7.119 Convection up-currents from the surgical team and operating lamp tend to counter the movement of clean air towards the operating site; hence, the air velocity reaching the operating level is critical. The minimum velocity given in paragraphs 7.120–7.121 has been selected to take account of these factors and is greater than the theoretical minimum value.

7.120 For all vertical UCV systems, the design discharge velocities will be as follows:

Air velocity 2 m above floor level:

- partial-wall system = 0.38 m/s average;
- full-wall system = 0.30 m/s average.

7.121 In order to ensure that the terminal quadrants are in balance, the average air velocity for each quadrant should not exceed ±6% of the measured average velocity for the terminal.

Air velocity 1 m above floor level:

- all systems = 0.2 m/s minimum within the operating zone.

7.122 Chapter 8 gives details of the method of measurement.

7.123 Variable-speed recirculation fans with differential-pressure control may be the most suitable solution for maintaining consistent performance and energy saving.

Horizontal UCV systems

7.124 Horizontal UCV air-flow systems have been shown to be less effective than vertical systems and are not the preferred solution. There may be occasions, however, where architectural, engineering, economic or workload considerations prevent the installation of a vertical-flow system and only a horizontal-flow system can be installed.

7.125 Horizontal- or cross-flow modular units comprise a wall-mounted air terminal standing vertically to produce a horizontal flow of air across the operating field. The terminal module contains the final filters, air diffuser, return-air grilles, filters and fans. The module may incorporate a full air-conditioning unit or be supplied with fresh air from a separate primary air-conditioning system. In the latter case, the return-air fan power may warrant the inclusion of a supplementary cooling coil within the module.

7.126 The system should have side-wall panels at least 2.4 m apart. The panels may fold to facilitate cleaning of the theatre. The minimum height of the terminal should be 2.1 m, and a deflector at the top of the filter/diffuser will be acceptable as an alternative to a full roof. These dimensions reflect currently available equipment and may impose operational constraints in addition to a lower level of performance common to these systems.

Note

In horizontal-flow systems, personnel working between the filter and surgical wound will disperse bacteria that are more likely to contaminate exposed surgical instruments and enter the wound. This may be minimised by the use of improved clothing and operating procedure to reduce dispersion of bacteria. The use of lines on the floor delineating the extent of the clean zone and hatching or colour-coding the "no-entry" zone between the air diffuser and patient will serve to prompt staff and are therefore essential.

7.127 The air discharge velocity as measured 1 m from the diffuser face should have a mean value of 0.4 m/s. Chapter 8 gives details of the method of measurement.

Filters

7.128 The main plant's primary and secondary filters should be to the standards and in the location set out in Chapter 4.

7.129 Terminal filters should be provided within the air-flow terminal or in the air supply to it. HEPA filters grade H10 (as specified in BS EN 1822) should be installed. There is no aerobiological benefit in fitting filters of a higher grade than this, although for practical reasons most UCV manufacturers recommend the fitting of H12-grade filters.

7.130 In some modular UCV units, the terminal filter is used as a pressure equaliser to balance air flow; filters of a higher grade with a greater pressure drop may be recommended by manufacturers. The increased resistance may affect the velocity of air reaching the operating level, and there will be penalties in terms of installed fan power and higher noise levels.

7.131 The final filters should be installed in a leak-proof housing in a manner that allows the terminal unit, filters and their seals to be validated. A challenge test should be carried out during commissioning to prove the effectiveness of the complete installation.

7.132 Where UCV units are constructed in sections, a means of measuring the pressure drop across the terminal filters in each section should be provided. The pressure test-points should be located outside of the partial wall, capped to prevent air leakage and accessible within the theatre without the need to open the unit's inspection panels. Alternatively, direct-reading pressure gauges should be fitted.

7.133 The UCV system will require a return-air filter to capture the relatively coarse particles that would otherwise significantly reduce the life of the final filter. This should be at least a G3 grade to BS EN 779. In remote recirculation systems, there may be advantages in fitting a higher grade return-air filter as it will reduce the load on the terminal HEPA filters and extend their life.

Noise level

7.134 If sound-attenuating material is used to line any portion of the inside of the UCV unit, it should be non-particle-shedding and fire-resistant (see Health Technical Memorandum 05-02).

7.135 The maximum noise level in an operating room fitted with a UCV terminal of any type should not exceed 50 NR. Chapter 8 gives details of the method of measurement.

Lighting and operating lights

7.136 CIBSE lighting guide LG2 and BS EN 12464-1 give detailed information on lighting requirements. Operating luminaires should comply with the photometric requirements detailed in relevant sections of BS EN 60601.

7.137 The position of the UCV light fittings and style of partial walls, where fitted, should neither adversely disturb the air flow nor result in significant spatial variations in illuminance levels.

7.138 In vertical units, specialised task lighting should be provided by toroidal, cruciform or small multiple dome-shaped luminaires, as they have good aerodynamic properties. The ideal luminaire will have a minimal effect on the air flow regardless of where it is positioned. Large-diameter saucer-shaped luminaires should not be used in vertical-flow systems as they will occlude the air flow in the critical central zone. It is important to consider the suitability of existing luminaires when retrofitting UCV systems.

7.139 In vertical UCV installations, a minimum of 2.75 m from floor to underside of the diffuser is required to allow for supporting mechanisms and lamp articulation. When upgrading existing systems, this dimension may not be achievable; however, when parked, the lowest point of the central light stem, luminaire and articulation arms should never be less than 2 m above floor level.

7.140 The traditional means of light support is a central column that passes through the UCV terminal and is rigidly fixed to the building structure. The position of the support therefore prevents air being supplied at the centre of the terminal. Separate supports displaced from the centre of the clean zone would lead to improved air flow.

Note

This approach was advocated in the 1994 version of this guidance but at the time of writing, no UK manufacturer has chosen to adopt this solution.

7.141 In horizontal units, the size or shape of the specialised task luminaire has little effect on the air-flow pattern.

Controls and instrumentation

7.142 The functions of the supply AHU and extract ventilation should be continuously monitored by a BMS control unit. The controls and instrumentation for the main plant are set out in Chapter 6.

7.143 UCV systems will additionally require:

- a set-back facility that can reduce the air supplied through the UCV terminal to a volume that equates to an amount not less than 25 air changes per hour of the operating room's gross volume whilst still leaving the supply AHU operating at full speed;
- a facility to turn off the entire system, the supply AHU and the UCV terminal (an emergency stop is not required);
- a read-out sufficiently large to be clearly visible from the operating table that shows the temperature of the air being supplied by the UCV terminal;
- a read-out sufficiently large to be clearly visible from the operating table that shows the relative humidity of the air being supplied by the UCV terminal;
- a red indicator light that will illuminate when either the supply AHU or the UCV terminal fails; either or both are switched off or the AHU and UCV terminal are at set-back;
- an amber indicator light that will illuminate when the UCV terminal is at set-back and the supply AHU is running;
- a green indicator light that will illuminate when both the supply AHU and UCV terminal are operating at full speed;
- a blue indicator light that will illuminate when the UCV terminal's HEPA-filter resistance causes the air delivered to fall below 80% of the design flow rate.

See Table 6.

7.144 The switching devices and indicators should be incorporated in the surgeon's panel and their functions clearly labelled. In retrofit installations, an auxiliary panel for the UCV may be the most practical option. If fitted, it should be mounted adjacent to the surgeon's panel and their control functions interlocked as necessary.

7.145 When a system is designed to have partial walls with full-wall extensions, a volume control facility may be incorporated to allow the system to be run with reduced velocity when the demountable full walls are in place. It is the responsibility of the user to ensure correct operation of the system. To assist

Table 6 Indicator-light logic table

AHU	UVC terminal	Indicator light	Comment
Off or Fault	Off or Fault	Red	Ventilation not operating at a suitable level to commence surgical procedures
Off or Fault	On (set-back)		
Off or Fault	On (full speed)		
On (set-back)	Off or Fault		
On (full speed)	Off or Fault		
On (set-back)	On (set-back)		
On (full speed)	On (set-back)	Amber	Ventilation provided to at least conventional theatre standard
On (full speed)	On (full speed)	Green	Full UCV standard conditions
–	–	Blue	HEPA-filter resistance causing low air flow

the user, an explanatory notice should be included on the theatre's control panel.

7.146 A direct-reading gauge should be fitted in the theatre to show a representative pressure drop across the final filters. If the UCV control box is located out of the theatre and has a means of manually adjusting the return-air fan speed, it should also be fitted with a direct-reading differential-pressure gauge. The means of adjusting the return-air fan speed should be lockable to prevent casual adjustment. The direct-reading gauges should be fitted with a means of indicating the correct operating pressure range.

7.147 The UCV-unit manufacturer's control box should be located in an accessible position, preferably in the operating department adjacent to the operating theatre that it serves. A service corridor, if provided, is an ideal location. The control box should be clearly labelled with the identity of the operating theatre that it serves.

Extract systems

7.148 Extracts may be provided for a variety of reasons including:

- simple odour control (for example in a WC or mortuary);
- to receive and remove moisture-laden air (for example in a kitchen);
- as part of a combined supply/extract balanced system (for example in an operating suite);
- to capture a hazardous substance at source (for example a safety cabinet).

7.149 Devices that use an inflow of air to control exposure of staff to hazardous substances are classified as LEV systems under the COSHH Regulations.

7.150 An LEV system may comprise a self-contained unit incorporating its own carbon filter such as a simple bench-top fume cupboard. Alternatively, it may be a complete ventilation system comprising a make-up air supply, multiple-exhaust-protected workstations, branch and central extract ductwork, duplex extract fans and a high-level discharge terminal. It may also incorporate a special filtration system appropriate to the hazardous substance being controlled. Such systems could be required for workshops containing woodworking machinery or large centralised pathology laboratories housing multiple safety cabinets, cut-up benches, fume cupboards and specimen stores.

7.151 Typical LEV systems found in healthcare premises include:

- microbiological safety cabinets and Category 3 containment rooms;
- fume cupboards and plate-staining equipment;
- welding-fume extracts;
- woodworking-machinery dust collectors;
- battery-charging bay extracts;
- powered plaster and bone saws;
- pharmaceutical preparation cabinets and tablet machines;
- dissection benches, cut-up benches and some specimen stores;
- isolation facilities for medium- and high-risk infectious diseases;
- dental furnaces, grinders and polishers.

7.152 General design information and guidance for LEV systems is produced by the Health and Safety Executive (HSE) as HS(G)37. Information on the design and installation of microbiological safety cabinets is given in BS5726 and that for fume cupboards is given in BS EN 14175. Their recommendations should be closely followed.

7.153 LEV systems are statutory items that are subject to an independent inspection and test at least every 14 months.

Hood extract systems

Special requirements

7.154 Extract canopies are required over steam-and-heat-emitting appliances, for example sterilizers, and catering and washing equipment.

7.155 Perimeter-drain gulleys and corrosion-proof grease eliminators should be provided on kitchen hoods.

Typical arrangements

7.156 An air-flow velocity of 0.25 m/s to 0.5 m/s is suitable to collect and remove evaporation of steam and cooking vapours. Excessive velocities are wasteful of power and generate noise.

7.157 The lowest edge of the canopy should be 2 m above finished floor level, with a minimum of

300 mm overhang beyond the edge of the equipment on all sides.

7.158 A compact arrangement of equipment (but with access for maintenance) will minimise the canopy area and hence reduce the air volume necessary to achieve the optimum capture velocity.

7.159 Hoods required for the control of heat gain and vapours may be connected to the general extract system when it is convenient to do so, but where non-corrosive ductwork materials are necessary, a separate discharge is preferred.

7.160 Lighting and internal divider plates are often included in the perimeter of large canopies; however, built-in shelving systems are not recommended as they interfere with the air flow and constitute a maintenance problem.

Control of hood extracts

7.161 Provided that it does not interfere with the operation of the department when not in use, the ventilation system for the hood extract and any associated supply make-up can be shut down. To this end, local or automatic-use control should be provided.

Bench extract systems

Special requirements

7.162 Bench extract ventilation is required in departments such as pathology and mortuary where activities involve the release of malodorous fumes or hazardous substances. Where hazardous substances are being controlled, the system should be designated an LEV.

7.163 Processes that produce hazardous vapours, fumes, dusts or vapours should be enclosed or semi-enclosed in a suitable cabinet or exhaust-protected workstation.

Typical arrangements

7.164 Each ventilated position will usually be accommodated in a continuous run of benching, which should not be more than 650 mm from front to rear and which should be provided with a continuous upstand at the rear. Each position should have a 1200 mm × 150 mm linear extract grille mounted on a purpose-designed plenum box (incorporating guide vanes as necessary), with its face flush with the upstand. The bottom of the grille should be as close as practicable to the level of the working surface (usually 75 mm above, to allow for cleaning). The minimum velocity across any part of the grille should be 1 m/s. The grille should be readily demountable to allow for cleaning.

Control of bench extract systems

7.165 Provided that it does not interfere with the operation of the department when not in use, the ventilation system for the bench extract and any associated make-up supply can be shut down. However, a run-on timer with a minimum setting of 30 minutes must be provided. To this end, local or automatic-use control should be provided.

Safety cabinet and fume-cupboard extract systems

7.166 Safety cabinets and fume cupboards are devices that use an inflow of air to control exposure of staff to hazardous substances. The units, their exhaust systems, filters, fans and discharge terminals are all classified as local exhaust ventilation (LEV) systems under the COSHH Regulations. The make-up air system to a room that contains an LEV system should also be considered as an essential part of the system and be included in the LEV classification.

7.167 Information on the design and installation of microbiological safety cabinets is given in BS5726 and that for fume cupboards is given in BS EN 14175. Their recommendations should be closely followed. The Advisory Committee on Dangerous Pathogens (ACDP) publishes 'The Management, Design and Operation of Microbiological Containment Laboratories' covering the general environment in which they are used and operational considerations.

Special requirements

7.168 The supply-air system should not distort the unidirectional and stable air pattern required for fume cupboards and microbiological safety cabinets. In general, supply-air ceiling diffusers should not discharge directly towards fume cupboards or safety cabinets, unless the terminal velocity is such that the air-flow pattern of the cabinet is unaffected. The design should ensure that high air-change rates and/or the opening and closing of doors do not have any adverse effect on the performance of safety cabinets or fume cupboards. A damped door-closure mechanism may help.

7.169 In order to safeguard the user, all safety cabinets and fume cupboards must be fitted with a clear indication that they are operating correctly. Direct-reading gauges or falling-ball indicators are preferred (in addition to electronic pressure indicators). The system should be set to audibly alarm if the face velocity falls below the minimum safe operating level.

Arrangements for safety cabinet installations

7.170 A Class 1 microbiological safety cabinet must be specified for routine work involving Group 3 pathogens. It should be housed in a Category 3 containment room. Information on containment rooms is issued by ACDP in 'The Management, Design and Operation of Microbiological Containment Laboratories'.

7.171 Siting and installation of microbiological safety cabinets are of particular importance because:

- protection afforded to the operator by the cabinet depends on a specific and stable unidirectional air flow through the open front;
- protection to the environment by the cabinet depends on HEPA filters. The exhaust air should never be considered as totally free from microbiological hazard.

7.172 Extract air from a microbiological safety cabinet is HEPA-filtered prior to discharge to the outside. The extract ductwork should as far as practicable be kept under negative pressure while inside the building.

7.173 Current standards permit the installation of microbiological safety cabinets with integral fans, provided that the extract ductwork can be kept short (that is, less than 2 m); such an installation, however, is likely to be noisy and is not recommended for use in new buildings.

7.174 The discharge from the cabinet should be fitted with a back-draught damper. In multiple installations where several cabinets discharge into a common extract and discharge duct, it must be possible to isolate each cabinet from the system when not in use.

7.175 Roof-level discharge, wherever practicable, is preferred since it removes much of the uncertainty over air re-entering the building through ventilation inlets and/or windows. In such an installation, the extract fan should be situated separately from the cabinet and close to the discharge outlet, to maintain the duct within the building under negative pressure. The discharge point on a flat roof should be through a 3 m high terminal. This is required to safeguard staff who may need to periodically access the roof for maintenance. This requirement will also be applicable to fume-cupboard discharges.

7.176 Where this is impracticable, discharge into the room via a double HEPA filter has been accepted; the preferred method, however, is to discharge above the roof line as above.

Arrangements for fume-cupboard installations

7.177 The primary factors which contribute to the effective performance of fume cupboards include:

- an adequate volume of supply air;
- an effective exhaust system to promote the safe dispersal of waste products to atmosphere.

7.178 The air velocities through sash openings must be sufficient to prevent hazardous materials from entering the laboratory while avoiding excess flow rates that interfere with the investigation process. The design velocity must be maintained irrespective of whether the sash opening is varied or whether doors or windows are open or closed. Variable air volume (VAV) cupboards are available, which will offer a reduction in energy costs.

7.179 The possibility of a fire or explosion which may not be contained by a fume cupboard must always be considered. A fume cupboard should not, therefore, be sited in a position where exit to an escape route will necessitate passing directly in front of it.

7.180 Fume-cupboard fans should be installed as near as possible to the termination of the duct, thus maintaining the maximum amount of ductwork at negative pressure.

7.181 Where there are adjacent buildings with opening windows, or where down-draughts occur, it may be necessary to increase the height of discharge ducts in order to achieve adequate dispersal. In complex locations, air-flow modelling or wind-tunnel tests may be required to determine the optimum height of the stack (see also paragraph 7.174).

7.182 Fume cupboards for certain processes must have separate extract systems; however, if permissible, individual fume-cupboard exhaust systems may discharge via non-returning dampers into a single

collection duct rather than having a large number of separate stacks. The collection duct should:

- have a large cross-sectional area to minimise its effect on individual exhaust systems;
- be open to atmosphere upstream of the first connection; and
- be designed to discharge a total air volume at least equal to the combined individual extract systems.

7.183 Individual fume-cupboard extract systems, discharging either directly to atmosphere or into a collection duct, do not require duplex fans. However, a collection duct designed to provide dispersal of effluent from a number of individual extracts should have duplex fans with automatic change-over.

7.184 Some fumes are particularly corrosive, so the choice of material for the ductwork and type of extract fan fitted should reflect the nature of the fume being conveyed.

Control of extract systems

7.185 It is desirable to provide local control of safety cabinets in order to maximise the life of the HEPA filter and to permit the sealing of the cabinet and room for fumigation if spillage occurs.

7.186 To cope with the risk of an accident or spillage outside safety cabinets, a panic button should be provided to switch off the supply to that area and to discharge all extracted air to atmosphere.

7.187 In pathology departments, it is necessary to have one or more microbiological safety cabinets and one or more fume cupboards available for use at all times, including weekends; therefore, local overriding controls for all these items and any associated ventilation plant will be necessary.

Plantroom ventilation

General requirements

7.188 Plantrooms need to be ventilated to maintain acceptable temperatures for satisfactory operation of the plant and controls, and for maintenance activities. In the case of plantrooms housing combustion equipment, a secondary function of the ventilation is to provide make-up air for the combustion process.

7.189 The air required should be introduced into the space through inlets positioned to minimise the discomfort to occupants. It should be ensured that they are not blocked, closed deliberately (except in the case of fire shutters if required) nor rendered inoperative by prevailing winds.

Typical LEV discharge stacks

7.190 Plantroom ventilation air should not be used for any other purposes, such as make-up air for extract. Where the plantroom contains combustion equipment, the appliance pressure must not fall below the outside air pressure.

7.191 Specialised healthcare air-handling equipment must not be located in a fire compartment that houses combustion equipment.

7.192 Statutory regulations for plantroom ventilation are contained in the Building Regulations Part J, and further guidance in given in the CIBSE Guides A and B.

7.193 Plant noise is subject to the Control of Noise at Work Regulations 2005 and should not exceed 80 dB(A) within a plantroom. It should be reduced to lower levels where the plant is near to departments sensitive to noise.

Assessment of ventilation levels

7.194 Ventilation requirements must take into account all heat sources within a plantroom and, where there are large glazing areas, solar gains. The ventilation rate should limit the maximum temperature within the plantroom to 32°C.

7.195 As the level of equipment operating during mid-season and summer is often lower than winter conditions, and the cooling effect of the outside air is reduced, it is necessary to calculate the minimum volume for each season of operation, and the inlet and outlet grilles or fan sizes should be chosen to cater for the largest seasonal air volume.

7.196 Replacement air should not be drawn through pipe trenches or fuel service ducts. Where metal ducts penetrate walls and floors, effective sealing should be provided to confine the ventilation to the boiler room and to meet fire protection requirements. Penetration of fire-barrier walls by ventilation ducts should be avoided if possible.

7.197 Fire dampers in plantroom ventilation ducts should be electrically interlocked with the boiler plant.

7.198 Care must be taken to prevent any noise generated in the plantroom emerging from natural or mechanical ventilation openings to the detriment of the surrounding environment. Particular care is necessary with mechanical flue draughts and fan-diluted flue systems.

7.199 Information on required air volumes in contained in the CIBSE Guides A and B.

7.200 Where combustion plant is installed, the high-level (outlet) openings should be sized to cater for the total ventilating air quantity, and the low-level (supply) openings sized to cater for the total combined ventilating and combustion air quantity.

Choice of ventilation system

7.201 Ventilation air may be introduced and exhausted by either natural or mechanical means or a combination of both; however, where possible, natural systems are preferred.

7.202 Generally, small installations at or above ground level should have their combustion and ventilation air provided by natural means, employing both high- and low-level openings.

7.203 Basement, internal and large installations at or above ground level will usually require a combination of natural and mechanical ventilation. If the air-flow rate is difficult, both supply and extract may require mechanical means.

7.204 Whether natural or mechanical, the system should be designed to avoid both horizontal and vertical temperature gradients. Both inlet and outlet openings should be placed on opposite or adjacent sides of the building to reduce the effect of wind forces.

7.205 Where mechanical air supply is employed, electrical interlocks with the boiler plant should be provided to prevent damage in the event of failure of the supply fan(s) once the air volume is established.

7.206 The necessary free opening areas for a naturally ventilated plantroom may be calculated using the method in the CIBSE Guides A and B.

7.207 A combined natural and mechanical ventilation system should allow for natural extract at high level, to take advantage of convective forces in the room, with mechanical supply at low level. The high-level natural ventilators should be sized to cope with the total quantity of ventilation air, as above.

7.208 To prevent leakage of flue gases and to ensure that the flue draught is not impeded at any time, air pressure in the boiler room must not exceed the prevailing outside pressure. Therefore, the fan duty should exceed the calculated total combined combustion and ventilation air quantity by at least 25%. Fan-powered inlets should be arranged to flow outside air into the space at a point where cross-ventilation will ensure pick-up of heat without causing discomfort to occupiers.

7.209 Where it is impractical to provide sufficient natural ventilation to remove the heat emitted by the plant, both mechanical supply and extract will be required.

7.210 The high-level extract should be sized to cater for the total ventilating air quantity, and the low-level supply should exceed the total combined combustion and ventilating air quantity by at least 25%, as above.

Ventilation of hydrotherapy suites

General requirements

7.211 In a hydrotherapy suite, heat recovery should be via a heat pump.

7.212 The quantity of supply air should be calculated as 25 L/s per square metre of wetted surface, with the wetted surface taken as 110% of the pool water surface area.

7.213 A recirculation plant is recommended with fresh air make-up to the standard required by the Building Regulations Part F – Non-domestic Buildings. In practice this may need to be increased to control condensation.

7.214 As far as practicable, recirculated pool air should be provided to the ancillary changing and recovery accommodation, with the only extract from the toilets, laundry/utility room and pool hall.

7.215 Supply air to the pool hall should be introduced at high level and directed towards the perimeter to mitigate condensation, with extract air taken from directly over the pool.

Control of hydrotherapy pool installations

7.216 The supply and extract fans should be interlocked so that the supply fan does not operate until flow is established within the extract system.

7.217 Time-clock control should be provided, with a local override switch to extend the normal operating period as required.

7.218 Night set-back temperature (in the range of 21–25°C) and high humidity control (in the range of 60–75% sat) should be provided to override the time-clock in order to prevent condensation. The exact set-points should be ascertained post-installation.

7.219 A remote indication panel should be provided in the pool hall, giving a visual display of the pool water and pool air temperature.

8 Validation of specialised ventilation systems

Definitions

Commissioning. Commissioning is the process of advancing a system from physical completion to an operating condition. It will normally be carried out by specialist commissioning contractors working in conjunction with equipment suppliers. Commissioning will normally be the responsibility of the main contractor.

Validation. A process of proving that the system is fit for purpose and achieves the operating performance originally specified. It will normally be a condition of contract that "The system will be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life."

Commissioning is often subdivided into sections (for example AHU, automatic controls, air-side balance, building fabric and fittings). Each section may be commissioned by its specialist installer, and they are often accepted in isolation. Validation differs from commissioning in that its purpose is to look at the complete installation from air intake to extract discharge and assess its fitness for purpose as a whole. This involves examining the fabric of the building being served by the system as well as inspecting the ventilation equipment fitted and measuring the actual ventilation performance.

It is unlikely that "in-house" staff will possess the knowledge or equipment necessary to validate critical ventilation systems such as those serving operating suites, pharmacy clean rooms and local exhaust ventilation systems. Validation of these systems should therefore be carried out by a suitably qualified Authorised Person appointed by the client.

It is anticipated that training and certification in the validation of specialised healthcare ventilation systems for Authorised Persons will become available during the life of this Health Technical Memorandum.

Commissioning

8.1 Commissioning is an essential process for ventilation systems. It is therefore important that adequate provision for the process be made at the design stage of the project. Procedures for commissioning air-handling systems are given in CIBSE Commissioning Codes and BSRIA Application Guide Set COMPAK 1.

8.2 The duct-sizing procedure should take into account the requirements of system balancing, and the position and number of regulating dampers included in the design should be sufficient for this purpose.

Location of dampers and test holes

8.3 Balancing/commissioning dampers should be installed in each branch of the distribution ductwork.

8.4 Test holes for the measurement of air-flow should be provided at carefully selected points in main and all branch ducts. The number and spacing of holes are given in the BSRIA Application Guide Set COMPAK 1. Their positions must be identified at the design stage.

8.5 The test positions need to be accessible for commissioning to take place. They may also be required for subsequent annual verification of the system performance, so they should be capped to prevent air leakage but not covered by permanent lagging.

8.6 The measurement point should be in a straight length of duct as far away as possible from any upstream bends, dampers or other elements that could cause disturbance to the air flow. The actual location should be:

a. at least 1.5 duct diameters upstream of sources of turbulence (such as dampers and bends);

b. if (a) is not possible, ten duct diameters downstream of dampers, bends or tees, and five

duct diameters downstream of eccentric reducers;

c. where there is enough space round the duct to insert the Pitot tube and to take readings;

d. where the duct has a constant cross-sectional area.

8.7 Test holes for measuring total air-flow from a fan should be located either four duct diameters upstream or ten duct diameters downstream of the fan. Provision should also be made for ascertaining the direction and measuring the speed of rotation.

Commissioning personnel

8.8 It is unlikely that one particular individual will have all of the required commissioning skills; a commissioning team is therefore usually needed. The objective of commissioning is to ensure that the necessary performance and safety requirements are met.

8.9 During the commissioning process, a great deal of information will be generated, which will form an invaluable future source of reference about the plant. It is essential to ensure that it is collected together in the form of a commissioning manual and handed over to the client on completion of the contract together with the as-fitted drawings. The information should be both in hard copy and electronic format.

8.10 In order to be successful, the commissioning process must start before practical completion, as many parts of the system will become progressively less accessible. The correct installation of those parts will need to be witnessed, and leak-rate tests carried out as construction proceeds. Failure to establish responsibility for commissioning early enough will delay the completion of the project or lead to unsatisfactory plant performance.

Commissioning brief

8.11 The commissioning team will require a detailed brief from the system designer. This should include:

- a user brief comprising a description of the installation and its intended mode of operation;
- the precise design requirements with regard to the scheme of air movement, room static pressures, supply and extract air-flow rates and acceptable tolerances;
- full details of the design conditions, both inside and out, for winter and summer together with the control strategy;
- the equipment manufacturer's type-test data, commissioning, operation and maintenance recommendations;
- drawings showing the layout of the system, positions of air-flow measurement test-points, dampers, regulating devices and filters within the duct runs, together with sizes of ducts and terminal fittings. It will save time if these drawings are annotated with the design volumes and static pressures required at each branch and outlet point (see Table 7 for information to be included on schematic drawings);
- wiring diagrams for all electrical equipment associated with the air-handling systems including motor control circuit details and any interlocking and safety devices such as emergency-stop buttons adjacent to the item of plant.

8.12 CIBSE's Commissioning Code A – 'Air distribution systems' provides full guidance on the information that will be required by the commissioning team.

8.13 The designer should include in the contract documents instructions on verifying the accuracy of test instruments, which should be supported by reference to relevant calibration certificates.

8.14 On completion, the system should be operated by the contractor as a whole and subject to performance tests in accordance with the contract requirements. For critical systems, these should include independent validation of the system performance on behalf of the client.

8.15 The commissioning process should be carried out in the order in which it appears in this guidance document; that is, the static checks and visual inspections should be followed by the dynamic and performance tests (as outlined in this chapter) and finally the handover procedures.

8.16 Prior to dynamic commissioning, it is essential that builders' work in the area served by the system is complete, all rubbish and dust is removed, Institute of Plumbing service (IPS) panels are in position and ceiling tiles are in place and clipped. Floors should be mopped, and visible dust removed from all other surfaces.

8.17 Once the system is shown to meet the design intent, the handover documentation should be

Table 7 Information to be provided on schematic drawings

Items in system	Information to be provided
Fans	Fan total pressure Volume flow rate at high and low speed Maximum motor current
Plant items	Type and identification numbers from equipment schedules Fluid and air-volume flow rates Fluid and air-side pressure losses Dry-bulb temperatures Wet-bulb temperatures Humidity
Dampers, including motorised and fire dampers	Identification numbers from equipment schedules Location Identification number Volume flow rate
Main and branch ducts	Dimensions Volume flow rates and velocities Identification numbers from equipment schedules
Terminal	Location Identification number Grille or diffuser factor Volume flow rate and neck velocity Operating static pressure
Test holes and access panels	Location Identification number
Controllers	Set-points

Notes: Fan total pressure is the difference between the total pressure (static pressure + velocity pressure) at the fan outlet and the total pressure at the fan inlet.
Where volume flow rates are variable, maximum and minimum values should be provided.

completed. In the event of performance not being acceptable, the matter should be dealt with in accordance with the contract arrangements.

Pre-commissioning checks

8.18 The pre-commissioning checks consist of visual inspection, manual operation of equipment, static measurements and functional tests of individual components. They should be carried out prior to setting the system to work and undertaking the dynamic commissioning process set out in paragraphs 8.29–8.42.

Standard of installation

8.19 During the installation of the system, the following must be witnessed by either the client or his representative:

- that the plant and installations have been provided and installed in accordance with the design specification and drawings;
- that only approved sealants have been used in the installation;
- that all components function correctly;
- that the satisfactory sealing of access doors and viewing ports have been carried out;
- that air-pressure tests and air-leakage tests on ventilation ducting have been carried out in accordance with the methods set out in the HVCA's (1998) 'DW/143 – A practical guide to ductwork leakage testing'. It is usual to carry out these tests a section at a time as the ductwork is installed and before its insulation is applied. The results must be recorded in the commissioning manual;
- that gaps around doors and hatches are as specified in the design;
- that the correct operation of pressure stabilisers, and control, isolating and non-return dampers have been checked and installed in the correct orientation for air flow;

- that test holes have been provided in their specified locations and are sealed with suitable grommets;
- that control dampers are secured and their quadrants fitted correctly;
- that any interlocks are operative and in accordance with specification;
- that the electric circuits are completed, tested and energised;
- that electric motors have been checked for correct direction of rotation at both full speed and set-back;
- that cooling and heating media are available at correct temperatures and pressures, and in specified quantities;
- that the air-conditioning plant's components and controls function correctly;
- that the air-conditioning plant's interlocks and safety controls function correctly;
- that the plant is physically complete, insulation is applied, and all ducts and pipework are identified as specified;
- that the building housing the ventilation plant is generally in a fit condition for commissioning and performance tests to commence – that is, windows, doors, partitions etc are completed, surfaces sealed and their final finish applied;
- that the areas containing the ventilation plant and those being served by it are clean;
- that access to all parts of the system is safe and satisfactory.

Cleanliness of installation

8.20 During installation it must be established that ductwork is being installed to the "advanced level" as defined in the HVCA's (2005) 'TR/19 – Guide to good practice: internal cleanliness of ventilation systems'. This specifically includes ensuring that ductwork sections arrive on site and are stored with their open ends sealed and that open ends remain sealed during installation to prevent the ingress of builders' dust.

8.21 Should any doubt exist as to whether the guidance has been observed, the ducts must be cleaned internally to restore them to this standard before being taken into use.

8.22 Builders' work ducts of brick or concrete must be surface-sealed to prevent the release of dust before being taken into use.

8.23 The area around the supply-air intake must be free of vegetation, waste, rubbish, builders' debris or any other possible source of contamination.

Certification of equipment

8.24 The following test certificates should be assembled by the commissioning team and be available for inspection at any time during the contract period. They will form part of the handover information and should be placed in the commissioning manual:

- type-test performance certificates for fans;
- pressure-test certificates for:
  - heater-batteries;
  - cooling coils;
  - humidifiers (if appropriate);
- type-test certificates for attenuators;
- type-test certificates for primary and secondary filters;
- individual test certificates for HEPA filters.

Equipment tests

8.25 Prior to setting the system to work, the checks in paragraphs 8.26–8.28 should be witnessed, and proving tests should be carried out as detailed.

Filters

8.26 The quality of filter housing and, in particular, seals is a critical factor in maintaining the efficacy of the filtration system by ensuring that air does not bypass the filter panels. Therefore, the following checks should be made:

- filter seals should be fitted and in good condition;
- filters should be installed correctly with respect to air flow;
- bag filters should be installed so that the bags are vertical and their pockets free;
- HEPA filters should be installed in a sealed housing and their seals tested to DIN 1946 if specified;

- all filters should be checked to ensure they are free of visible damage;
- the differential-pressure indicators should be checked for accuracy and to see that they are marked with the initial and final filter resistance.

Drainage arrangements

8.27 The drain should conform in all respects to the guidance given in this Health Technical Memorandum. In addition, the following must be proved:

- that the drain tray is easily removable;
- that a clear trap is fitted and is easily removable;
- that the drain has a clear air gap of at least 15 mm;
- that the pipework and trap are supported so that the air break cannot be reduced;
- that the drain system from each drain tray is independent up to the air break;
- that the operation of the drainage system is proved by introducing water into the duct at the drain tray and observing that it completely drains out. This check is to be repeated both at normal speed and set-back once the fans have been commissioned. At this time, the clear trap can be marked to indicate the normal water level with the fan running.

Fire dampers

8.28 The following must be witnessed, and proving tests should be carried out as detailed:

- the operation of all fire dampers;
- access provided to enable the dampers to be visually inspected and/or re-set should be sufficient for the purpose;
- indication should be provided of the dampers' position (open/tripped);
- indication of the fire dampers' location should be provided both on the ductwork and at a visible point on the building fabric if the ductwork is concealed.

Dynamic commissioning

Air-handling and distribution system

8.29 The fan drive, direction of rotation, speed and current drawn should be set in accordance with manufacturers' instructions.

8.30 After the installation has been checked to ensure that it is in a satisfactory and safe condition for start-up, it should be set to work and regulated to enable the plant to meet its design specification. The proportional balancing method described in CIBSE's Commissioning Code A should be followed. The air-flow rates must be set within the tolerances laid down in the design brief. This will normally be the design air-flow rate +10% –0%, that is, the measured value must at least achieve the design but must not exceed it by more than 10%.

8.31 When combined supply and extract systems are to be balanced and the area that they serve is to be at or above atmospheric pressure, the supply should be balanced first with the extract fan switched off, and then the extract balanced with the supply fan(s) on.

8.32 For combined systems where the area that they serve is to be below atmospheric pressure, the extract should be balanced first with the supply fan switched off and then the supply balanced with the extract fan on.

8.33 On completion of the balance, all volume air flows in supply and extract ducts and from grilles and diffusers must be measured and recorded. The true air-change rate can then be calculated from the data obtained.

8.34 The main supply and extract duct-volume control dampers should be locked and their position marked.

8.35 All grille and diffuser volume-control registers should be locked to prevent alteration and their final position marked.

Room-air distribution

8.36 Pressure-relief dampers and pressure stabilisers should be set to achieve the specified room's static pressures and should be locked. The grille's direction-control vanes and diffuser cones must be set to give the specified air-movement pattern. Visualisation techniques may need to be employed in order to prove that the required air-flow pattern is being achieved. This may be a particular

requirement when commissioning LEV systems or rooms that contain them.

Air-conditioning plant

8.37 The specified flow rate and/or pressure drops must be set for all heater-batteries, cooling coils and humidifiers. The methods described in CIBSE's Commissioning Codes W and R should be followed. On completion, their regulating devices must be locked to prevent alteration.

Control system

8.38 The control system should not be commissioned until both the air distribution system and air-conditioning equipment have been commissioned.

8.39 Because of the specialised nature of control systems and the fact that each manufacturer's system will contain its own specific components and settings, the commissioning should be completed by the supplier and contractor before being witnessed by a representative of the client.

8.40 The location of all control and monitoring sensors should be checked and their accuracy proved.

8.41 The control system's ability to carry out its specified functions must be proved. In this respect it is essential that control indication lights on the panel or mimic on the BMS actually relate to the running of a specific fan or movement of a damper.

8.42 If the plant is provided with a user's control panel in addition to the one located in the plantroom, the operation of both must be proved. This will typically apply to operating departments and laboratory systems.

Specific performance standards

Air movement

8.43 The performance of the system should be measured and compared with information provided by the designer.

Plant capacity and control

8.44 When setting to work and proving the design, both the contractor responsible for the air-handling plant and the control specialist should attend the site together and jointly commission the system.

8.45 If any doubt exists as to the capacity of the installed system, its ability to achieve the specified internal design conditions with the plant operating at external winter and summer design conditions must be proved. Artificial loads will be required in order to simulate the internal gains/losses and the external design conditions.

8.46 On completion of the plant's performance test, recording thermo-hygrographs should be placed in each room/area served by the plant and also the supply-air duct upstream of the fog/frost coil. The plant should be run for 24 hours with all doors closed. During this period, the inside conditions must stay within the tolerances specified. Alternatively the BMS may be used to obtain the information required.

Noise levels – general

8.47 The commissioning noise level is that measured with a sound-level meter in the unoccupied room, taking account of the external noise together with the noise generated by the ventilation system. Appendix 2 gives a summary for many applications. Full details and design information are contained in Health Technical Memorandum 08-01 – 'Acoustics'.

8.48 The noise levels apply at the maximum velocity for which the system is designed to operate. Acoustic commissioning tests should be carried out with all plant and machinery running normally and achieving the design conditions of air flow, temperature and humidity.

8.49 An industrial-grade Type 2 sound-level meter fitted with a muff will normally be sufficient to check the noise level. Its accuracy should be checked using a calibrated sound source before use.

8.50 The noise-level readings should be taken at typical normal listening positions 1.5 m above floor level and at least 1 m from any surface, and not on any line of symmetry. In critical care areas, the noise should be measured near to the centre of the room and near to the centre of each quarter. The mean of the five readings should then be calculated.

8.51 In the event of a contractual deficiency, a Type 1 precision-grade sound-level meter should be used, and the noise level determined by the procedure given in Health Technical Memorandum 08-01.

Filter challenge

General ventilation filters

8.52 In-situ performance tests will not normally be required for primary and secondary filters and

their housings. However, filters should be visually inspected for grade, tears, orientation and fit within their housings. Filters should be clean and a replacement set should be available. Bag filters should be installed so that their bags are vertical, and spaced so that air can move through them freely. Any filter found to be wet should be replaced and the cause investigated.

HEPA filters (for exhaust protective enclosures and laboratories)

8.53 Pathogenic material may be discharged through damaged or badly installed HEPA terminal filters. The complete installation must be tested using the method set out in BS EN: 14644 'Method of Testing for the Determination of Filter Installation Leaks'.

8.54 The challenge tests may be carried out using either of the following techniques:

- use DOP to provide the challenge and a photometer to detect leaks;
- use a discrete particle counter (DPC) to detect leaks. (In order to obtain a sufficient challenge, it may be necessary to temporarily remove the supply AHU's secondary filters.)

8.55 In both cases, the upstream challenge should be measured. A measurement of particle penetration through a representative section of the HEPA-filter media is then taken and used as the reference background level. These two readings enable the range of the detecting instrument to be set.

8.56 A challenge aerosol of inert particles of the type produced by a DOP generator should be introduced into the air, upstream of the HEPA filter. The downstream face of the filter, its mounting seal and housing would then be scanned for leakage using a photometer. A leak should be deemed to have occurred if a steady and repeatable reading on the photometer at any point exceeds 0.01% of the upstream reading.

8.57 Alternatively, a DPC may be used. For the DPC method, the filter face is sampled at several points to establish the smallest non-penetrating particle size. This will directly relate to the grade of filter under test. The filter face, its seal and housing are then scanned, and if a significant number of particles at or above this size are detected, there is deemed to be a leak at or near the test position.

8.58 Should the HEPA filter fail this test, it must be replaced. Should the filter mounting seal or housing fail this test, it may be repaired and the test repeated.

Bacteriological sampling

General ventilation systems

8.59 Bacteriological sampling will not normally be required for either general or local exhaust ventilation (LEV) systems unless otherwise specified.

Conventional operating rooms

8.60 Before commencing bacteriological testing, the room and its ventilation system should have achieved a steady state condition (see also paragraph 8.75).

8.61 The level of airborne bacteria introduced by the supply air should be checked by closing all doors and leaving the operating room empty with the ventilation system running for 15 minutes. An active air sampler set to take at least a 1 m^3 sample and mounted in the centre of the room approximately 1 m above floor level should then be activated remotely. Aerobic cultures on non-selective media should not exceed ten bacterial and/or fungal colony forming units per cubic metre (CFU/m^3).

8.62 The results should be examined to establish the broad category of organisms present. A high preponderance of fungal organisms may be an indication of inadequate filtration for the particular installation. Precise guidance is inappropriate and will depend on local circumstances.

8.63 A check of airborne bacteria should be carried out during a surgical operation. Unless there are unusually high numbers of personnel or extensive activity in the room, the number of airborne bacterial and/or fungal CFU averaged over any five-minute period would be unlikely to exceed 180 per m^3.

The Hospital Infection Society has issued guidance on the microbiological testing of operating theatres (www.his.org.uk/_db/_documents/OTIC-final.pdf).

Information on the additional validation testing of UCV operating suites is given in paragraphs 8.66–8.164.

Ventilation system commissioning/validation report

8.64 Following commissioning and/or validation, a full report detailing the findings should be produced. The system will only be acceptable to the client if at the time of validation it is considered fit for purpose and will only require routine maintenance in order to remain so for its projected life.

8.65 The report should conclude with a clear statement as to whether the ventilation system achieved or did not achieve the required standard. A copy of the report should be lodged with the following groups:

- the user department;
- infection control (where required);
- estates and facilities.

Validation of UCV operating suites

General

8.66 Commissioning of a UCV terminal will normally be carried out by its supplier. Commissioning of the AHU, fire dampers, distribution ductwork and control systems may be undertaken by different teams. It is therefore important to recognise that the UCV terminal is only one element of the specialised ventilation system serving the operating suite, and it cannot be accepted in isolation.

8.67 In order to ensure that the complete system operates correctly, it will be necessary to validate the system as a whole from the air intake through to the extract discharge.

8.68 It is unlikely that in-house staff will possess the knowledge or equipment necessary to undertake this process. Therefore, a suitably qualified Authorised Person appointed by the client should carry out the validation of ultra-clean operating theatre ventilation systems.

Note

It is anticipated that training in the validation of specialised healthcare ventilation systems for Authorised Persons will become available during the life of this Health Technical Memorandum.

8.69 The following regime of inspection and testing should be applied to the validation of new installations designed to provide ultra-clean conditions in an operating suite. The test regime has been devised to ensure that the system, as installed, fully achieves the design requirement for these systems as set out in paragraphs 7.91–7.147.

Basic requirement

8.70 The operating suite to be validated should be physically complete with final finishes applied. All ventilation systems serving it should be operating correctly and delivering their design air-flow rates.

8.71 In order to avoid preloading the UCV terminal's recirculation ducts and HEPA filters, the operating suite should be free of any obvious dust and at least "builders clean" before the recirculation fans are set to work (see also paragraph 8.16).

8.72 The validation procedure for a conventional theatre suite should have been satisfactorily completed to the standard set out in this chapter prior to attempting to validate the UCV unit. In particular:

- the supply AHU will have achieved the minimum standard;
- the operation of all fire dampers will have been proved;
- the supply and extract air-flow rates as measured in ducts and at room terminals will achieve their design values +10% –0% (see paragraph 8.30);
- the room's differential pressures will be correct.

8.73 Evidence of the satisfactory achievement of the foregoing standards should be available for inspection and independently measured as necessary prior to validating the UCV unit.

UCV unit validation procedure

8.74 Tests to validate the suitability and performance of an ultra-clean operating suite should be undertaken in the order that they appear in Table 8. Should an item fail to meet the required standard, it should be rectified and successfully retested before passing on to the next test.

Table 8 Summary of test regime

1. Challenge tests to ensure that: • the UCV terminal unit is correctly assembled and sealed so that no air will bypass the filters; • the terminal filters are correctly sealed in their housings; • the terminal filters are of the same grade, of uniform quality and undamaged.
2. Air velocity measurements to ensure that: • a sufficient quantity of air is being delivered by the terminal; • the terminal quadrants are in balance; • the air flow has sufficient velocity to reach the working plane.
3. An entrainment test to ensure that contaminants arising outside of the UCV terminal footprint are not drawn into it.
4. Visualisation techniques to gain an understanding of the overall system performance.
5. Noise measurement to ensure that working conditions are satisfactory.
6. Control system checks to ensure that the system operates as specified.
7. Biological monitoring to determine how effective the system is in use.

Test and measuring conditions

8.75 While validating the UCV terminal, the conditions in the operating room should be stable and within the given ranges:

- temperature: 19–23°C dry bulb;
- humidity: 30–65% relative humidity.

Test and measuring equipment

8.76 Any test or measuring equipment used should have a certificate to prove that it has been validated within the previous 12 months at a calibration facility using traceable national standards.

8.77 In the case of a noise meter, its "matched sound source" should have a certificate to prove that it has been validated within the previous 12 months at a calibration facility using traceable national standards. The noise meter should be calibrated to the sound source on each occasion that it is used.

Test grid – vertical units

8.78 A test grid should be constructed on the floor within the ultra-clean terminal footprint as projected by the inside dimensions of the side walls or boundary air curtain. A suitably marked test sheet will provide a consistent standard of test grid.

8.79 The test grid should comprise test squares of 280 mm each side.

8.80 The test grid should be aligned along the centre lines of the terminal footprint with its centre under the centre point of the terminal.

8.81 Any test square with 80% or more of its area within the UCV footprint should be used as a test position.

8.82 An inner zone should be designated that is not less than 36% of the total footprint. It should be made up of a number of test squares distributed symmetrically about the terminal footprint's centre-line. Regardless of the shape of the terminal footprint, the inner zone should comprise a minimum grid of 6 × 6 test squares.

8.83 Unless specified otherwise, a test position should be in the geometric centre of a test square.

8.84 Test position 1 should be the leftmost test square in the row nearest to the operating room wall that houses the surgeon's panel.

8.85 Figure 8 shows a grid for a 2.8 m × 2.8 m terminal.

Test grid – horizontal units

8.86 A line of test positions should be marked on the floor 1 m in front of the face of the UCV terminal.

8.87 A test position should be marked in the centre of the line. Additional test positions should be marked at 280 mm intervals along the line either side of the centre position, up to the full face width of the unit.

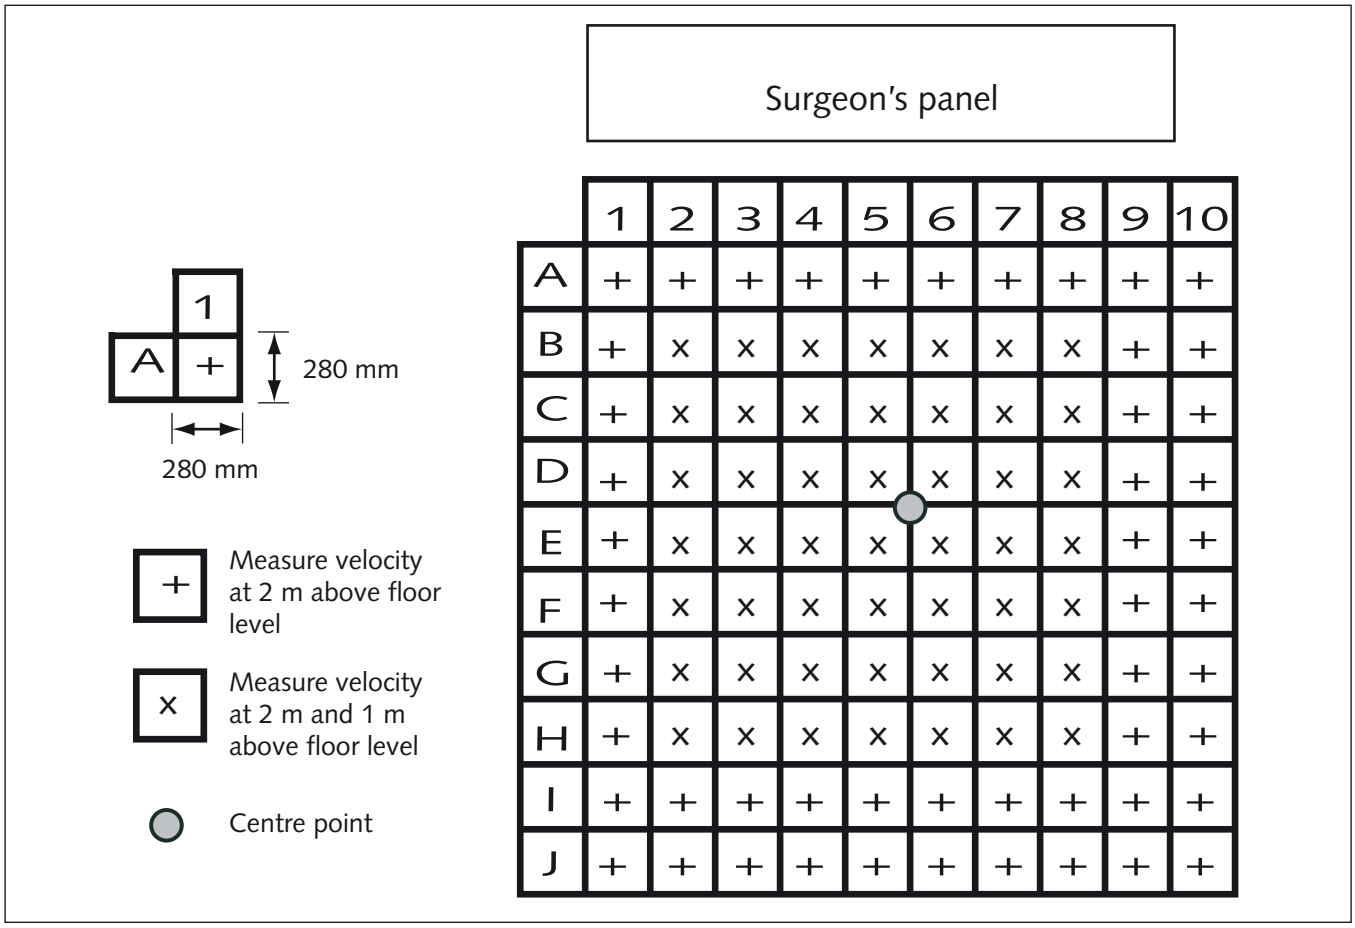
UCV terminal challenge tests (vertical and horizontal systems)

8.88 The diffuser screen fitted below the face of the terminal HEPA filters should be lowered or removed while the challenge tests are being carried out.

8.89 The installed HEPA filters should be checked to ensure that their grades accord with the design specification and that their performance has been certified by the manufacturer.

8.90 The challenge tests may be carried out using either of the following techniques:

Figure 8 Example of a test grid for a 2.8 m x 2.8 m UCV terminal



- use DOP to provide the challenge and a photometer to detect leaks;
- use a DPC to detect leaks. (In order to obtain a sufficient challenge, it may be necessary to temporarily remove the supply AHU's secondary filters.)

8.91 In both cases, the upstream challenge should be measured. A measurement of particle penetration through a representative section of the HEPA-filter media is then taken and used as the reference background level. These two readings enable the range of the detecting instrument to be set.

8.92 For the DOP test, this should be set as the reference level, and a leak will be declared significant if penetration greater than 0.01% of the range is detected (see paragraph 8.56 for details).

8.93 For the DPC method, the filter face is scanned to establish the smallest non-penetrating particle size. If significant particles at or above this size are detected when subsequent scans are made, there is deemed to be a leak at or near the test position (see paragraph 8.57 for details).

UCV terminal unit clean zone leak test

8.94 This test will confirm that there is no unfiltered air bypassing the HEPA filter.

8.95 The joints and service penetration points under the UCV terminal within its side walls or boundary air curtain should be scanned to prove that there are no leaks.

8.96 A leak is defined as a significant rise above the background level.

Terminal HEPA filter seal leak test

8.97 This test will confirm that there is no unfiltered air bypassing the HEPA filter's seal.

8.98 Each HEPA filter's seal should be scanned to prove that there are no leaks.

8.99 A leak is defined as a significant rise above the background level.

Terminal HEPA filter media leak test

8.100 This test will confirm that the HEPA filters have not sustained damaged while being installed.

8.101 The face of each HEPA filter should be scanned to prove that there are no leaks.

8.102 A leak is defined as a significant rise above the background level.

Vertical UCV terminal air velocity tests

Test set-up

a. The terminal face diffuser screen should be in place for these tests.

b. Take spot readings to establish that the room is within the specified temperature and humidity test conditions.

c. Set out the test grid as described in paragraphs 8.78–8.85.

d. Swing the operating lamp arms and any other stem arms so that they align to present the least resistance to air flow, are perpendicular to the front edge of the test sheet, and face the back edge. Any lamp and equipment heads should as far as practicable be outside of the UCV terminal footprint.

Test instrument

8.103 The measuring instrument should be a hot-wire anemometer with a digital read-out. The instrument resolution should be at least 0.01 m/s, have a tolerance of ±0.015 m/s or 3% of the reading, and be calibrated down to 0.15 m/s or lower. An alternative instrument may be used, providing it is of no lesser specification.

Test method

8.104 The instrument should be mounted on a test stand and set to record a mean reading over a ten-second sample interval.

8.105 It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. Alternatively they could be downloaded to a computer or data logger at the end of the test.

8.106 The test stand should be positioned at each test point in turn and the reading taken when the instrument has stabilised.

8.107 When taking a reading, the test person should not stand within the same quadrant as the test instrument.

8.108 Readings are to be taken at the test positions – with the instrument probe facing the wall that houses the surgeon's panel – commencing at the first test position. Readings are taken either working along the row from left to right and back, or for all test positions in one quadrant at a time.

8.109 When all the test positions under one half of the terminal have been covered, readings of temperature and humidity are taken at the specified height in the centre of the terminal. The read-outs on the surgeon's panel should be recorded at the same time.

8.110 Having completed one half of the test grid, the operating lamp arms and any other stem arms should be swung round through 180 degrees and the test stand reversed so that the wall that houses the surgeon's panel is behind the test person. Readings are recommenced starting at the right of the test row and working from right to left or a quadrant at a time, as above.

UCV high level discharge velocity test

8.111 Measurements of air velocity are to be taken at every test position 2 m above floor level, and the results averaged.

8.112 The average of the total readings taken is to be not less than:

- 0.38 m/s for a partial-wall system;
- 0.30 m/s for a full-wall system.

8.113 The average air velocity for each quadrant should not exceed ±6% of the measured average velocity for the terminal.

UCV low level air velocity test

8.114 Measurements of air velocity are to be taken at each of the inner zone test positions 1 m above floor level.

8.115 The measured velocity at every test position in the inner (operating) zone should be not less than 0.2 m/s.

Horizontal UCV terminal air velocity test

Test set-up

a. Set out the line of test positions as described previously.

b. Swing the operating lamp arms and any other stem arms so that they align to present the least

resistance to air flow and are perpendicular to the line of test positions.

Test instrument

8.116 See paragraph 8.103.

Test method

8.117 The instrument should be mounted on a test stand and set to record a mean reading over a ten-second sample interval.

8.118 It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. Alternatively, they could be downloaded to a computer or data logger at the end of the test.

8.119 The test stand should be positioned on each test point in turn and the reading taken when the instrument has stabilised.

8.120 When taking readings, the test person should stand well downstream of the instrument.

8.121 Readings are to be taken at the test positions – with the instrument probe facing the UCV terminal – commencing at the first test position on the left and working along the row from left to right at the specified height.

8.122 The instrument should be reset to the next specified height and the test repeated, and so on.

8.123 Readings of temperature and humidity should be taken at the specified height in the centre of the terminal. The read-outs on the surgeon's panel should be recorded at the same time.

UCV discharge velocity test

8.124 Measurements of air velocity are to be taken at all test positions at 1 m, 1.5 m and 2 m above floor level.

8.125 The average of the total readings taken should be no less than 0.4 m/s.

UCV entrainment test (vertical systems only)

Rationale for the entrainment test

8.126 The performance of UCV systems may be compromised by room air being drawn into the ultra-clean air flow, a phenomenon known as "entrainment". Significant levels of entrainment could lead to microbial contamination of items left exposed on instrument trolleys laid out beneath the canopy.

8.127 UCV systems having permanently fitted full side walls do not need to be tested, as the side walls physically prevent entrainment.

Principle of the test

8.128 A source of particles is produced outside of the UCV terminal and is used to challenge the system. A detector is placed within the ultra-clean air flow and used to determine the percentage penetration of the test particles at predefined locations under the UCV terminal footprint. The source and detector are moved in tandem around the UCV canopy and pairs of readings taken, from which the percentage penetration at specified locations is calculated. The degree of penetration should be below specified maximum limits if entrainment is to be declared not significant.

8.129 The entrainment test may be carried out using either of the following techniques:

- use DOPs to provide the challenge source at the specified release position and a photometer to measure the entrainment; or
- duct non-HEPA-filtered air to the specified release position and use a DPC to measure the entrainment.

Test set-up

a. The terminal face diffuser screen should be in place for these tests.

b. The test should be performed without any equipment in place beneath or closely adjacent to the UCV terminal.

c. Theatre lights should be moved to a central position beneath the terminal and raised to 2 m above floor level so as not to interfere with the peripheral air flows.

d. Take spot readings at the centre of the canopy, 1 m from floor level, to establish that the room is within the specified temperature and humidity test conditions.

e. Set out the test grid as described previously.

f. For either of the entrainment tests mentioned in paragraphs 8.131–8.132, a measurement of particle penetration through a representative section of the HEPA-filter media is to be taken and used as the reference background level.

Test equipment

a. Challenge source, measuring instrument and detector head

8.130 The challenge and detector equipment should be chosen so that:

- the tracer particles are mainly within the size range 0.3–5 µm and thus capable of remaining airborne for a substantial time;
- the particles used should not be able to penetrate the terminal filters in sufficient numbers to cause a background count that is more than 0.1% of the challenge count;
- the choice of particle and detector will enable a minimum of a three-logarithm (1000-fold) range of counts to be recorded between the highest (that is, source) and lowest (that is, background) readings expected. (A concentration of approximately 10^5 particles per cubic metre of source air has been shown to be adequate.)

b. Challenge source – DOP

8.131 The DOP generator should be able to produce a cloud of test particles in the form of a visible smoke. The test smoke should be delivered via an aperture so that it flows vertically downward from the lowermost edge of the partial wall, on the outside of the UCV canopy.

Note

To prevent undue contamination of the theatre and filters with deposits of oil, DOP should only be released for the minimum amount of time necessary to complete the test.

c. Challenge source – natural particles

8.132 The source unit should be a fan/blower or other method that takes non-HEPA-filtered air and expels it via a delivery head at the specified release position to provide the particle challenge. The challenge air should be delivered vertically downwards from the lowermost edge of the partial wall, on the outside of the UCV canopy, parallel to the air flow coming from the diffusers. The challenge air velocity should be the same as the measured average velocity at 2 m for the terminal under test.

Note

The use of DOP for testing is gradually being phased out and replaced by a natural challenge measured with a DPC. At the time of writing research is under way to more precisely define a challenge source unit for natural particles. It is anticipated that such a unit, together with a matching test methodology, will become available during the life of this Health Technical Memorandum.

The detector

8.133 This may be a photometer or a DPC. It is recommended that a printer be linked to the test instrument so that readings are recorded automatically. The instrument should be capable of sampling a minimum of 28.3 L of air (1 ft^3) per minute and, in the case of the DPC, provide readings for particle size ranges from 0.3 µm to 5 µm and greater. The instrument should be compliant with the requirements of BS EN ISO 14644-1. An alternative instrument may be used providing it is of no lesser specification.

Test positions and orientation of source and detector

8.134 The test positions should be at the centre of each test square, as defined for the velocity test.

8.135 For rectangular UCV terminals, measurements of penetration are to be taken at the four corner test squares of the test grid and at intermediate positions along the line of test squares between the corners. The number of intermediate test positions should be as equally spaced as possible around the periphery, with no fewer than three and no more than five complete test squares between test positions.

8.136 A further series of measurements are to be obtained around the periphery of the inner zone. Measurements of penetration are to be taken at the four corner test squares of the inner zone of the test grid and, if necessary, at intermediate positions along the line of test squares between the corners as equally spaced as possible, with no fewer than three and no more than five complete test squares between test positions.

8.137 A single measurement should be taken at the geometric centre of the UCV terminal footprint. The centre measurement should be taken with the

detector head mounted vertically upwards, 1 m above floor level.

8.138 The centre of the challenge particle source should be aligned with the centre of the designated test square, with its longer edge against the outer edge of the partial wall and delivering the challenge from the lower edge of the partial wall. The air containing challenge particles is directed vertically downwards from the lower edge of the partial wall, in a plane parallel to the partial wall. Where there is physical interference due to obstructions such as gas pendants, the source should be moved to the next available non-obstructed test-square location nearest to the stipulated sampling position. The detector should then also be moved to remain opposite the source.

8.139 In the case of non-rectangular terminals, an interpretation of the above strategy should be adopted that will yield a no less searching examination of the unit's ability to control entrainment.

Test method

8.140 The sampling head of the detector instrument is mounted on a test stand with its sampling orifice facing outwards horizontally from the centre of the UCV canopy, 1 m above floor level. The sampling head should be orientated at right-angles to the partial wall when sampling along the sides of the test grid, but should be set to bisect the angle when measuring at the corner test positions.

8.141 The test will commence at the first test position, this being designated the leftmost corner of the test grid when facing the wall housing the surgeon's panel. The penetration should also be measured at the corresponding test point on the inner zone commencing at the corner nearest to the first test position. When these tests have been completed, the source and detector equipment should be moved to the next test positions, working around the test grid in a clockwise direction.

8.142 The test stand should be positioned on each test point in turn and a pair of readings (challenge, then penetration) taken when the instrument has stabilised. The detector should be set to take a reading over a 15-second sample interval.

8.143 When taking a reading, the test person should stand within the UCV terminal footprint but not in the same quadrant as the detector head.

Analysis and interpretation

8.144 The following standard is to be achieved:

- at each test position in the outer zone, penetration is to be no greater than 10% of the challenge;
- at each test position in the inner zone, penetration is to be no greater than 1% of the challenge;
- at the centre test position, penetration is to be no greater than 0.1% of the challenge.

8.145 If a result is close to, or above, the given limits, a further reading must be obtained using a longer time base (one minute), and the penetration must not exceed the given limit.

Note

The entrainment test is based on the research of Whyte et al (1974) and Whyte et al (1983).

UCV visualisation

8.146 The use of smoke to gain an understanding of the overall performance of the system may prove useful at this stage in the validation process but cannot be relied on to produce a contractually definitive measure of performance.

UCV noise level

8.147 An industrial-grade Type 2 sound-level meter fitted with a muff should be used to check the noise level. The instrument should be calibrated using a matched sound source prior to each set of readings.

Vertical systems

8.148 The noise level readings should be taken at typical normal listening positions 1.5 m above floor level and at least 1 m from any surface and not on any line of symmetry. Measurements should be taken approximately under the centre of each quadrant of the UCV terminal and the four readings averaged.

Horizontal systems

8.149 The noise-level readings are to be taken at typical normal listening position 1.5 m above floor level on the test line. The width of the unit should be divided in two and a measurement taken in the

centre of each half but avoiding any line of symmetry. The two readings should be averaged.

8.150 Measurements should also be taken in each room of the suite.

8.151 In the event of a contractual deficiency, a Type 1 precision-grade sound-level meter should be used in accordance with Health Technical Memorandum 08-01.

8.152 For vertical or horizontal systems, the noise level should not exceed:

- 50 NR [55 dB(A)] – for UCV operating rooms and spaces without doors that open directly onto it (for example the scrub);
- 40 NR [45 dB(A)] – for all other peripheral rooms of the suite.

UCV control system checks

Temperature

8.153 The readings of temperature taken under or in front of the UCV unit should be within ±1 K of each other and the read-out on the surgeon's panel.

Humidity

8.154 The readings of humidity taken under or in front of the UCV unit should be within ±5% of each other and the read-out on the surgeon's panel.

Direct-reading differential-pressure gauges

8.155 The accuracy of the indicated reading of these gauges should be checked by measuring the actual differential pressure across the terminal filter(s).

Control functions

8.156 The operation of all control functions provided on the surgeon's panel should be proved for conformity with the design specification.

8.157 If an auxiliary panel has been fitted, its interlocking with the control functions of the main surgeon's panel must be proved to conform to the design specification.

Panel indicator lights

8.158 The panel indicator lights should illuminate as appropriate when the control functions are selected or warning levels are reached.

BMS interface

8.159 The operation, monitoring and alarm functions must be proved to conform to those set out in the design specification.

UCV theatre microbiological tests

8.160 There is little value in performing microbiological sampling in a new theatre supplied with ultra-clean ventilation. The foregoing filter challenge tests, air velocity measurements and entrainment test should have proved that the system operates satisfactorily and achieves the contracted level of performance. The HEPA filters will remove bacteria-sized particles from the air supplied through the UCV terminal. Therefore there will be an insignificant number of bacterial and/or fungal CFU present until the theatre is actually used.

8.161 Once the theatre has been taken into use, microbial sampling during a surgical procedure should help to confirm the satisfactory performance of the system and discipline of the users. Before commencing bacteriological testing, the room and its ventilation system should have achieved a steady state condition (see also paragraph 8.75).

8.162 The installation should be tested during surgical procedure at intervals between the time of first incision and final closure of the wound. On average, air sampled within 300 mm of the wound should not contain more than 10 CFU/m^3.

The Hospital Infection Society has issued guidance on the microbiological testing of UCV operating theatres (www.his.org.uk/_db/_documents/OTIC-final.pdf).

UCV validation report

8.163 Following validation, a full report detailing the findings should be produced. The report should conclude with a clear statement as to whether the UCV theatre suite achieved or did not achieve the standard set out above.

8.164 A copy of the report should be lodged with the following groups:

- operating department;
- infection control;
- estates and facilities.

Appendix 1 – Use and function of typical equipment used in ventilation systems

A1.1 Typical equipment used in ventilation systems is listed below together with a brief description of both function and use.

General

A1.2 The equipment built into the ventilation system and its ductwork should be of a type that will neither cause nor sustain combustion.

A1.3 No materials that could sustain biological activity should be used in the construction or assembly of the system.

Air intake

A1.4 An uncontaminated air supply to the system is essential. In order to achieve this, the air intake should be positioned so that air discharged from extract systems or other sources of dubious quality cannot be drawn in. Exhaust fumes from vehicles can present particular problems. The area surrounding the intake will need to be kept clean and free of vegetation and waste material in order to reduce the possibility of biohazards or fire. The intake itself should be protected by a louvre and mesh screen to prevent rainwater, vermin and leaves etc entering the system.

Damper

A1.5 Several types of damper may be fitted:

a. automatic dampers fitted immediately behind the air intake and extract louvres. They will automatically close when the system is shut down in order to prevent an uncontrolled circulation of air;

b. balance dampers are fitted into each branch of the air distribution ductwork system so that the design air-flow rate can be set during the commissioning process;

c. where ductwork passes through a fire compartment wall, ceiling or floor, a fire and/or smoke damper may be required;

d. plant-isolating dampers are fitted so that the main plant can be isolated from its air distribution duct system. They are manually operated, and enable cleaning and maintenance of the air-conditioning equipment to be carried out.

Ducting

A1.6 Ducting is the means by which air is conveyed from the intake to its point of use. It is usually constructed of galvanised steel and will normally be insulated to reduce noise and conserve energy. Ducts can also be formed in concrete, brickwork, stainless steel or plastic, and may be rigid or flexible.

Fan

A1.7 A fan is a series of rotating blades that move the air in the direction required. Fans are usually powered by electric motors either directly connected to them or driven through belts and pulleys. A fan may be arranged to either force air into or draw air from a ductwork system.

Attenuator/silencer

A1.8 An attenuator is a device that will contain and absorb the noise emitted by a fan. It may be required to reduce disturbance caused by noise breaking out through the air intake and also noise transmitted along the ductwork to the conditioned space.

Filter

A1.9 A filter consists of a labyrinth of fibrous material contained in a frame. It is designed to capture and hold particles being carried in the air stream. Because of the size range and number of particles that exist in air, no filter can remove them all. The purpose of filtration is to reduce their number and size range to an acceptable level. Filters of progressively higher grades are fitted through the ventilation system:

- primary filters (coarse) are designed to collect the larger particles and are intended to keep the air-handling plant clean;
- secondary filters (fine) remove the staining particles from air and keep the ventilated space visibly clean;
- high efficiency particulate air filters (HEPA/absolute) remove virtually all particles from air. These may be required in order to reduce contamination in the working area either biologically or in terms of particle count.

A1.10 Filters may be fitted to extract systems to protect energy-recovery devices. They are also fitted to remove biological, radiation or chemical hazards. They are often contained in a "safe change" facility in order to protect those carrying out maintenance.

A1.11 Activated carbon filters will reduce odours in extracted or recirculated air.

Heater coil/battery

A1.12 A heater coil/battery is a series of coils with or without fins through which steam or hot water is circulated. Heat is given up to the air passing over the battery, thus increasing its temperature. Heating is usually carried out in stages, the final battery being controlled by the end-user. Small batteries may be electric.

Humidifier

A1.13 A humidifier is a device for increasing the humidity of air by adding moisture. For ventilation in healthcare premises, this is normally achieved by releasing clean steam into an air-supply duct. The steam should be completely absorbed into the air, increasing its humidity. The level of humidity may be preset or controlled by the end-user.

Chiller battery/cooling coil

A1.14 A chiller battery/cooling coil is a series of finned coils mounted in the air-supply duct. Either chilled water or refrigerant is circulated through the coils, causing heat to be removed from the air. This will reduce its temperature and may also condense moisture out of the air. As free moisture in a duct can be a source of contamination, the coil will be fitted with an eliminator and drainage system.

Eliminator

A1.15 An eliminator is a device for catching and removing water droplets from an air stream. It may form part of a cooling coil or be a separate device.

Drainage system

A1.16 The drainage system is a means of removing water from ductwork and disposing of it safely. Typically it will consist of a tray mounted in the duct to catch moisture, a glass water-seal trap, continuously falling drainage pipework and an air break in the drain run to prevent waste water returning and contaminating the duct.

Access doors and observation ports

A1.17 Access doors and observation ports are doors and removable panels that provide access for routine maintenance and cleaning. The doors should be fitted with glazed ports, and suitable lighting should be provided so that the condition and correct operation of devices such as cooling coils, humidifiers and filters can be easily observed without needing to switch off the plant.

Energy recovery

A1.18 Modern plants are fitted with the means to recover energy from the extract air without causing contamination of the incoming supply air. These devices will be fitted with a drainage system and may incorporate an eliminator. Several types of energy-recovery system are available.

A1.19 Precise definitions of ventilation and air conditioning terms are given in CIBSE Guide B.

Typical plant

A1.20 The layout of a typical plant that conforms to the requirements for healthcare applications is shown in Figure 1 in Chapter 1 of this document. It contains most of the equipment described above.

Appendix 2 – Recommended air-change rates

Application	Ventilation	AC/hr	Pressure (Pascals)	Supply filter	Noise (NR)	Temp (°C)	Comments (for further information see Chapter 6)
General ward	S/N	6	–	G4	30	**18–28**	
Communal ward toilet	E	6	–ve	–	40	–	
Single room	S/E/N	6	0 or –ve	G4	30	**18–28**	
Single room WC	E	3	–ve	–	40	–

Treatment room	S	10	+ve	F7	35	*18–25*	
Pharmacy aseptic suite	S	20	#	H14	–	*18–22*	# See EGGMP (Orange guide) [a]
Category 3 or 4 containment room	#	>20	#	H14*	–	*18–22*	# See ACDP guide; *Filter in extract
Post-mortem room	S & E	S = 10 E = 12	–ve	G4	35	**18–22**	Provide clean air-flow path
Specimen store	E	–	–ve	–	–	–	Fan accessible from outside of store

Notes: **18–22**°C indicates the range over which the temperature may float.
18–22°C indicates the range over which the temperature should be capable of being controlled.
S = suppy
E = extract
N = natural ventilation
a – European guidelines on good manufacturing practice published by the Medicines and Healthcare products Regulatory Agency (MHRA)

Appendix 3 – Hierarchy of cleanliness

			Air-flow rate for bacterial contaminant dilution	
Class	**Room**	**Nominal pressure (Pa)[a]**	**Flow in or supply (m^3/s)**	**Flow out or extract (m^3/s)**
Sterile	Preparation room		See standard schemes in Appendix 7 for recommended design values	
	(a) lay-up	35		
	(b) sterile pack store	25		
	Operating room	25		
	Scrub bay[b]	25		
Clean	Sterile pack bulk store	+ve	6 AC/h	–
	Anaesthetic room[c]	14[c]	The greater of 15 AC/hr or 0.15	The greater of 15 AC/hr or 0.15
	Scrub room	14	–	0.10
Transitional	Recovery room	3	15 AC/hr[d]	15 AC/hr[d]
	Clean corridor	0	(See note e)	7 AC/hr
	General access corridor	0	(See note e)	7 AC/hr
	Changing rooms	3	7 AC/hr	7 AC/hr
	Plaster room	3	7 AC/hr	7 AC/hr
Dirty	Service corridor	0	–	(See note f)
	Disposal room	–5 or 0	–	0.41 or 0.10

Notes:

a. Nominal room pressures are given to facilitate setting up of pressure-relief dampers, the calculation process, and the sizing of transfer devices. In practice, the resultant pressures are not critical, provided the desired air-flow rates and movement are achieved.

b. An open or semi-open bay is considered to be part of the operating room; provided air movement is satisfactory, no specific extract is required. However, if the layout means that air movement is poor, a local extract may be required to control local condensation on the building surfaces, which can result in mould growth.

c. For design purposes, anaesthetic should be assumed to be at 14 Pa. When commissioning, 10 Pa is considered suitable.

d. 15 AC/hr is considered necessary for the control of anaesthetic gas pollution.

e. Supply air-flow rate necessary to make up 7 AC/hr after taking into account secondary air from cleaner areas.

f. No dilution requirement. Temperature control requirements only.

Appendix 4 – Leakage flows in m^3/s through closed door gaps

Type	Pressure difference (Pa)						
	5	10	15	20	25	30	40
Single door	0.03	0.05	0.06	0.06	0.07	0.07	0.08
Double door	0.04	0.08	0.10	0.11	0.12	0.13	0.14
High permanent length of 3 mm gap	0.004	0.008	0.010	0.011	0.012	0.012	0.013

Designers' notes:

The door gaps assumed are 4 mm along the bottom, 3 mm at the top and sides, and 2 mm between double leaves.

If doors are fitted with cold smoke seals, these will significantly reduce the door leakage rate when new and undamaged. It is therefore recommended that provision for the design leakage be factored into the size of the appropriate transfer grille or pressure stabiliser. Failure to do this will result in air-gap whistles and doors being held partially open by air pressure.

Factory-assembled door-sets with a steel frame and pre-hung leaves are becoming common. There is effectively no leakage across these doors when closed. Therefore, when this type of door assembly is fitted, the door leakage can be ignored and the design air flow into the room reduced accordingly. The design air flow would then become that required either (i) for open door protection (Appendix 5), or (ii) to achieve the specified air-change rate – whichever is the greater.

Appendix 5 – Recommended air-flow rates in m^3/s through a doorway between rooms of different cleanliness to control cross-contamination

Room class		Dirty	Transitional	Clean	Sterile
Sterile	Hatch	0.3	0.24	0.18	
	Single door	0.47	0.39	0.28	0 or 0.28[a]
	Double door	0.95	0.75	0.57	0 or 0.57[a]
Clean	Single door	0.39	0.28	0 or 0.28[a]	
	Double door	0.75	0.57	0 or 0.57[a]	
Transitional	Single door	0.28	0 or 0.28[a]		
	Double door	0.57	0 or 0.57[a]		
Dirty	Single door	0	Open single door = 0.80 m × 2.01 m high		
	Double door	0	Open double door = 1.80 m × 2.01 m high		

Designers' notes:

The degree of protection required at an open doorway between rooms is dependent on the degree of difference in cleanliness between them.

Flow rate required between rooms within the same class tends to zero as class reduces.

a. If two rooms are of equal cleanliness, no flow is required (in practice there will be an interchange in either direction) and the design of the air movement will assume zero air flow. In certain cases, however, interchange is not permitted, and a protection air flow of 0.28 is assumed in the design – for example in the case of a preparation room used as a "lay up"

Appendix 6 – Typical approximate pressures in an operating suite when a given door is open

		Typical approximate effect on other rooms	
Door open between	**Typical approximate resultant pressure in these rooms (Pa)**	**Room**	**Pressure (Pa)**
Operating room and corridor or Scrub bay and corridor	0	Anaesthetic Preparation – lay-up Disposal Preparation – sterile pack store	0 12 –6 5
Operating room and anaesthetic room (or other series room with double doors)	17	Preparation – lay-up Disposal Preparation – sterile pack store	26 –9 22
Operating room and disposal room or Operating room and preparation room	25	No change	
Anaesthetic room and corridor (or other series room with double doors)	0	Preparation – lay-up Disposal Operating room Preparation – sterile pack store	30 –6 20 25
Preparation room and corridor or Disposal room and corridor	0	No change	
Disposal room and outer corridor	0	No change	

Notes:

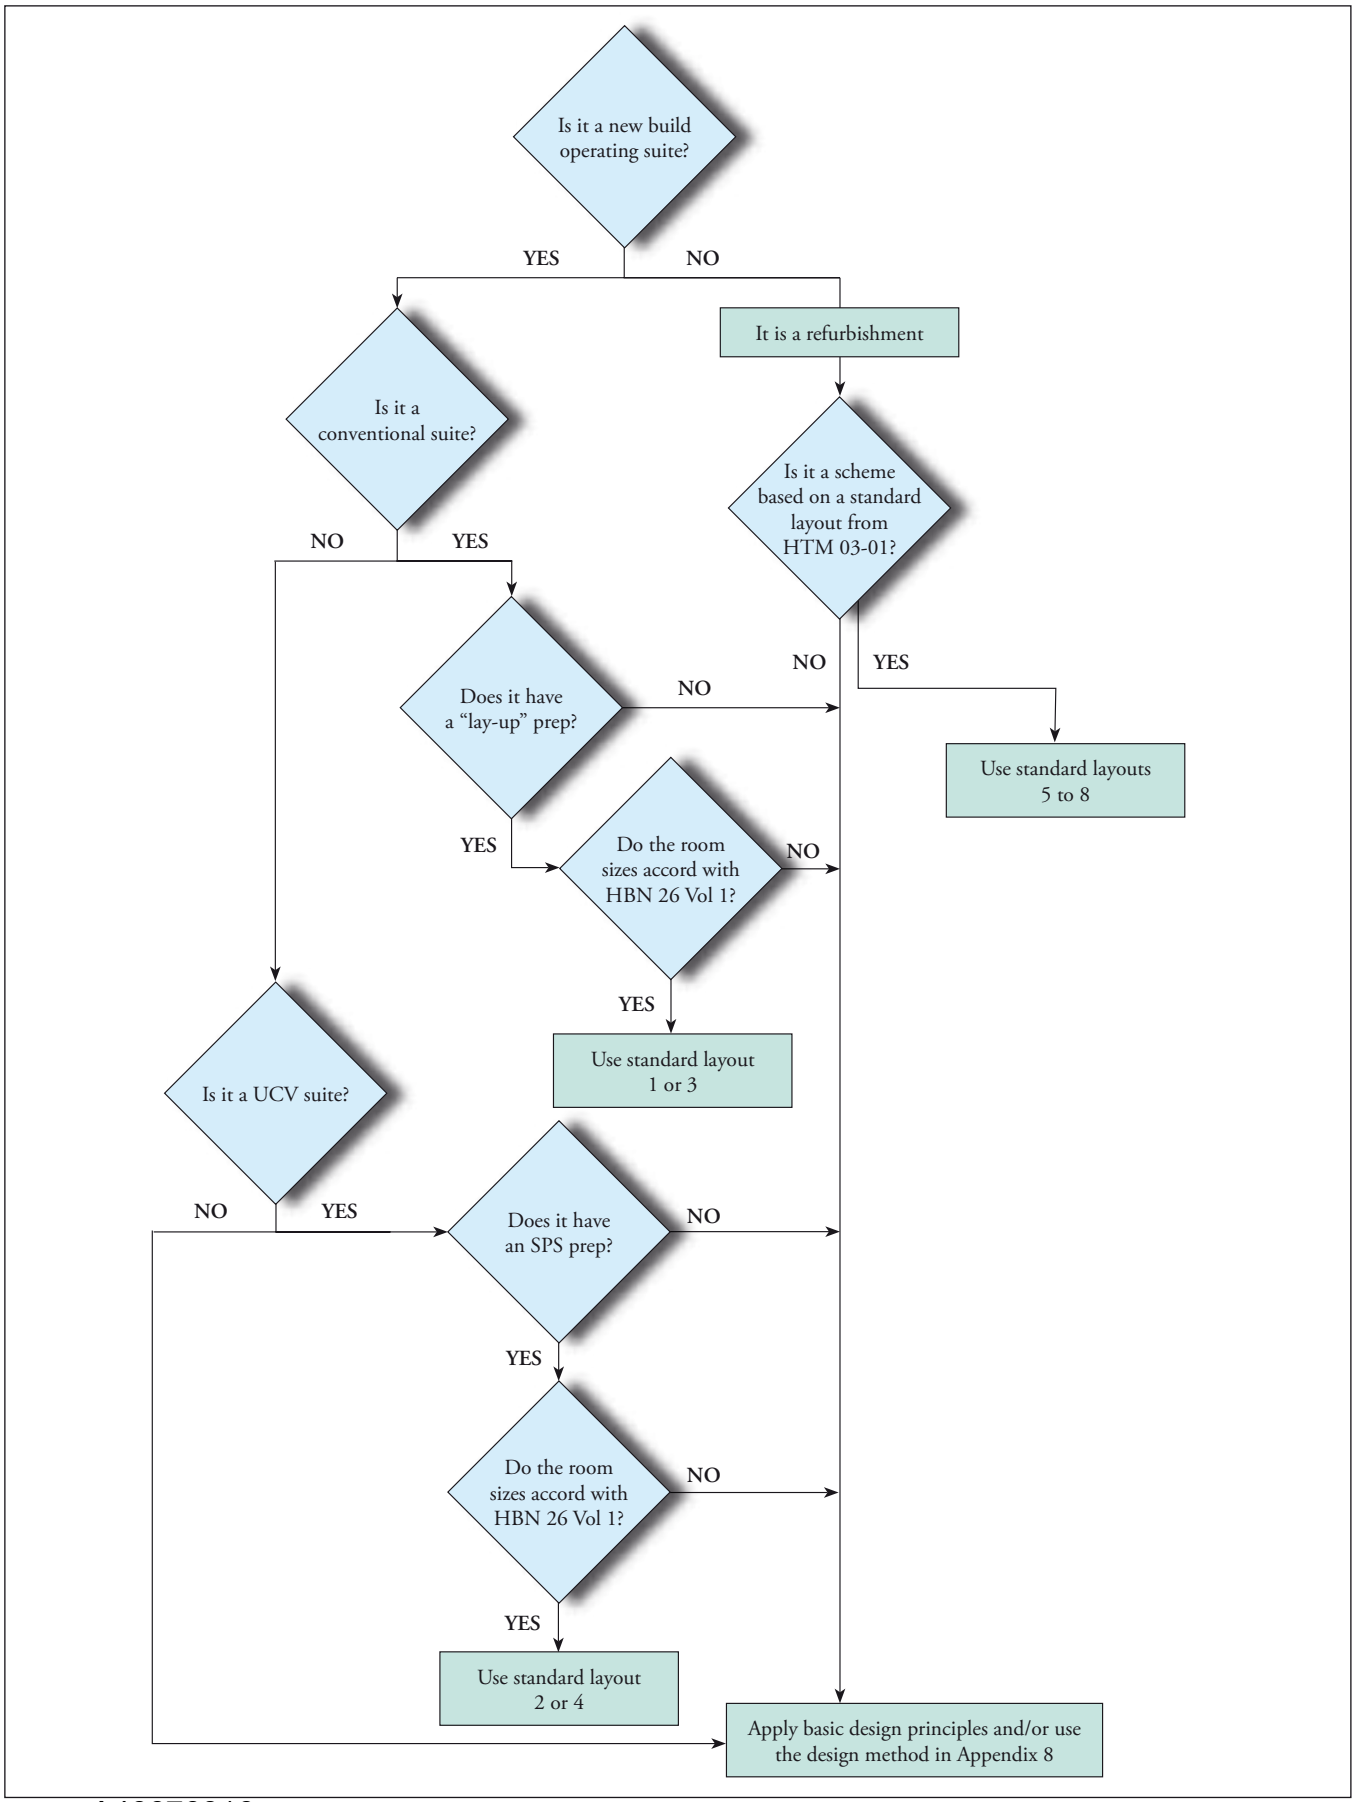
The room differential pressure protects against reverse flows when the door is closed.

The flow of air through a doorway protects against reverse air flow when the door is open.

Pressure stabilisers control flow and ensure a known air-flow path between rooms when doors are closed, and also reduce back-flow between rooms when doors to other rooms are open

Appendix 7 – Operating suite standard design solutions

Operating suite design logic



Standard layout 1 – Suitable for a typical conventional theatre suite

Room	Size (m^3)‡	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	165	25	25	1.15
Anaesthetic	57	15	>10	0.24
Lay-up-prep	36	>25	35	0.28**
Scrub	*	–	25	–

Notes:

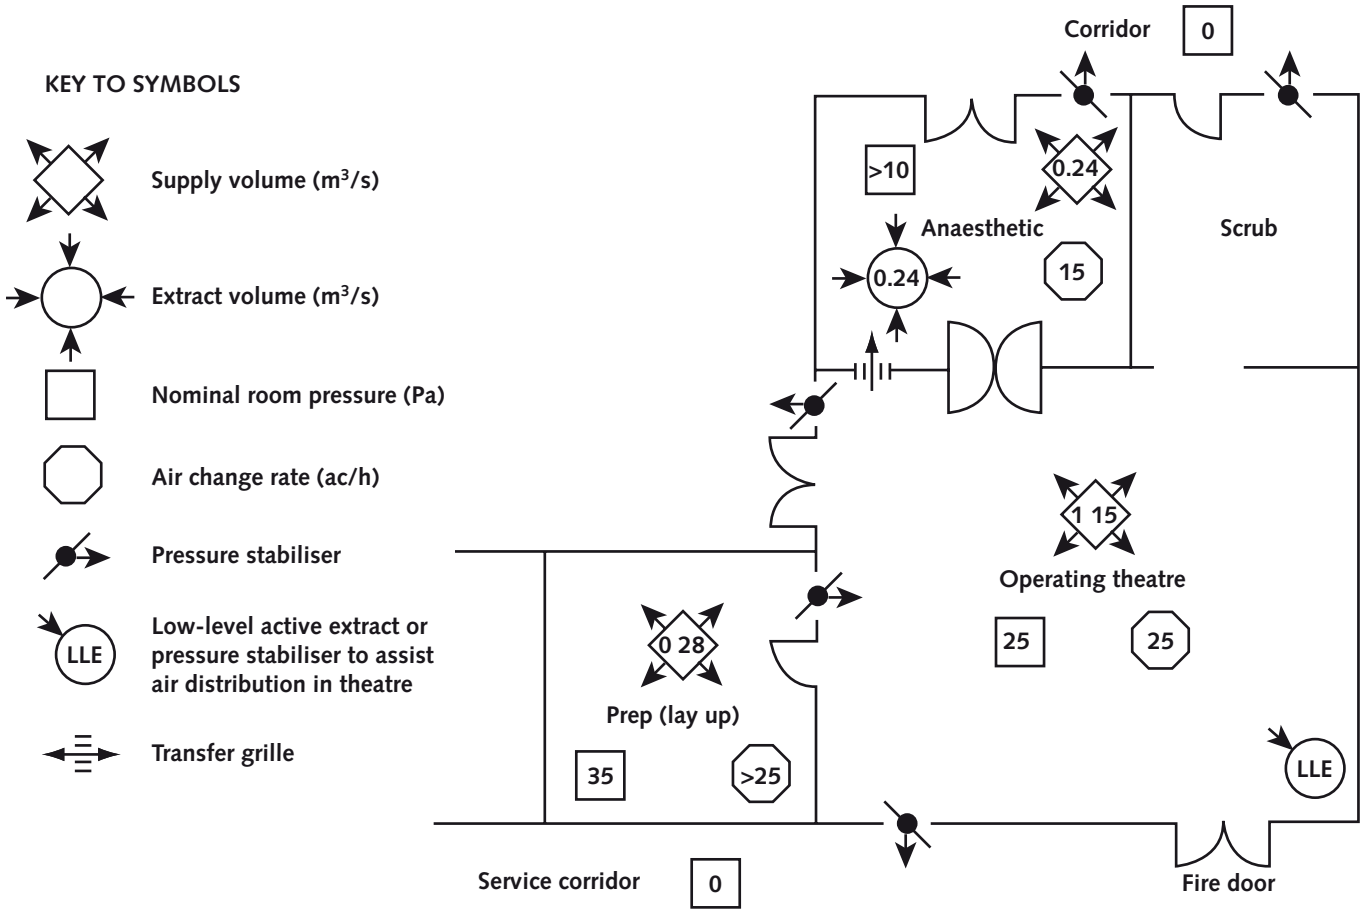
‡ Derived from Health Building Note 26.

* This is a separate scrub and is not considered as being part of the theatre volume.

** Interchange is not permitted between the theatre and lay-up prep; therefore, as in Appendix 5, an air-flow protection of 0.28 m^3/s is required as a minimum (but see also the "designers' notes" in Appendix 4).

The volume of air to be extracted from the theatre should be determined by subtracting the air flow required for door protection at the key door from the total air entering the space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilisers, or active and connected to the extract system. They should where possible be located at low level and positioned to promote the ventilation of all areas of the space



Standard layout 2 – suitable for a typical UCV theatre suite

Room	Size (m^3)‡	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	165	25	25	1.15**
Anaesthetic	57	15	>10	0.24
Sterile pack store prep	36	10	25	0.10
Scrub	*	–	25	–

Notes:

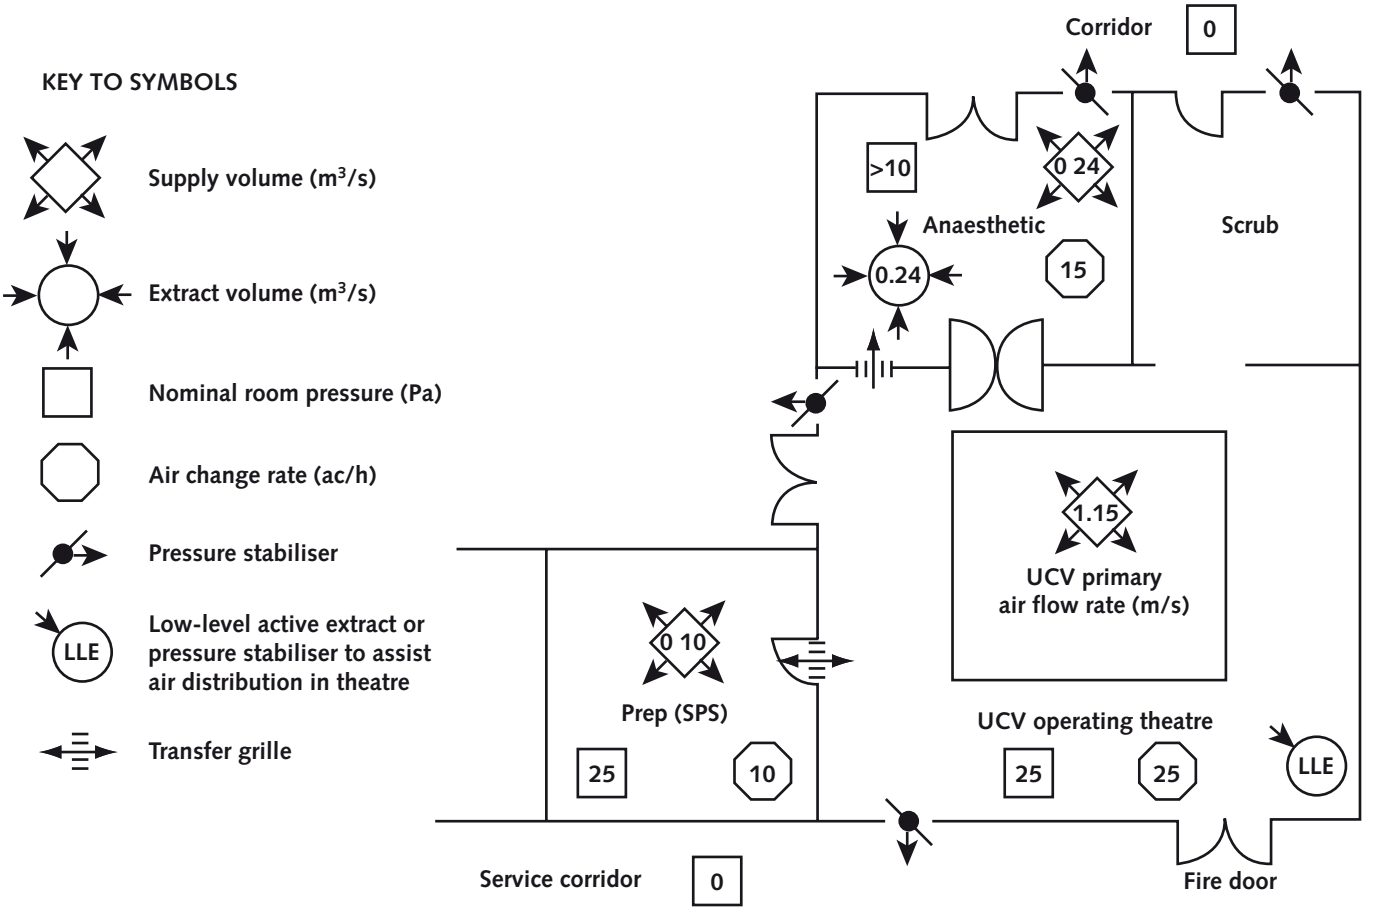
‡ Derived from Health Building Note 26

* This is a separate scrub and is not considered as being part of theatre volume.

** Primary fresh-air volume only.

The volume of air to be extracted from the theatre should be determined by subtracting the air flow required for door protection at the key door from the total air entering the space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilisers, or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space



Standard layout 3 – suitable for a typical conventional theatre suite

Room	Size (m^3)‡	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	165	25	25	1.15
Anaesthetic	57	15	>10	0.24
Lay-up prep	36	>25	35	0.34**
Scrub	*	–	25	–
Dirty utility	36	–	–5	0.41

Notes:

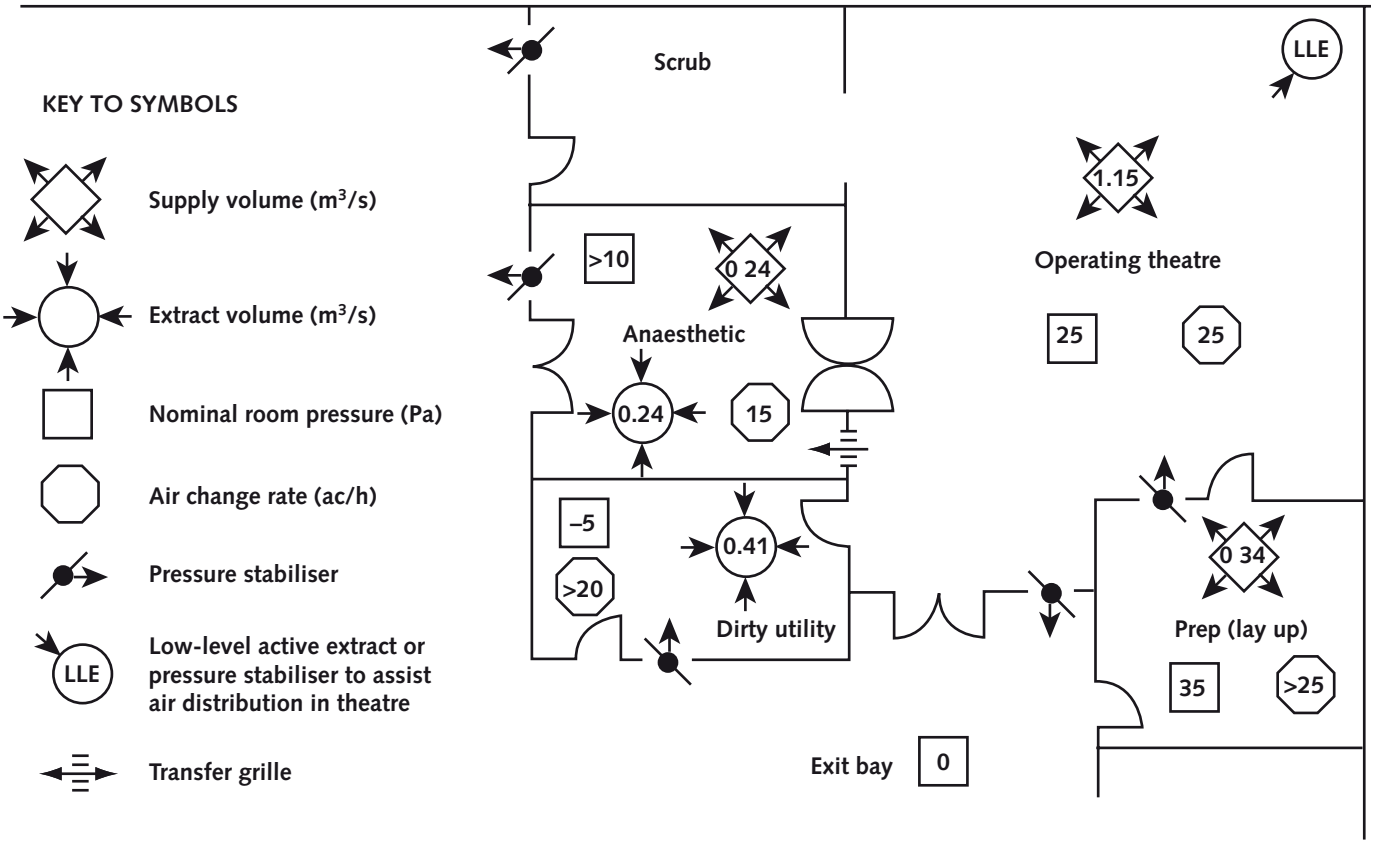
‡ Derived from Health Building Note 26

* This is a separate scrub and is not considered as being part of the theatre volume.

** Interchange is not permitted between the theatre and lay-up prep; therefore, as in Appendix 5, an air-flow protection of 0.28 + 0.06 closed-door air flow is required as a minimum (but see also the "designers' notes" in Appendix 4).

The volume of air to be extracted from the theatre should be determined by subtracting the air flow required for protection at the key door from the total air entering the space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilisers, or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space



Standard layout 4 – suitable for a typical UCV theatre suite

Room	Size (m^3)‡	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	165	25	25	1.15**
Anaesthetic	57	15	>10	0.24
Sterile pack store prep	36	10	25	0.10
Scrub	*	–	25	–
Dirty utility	36	–	–5	0.41

Notes:

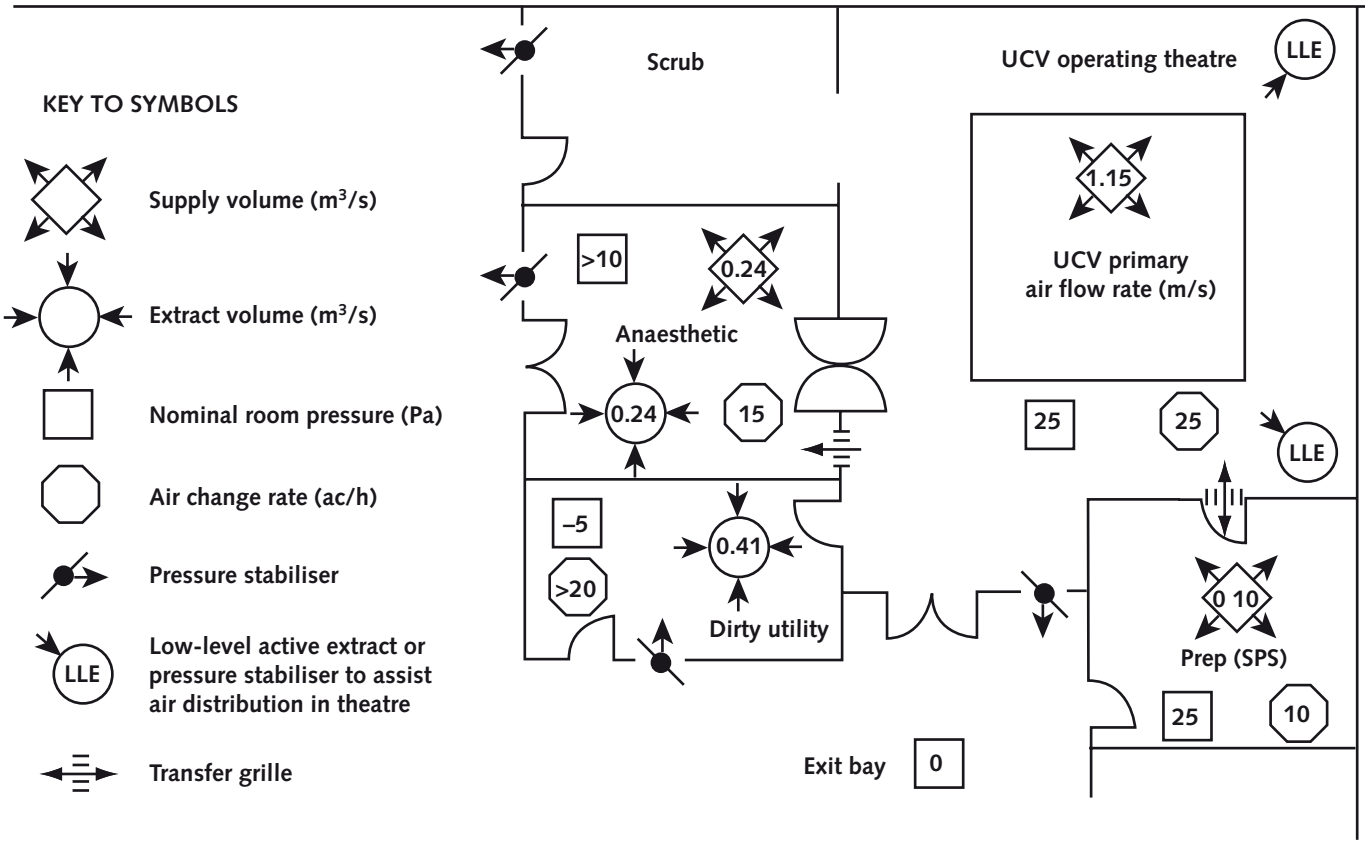
‡ Derived from Health Building Note 26

* This is a separate scrub and is not considered as being part of the theatre volume.

** Primary fresh-air volume only.

The volume of air to be extracted from the theatre should be determined by subtracting the air flow required for protection at the key door from the total air entering the theatre space. The balance should be equally divided between the passive or active extract locations.

The extracts within the theatre may be either passive and fitted with pressure stabilisers, or active and connected to the extract system. They should be located at low level and positioned to promote the ventilation of all areas of the space



Standard layout 5 (Health Technical Memorandum 2025 existing standard plan "1b") – typical layout for a conventional theatre suite

Note

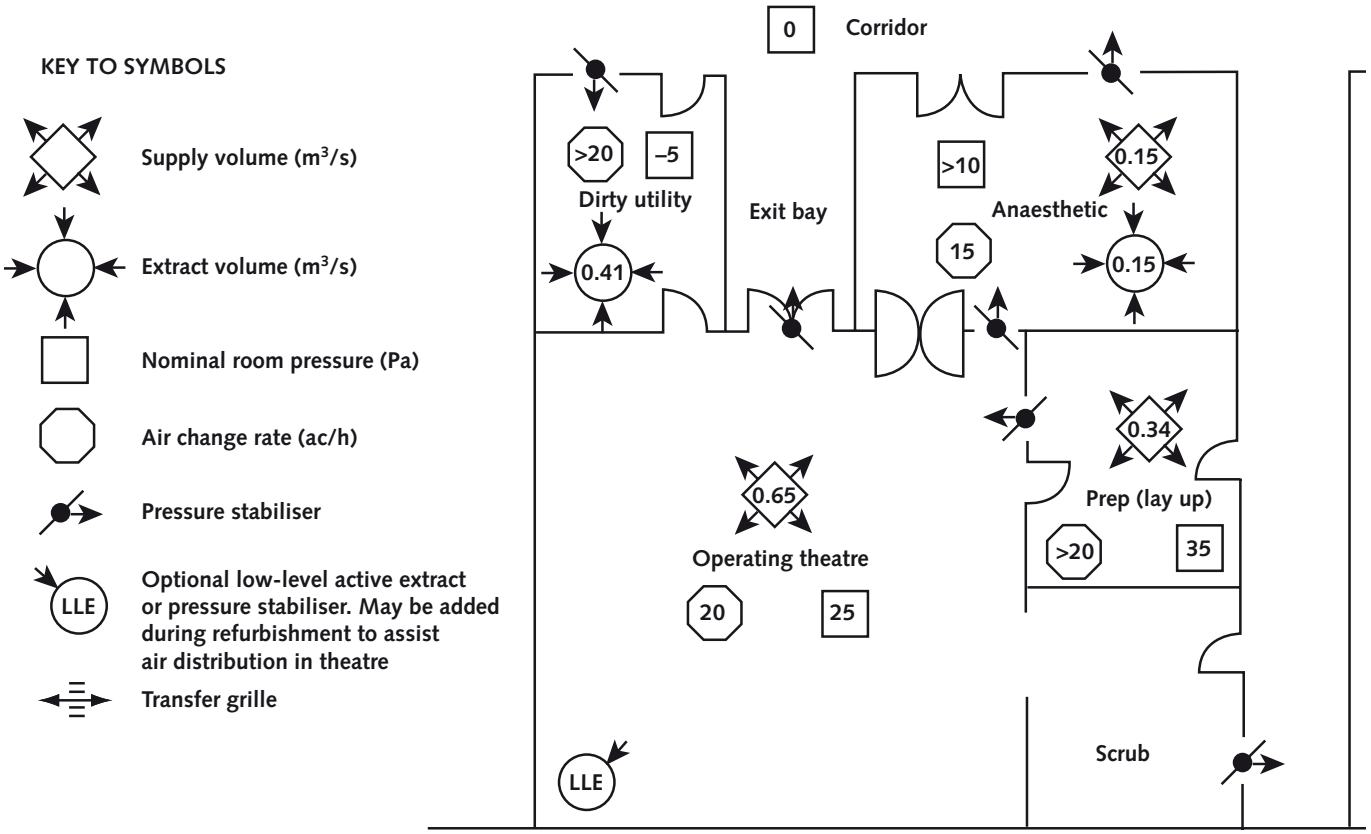
This layout and data is for historical purposes only. The information is to be used for the evaluation of existing systems, the fitting out of existing shell schemes or rebalancing following ventilation system cleaning.

Room	Size	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	**Existing theatre suite to be measured on site**	20	25	0.65
Anaesthetic		15	>10	0.15
Lay-up prep		–	35	0.34*
Scrub		–	25	–
Disposal		–	–5	0.41

Notes:

* See the "designers' notes" in Appendices 4 and 5.

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor



Standard layout 6 (Health Technical Memorandum 2025 existing standard plan "1a") – typical layout for a UCV theatre suite

Note

This layout and data is for historical purposes only. The information is to be used for the evaluation of existing systems, the fitting out of existing shell schemes or rebalancing following ventilation system cleaning.

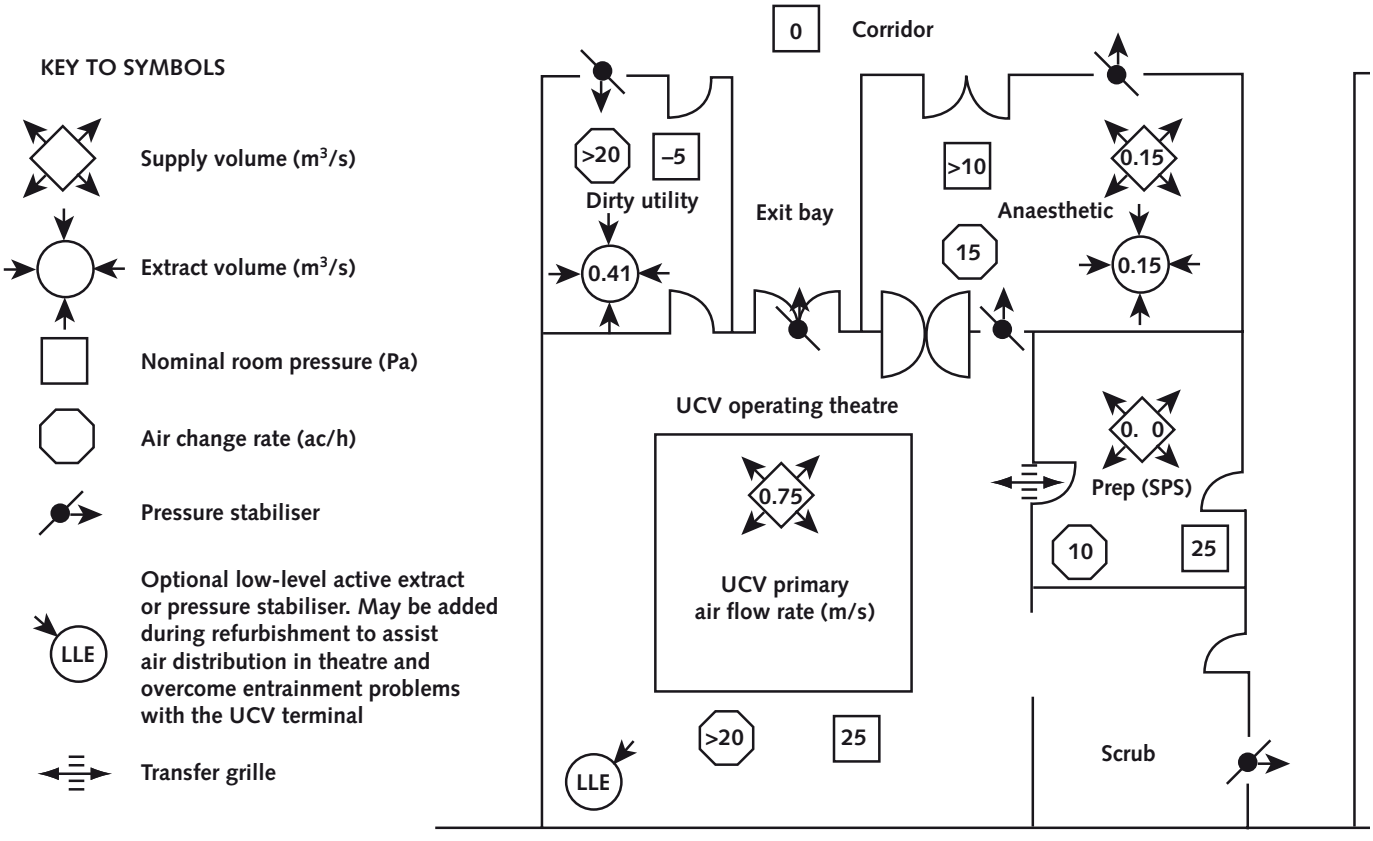
If difficulties are experienced with entrainment around the periphery of the UCV, adding a low-level active or passive extract in the location indicated will usually resolve the problem.

Room	Size	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	**Existing theatre suite to be measured on site**	20	25	0.75*
Anaesthetic		15	>10	0.15
Sterile pack store prep		10	25	0.1
Scrub		–	25	–
Disposal		–	–5	0.41

Notes:

* Primary fresh-air-flow volume

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor



Standard layout 7 (Health Technical Memorandum 2025 existing standard plan "5b") – typical layout for a conventional theatre suite

Note

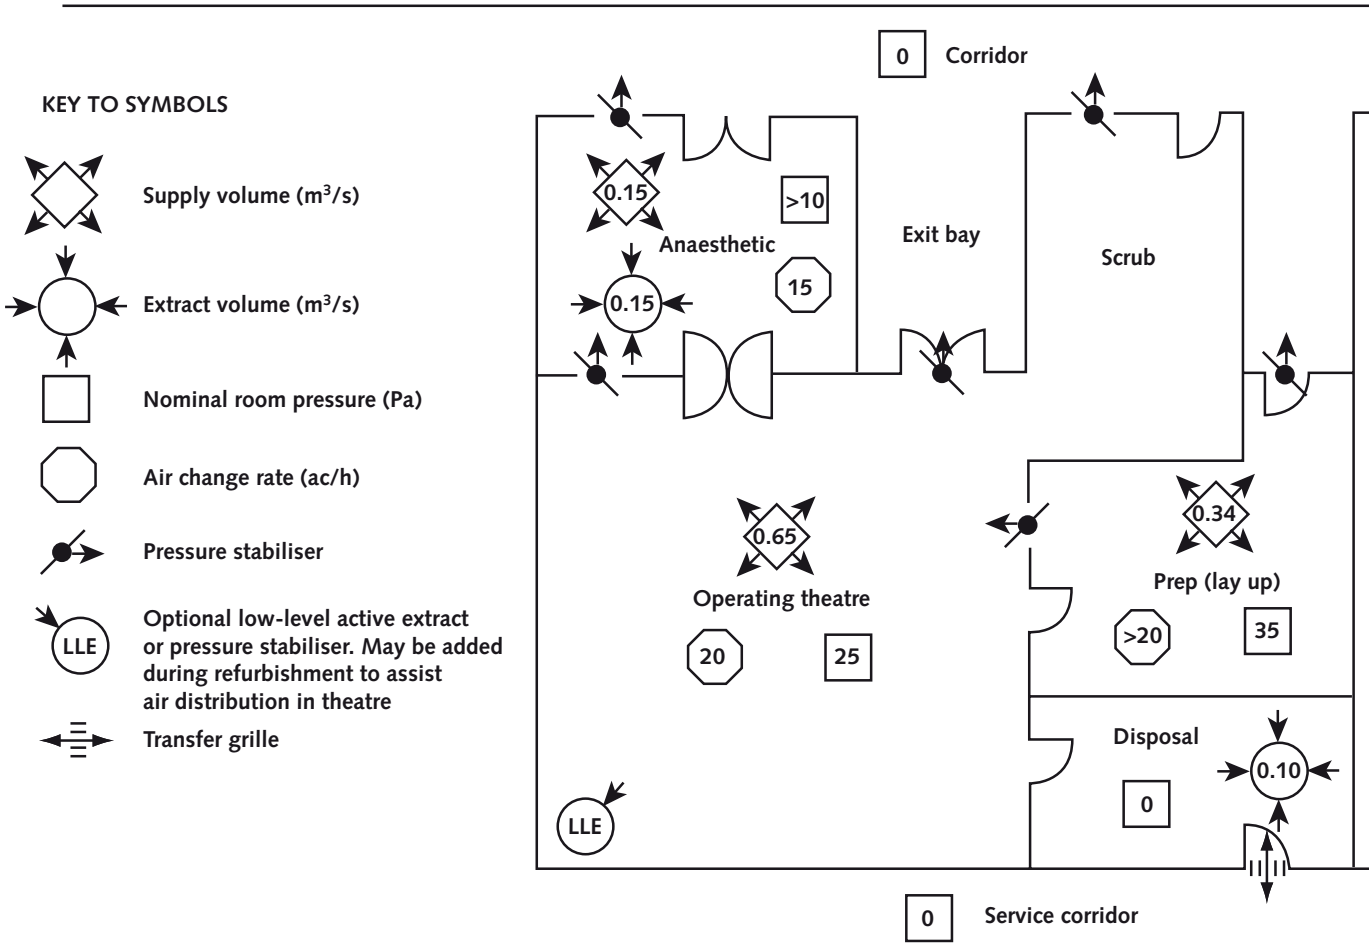
This layout and data is for historical purposes only. The information is to be used for the evaluation of existing systems, the fitting out of existing shell schemes or rebalancing following ventilation system cleaning.

Room	Size	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	**Existing theatre suite to be measured on site**	20	25	0.65
Anaesthetic		15	>10	0.15
Lay-up prep		>20	35	0.34*
Scrub		–	25	–
Disposal		–	0	0.1

Notes:

* See the "designers' notes" in Appendices 4 and 5.

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor. Alternatively the disposal room could be omitted and replaced with a disposal hatch between the theatre and corridor



Standard layout 8 (Health Technical Memorandum 2025 existing standard plan "5a") – typical layout for a UCV theatre suite

Note

This layout and data is for historical purposes only. The information is to be used for the evaluation of existing systems, the fitting out of existing shell schemes or rebalancing following ventilation system cleaning.

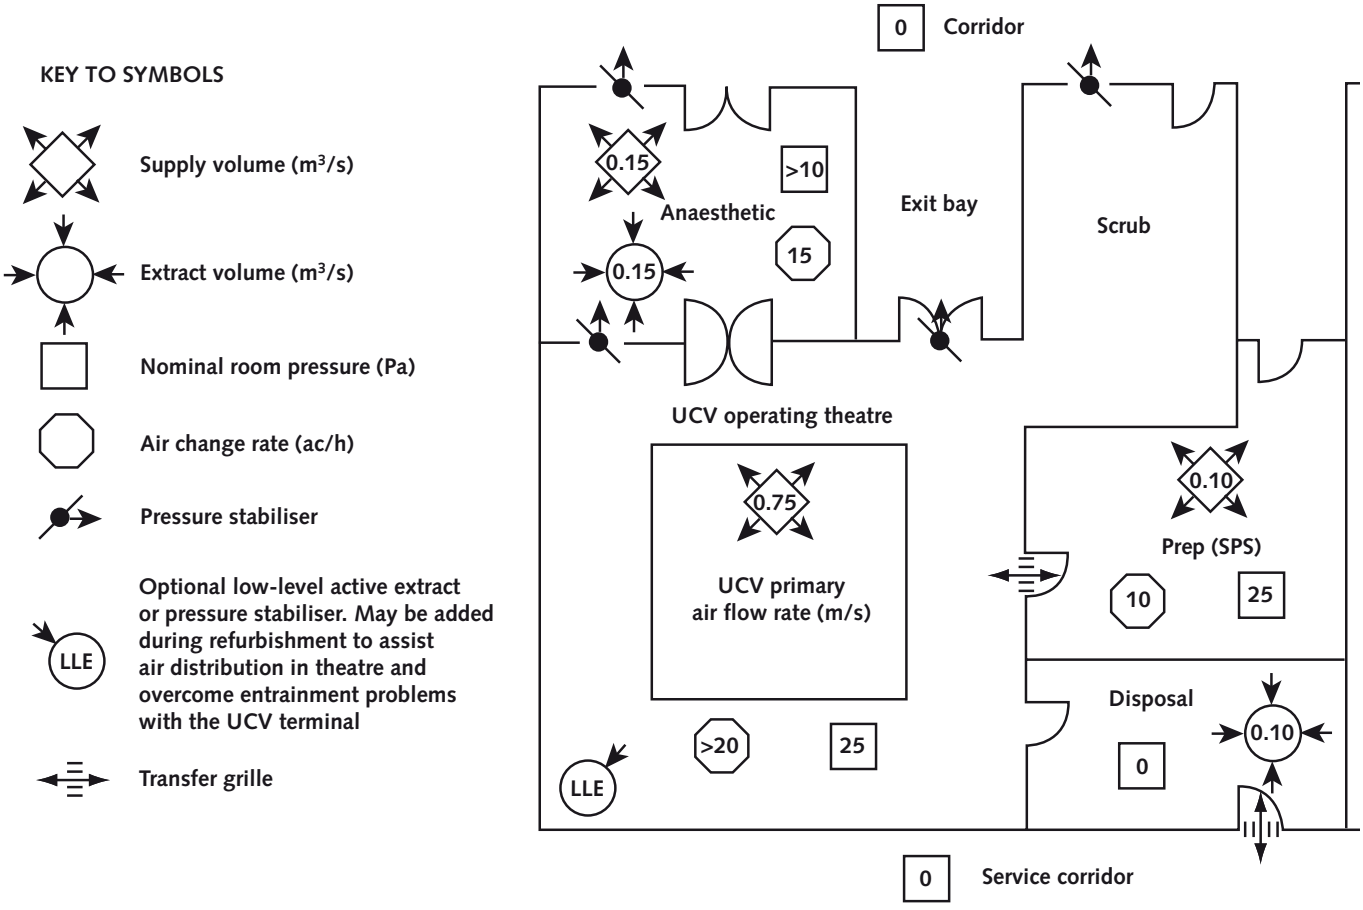
If difficulties are experienced with entrainment around the periphery of the UCV, adding a low-level active or passive extract in the location indicated will usually resolve the problem.

Room	Size	Air-change rate (AC/hr)	Nominal pressure (Pa)	Flow rate (m^3/s)
Theatre	**Existing theatre suite to be measured on site**	20	25	0.75*
Anaesthetic		15	>10	0.15
Sterile pack store prep		10	25	0.1
Scrub		–	25	–
Disposal		–	0	0.1

Notes:

* Primary fresh-air-flow volume only

The disposal layout detailed will remain the same should a hatch be utilised instead of a door onto the outer corridor. Alternatively the disposal room could be omitted and replaced with a disposal hatch between the theatre and corridor



Appendix 8 – Design of air-movement control schemes for operating theatres

General

A8.1 Standard operating suite design solutions are given in paragraphs 7.31–7.90 and Appendix 7. If these standard solutions cannot be used, the following procedure should be adopted, which will result in an acceptable design. Note that the method employed can equally be used to provide a design solution to a ventilated suite of rooms for any application.

A8.2 The method is concerned with the calculation of air-flow rates to ensure that correct air movement occurs between rooms when any one door is open. Under most circumstances, the air quantities required for air-movement control will approximate to those for either temperature control or bacterial contaminant dilution. This flow rate is sufficient to control the effects of any slight reverse flows occurring when a door is opened.

A8.3 The progression through the design procedure is shown in the air-flow design procedure chart (Figure A3) and is supported by worksheets WS1 to WS7 described in paragraph A8.4. It is recommended that a plan of the suite and an air-flow network be made (Figure A2) to collate all information. Flow rates, air-transfer devices etc should be entered as required. The remainder of this Appendix may be treated as reference data to assist in the various steps. The following symbols are used:

S_S – supply air-flow rate for summer temperature control;

S_W – supply air-flow rate for winter temperature control;

S_D – supply air-flow rate for dilution of bacterial contaminants;

S_L – supply air-flow rate for heat loss;

S_G – supply air-flow rate for heat gain;

E_D – extract air-flow rate for dilution of bacterial contaminants;

S_F – final supply air-flow rates

E_F – final extract flow rates;

S_{AMC} – air-supply flow rate for air-movement control;

E_{AMC} – air-extract flow for air-movement control;

L_{OUT} – leakage air-flow rate outward;

L_{IN} – leakage air-flow rate inward;

Σ_{OUT} – total air-flow rate outward;

Σ_{IN} – total air-flow rate inward.

A8.4 To simplify the procedure, standard worksheets (WS1 to WS7) have been devised. For each operating suite, a set is required comprising one each of WS1, WS3, WS5, WS6a, WS6b and WS7, one WS4 for each corridor and one WS2 to cover each peripheral room. WS2 has five versions:

- WS2a single flow,
- WS2b parallel/series multi-flow,
- WS2c parallel multi-flow or series multi-flow (unbalanced);
- WS2d series multi-flow (balanced); and
- WS2e bay (semi-open).

Peripheral room type

A8.5 The rooms in the operating suite other than the operating room and corridor are referred to as peripheral rooms. Peripheral rooms have been classified according to the flows in and out. These room classifications are defined in paragraphs A8.6–A8.11.

Single flow

A8.6 This is a room with only one door and a net surplus of supply or extract air.

Parallel multi-flow

A8.7 This is a room with two or more doors through each of which the air flows either outwards (high pressure) or inwards (low pressure) (for example the Prep (lay-up) in standard layout 5 in Appendix 7).

Parallel/series multi-flow

A8.8 This is a room having a net surplus of supply or extract and with two or more doors. One or more doors will be to an area of equal cleanliness and need not be protected; hence, the flow may vary between inwards and outwards, the remaining door being to an area of greater or lesser cleanliness (for example the Prep (SPS) in standard layout 6 in Appendix 7).

Series multi-flow (unbalanced)

A8.9 This is a room having a net surplus of supply or extract and with two or more doors. Air flows inwards through one or more doors and outwards through one or more doors.

Series multi-flow (balanced)

A8.10 This is a room as in paragraph A8.9 above, but having either no mechanical ventilation or no net surplus of supply or extract (for example an anaesthetic room).

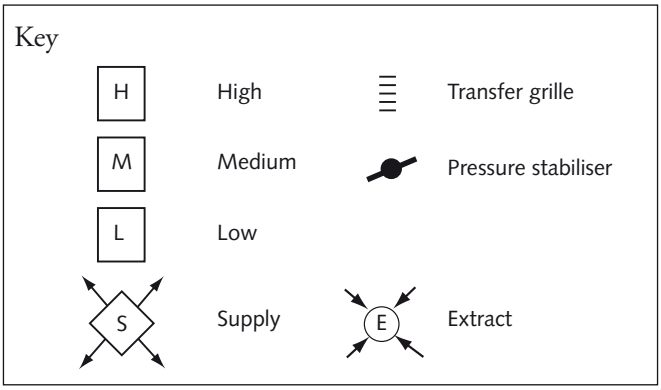
Bay

A8.11 A room which has a permanent opening to the operating room may be considered as a bay off the latter (for example a scrub). Two categories exist:

- open bay – the opening is larger than a normal single door opening. The bay may be considered as part of the main room;
- semi-open bay – the opening is no larger than a normal single door opening. In this case it is possible to protect the bay from the main room by provision of air supply or extract in the bay, or by passing air to or from another area.

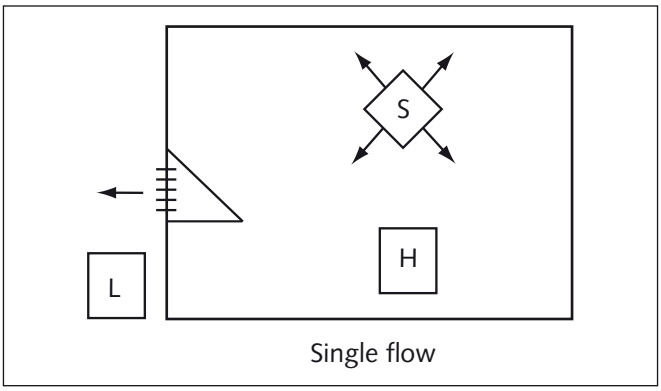
Air-movement control in peripheral rooms

A8.12 For the design of air-movement control, two types of air-transfer device are considered. These are transfer grilles and pressure stabilisers. Each has a particular field of application within the design, as described in paragraphs A8.34–A8.43. Air movement is controlled in each of the different room types described in paragraphs A8.13–A8.31.



Single flow rooms

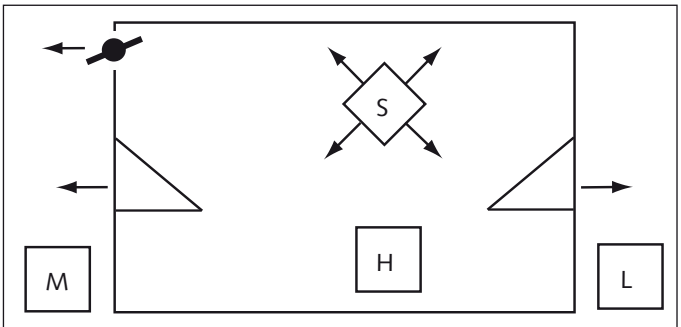
A8.13 An appropriately-sized transfer grille should be located in or adjacent to the door of each single flow room to relieve the pressure differences across the door when closed.



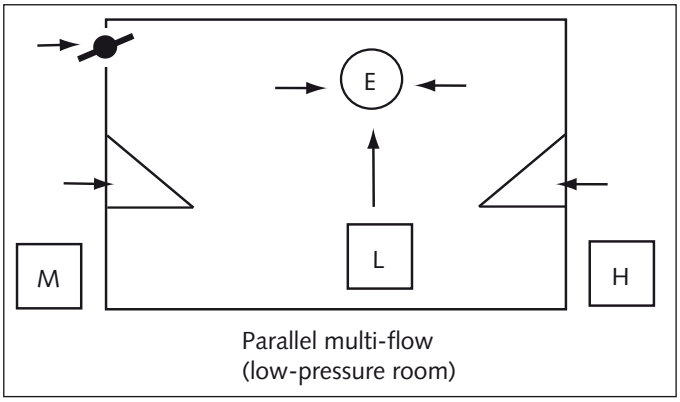
Single flow

Parallel multi-flow rooms

A8.14 The pressure difference across the closed doors must be relieved, but transfer grilles are not appropriate where two doors lead to areas of different pressures, because reverse flow could occur when the other door is open. For this reason, pressure stabilisers are used.



Parallel multi-flow
(high-pressure room)



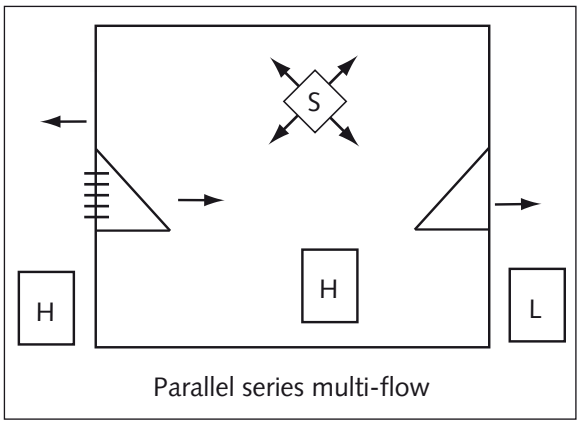
Parallel multi-flow
(low-pressure room)

A8.15 These rooms will be either high-pressure or low-pressure with respect to the adjacent areas (see preparation lay-up room and disposal room, respectively, in standard layout 5 of Appendix 7). The pressure-relief damper is always situated between the room and area, which results in the smaller differential pressure to ensure best use of air.

A8.16 Just as reverse flow can occur if transfer grilles are used, it can similarly occur via door gaps when the other door is opened. It is not possible to avoid this, except by using air locks, but due to the low flow rates and short durations involved, this is not considered to be of importance.

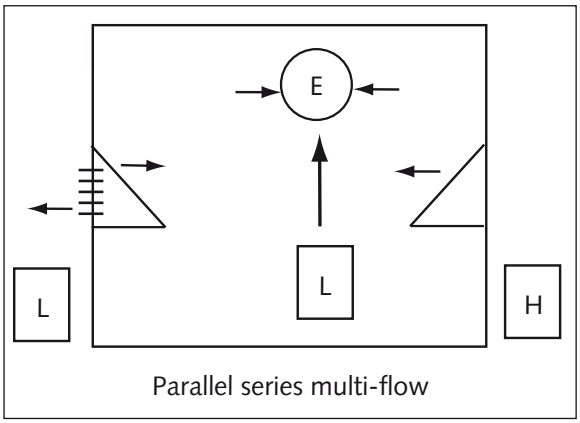
Parallel-series multi-flow rooms

A8.17 These rooms are similar to those in paragraph A8.14 above, but because the room is of equal cleanliness to one of the adjacent rooms, the nominal pressures will be equal and air may flow through the adjoining doorway in either direction (for example the Prep (SPS) in standard layout 6 of Appendix 7).



Parallel series multi-flow

A8.18 Where the nominal room pressure equals that of the higher-pressure adjacent room, the best use of air is by supplying air required for bacterial dilution only and allowing this to exhaust via a transfer grille to the area of equal cleanliness. The doorway to the lower pressure area is protected by the combination of the supply air and the air that will flow inwards through the transfer grille from the area of equal cleanliness.

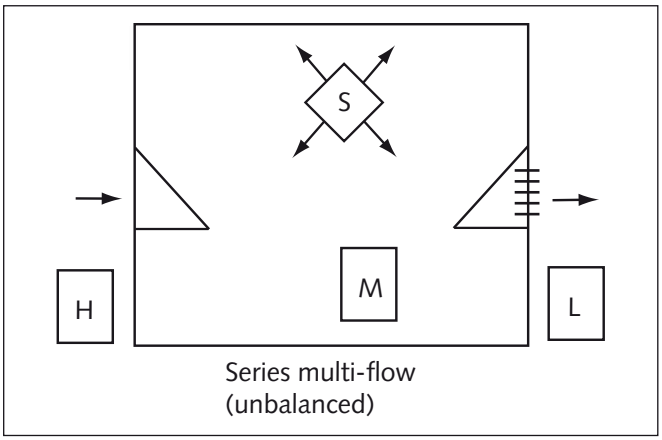


Parallel series multi-flow

A8.19 Conversely, where the nominal pressure equals that of the lower-pressure adjacent room, extract ventilation and a transfer grille to the lower pressure adjacent room should be provided (for example the disposal room in standard layout 8 of Appendix 7).

Series multi-flow (unbalanced)

A8.20 These rooms are somewhat similar to those in paragraph A8.15 above, but because the pressure lies between that of the rooms on either side, the back-flow problem does not exist.



Series multi-flow
(unbalanced)

A8.21 Where the room has a net surplus of mechanical supply air, a transfer grille should be located in or adjacent to the door through which air flows outwards, and the mechanical supply flow rate to the room should be chosen to give protection when this door is open.

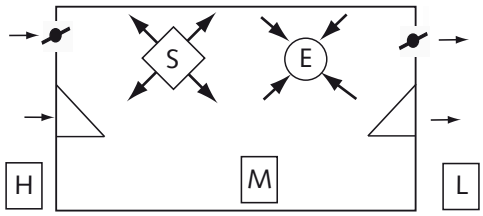
A8.22 Where the room has a net surplus of mechanical extract air, a transfer grille should be located adjacent to the door through which the air flows

inwards, and the mechanical extract flow rate to the room should be chosen to give protection when this door is open.

A8.23 The grille must be sized for the protection requirement of the opposing door when open. When the room on the high-pressure side depressurises, there is a possibility of back-flow through gaps around the door, but this problem may be ignored.

Series multi-flow (balanced)

A8.24 In these rooms, a transfer device adjacent to each doorway is required in order to provide a flow path for the air required to protect the opposing door when opened.



Series multi-flow (balanced)

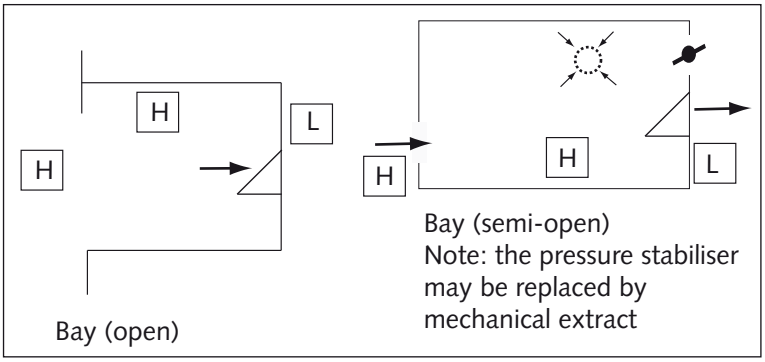
A8.25 These transfer devices will normally be pressure stabilisers, although transfer grilles may be used where a large amount of excess air is to be exhausted from the operating room when all doors are closed (for example anaesthetic rooms).

A8.26 The calculation procedure is to assume that pressure stabilisers are being used; then – if there is sufficient excess air – change to transfer grilles as described in paragraph A8.50.

Bay

Open bay

A8.27 A bay of the open type (for example scrub-up) is considered to be part of the operating room. Provided air movement is satisfactory, no specific extract is required.



Semi-open bay

A8.28 In a bay of the semi-open type, protection of one area from the other is possible (for example scrub-up).

A8.29 As stated previously, the need for protection between operating room and scrub-room is not very great. Better use of air can therefore be achieved in this case by installing a pressure stabiliser between the scrub-room and clean corridor. This will allow a flow of air through the scrub-room at all times, except when a door is opened elsewhere in the suite. The pressure stabiliser will then close and the air will be diverted to the other door. When it is considered necessary to protect the scrub-room at all times, either a transfer grille to the corridor or mechanical extract in the scrub-room should be provided.

Operating room

A8.30 Once the peripheral rooms have been considered, the operating room requirements may then be decided and the supply flow rate required for air-movement control calculated. This flow rate should be such that, with any one door open, the correct air movement directions are maintained. There will be one door in the suite that will require the largest supply flow rate to the operating room for protection when open. This is called the "key door" and is discussed separately in paragraph A8.33. Use of this concept avoids repetitive calculations for each door in turn. Having established the required supply flow rate, a relief route must be provided to the clean corridor for any excess air when the doors are closed. This would be via transfer grilles or pressure stabilisers through a series-flow room or via pressure stabilisers to the clean corridor directly.

Corridors

A8.31 All surplus air from the suite, except that lost through structure leakage and any passing to the outer corridor, will arrive in the patient/staff corridor. Should this air be insufficient to achieve the required air-change rate (see Appendix 3), some additional air supply should be provided. (The air balance should take account of structural leakage.)

Door opening

A8.32 Whereas the resulting pressures are dependent on ductwork layout, room relationships and characteristics of the fan, the generalisations shown in Appendix 6 can be used to estimate the change in room pressure when a door is opened.

A8.33 The "key door" will be the open double door which leaves the operating room at the highest pressure, and/or requires the largest air flow. This should be determined using the procedure in worksheet WS3.

Transfer grilles

A8.34 These may be used to limit the pressure differences across the closed door of a single-flow room or, in some instances, for protection of a series-flow or parallel-series-flow room. They allow air flow in both directions and may not be suitable for all applications.

A8.35 The free area of a grille is calculated from the following equation:

$$A = \frac{Q}{0.84\sqrt{\Delta P}}$$

where:

A is free area (m^2)

Q is flow rate (m^3/s)

P is pressure difference (Pa).

A8.36 The flow through a grille at a different pressure may be found from the following equation:

$$Q_2 = Q_1\sqrt{\frac{\Delta P_1}{\Delta P_2}}$$

where:

Q_1 and P_1 are original flow and differential pressure

Q_2 and P_2 are new flow and differential pressure.

A8.37 The transfer grille may be replaced by carefully proportioned door undercuts of the equivalent free area.

A8.38 The function of the transfer grille is to provide a means of air-flow control by which the volume and pressure loss can be established. If a grille is used, it should have an easily removable core to facilitate cleaning.

Pressure-relief dampers

A8.39 The functions of a pressure-relief damper are now carried out by pressure stabilisers. Accordingly, all mention of them has been removed from this document.

Pressure stabilisers

A8.40 Pressure stabilisers can be adjusted to hold the pressure constant over a wide range of flow rates. They are used where requirements exist for accurate room-pressure control or rapid shut-off on pressure fall.

A8.41 The installation of a grille or baffle in association with a stabiliser will alter the operating characteristics. It is recommended that a location be chosen to avoid the need for visual screening, for example, at high level. The location should be chosen to minimise the likelihood of damage.

A8.42 The stabilisers used should be virtually silent in operation, adjustable on site, maintenance-free and of a type which cannot be wrongly inserted. They should not be used in external walls or where the pressure difference is less than 5 Pa. The required size of a pressure stabiliser is dependent on the design pressure difference across it and flow rate through it. The manufacturer should provide data relating pressure difference to mean velocity (or flow rate per unit area). From this, the required area can be calculated and then rounded-up to the nearest size manufactured or nearest combination of smaller sizes.

A8.43 It is sometimes possible to arrange for a pressure stabiliser to perform two tasks. In an anaesthetic room, for example, the two pressure stabilisers may be made to pass the open door protection air, and also control the operating and anaesthetic room pressures with the door closed. To achieve this, the stabilisers are sized for the flow rate required with one of the doors open, but the pressure setting is

adjusted to be the value required with the doors closed. This is shown in Figure A1.

Door leakage flows

A8.44 For an air-movement control scheme to work satisfactorily, it is essential that the estimates of door-gap leakage made at the design stage are closely related to those which are achieved in practice. The calculation of gap-flows is complicated by the fact that such flows generally fall into the transition region between laminar and turbulent flow and hence do not follow the normal flow equations. The gaps assumed are 4 mm along the bottom, 3 mm at the top and sides, and 2 mm between double leaves. Doors should not have wider gaps than these. Tighter gaps would result in lower flow-rate requirements and hence lower fan power, but care should be taken to ensure that all doors in the suite have similar gap dimensions. It may be possible to ignore the door leakage and so reduce the air-flow requirement (see the "designers' notes" in Appendix 4).

Room temperature estimation

A8.45 The air-flow rate required to prevent back-flow through an open door is dependent on the temperature difference across the door. The design figures shown in Appendix 6 are based on the temperature differences that will normally occur in practice, assuming heat gains and losses in accordance with Appendix 4.

A8.46 At step 11 of the air-flow design process, the temperature differences across the doors of all rooms classed as "sterile" are calculated. Worksheet WS6 is recommended for the calculations, using the following criteria:

a. assume that the operating room is being controlled at 20°C and calculate the incoming air-supply temperature as shown on worksheet WS6;

b. the calculation should be repeated for both summer and winter conditions, with an operation in progress;

c. assume all doors are closed;

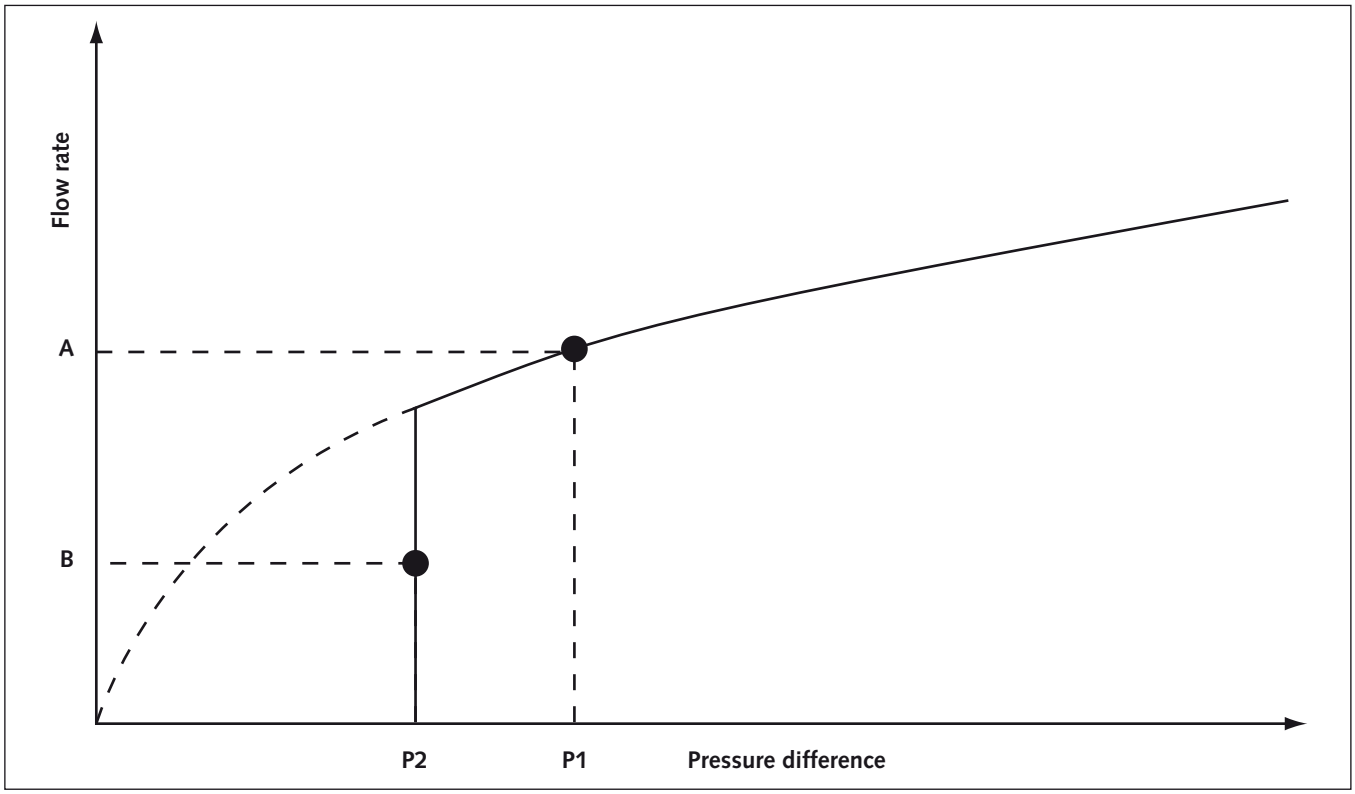
d. use the room supply flow rates from WS1;

e. use the inward air flows through air-transfer devices and closed door leakages from WS2a to WS2E;

f. the formula used in worksheet WS6 is as follows:

$$T = \frac{(t_1 Q_1 + t_2 Q_2 + \ldots + t_n Q_n) + 0.828H}{(Q_1 + Q_2 + \ldots Q_n)}$$

Figure A1 Pressure stabilisers performing two tasks



where:

Q = flow rate from source (m^3/s)

t = the temperature of source (°C)

H = the room heat gain (kW).

A8.47 If the evaluated temperature differences between rooms do not exceed 2°C, the solution is satisfactory; otherwise proceed as follows:

(i) check the assumption on which the heat gains are based;

(ii) take steps to reduce the heat gains;

(iii) if the door is to a corridor, the flow through the open door will be larger than the value given in Appendix 6. Calculate on WS3, assuming it is the "key door" with door-flow unknown, and the supply as known;

(iv) if the door leads to a room with mechanical supply, install a trimmer heater in the supply to the room controlled by either a differential thermostat or a thermostat slaved to the operating room thermostat to ensure that T is minimised;

(v) if the door leads to a room with no mechanical supply, increase the door protection flow as follows:

$$Q_{new} = Q_{old}\left[\frac{\Delta T + 1}{2}\right]$$

A8.48 These options should be considered in this order, and (i), (ii) and (iii) should be investigated thoroughly before proceeding to (iv) or (v). The mechanical supply may need to be increased in order to achieve the desired air-change rates.

Relief of excess air from operating room when all doors are closed

A8.49 As the mechanical supply to the operating room is sized to provide an appropriate flow outward through any door which is opened, it follows that when all doors are closed, there will be more air supplied to the operating room than can exit from it via leaks etc. This "excess" air can be relieved by either of the two methods described in paragraphs A8.50–8.54.

By transfer devices via the anaesthetic room

A8.50 For door protection, the transfer devices in the anaesthetic room are typically designed to pass 0.47 m^3/s at a differential pressure of 14 Pa. When the doors are closed, the differential pressure will change to 11 Pa between theatre and anaesthetic room, and 14 Pa between anaesthetic room and corridor; the volume of air passed by the transfer devices will be modified as shown in the following formula:

$$Q = Q_1\left(\frac{\Delta P_1}{\Delta P_2}\right)^{1/2}$$

$$= 0.47\left(\frac{11}{14}\right)^{1/2}$$

$$= 0.42\ m^3/s$$

where:

Q = "excess" air to be vented with doors closed

Q_1 = air flow required for door protection through transfer device

ΔP_1 = nominal differential pressure with door to operating room closed and door to corridor closed

ΔP_2 = nominal differential pressure between either the anaesthetic room and corridor when the operating room door is open, or the anaesthetic room and operating room when the corridor is open. This differential pressure is used when selecting size of both devices.

A8.51 If the "excess" air is less than 0.42 m^3/s, a pressure stabiliser is required to ensure that the correct protection air-flow is available to pass through the door.

A8.52 If the "excess" air is greater than 0.42 m^3/s, a transfer grille is acceptable because at all times the air-flow will exceed the flow required for door protection.

By pressure stabilisers to the corridor

A8.53 If it is undesirable to pass operating room air through the anaesthetic room, it may be passed directly to a corridor via a separate pressure stabiliser.

A8.54 If there is sufficient "excess" air, the transfer grille solution at paragraph A8.52 should be adopted, as it provides the simplest solution and, once set up, will require no further maintenance. With less excess air, it is recommended that the air be passed through the anaesthetic room via the pressure stabilisers as at paragraph A8.51, thus keeping the number of pressure stabilisers to a minimum. Both these solutions increase the air-change rate in the anaesthetic room, but care should be taken to avoid passing excessive amounts through that would cause discomfort to the occupants.

Figure A2 An example of an air-flow network

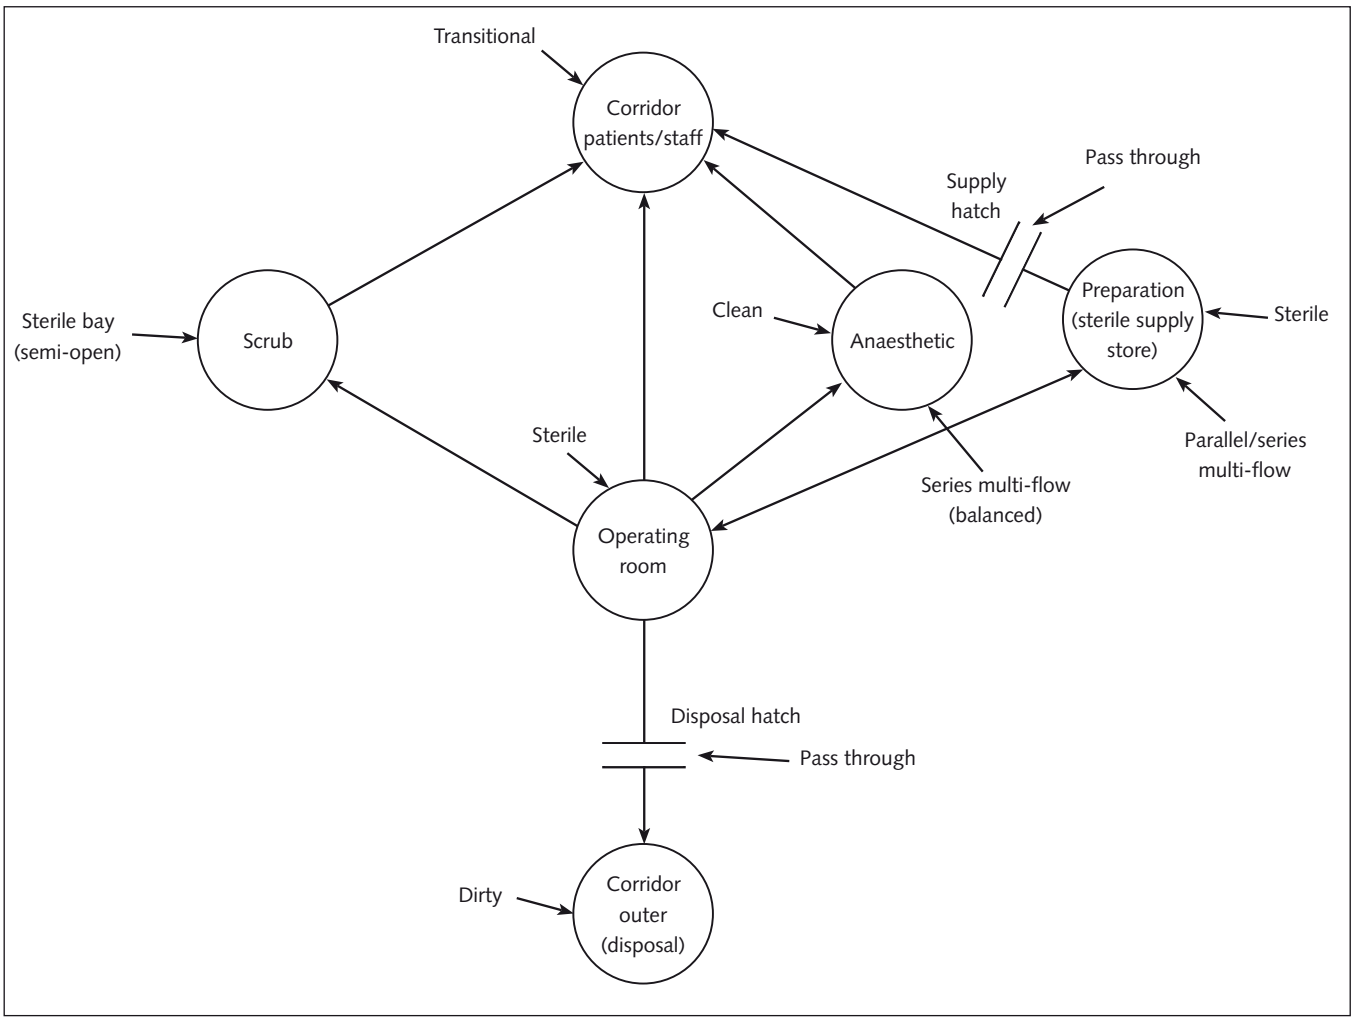


Figure A3 Air-flow design procedures

Step	Description	Worksheet
1	Show nominal room pressures and air flow directions on the plan of the theatre suite and WS1	WS1
2	Enter heat/loss/gain data and calculate supply air flow rates for temperature control only. Categorise room types, eg sterile, clean etc	WS1
3	Enter air flows required for bacterial contamination control or air change rate, whichever is the greater; add supply and extract volumes (S_D, E_D) on the plan	WS1
4	Define peripheral room types, see paragraphs A8.5–A8.11, and select appropriate worksheets	Select from WS2a to WS2e
5	Locate air transfer devices, enter details on worksheets and locate on the plan and Figure A2	Selected worksheets from WS2a to WS2e
6	For each peripheral room, determine air flows through doors when open and calculate mechanical supply or extract and transfer device flows	as above
7	Select "Key Door" and calculate air supply for operating room	WS3
	Does this door produce solution with greatest flow? — NO → (return to step 7)	
	YES ↓	
8	Transfer to WS1 and select final rate S_F and E_F	WS1, WS3
9	Make provision for relief of excess air with doors closed	Selected worksheets and WS3
10	Calculate supply and extract flow rates for corridor(s)	WS4, WS5
11	Calculate room temperatures (all doors closed) and ΔT's	WS6a and WS6b
	Do any ΔT's across doors to sterile rooms exceed 1.0°C? — YES → Rectify as in paragraph A8.47	
	NO ↓	
12	Make summary of flows	WS6a and WS6b
13	Size transfer devices, size ductwork, central plant etc	WS7
14	Design ductwork layout, control plant etc	–

BETWEEN:

(1) **BROOKFIELD MULTIPLEX CONSTRUCTION EUROPE LTD** (Company Registration No. 03808946 whose registered office is at 99 Bishopsgate, 2nd Floor, London EC2M 3XD (the "**Contractor**" which shall include its successors in title and permitted assigns under this Agreement); and

(2) **TUV SUD LIMITED (trading as WALLACE WHITTLE** (Company No. SC215164) whose registered office is at Napier Building, Scottish Enterprise Technology Park, East Kilbride, Glasgow G75 0QF (the "**Consultant**").

RECITALS:

(A) The Board has or will enter into the Project Agreement with Project Co whereby Project Co has agreed to design, build, finance and maintain the Project.

(B) Project Co has or will enter into the Construction Contract with the Contractor for the design and construction of the Works.

(C) The Contractor wishes to appoint the Consultant to provide services on the terms and conditions set out in this Agreement for the Project.

OPERATIVE PROVISIONS:

1. **DEFINITIONS**

In this Agreement the following words and expressions shall have the following meanings:

"Additional Services" means any additional services relating to the Project which the Contractor may instruct the Consultant to undertake provided always that any instruction relating to Additional Services must be given or confirmed in writing;

"Adequate Procedures" means procedures, as referred to in section 7(2) of the Bribery Act 2010 and described in guidance issued by the Secretary of State under section 9 of the Bribery Act 2010, both as amended, re-enacted or updated from time to time;

"BIM Execution Plan" means the plan prepared and agreed in accordance with Clause 10.3 to explain how the information modelling aspects of the Project will be carried out;

"BIM Outputs" means any and all information (whether graphical or non-graphical), calculations, designs, specifications and any other data, including without limitation, plans, sections, projections, elevations, tables, schedules, drawings, views and representations of the Works or any part thereof, produced or generated as an output

by the Project BIM or any other BIM output of any nature whatsoever, including but not limited to any information located in a "shared" folder;

"BIM Protocols" means the protocol for the use and development of the BIM Model attached at Schedule 10;

"Board" means Lothian Health board, a health board constituted in Scotland under the National Health Service (Constitution of Health Boards) (Scotland) Order 1974 (S.I. 1974/267) as amended by the National Health Service (Constitution of Health Boards) (Scotland) Amendment Order 2003 (S.S.I. 2003/217) pursuant to Section 2 of the National Health Service (Scotland) Act 1978 as amended by section 28 of the National Health Service and Community Care Act 1990 and having its principal address at Waverley Gate, 2-4 Waterloo Place, Edinburgh EH1 3EG;

"Board's Construction Requirements" means the requirements of the Board set out or identified in Section 3 (*Board's Construction Requirements*) of Schedule Part 6 (*Construction Matters*) of the Project Agreement as amended from time to time;

"BREEAM Report" means the BREEAM Prediction Report attached as Schedule 9;

"CDM Regulations" means the Construction (Design and Management) Regulations 2007 or any amendment or replacement thereof;

"Change in Control" means:

(a) any sale or other disposal of any legal, beneficial or equitable interest in any or all of the equity share capital of a corporation (including the control over the exercise of voting rights conferred on that equity share capital, control over the right to appoint or remove directors or members or the rights to dividends); and/or

(b) any other arrangements that have or may have or which result in the same effect as paragraph (a) above;

"Consents" means all permissions, consents, approvals, certificates, permits, licences, statutory agreements and authorisations required by Law, and all necessary consents and agreements from any third parties (including, without limitation, any planning permission), needed to carry out the Services in accordance with this Agreement;

"Contractor's Health and Safety Policy Statement" means the Contractor's health and safety policy statement as updated or amended from time to time;

"Construction Contract" means the contract between Project Co and the Contractor for the design and construction of the Works and any sub-contracts consequent thereupon in relation to the Project;

"Construction Quality Plan" means the document at Section 8 (*Quality Plans (Design and Construction)*) of Schedule Part 6 (*Construction Matters*) of the Project Agreement;

"Cost Plan" means the document attached as Schedule 8 identifying the estimated cost to the Contractor of executing and completing each element of the Project as the same may be revised by the Contractor from time to time such revisions to be notified to the Consultant;

"Deliverables" means any and all deliverables and the drawings, diagrams, CAD materials, technical data, inventions, computer software, pricing documents, details, plans, models, specifications, databases, schedules, reports, records, data, calculations and all other documents or recorded information of any nature whatsoever, and all revisions thereof and additions thereto, and the designs and work contained in them, prepared by or on behalf of the Consultant in respect of the Project (which shall include any BIM Outputs and the Design BIM if relevant to the Project);

"Deliverables Timetable" means the timetable of milestone dates for design documentation and deliverables set out in Schedule 6 as revised by the Contractor from time to time such revisions to be notified to the Consultant;

"Design BIM" means the building information models relating to the Services which shall be produced and maintained by the Consultant and submitted to the Project BIM Manager for incorporation within the Project BIM, as such model evolves and develops throughout the works, as more particularly described in the BIM Protocol;

"Design Consultant Responsibility Matrix" means the design consultant responsibility matrix agreed with the Contractor attached as Schedule 7 setting out the elements of the Works for which the Consultant is responsible together with those elements in respect of which the Consultant needs to co-ordinate its Services;

"Design Data" means all drawings, reports, documents, plans, software, formulae, calculations and other data relating to the design, construction, testing and/or operation of the Project whatsoever;

"Design Quality Plan" means the document at Section 8 (*Quality Plans (Design and Construction)*) of Schedule Part 6 (*Construction Matters*) of the Project Agreement;

"Direct Losses" means all damage, losses, liabilities, claims, actions, costs, expenses (including the cost of legal or professional services, legal costs being on an agent/client, client paying basis), proceedings, demands and charges whether arising under statute, contract or at common law but, to avoid doubt, excluding Indirect Losses;

"Disclosed Data" means any Design Data and any other written information, data and documents made available or issued to the Consultant in connection with the

Project by or on behalf of the Contractor, the Board or Project Co. whether on, before or after the execution of this Agreement;

"Documentation" shall have the same meaning as Deliverables;

"Environmental and Waste Minimization Policy Statement" means the Contractor's environmental strategy for sustainability and the minimization of waste as may be updated or amended from time to time;

"Fee" means the fee to be paid by the Contractor to the Consultant for the due and proper performance of the Services as detailed in Schedule 1;

"Fee Payment Schedule" means the schedule setting out the timetable for fee payments forming part of Schedule 1;

"Financial Close" means the execution of the Project Agreement and the appointment of the Contractor pursuant to the Construction Contract;

"Financial Close Payment" means the payment to be made to the Consultant in accordance with clause 5.3 of this Agreement and as set out in Schedule 1;

"Good Industry Practice" means using standards, practices, methods and procedures conforming to the Law and exercising that degree of skill and care, diligence, prudence and foresight which would reasonably and ordinarily be expected from a skilled and experienced person engaged in a similar type of undertaking under the same or similar circumstances;

"Independent Tester" means the party appointed or to be appointed by the Board and Project Co and who is identified as carrying out this role in Schedule 1 or such substitute independent tester as may be subsequently appointed pursuant to the Project Agreement.

"Indirect Losses" means loss of profits, loss of use, loss of production, loss of business or loss of business opportunity or is a claim for consequential loss or for indirect loss of any nature;

"Intellectual Property" means all registered or unregistered trademarks, service marks, patents, registered designs, utility models, applications for any of the foregoing, copyrights, unregistered designs, the sui generis rights of extraction relating to databases, trade secrets and other confidential information or know-how;

"Intellectual Property Rights" means the Intellectual Property which (or the subject matter of which) is created, brought into existence, acquired, used or intended to be used by the Consultant or by other third parties (for the use by or on behalf of or for the benefit of the Contractor or Project Co) for the purposes of the design or construction of the Project or the conduct of any other Project Operation or otherwise for the purposes of this Agreement;

"Law" means:

(a) any applicable statute or proclamation or any delegated or subordinate legislation;

(b) any enforceable community right within the meaning of section 2(1) of the European Communities Act 1972;

(c) any applicable guidance, direction or determination with which the Contractor, the Board and/or Project Co is bound to comply to the extent that the same are published and publicly available or the existence or contents of them have been notified to the Consultant by the Contractor; and

(d) any applicable judgement of a relevant court of law which is a binding precedent in Scotland,

in each case in force in Scotland;

"Insolvency Event" means the occurrence of any of the following events:

(a) any arrangement or composition with or for the benefit of creditors (including any voluntary arrangement as defined in the Insolvency Act 1986) being entered into by or in relation to either Party;

(b) a receiver, administrator, administrative receiver or other encumbrancer taking possession of or being appointed over, or any distress, execution or other process being levied or enforced (and not being discharged within ten (10) Business Days) upon, the whole or any material part of the assets of either Party;

(c) either Party ceasing to carry on business;

(d) a petition being presented (and not being discharged within twenty (20) Business Days), or a resolution being passed or an order being made for the administration or the winding up, bankruptcy or dissolution of either Party; or

(e) if either Party shall suffer any event analogous to the events set out in this definition in any jurisdiction in which it is incorporated or resident;

"NHS Requirements" means Health Building Notes and Health Technical Memoranda and such other requirements as are designated as NHS Requirements in the Board's Construction Requirements, all Executive Letters, Health Service Guidelines, Health Circulars of the NHS and any similar official requests, requirements and guidance having similar status for the time being in force, but only to the extent the same are published and publicly available or the existence and contents of them have been notified to the Consultant;

"Other Consultants" means any consultants which may be appointed by the Contractor from time to time in connection with the Project and notified to the Consultant;

"Practical Completion" means practical completion of the Works under the Construction Contract;

"Programme" means the overall construction programme for the Project identifying the time for executing and completing each element of the Works as may be revised by the Contractor from time to time such revisions to be notified to the Consultant;

"Project" means the project described in Schedule 1;

"Project Agreement" means the agreement entered into or to be entered into between the Board and Project Co. in respect of the design, build, finance and maintenance of the Project;

"Project BIM" means the federated building information model for the Works which shall be maintained by the Project BIM Manager as such model evolves and develops throughout the works, as more particularly described in the BIM Protocol;

"Project BIM Manager" means the Contractor unless any other party is identified as carrying out this role in Schedule 1, or such other party as notified to the Consultant by the Contractor from time to time;

"Project Co" means the party referred to as such in Schedule 1;

"Project Co's Proposals" means Project Co's Proposals as set out at Schedule Part 6, Section 4 of the Project Agreement;

"Project Manager" means the party referred to as such in Schedule 1;

"Project Operations" means the carrying out of the Works and all other obligations of the Project Co under the Project Agreement from time to time;

"Quality Plans" means the Design Quality Plan and Construction Quality Plan, prepared in accordance with Section 8 (*Quality Plans (Design and Construction)*) of Schedule Part 6 (*Construction Matters*) of the Project Agreement, as required to be

implemented by Project Co in accordance with Clause 20 (*Quality Assurance*) of the Project Agreement;

"Services" means the services as set out in Schedule 2 together with any Additional Services;

"Site" means the location described in Schedule 1 on which the Works are to be constructed;

"Third Party Agreements" means the agreements listed in Schedule 4 together with any other agreements entered into by or on behalf of Project Co or the Contractor, the relevant parts of which have or will be disclosed to the Consultant;

"Works" means the works described in and to be executed under the Construction Contract whether by the Contractor or his sub-contractors.

2. **CONSULTANT'S OBLIGATIONS**

2.1 The Contractor appoints the Consultant with effect from the date on which it first commenced performance of its obligations under this Agreement to undertake the obligations set out in this Agreement and to provide the Services listed in Schedule 2 (and in accordance with the Design Consultant Responsibility Matrix listed in Schedule 7), and the terms of this Agreement shall retrospectively govern any work or services carried out by the Consultant prior to the date of this Agreement.

2.2 The Consultant confirms that the drawings and specifications that it has provided to the Contractor together with any supporting information produced by the Consultant or its sub-consultants comply with the Project Co's Proposals (insofar as they relate to the Services) in their current form as at the date of this Agreement, are adequate and are sufficiently advanced so as to enable the Contractor to accurately price and programme the Project and the Consultant acknowledges that the Contractor has and will rely on the drawings and specification and supporting information for that purpose. Nothing in this clause extends the Consultant's obligation to exercise the standard of reasonable skill, care and diligence owed pursuant to clause 2.3.1.

2.3 The Consultant warrants that:

2.3.1 it has used, and will continue to use, the degree of skill, care and diligence in the performance of the Services that would reasonably be expected of a competent professional designer experienced in carrying out design activities and services of a similar nature, scope and complexity as the Project, and that it has and will continue to proceed with the Services in a regular and diligent manner and so as not to prejudice or interfere with the progress of the Project;

2.3.2 its officers, employees, agents and consultants are competent and appropriately qualified and experienced and hold all necessary licences to

perform the Services, and that the Consultant will promptly take steps to replace any such people that reveal themselves during the course of the Project not to have the necessary competence, qualifications or experience with people that are approved by the Contractor (such approval not to be unreasonably withheld);

2.3.3 it has the necessary power and authority to enter into this Agreement and that it is under no obligations or restriction that would in any way interfere or be inconsistent with, or create a conflict of interest concerning, its performance of the Services; and

2.3.4 it shall not permit or effect a Change in Control in respect of its business without the prior written consent of the Contractor.

2.4 The Consultant shall comply at all times with the Contractor's reasonable requests in relation to the Project. The Consultant shall co-operate, as directed by the Contractor, with the Board, Project Co., the Independent Tester and any funders of the Project.

2.5 The Consultant shall provide the Contractor with all reasonable assistance in relation to any disputes or claims that arise in connection with the Project insofar as the Services are relevant to such disputes and the Consultant shall not be entitled to additional payment for such assistance.

2.6 In carrying out the Services the Consultant shall at all times comply with the Deliverables Timetable so as to enable the Contractor to meet the Programme.

2.7 If the Consultant is delayed or likely to be delayed in the performance of the Services, the Consultant shall:

2.7.1 as soon as possible, notify the Contractor in writing of such delay and the Consultant shall use all reasonable endeavours to mitigate such delay. Such notice shall not in any event be given later than seven calendar (7) days after the Consultant becoming aware of the commencement of the delaying event.

2.7.2 The Consultant shall within seven (7) calendar days of service on the Contractor of a notice pursuant to clause 2.7.1 provide to the Contractor in writing full and detailed particulars of the delaying event and the actual or anticipated extent of the delay with details of the measures the Consultant has adopted or proposes to adopt to avoid or mitigate the effects of such delay.

2.7.3 To the extent that the Consultant is responsible for any delay to the Services the Consultant shall use all reasonable endeavours to recover the delay, including but not limited to the provision of additional resource and/or the implementation of such hours of working as are required to recover the lost time. To the extent that the Contractor is responsible for

any delay to the Services the Contractor shall adjust the Deliverables Timetable as is fair and reasonable in all the circumstances.

2.8 If the Consultant in breach of this Agreement fails to provide the Services in accordance with the Deliverables Timetable, the Contractor may serve a written notice on the Consultant requiring him to perform in accordance with the Deliverables Timetable and to take whatever steps are necessary to do so. If in the reasonable opinion of the Contractor the Consultant is not complying with such notice, the Contractor shall at its discretion be entitled to take such further action as it considers necessary, including but not limited to:

2.8.1 requiring the Consultant to supplement its resources with additional experienced personnel and/or replacement personnel at no cost to the Contractor; or

2.8.2 terminating the Consultant's engagement under this Agreement and the Consultant's entitlement to further payment shall be calculated in accordance with the provisions of Clause 12;

2.8.3 withholding or exercising rights of set-off against monies that may be due or become due to the Consultant in relation to the delayed Services.

The Consultant must comply forthwith with any direction issued by the Contractor pursuant to this clause 2.8.

2.9 The Programme and/or the Deliverables Timetable may be amended from time to time in accordance with the Contractor's instructions if in the Contractor's opinion it is reasonable to do so, provided that:

2.9.1 the Contractor shall consult with the Consultant over the proposed amendments to the Deliverables Timetable and shall give due consideration to the Consultant's suggestions prior to issuing any instruction amending the same; and

2.9.2 if an instruction given by the Contractor pursuant to clause 2.9 amounts to an instruction by the Contractor to provide Additional Services any adjustment to the Fee shall be determined in accordance with clause 2.11.

2.10 Without prejudice to the Services listed in Schedule 2 the Consultant warrants and undertakes that it will (exercising the level of skill and care set out in Clause 2.3):

2.10.1 whenever and wherever an inspection is reasonably necessary or expedient for the proper performance of their duties or where specifically requested by the Contractor, inspect the work and materials of the Contractor or any sub-contractor or supplier;

2.10.2 liaise as reasonably requested by the Contractor with the Independent Tester and Project Co's advisers and, if appointed, any funding institution's representative or adviser and give due consideration to any representations or suggestions made by them;

2.10.3 not specify for use or permit materials to be used in connection with that part of the Project to which the Services relate which are:

(a) contrary to the recommendations in the version of "Good Practice in the Selection of Construction Materials" published by Ove Arup & Partners current at the time of specification; or

(b) materials or substances whether on their own or in combination with other materials or substances, processes or methods of working generally known in the Consultant's profession to be deleterious to health and safety or to the durability of the Project in the particular circumstances in which they are used or which are not in accordance with British Standards and Codes of Practice (where applicable standards exist) or which are publicised in the Building Research Establishment Digest as being deleterious; or

(c) prohibited under the Construction Contract or any of the Third Party Agreements.

If such materials as referred to in Clause 2.10.3 are discovered in the Works or it becomes known to the Consultant that such materials have been used in connection with the Works the Consultant will as soon as practicable notify the Contractor.

2.10.4 not make or approve any material alteration, addition to or omission from any agreed design or part of the design of the Project nor except in an emergency for reasons of constructability shall it issue any instructions or give any approval or do any other thing which might materially increase the cost of the Services or the Project or affect the date of Practical Completion without referring the matter to the Contractor with its comments and obtaining the Contractor's prior written approval thereto. The Consultant shall use all reasonable endeavours in the performance of the Services so as to ensure that the Works are able to be undertaken in accordance with the Cost Plan. Where such Cost Plan is exceeded which is not as a result of the Consultant failing to carry out its obligations under this Appointment and causes the Consultant to carry out Additional Services, then such Additional Services shall be paid for in accordance with clause 5.

2.10.5 promptly comply with any instructions by the Contractor to correct any Deliverables provided by it that are, in the Contractor's reasonable opinion,

non-compliant or inadequate or inaccurate and shall do so without delay and without adjustment to the Fee.

2.11 The Contractor may instruct the Consultant in writing to provide any of the Additional Services or an omission from the Services. In the event that the Consultant receives such an instruction from the Contractor to provide any of the Additional Services or an omission from the Services, then the following provisions will apply:

2.11.1 The Consultant shall notify the Contractor within ten working days following receipt of any instruction given under clause 2.11 of any addition or deduction to be made to the Fee which the Consultant considers is fair and reasonable as a consequence of such instruction, and shall provide the Contractor with such information as the Contractor reasonably requests to enable it to determine, in its reasonable opinion, the fair and reasonable addition or deduction to be made to the Fee as a consequence of such instruction together with confirmation that the said adjustment represents the entire adjustment that the Consultant seeks in relation to the instruction.

2.11.2 Within a reasonable time following the receipt of the information referred to in clause 2.11.1 the Contractor shall notify the Consultant of its determination of the fair and reasonable addition or deduction to be made to the Fee as a consequence of an instruction given under clause 2.11. For the avoidance of doubt, no addition to the Fee shall be made in respect of any instruction or order issued by the Contractor to repeat, modify or revise the Services where the repetition, modification or revision required by the Contractor arose through any negligent act, omission, default or breach by the Consultant in carrying out the Services.

2.11.3 If the Contractor issues any instruction pursuant to clause 2.11, the Consultant shall immediately implement the necessary variation to the Services notwithstanding any disagreement between the Consultant and the Contractor as to any sum determined by the Contractor pursuant to clause 2.11.2 and, except as expressly excluded, the provisions of this Agreement shall apply to all Services which are the subject of the instruction.

2.12 In performing its obligations under this Agreement the Consultant:

2.12.1 shall comply with all Law and Consents (including without limitation the giving of notices and the obtaining of any such Consents which are the responsibility of the Consultant as set out in the Services) and so as not to prejudice the renewal of any such Consents;

2.12.2 shall act in a manner that is not likely to be injurious to health or to cause damage to property;

2.12.3 shall act in a manner consistent with the Quality Plans;

2.12.4 except to the extent expressly stated to the contrary in the Board's Construction Requirements, shall comply with all applicable NHS Requirements;

2.12.5 shall act in a manner consistent with the Board, Project Co and/or Contractor discharging their respective statutory duties and other functions undertaken by it as the same may be notified to the Consultant from time to time;

2.12.6 in so far as not in conflict with an express obligation of the Contractor under the Construction Contract, or where in relation to a matter there is no express obligation or standard imposed on the Contractor under the Construction Contract, shall act in accordance with Good Industry Practice;

2.12.7 shall carry out the Services in accordance with the Board's Construction Requirements;

2.12.8 shall comply with the CDM Regulations and in particular the obligations allocated to a "designer" as defined and set out in the CDM Regulations, and in particular Regulation 11, and will furnish to Project Co information showing how the Consultant has sought to eliminate hazards to health and safety and to assist it and its Other Consultants to do the same;

2.12.9 warrants it is competent to act as a designer as defined in the CDM Regulations, and will provide Project Co with reasonable evidence of the same in accordance with Regulation 4 and Appendix 4 of the Regulations, and has allocated and will continue to allocate adequate resources to enable it to undertake the Services and comply with the CDM Regulations;

2.12.10 will liaise and co-operate with the 'CDM Co-ordinator', as defined in Schedule 1, and provide all information and assistance reasonably required to see that the Project is undertaken at all times in accordance with the CDM Regulations;

2.12.11 shall notify the Contractor of any changes or potential changes to applicable statutory requirements, professional standards, codes of practice and regulations. The Consultant shall comply with any instruction issued by the Contractor to review and advise upon such foreseeable changes and there shall be no addition to the Fee in respect of such instructions, including, but not limited to, if such instructions require re-documentation save to the extent that the said changes were not reasonably foreseeable then any instruction issued by the Contractor pursuant to this clause shall be deemed to be a variation and valued in accordance with the principles set out in clause 2.11;

2.12.12 acknowledges that the Project and/or the Services may be subject to various performance ratings assessments during the design stages (including without limitation environmental assessments, sustainability and energy efficiency assessments). In performing the Services, the Consultant shall observe and implement the standards and recommendations described in the relevant assessments and any report of the assessors, provided these standards and recommendations are consistent with Project Co's Proposals for the Project;

2.12.13 shall comply with the requirements of all health and safety legislation, regulations, approved codes of practice and guidance documents;

2.12.14 shall establish and implement an effective safety management system complying with or certified to the requirements of OHSAS 18001. The Consultant recognises and shall undertake to operate within the requirements of the Contractor's Health and Safety Policy Statement;

2.12.15 shall submit to the Contractor a Quality Management Plan for comment and approval, which shall specify how the design is to be developed in accordance with British Standard EN ISO 9001 or 9002 (as the case may be) and which will make specific reference to the Consultant's internal quality management procedures including those in relation to:

(a) the design and development stages;

(b) the review, verification and validation that are appropriate to each design and development stage;

(c) the responsibilities and authority for design development.

2.12.16 shall, insofar as they relate to the performance of the Services, (and exercising the level of skill and care set out in clause 2.3.1) diligently and regularly review the various documents which are relevant to the performance of the Services obtained by or provided to it in connection with the Project in particular to ascertain whether any ambiguities, discrepancies, inconsistencies, divergences, design or construction impracticalities or omissions exist from, within or between any such documents so as to identify conflicts in the design. The Consultant shall forthwith notify the Contractor of any issue arising from such review and provide the Consultant's recommendations in respect thereof;

2.12.17 shall provide the Contractor with all reasonable assistance including arranging for the Contractor, its servants, agents and any Other Consultant employed by it to have access to personnel, and relevant design and project related information from time to time, whether stored in human readable or machine readable form, to enable the Contractor to carry out a

full and systematic review of any part of the Services, provided always that such assistance does not disrupt the performance of the Services by the Consultant. The Consultant shall ensure that in any agreement with any sub-consultant that such sub-consultant will be obliged to afford like assistance to the Contractor as aforesaid. For the avoidance of doubt, all assistance provided by the Consultant in accordance with this clause, save for the delivery of such information to the Contractor's office outside of the UK as required, shall not be a variation to the Appointment or the Services, and the Consultant shall not be entitled to any additional payment for providing such assistance;

2.12.18 shall include in each of its monthly reports written confirmation that:

(a) it has performed the Services to date in full compliance with this Agreement (or to the extent the Services have not been so performed, it shall identify areas of material non-compliance); and

(b) it is not aware of any reason that may cause or result in either an increase in the cost of the Project and/or a delay to the Project.

2.12.19 shall aim to minimise any adverse impacts that construction has on the environment. This shall be through the design process, materials selection, construction techniques, and operational methods;

2.12.20 shall undertake the Services having due regard to the Contractor's Environmental and Waste Minimization Policy Statement;

2.12.21 shall identify throughout the performance of the Services methods to reduce waste and waste to landfill, and increase reused and recycled content, which shall be reported to the Contractor at the end of each design and construction phase together with the financial and practical implications of implementing the recommended actions;

2.12.22 shall work with the project team to ensure that design actions to reduce construction waste and increase reused / recycled content are implemented;

2.12.23 shall agree with the Contractor which level of waste reduction and reuse to pursue;

2.12.24 shall work with the project team to develop a site waste management plan for the Project as soon as possible following commencement of the Services, including waste forecasts and data on reduction targets and actions;

2.12.25 shall use site waste management software nominated by the Contractor;

2.12.26 shall produce its design in accordance with and so as to meet the lifecycle replacement requirements and the energy performance targets as set out in clause 23 of the Project Agreement; and

2.12.27 shall comply with and produce its design in accordance with and so as to meet the Board's requirements in relation to achieving a minimum performance for BREEAM credit ENE 01 and a minimum Energy Performance Certificate rating, as set out in the Board's Construction Requirements.

3. **OTHER CONSULTANTS**

3.1 The Consultant shall where appropriate co-ordinate and integrate the performance of the Services with the services performed by the Contractor and/or the Other Consultants and/or with all relevant authorities and others involved on the Project and shall exercise the level of skill care and diligence referred to in Clause 2.3.1 to ensure it performs the Services in such manner so as not to interfere with any of the services provided by the Other Consultants.

3.2 The Consultant will prepare and supply to the Contractor and the Other Consultants such information and drawings (based on information available to the Consultant or reasonably obtainable by the Consultant) at such times as may be reasonably necessary and shall comply with the Deliverables Timetable and have due regard to the Programme.

4. **CONTRACTOR'S OBLIGATIONS**

4.1 The Contractor upon the request of the Consultant shall supply in such time as may be reasonable having regard to the timing and nature of any such request any reasonably necessary and relevant data and information in the possession of the Contractor and the Contractor shall give or shall request that the Other Consultants or Project Co give such assistance as shall be reasonably required by the Consultant in the performance of the Services provided that this obligation shall not affect the Consultant's obligation to liaise directly with the Other Consultants and with the Contractor in order to procure the production of any information to be supplied by such persons.

4.2 The Consultant acknowledges that the Contractor gives no warranty or undertaking of any nature in respect of the Disclosed Data and, specifically (but without limitation), the Contractor does not warrant that the Disclosed Data represents all of the information in its possession or power (either during the conduct of the tender process for the Project or at the time of execution of this Agreement) relevant or material to or in connection with the Project or the obligations of the Contractor under this Agreement or under any of the Project Documents. In addition, neither the Board, Project Co or the Contractor shall be liable to the Consultant in respect of any failure to disclose or make available to the Consultant (whether before, on or after the

execution of this Agreement) any information, documents or data, nor any failure to review or to update the Disclosed Data, nor any failure to inform the Consultant (whether before, on or after execution of this Agreement) of any inaccuracy, error, omission, defects or inadequacy in the Disclosed Data.

4.3 The Consultant acknowledges and confirms that:

4.3.1 it has conducted its own analysis and review of the Disclosed Data and has, before the execution of this Agreement, satisfied itself as to the accuracy, completeness and fitness for purpose of any such Disclosed Data upon which it places reliance; and

4.3.2 it shall not be entitled to and shall not make any claim against the Board, Project Co or the Contractor whether in contract, delict or otherwise including, without limitation, any claim in damages, for extensions of time or for additional payments under this Agreement on the grounds:

(a) of any misunderstanding or misapprehension in respect of the Disclosed Data; or

(b) that incorrect or insufficient information relating to the Disclosed Data was given to it by any person,

nor shall the Consultant be relieved from any obligation imposed on, or undertaken by it, under this Agreement on any such ground.

5. **FEE**

5.1 The Contractor shall pay the Consultant the Fee for performance of the Services in accordance with this Clause 5 and Schedule 1.

5.2 The Consultant acknowledges and agrees that:

5.2.1 it has no entitlement to payment whatsoever in respect of stages of the design (as detailed in the Fee Payment Schedule) that it has not been expressly instructed in writing by the Contractor to undertake;

5.2.2 until such time as the Contractor notifies the Consultant in writing that Financial Close has occurred, the Consultant shall only be entitled to be paid the Preferred Bidder Fee as set out in Schedule 1.

5.3 The Employer shall make the Financial Close Payment to the Consultant within 21 days of the occurrence of Financial Close. For the avoidance of doubt the Consultant acknowledges and agrees that it has no entitlement whatsoever to the Financial Close Payment (or loss of profit or otherwise) if Financial Close does not occur.

5.4 Not later than five (5) days before the end of each calendar month the Consultant shall submit to the Contractor:

5.4.1 a valid tax invoice showing the instalment of the Fee and any other sums which the Consultant considers is due under this appointment, together with value added tax. Invoices shall comply with Regulations 13 and 14 of the Value Added Tax Regulations 1995 (SI 2518) and shall be supported by documents necessary for verifying the same; and

5.4.2 a payment notice to the Contractor specifying the sum that the Consultant considers to be due or to have been due at the payment due date and the basis on which that sum is calculated with reference to the Fee Payment Schedule and progress of the Services ("Payment Notice").

5.5 The payment due date shall be the date of receipt by the Contractor of the documents required under clause 5.4 ("the Due Date"). The final date for payment shall be 30 days from the Due Date ("the Final Date for Payment").

5.6 The Contractor may give to the Consultant, not less than five (5) days before the Final Date for Payment, a notice of the payer's intention to pay less than the notified sum ("Payless Notice"). The Payless Notice shall specify the sum that the Contractor considers to be due on the date such notice is served and the basis on which that sum is calculated.

5.7 Without prejudice to any other rights or remedies at common law, the Contractor shall at all times before the completion of the Services be entitled to set off against or withhold against any monies due to the Consultant under this Appointment which the Contractor considers are due and payable by the Consultant under this Appointment provided that any such set off or abatement will be effected in accordance with this clause.

5.8 No later than three (3) days before the Final Date for Payment the Consultant shall submit a formal invoice for the amount stated in the Payment Notice issued pursuant to Clause 5.4 or as adjusted by the Payless Notice issued pursuant to Clause 5.6 as the case may be and (subject to receiving such invoices) the Contractor shall pay the Consultant all sums properly due under this Agreement on or before the Final Date for Payment.

5.9 Where any amount due is not paid by the relevant Final Date for Payment and the Consultant has issued the invoice required pursuant to clause 5.8 (taking account of any Payless Notice issued under Clause 5.6) and where such failure to pay has continued for thirty (30) days after the Consultant has given to the Contractor written notice of the amounts owed and of its intention to suspend the performance of any or all of its obligations under this Agreement, the Consultant shall be entitled to charge interest on any outstanding amounts at 3% above the Bank of England Base Rate,

such interest to be calculated on a daily basis from the Final Date for Payment, and to suspend performance (without prejudice to any other right or remedy) of any or all of its obligations under this Agreement. The right to suspend shall cease when the Contractor makes payment of the outstanding amounts and any period during which performance is validly suspended under this clause 5.9 shall be disregarded in computing the time taken by the Consultant to complete any of the Services affected by the suspension.

5.10 All payments made by the Contractor pursuant to this Agreement shall be on account save for the final payment upon completion of the Services.

6. PROFESSIONAL INDEMNITY INSURANCE

6.1 The Consultant shall maintain professional indemnity insurance with a reputable insurance company and which does not include any unusual exclusions or conditions covering its liability under this Agreement to cover claims arising out of any one claim or series of claims arising out of any one originating source or cause, for not less than the amount stated in Schedule 1 for a period ending twelve years after Practical Completion provided such insurance is available in the open market at commercially reasonable rates. The Consultant must ensure that such insurance shall cover the performance of any aspect of the Services by a sub-consultant engaged by the Consultant or alternatively that the relevant sub-consultant has taken out and maintained equivalent insurance with the effect that entirety of the Services are adequately insured up to the level of cover set out in Schedule 1.

6.2 If professional indemnity insurance ceases to be available in accordance with Clause 6.1 then the Consultant shall notify the Contractor before the expiry of its then current policy and the parties shall determine the best insurance cover available which the Consultant shall thereafter maintain at its cost.

6.3 The Consultant shall comply with all conditions and obligations of any insurance policy, and as and when reasonably requested to do so by the Contractor, the Consultant shall provide documentary evidence to the satisfaction of the Contractor that his professional indemnity insurance is being maintained, which shall include a letter from the Consultant's insurance provider confirming the same.

6.4 The above obligations in respect of professional indemnity insurance shall continue notwithstanding termination of this Agreement for any reason whatsoever, including (without limitation) breach by the Contractor.

6.5 Should the Consultant be in breach of any of the provisions of Clause 6, the Contractor may insure against any risk with respect to which the breach shall have occurred and may deduct the sum or sums equivalent to the amount paid or payable in respect of premiums from any monies due or to become due to the Consultant under this Agreement or may otherwise recover such sum or sums as a debt due to the Contractor by the Consultant.

7. **COLLATERAL WARRANTIES**

7.1 The Consultant shall, within 10 working days of a request by the Contractor to do so, enter into a collateral warranty in favour of Project Co, the Board, or a Funder in the form set out in Schedule 3 or in such other form as may reasonably be agreed between the parties.

7.2 The provision of any collateral warranties requested by the Contractor pursuant to clause 7.1 shall be a condition precedent to payment pursuant to this Agreement and the failure of the Consultant to provide any such requested collateral warranties will constitute valid grounds for the Contractor to issue a pay less notice pursuant to clause 5.3 of this Agreement.

7.3 The Consultant's obligation to provide the collateral warranties in favour of third parties shall continue notwithstanding termination of this Agreement for any reason whatsoever, including (without limitation) breach by the Contractor. However, any collateral warranty given after such termination shall be amended so as to refer to the fact and date of such termination, to omit any obligation to continue to exercise skill, care and diligence and any provision enabling a third party to assume the position of the Contractor.

8. **STAFF**

8.1 The Consultant's key personnel with responsibility for the Services are set out in Schedule 1 and the persons listed will remain involved in the performance of the Services (unless otherwise agreed with the Contractor) until completion of the Services. The Consultant shall not remove the said key personnel or any replacements of any of them without the prior written consent of the Contractor which consent shall not be required in case of permanent incapacity, death, sickness or where such person voluntarily leaves the employment of the Consultant. The Contractor shall be entitled to require the removal from the performance of the Services of any persons employed by the Consultant whose performance or conduct is, in the reasonable opinion of the Contractor, unsatisfactory and/or who do not evidence the necessary level of experience, qualification or competence to properly carry out the Services. The Consultant shall replace such removed person with a person of appropriate experience and expertise.

8.2 The Consultant shall at all times have adequate resources devoted to the Project so that the Services can be performed in accordance with any timetables agreed with the Contractor, and in accordance with the Deliverables Timetable and having due regard to the Programme.

9. **COPYRIGHT**

9.1 Copyright and all other intellectual property rights relating to or in the Deliverables and the Intellectual Property Rights shall remain vested in the Consultant, but the

Consultant hereby grants to the Contractor a free of charge, perpetual, irrevocable, royalty-free, non-exclusive and transferable licence to copy and use the Deliverables and the Intellectual Property Rights and to reproduce the designs contained in them for any purpose whatsoever relating to the Project including, but without limitation, the construction, completion, reconstruction, reinstatement, modification, extension, maintenance, operation, repair, letting, sale, advertisement or use of the Project and the Consultant shall ensure that the Contractor is provided with hard and electronic copies of such Deliverables as are necessary or desirable to enable the Contractor to carry out and complete the Project and to comply with its obligations under the Construction Contract and any of the Third Party Agreements.

9.2 To the extent that the Consultant is the owner of any copyright, design right, database right or other intellectual property right in the Design BIM and/or the BIM Outputs, the Consultant assigns to the Contractor with full title guarantee (by way of present assignation of future rights) (and insofar as such assignation is ineffective shall forthwith upon the Contractor's request assign) all of the rights, title and interest in all of the BIM Outputs and the Design BIM to the Contractor. The Contractor hereby grants to the Consultant a licence to use the BIM Outputs and the Design Model for the purposes of carrying out the Services. For the avoidance of doubt, the Consultant waives any intellectual property rights it may otherwise have in the Project BIM whatsoever.

9.3 The Consultant shall not without the Contractor's prior written approval use the Deliverables:

9.3.1 to design any building or structure obviously similar in overall design, appearance or features to the Project; and/or

9.3.2 for any purpose connected with the Project other than for the purposes of this Agreement and the completion of the Project.

9.4 The Consultant will work with the Contractor exclusively in connection with the Project and any future manifestations of the Project, and it will not provide services, advice, information or assistance to any other party in connection with the Project without the Contractor's prior written approval.

9.5 The licence granted pursuant to clause 9.1 above shall carry with it the right to grant sub-licenses and shall be transferable to third parties. The Consultant shall not be liable to the Contractor or any sub-licensee for any use of the Deliverables or the Intellectual Property Rights for any purpose other than that for which the same was prepared or provided by the Consultant.

9.6 The Consultant shall at any time (including after any termination or suspension of this Agreement) on request immediately provide the Contractor with further copies of any of the Deliverables referred to in clauses 9.1 subject to the Contractor undertaking to pay the Consultant's reasonable copying charges.

9.7 The Consultant hereby waives any rights it may have by virtue of Chapter IV (Moral Rights) of Part 1 of the Copyright, Designs and Patents Act 1988 and any revisions, re-enactments or similar ("the 1988 Act") in respect of both the Deliverables and the Project and agrees and undertakes that the Consultant will not assert against the Contractor or any other person, who with the Contractor's permission publishes commercially, exhibits in public, films, broadcasts, includes in a cable programme service, photographs or otherwise copies or deals with any image of the Project or any document, drawing or model prepared by the Consultant in connection with the Project any right which the Consultant may have to be identified as author of the Project (or any part thereof) or such document, drawing or model pursuant to Section 77 of the 1988 Act or any other legislation which may supplement the 1988 Act.

9.8 The Consultant undertakes to the Contractor that it shall observe all restrictions on copyright and other intellectual property rights as set out in the Construction Contract and any of the Third Party Agreements.

9.9 The Consultant warrants and undertakes to the Contractor that the design, construction, alteration, modification, extension, maintenance, repair and use of the Works or any part thereof in accordance with the Deliverables, the Intellectual Property Rights, the BIM Model and/or the BIM Outputs, and/or the use of the Deliverables, the BIM Model and/or the BIM Outputs, for any purpose described in clause 9.1 will not infringe any copyright, moral right, related right, patent, design right, trademark, service mark, trade name or other intellectual property right such as know-how, trade secrets or inventions (whether patentable or not) of any third party, and the Consultant shall indemnify the Contractor from and against any and all losses, expenses, liabilities, claims, costs or proceedings whatsoever arising by reason of this warranty being or becoming incorrect.

9.10 All documents made available by the Contractor to the Consultant in connection with the Project or otherwise must be returned to the Contractor on the earlier of completion of the Services or termination of the Consultant's appointment under this Agreement.

9.11 The Consultant hereby indemnifies the Contractor against all actions, suits, claims, demands, losses, charges, damages, costs and expenses and other liabilities which the Contractor may suffer or incur as a result of or in connection with any infringement or alleged infringement of any intellectual property rights of any person arising from the carrying out of the Works and any use of the Deliverables, except to the extent that such claim relates to the use of material supplied by the Contractor or the use of the Deliverables which is the subject of the licence set out in clause 9.1 for purposes not permitted under the terms of licence.

9.12 The provisions of this clause 9 shall continue to apply notwithstanding the completion of the Services or the termination of the Consultant's appointment under this Agreement.

10. **BIM**

10.1 The Consultant shall, in performing the Services, comply with and adhere to the BIM Protocols and the BIM Execution Plan. Without limiting its other obligations under this Agreement, the Consultant shall as part of the Services and as often as necessary update the Design BIM in accordance with the BIM Protocols and the BIM Execution Plan and see that updates to the Design BIM have been carried out correctly and that the Consultant's designs are accurately depicted on or incorporated into the information set out in the Design BIM. In doing so, the Consultant must ensure that information is updated to the Design BIM and provided to the Project BIM Manager promptly to ensure the Project BIM is kept continuously up to date.

10.2 Exercising the standard of reasonable skill, care and diligence required pursuant to clause 2.3.1 of this Agreement, the Consultant warrants the accuracy of each Design BIM and the BIM Outputs and confirms it remains responsible for the Design BIM and the BIM Outputs notwithstanding its incorporation into the Project BIM.

10.3 As soon as it is practicable, but in no event later than thirty (30) days after the latter of the execution of the Construction Contract or the date of this Agreement, the Contractor and the Consultant shall meet with the Other Consultants and Project Co and confer and use their best efforts to agree upon the terms of or modifications to a BIM Execution Plan. The Project BIM Manager shall be responsible for compiling the final BIM Execution Plan. The parties shall work in accordance and comply with the BIM Execution Plan.

10.4 Unless otherwise agreed, the Project BIM Manager shall schedule and chair all such meetings.

10.5 The BIM Execution Plan shall address the following elements, but may include additional elements:

10.5.1 Contact information for each party contributing to the BIM Model ("a Project Participant");

10.5.2 Identification of what Design BIM are to be created, the purpose(s) each Design BIM Model is intended to serve, and which Project Participant(s) is(are) responsible for creating each Design BIM;

10.5.3 Procedures and protocols for 3D co-ordination and clash detection;

10.5.4 Procedures and protocols for quality control of the Design BIM;

10.5.5 Procedures and protocols for BIM quality audits;

10.5.6 The spatial portions or areas of the Project to be modelled in each Design BIM;

10.5.7 The expected content of each Design BIM and the required level of detail at various Project milestones, which content includes

(a) geometric and spatial data;

(b) object property data;

(c) object constitution data;

(d) provision for object parameters as place holders for cost and schedule data; or

(e) authoritative source information;

10.5.8 A schedule of Design BIM exchange and delivery of both the Design BIM and BIM Outputs to the Project BIM Manager;

10.5.9 A schedule for updating of each Design Model and preservation of versions of each Project BIM and its constituent Design BIM models;

10.5.10 A definition of what Design BIM or Project BIM Models shall constitute part of the record documents for the Project;

10.5.11 Procedures and protocols for submission of a Design BIM, including electronic stamping, and for designating a Design BIM as a design model;

10.5.12 Procedures and protocols for designating two-dimensional projections derived from a Design BIM as being contractually binding;

10.5.13 Establishment of a common coordinate system;

10.5.14 Establishment of conventions as to units;

10.5.15 Conventions for defining critical dimensions and critical BIM Model content;

10.5.16 File format to be used;

10.5.17 Software to be utilized;

10.5.18 Measures needed to achieve interoperability of applications;

10.5.19 Utilization of a Design BIM for RFI process;

10.5.20 Utilization of a Design BIM for the change order process;

10.5.21 A schedule for BIM development, coordination and clash detection meetings among the Project Participants;

10.5.22 Utilisation of Aconex or such other data sharing system notified by the Contractor;

10.5.23 Procedures and protocols for confirmation of field changed through an as-built Project model;

10.5.24 Specification of Project close-out and final deliverables; and

10.5.25 The extent, if any, to which Project participants or specified staff for each will be co-located.

11. APPROVALS

The obligations of the Consultant under this Agreement shall not be lessened or affected by:

11.1 any power or duty of Project Co, the Independent Tester, the Contractor, the Project Manager or any of the Other Consultants to grant or withhold approval of, or object to, any matter in connection with the Project, or to inspect the Project; or

11.2 the granting, or failure to grant, such approval, or the making, or failing to make, such objection;

11.3 any inspection of, or failure to inspect, the Project; or

11.4 the incorporation, approval, integration and co-ordination of the Consultant's Deliverables, the Design BIM and the BIM Outputs into the Project BIM alongside the design deliverables produced by the Other Consultants.

12. TERMINATION AND SUSPENSION

12.1 The Contractor may suspend the whole or any part of the Services at any time upon 10 working days written notice. Subject to Clause 12.7 the Contractor shall pay the Consultant all sums properly due to the Consultant in accordance with this Agreement up to the date of suspension.

12.2 In the event of a suspension of the Services the Contractor may at any time within a period of 12 months of the suspension require the Consultant to resume performance of the Services upon 10 working days written notice. In the event that the Contractor has not instructed the Consultant to resume performance of the Services within 12 months of the date of suspension, the Consultant shall be entitled to give the Contractor 10 working days written notice of his intention to terminate his appointment in respect of the Services that have been suspended pursuant to clause 12.1. If the Contractor does not serve a counter notice upon the Consultant within the said 10 working days requiring him to resume performance of such Services, the Consultant shall be entitled to terminate the appointment only in respect of the Services that have been suspended pursuant to clause 12.1.

12.3 The Contractor reserves the right to terminate the Consultant's appointment at any time on 20 working days written notice, in which case, subject to the Consultant complying with the requirements of clause 12.7 and any other rights and remedies which the Contractor might have, the Contractor will be liable to pay the Consultant such proportion of the Fee as is reasonable in all the circumstances in relation to the Services carried out prior to the termination.

12.4 The Contractor may terminate the Agreement immediately and without notice to the Consultant in the event that the Consultant has a winding up order made against it, has a provisional liquidator appointed to it, passes a resolution for winding up, has an administration order made against it, has a receiver, receiver and manager or administrative receiver appointed over the whole or a substantial part of its undertaking or assets, or has made an arrangement with creditors.

12.5 This Agreement shall automatically terminate if the Contractor's employment is terminated under the Construction Contract.

12.6 The Consultant may terminate its appointment upon 20 working days written notice, in the event that an Insolvency Event occurs in respect of the Contractor or the Contractor has not paid the Consultant any sums properly due under this Agreement and has failed to remedy such breach within 20 working days of receipt of a written notice from the Consultant requiring it to do so.

12.7 Upon any termination or suspension of the Consultant's appointment, the Consultant shall forthwith deliver to the Contractor all Deliverables in its possession relating to the Project and shall take immediate steps to bring to an end the Services in an orderly manner, but with all reasonable speed and economy. The delivery of all Deliverables to the Contractor is a condition precedent to the Consultant's entitlement to be paid any further monies pursuant to this Agreement following a suspension and/or termination.

12.8 Upon any termination or suspension of the Consultant's appointment and whether or not such termination or suspension shall have arisen as a result of any fault, negligence or breach of contract by the Contractor, the Contractor shall not be liable to the Consultant for any Indirect Losses, including loss of profit, loss of contracts or other losses and/or expenses arising out of or in connection with such termination or suspension. Termination or suspension of the Consultant's appointment shall be without prejudice to the parties' respective rights and liabilities under this Agreement.

12.9 In the event that the Consultant's appointment is terminated by reason of its default of its obligation, or pursuant to Clause 12.4, 12.5 or 21.2, then the Consultant shall not be entitled to any further payment until after completion of the Services by a replacement consultant. The Contractor shall have the right to set off against the aforesaid payment any losses that it sustains by reason of the Consultant's failure to complete the Services.

13. **ASSIGNATION**

The Contractor shall be entitled to assign its entire benefit under this Agreement at any time for the sole purpose of completing the Services. The Consultant shall not assign charge or transfer any right or obligation under this Agreement.

14. **CONFIDENTIALITY**

14.1 Save as may be necessary for the proper performance of the Services, the Consultant may not disclose to any third party or make use of any information of any kind whatsoever relating to the Project (including but not limited to any or all Deliverables) without the Contractor's prior written consent.

14.2 Unless otherwise required by any Law or any regulatory or governmental authority (but only to that extent), the Consultant shall not make or permit or procure to be made any public announcement or disclosure (whether for publication in the press, the radio, television screen or any other medium) of any Confidential Information or the Consultant's interest in the Project or, in any such case, any matters relating thereto, without the prior written consent of the Contractor (which shall not be unreasonably withheld or delayed).

15. **SUB-CONTRACTING**

The Consultant shall not sub-contract to or allow any other person to perform any of the Services without the Contractor's prior written consent. The Consultant shall remain responsible for the performance of any of the Services so sub-contracted as if no sub-contracting had occurred.

16. **OTHER AGREEMENTS**

The Consultant confirms it has received copies and reviewed the Construction Contract and the Third Party Agreements. The Consultant shall as far as is consistent with the terms of this Agreement take into account the provisions of the Construction Contract and Third Party Agreements as they may relate to the Project and where appropriate actively assist the Contractor in complying with its obligations under the Construction Contract and such Third Party Agreements and subject to clause 2.3 perform the Services so that no act, omission or default on its part shall constitute, cause or contribute to any breach by the Contractor of the Construction Contract or such Third Party Agreements.

17. **INDEMNITIES**

17.1 The Consultant shall indemnify and keep the Contractor indemnified at all times from and against all Direct Losses sustained by the Contractor or for which the Contractor becomes liable by reason of any act or omission of the Consultant for which the Consultant acknowledges may include any Direct Losses sustained by the Contractor in consequence of:

17.1.1 any claim for, or in respect of, the death and/or personal injury of any employee of, or person engaged either directly or indirectly by the Consultant notwithstanding any act or omission of the Contractor;

17.1.2 any claim for, or in respect of, the death and/or personal injury of any third party (other than a person referred to in clause 17.1.1) arising due to the breach of this Agreement by the Consultant;

17.1.3 any physical loss of or damage to property or assets of Project Co, the Board, the Contractor or any other third party arising by reason of any act or omission of the Consultant arising due to the breach of this Agreement by the Consultant;

17.1.4 any breach of and/or any negligent act in complying with the terms of the Board's Construction Requirements save to the extent such breach arises due to the breach of any express provision of this Agreement by Contractor or any deliberate or negligent act or omission of the Contractor.

18. **ENTIRE AGREEMENT**

This Agreement supersedes any previous agreement or arrangements between the parties or the Consultant and any other party previously interested in the Project in respect of the Services (whether written or oral) and represents the entire understanding between the parties in relation thereto. All additions, amendments and variations to this Agreement shall be binding only if in writing.

19. **NOTICES**

Any notice provided for in accordance with this Agreement shall be deemed to be duly given if it is delivered by hand at, or sent by registered post or electronic transmission to the party named therein at, the address of such party shown in this Agreement or such other address as such party may by notice in writing nominate for the purpose of service (such notice to be acknowledged in writing by the recipient), and if sent by registered post shall be deemed to have been received not later than forty eight hours after the same shall have been posted.

20. **GOVERNING LAW AND JURISDICTION**

20.1 This Agreement shall be governed by and construed in accordance with Scottish Law.

20.2 Subject to Clause 20.3, the parties submit to the jurisdiction of the Scottish Courts.

20.3 If any dispute shall arise under this Agreement, the Dispute Resolution Procedure set out at Schedule Part 20 of the Project Agreement shall apply.

20.4 Notwithstanding any other provision of this Agreement, where an adjudicator or other relevant court has made a decision in relation to a dispute under the Project

Agreement or the Construction Contract then that decision shall be binding on the Parties insofar as that decision relates to any issue under this Agreement.

20.5 If any provision of this Agreement is determined to be invalid or unenforceable as against any party the remainder of this Agreement shall not be affected thereby. Each provision of the Agreement shall, except as otherwise provided herein, be valid and enforced to the fullest extent permitted by law.

21. **BRIBERY ACT**

21.1 The Consultant undertakes to the Contractor that:

21.1.1 it has not given or agreed to give and shall not during the term of this Agreement give or agree to give to any person any bribe on behalf of the Contractor or otherwise with the object of obtaining a business advantage for the Contractor;

21.1.2 it has not offered or given or agreed to give or accepted or agreed to accept to or from any person any gift or consideration or commission of any kind as an inducement or reward for doing or forbearing to do or for having done or forborne to do any action in relation to obtaining or execution of this or any other agreement relating to the Project or for showing or forbearing to show any favour or disfavour to any person in relation to this or any other agreement relating to the Project;

21.1.3 during the term of this Agreement it will not engage in any activity or practice which would constitute an offence under any applicable anti-corruption laws;

21.1.4 it has and during the term of this Agreement will maintain in place its own policies and procedures including Adequate Procedures to ensure compliance with any applicable anti-corruption laws and will impose similar obligations on its own sub-consultants and supply chain; and

21.1.5 from time to time during the term of this Agreement, at the reasonable request of the Contractor, it will confirm in writing that it has complied with its undertakings under clause 21.1 and will provide any information reasonably requested by the Contractor in support of such compliance.

21.2 In the event that the Contractor has at any time during the term of this Agreement reasonable cause to believe that the Consultant or his agents, contractors, sub-contractors, and/ or sub-consultants or any person employed by him or them or acting on his or their behalf (whether with or without the knowledge of the Consultant) or his agents, contractors, sub-contractors and/or sub-consultants is in breach of any of the provisions of clause 21.1 the Contractor may suspend performance of or terminate this Agreement with immediate effect by the service of written notice on the Consultant.

22. **THIRD PARTY RIGHTS**

Save to the extent expressly provided in this Agreement and, to avoid doubt, without prejudice to the rights of any permitted assignee, it is expressly declared that no rights shall be conferred under and arising out of this Agreement upon any person other than the Contractor and without prejudice to the generality of the foregoing, there shall not be created by this Agreement a *jus quaesitum tertio* in favour of any person whatsoever.

23. **LIMITATION**

No action or proceedings for any breach of this Agreement shall be commenced after 12 years from Practical Completion.

IN WITNESS WHEREOF these presents typewritten on this and the preceding 28 pages together with the 10 annexed Schedules are executed by the parties hereto as follows:

SUBSCRIBED for and on behalf of **BROOKFIELD MULTIPLEX CONSTRUCTION EUROPE LIMITED**

SCHEDULE 1

PROJECT PARTICULARS

The Site:	The area of land adjoining the Royal Infirmary of Edinburgh at Little France made available to the Consultant for the Project
The Project:	Design and construction of the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France
Project Co:	IHS Lothian Limited
The Project Manager:	Such party appointed by Project Co and notified to the Consultant.
Independent Tester:	Such party appointed by Project Co and notified to the Consultant.

Consultant Team:	Lead Designer	HLMAD Ltd
	Architect	HLMAD Ltd
	Structural Engineer	Robert Bird and Partners Ltd
	Building Services Engineer	TUV SUD Ltd
	CDM Co-ordinator	The Contractor (sub-consulted to Brookfield Multiplex CDM Services Europe Ltd)
	Landscape Architect	HLMAD Ltd
	Acoustics Consultant	Acoustic Logic Consultancy (UK) Ltd
	Project BIM Manager	HLMAD Ltd
	Traffic Consultant	Ove Arup & Partners Ltd
	Planning Consultant	Ironside Farrar Ltd
	Fire Engineer	WSP Ltd
Consultant's Key Personnel:	Stewart McKechnie	
The required minimum indemnity limit under the professional indemnity to be maintained by the Consultant:	£15,000,000 (Fifteen Million pounds) for each and every claim.	
Specialist Consultants	None	
The following sub-consultants are the Specialist Consultants and all costs and co-ordination are deemed inclusive within the Fee and the terms of this Agreement.		

The Fee

The total Fee for the Project is [£2,160,000.00] (as broken down below) and is payable in accordance with Clause 5 and the Fee Payment Schedule set out below.

- The Fee payable for Services performed up to Financial Close is [£200,800.00] ("the Preferred Bidder Fee")
- The Financial Close Payment is [£135,200.00]
- The Fee payable for Services after Financial Close is [£1,824,000.00]

Fee Payment Schedule

The following is the Fee Payment Schedule referred to in clause 5 of the Appointment. Payment will be subject to a review of deliverables and as such the Consultant should ensure that an application is submitted for review by the due date as shown.

Design Stage	Fee
Design to end Feb '15	£106,666.67
Design to end March '15	£106,666.67
Design to end April '15	£106,666.67
Design to end May '15	£106,666.67
Design to end June '15	£106,666.67
Design to end July '15	£106,666.67
Design to end August '15	£106,666.67
Design to end Sept '15	£106,666.67
Design to end Oct '15	£106,666.67
Design to end Nov '15	£54,000.00
Design to end Dec '15	£54,000.00
Design to end Jan '16	£54,000.00
Design to end Feb '16	£54,000.00
Design to end March '16	£54,000.00
Design to end April '16	£54,000.00
Design to end May '16	£54,000.00
Design to end June '16	£54,000.00
Design to end July '16	£54,000.00
Design to end August '16	£54,000.00
Design to end Sept '16	£54,000.00
Design to end Oct '16	£54,000.00

Design to end Nov '16	£54,000.00
Design to end Dec '16	£54,000.00
Design to end Jan '17	£54,000.00
Design to end Feb '17	£54,000.00

SCHEDULE 2

SERVICES

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

- Scope of Services Appendix A MEP Design Demarcation Matrix 300115

SCOPE OF SERVICES

relating to

the Re-provision of the Royal Hospital for Sick Children,

Child and Adolescent Mental Health Service

and the Department of Clinical Neurosciences in a single building adjoining

the Royal Infirmary of Edinburgh at Little France, Edinburgh

(MEP) Services Engineer

Tuv Sud t/a Wallace Whittle

18 December 2014

Table of Contents

1. OUTLINE

Introduction

1.1 The Royal Hospital for Sick Children and Department of Clinical Neurology Project consists of new acute children's hospital and re-provision of Department of Clinical Neurology, Energy Centre, and associated support facilities and infrastructure for NHS Lothian (the Board).

The Project is located on the existing hospital site at the Royal Infirmary of Edinburgh (RIE) at Little France Edinburgh which is required to remain operational during the execution of the Works. The Project is to provide in the order of 51000m2 of internal area comprising approximately 400 beds in addition to the development of the external spaces.

1.2 The Services shall be the provision of professional labour, supplies, systems and other resources as necessary to design, specify, document, inspect, report and certify the building services elements of the Works for the Project. The Services outlined herein are the basic scope of works specifically applicable for this Project and are completely allowed for in the initial total fee.

1.3 Key Performance Indicators (KPIs) – The quantitive KPIs are defined in the Contract Datain addition to the Design Programme and the Cost Plan referenced in the Building Contract. This Scope of Services represents the qualitative KPIs to be achieved by the Consultant.

1.4 The Consultant shall adequately and timely coordination, cooperation and liaison with other consultants, subcontractors, suppliers, Authorities and other relevant parties/stakeholders to clearly define the relevant Project works, which minimises the Project costs, time and risk.

1.5 The Consultant's coordinated design and documentation shall be fully integrated with all relevant designs and advice from other consultants, the subcontractors (where arranged by the Employer) and Statutory Authorities.

1.6 The Services are to be provided in the following Work Stages:

- Concept Design and Design Development
- Construction Documentation and Construction Phase
- Commissioning, Completion and Post Completion

Note: Notwithstanding the entry point to an individual scheme or design task, the Consultant is required to review all the previous information for the scheme made available by the Employer in addition to those sourced by the Consultant and undertake the Services irrespective of where the Services is listed in order to enable the Employer to complete the Works.

Performance Standards

1.7 The Consultant shall submit its Quality Plan for review by the Employer. The Consultant shall amend its Quality Plan as reasonably required by the Employer. The Quality Plan shall explain how the design and documentation work are to be planned to the standard specified in ISO 9001:2008 particularly the Section 7.3 and shall include:

- The design and documentation stages
- The review, verification and validation that are appropriate to each design and documentation stages

- The responsibilities and authority for design and documentation

The Consultant shall review and comment on the Quality Plans (especially the Quality Inspection and Test Plans) from the subcontractors and suppliers as reasonably required by the Employer.

1.8 The Documentation (or Documents) to be provided by the Consultant shall be all that is required in order that the Project can be completed in the most time and cost efficient manner and shall include but not be limited to:

- Drawings (including 3D as required)
- Schedules
- Specifications
- Working models, illustrations and other presentation materials
- Calculations and sketches
- Reports (including Progress Status)
- Certifications (including Compliance)
- Meeting minutes, file notes etc.

1.9 Conform with the Project specific documentation protocols as updated from time to time by the Employer (or its designate) including the CAD& BIM parameters and electronic documentation transfer facilities such as the FTP websites or as requested by the Employer. Further information is contained within Section 6.0 for BIM requirements & compliance. Reference should also be made to the separate BIM responsibilities matrix documentation.

1.10 In respect of all Work Stages, the Consultant shall:

a) Perform the Services in a diligent manner with the standard of skill and care and undertake any work falling within the level of Services to be reasonably expected of a Consultant appointed for a Project of a similar size, scope and complexity.

b) Ensure that it has the necessary skill and resources to provide the Services and acknowledges that in reliance on this obligation, the Employer has agreed to engage the Consultant to perform the Services.

c) Take all necessary steps on an ongoing basis so that all persons engaged for the Services are properly qualified, competent and experienced for the size, scope and complexity of the Project.

d) Inform itself of the Project requirements by regularly consulting with other relevant parties and the Employer. Review all relevant documents and immediately inform the Employer of any apparent errors or ambiguities contained in such documents and make recommendations for the correction of such ambiguities.

e) Keep secure the Employer materials and documents and return them at the end of this Appointment.

f) Strictly remain within the scope of the authority granted by the Employer and not act beyond its authority or hold out that it has authority beyond this Appointment.

g) Seek the Employer's prior consent to any proposed sub-letting or employing outside agency and/or self employed staff.

h) Comply with all policies relating to the use of the Employer office premises and facilities when using them.

i) Permit the Employer to carry out agreed and scheduled visits to the Consultant's business premises in connection with the Services.

j) Keep proper commercial records and accounts for any claims it makes on the Employerincluding if applicable, for reimbursement of expenses and remuneration of fees based on time charged billing and permit the Employer auditors to inspect such records and accounts.

k) Nominate a person or persons who have authority to receive notices and take instruction under this Appointment and not change such nominees without the consent of the Employer.

l) Liaise and cooperate with the other consultants employed (and likely to be employed) by the Employer for the purpose fulfilling its obligation that the Project shall be designed in compliance with the Project requirements.

m) Coordinate and manage the sequence of design and documentation production.

n) Provide Technical Advisory role to the Employer for design works provided by others associated with the Project.

Performance Obligations

1.11 The Consultant shall:

a) Carry out the Services using proven best up-to-date practice and to appropriate standards (having regard to the nature of the Project) and consistent with the intended use of the Project.

b) Comply with the requirements of planning consent for the Project and with all Statutory Authorities requirements and regulations and with all other legislation applicable to the Services and/or to the Works.

c) Comply with all specific standards contained in this Appointment. If no such standards are stated in this Appointment and if they cannot be reasonably inferred from the Project Documents, the standards shall be those required by relevant British Standards and/or UK Building Regulations and/or any relevant applicable legislation and/or relevant local Statutory Authority requirements.

d) Comply with the Employer's Requirements and the Contractor's Proposals.

e) In the event of any discrepancies, ambiguities and inconsistencies within and/or between the Project documents, such discrepancies shall be decided on by the Employer and the Consultant shall at no cost to the Employer and that the Services and any Documentation prepared by the Consultant in relation thereto shall comply with and meet the requirements as decided by the Employer.

f) Progressively submit the Consultant's Documentation and any other documentation included within the ambit of the Services to the Employer by the dates specified in the Programme or if no dates are specified, in accordance with the progress of the Works and the Employer's reasonable requirements.

g) In respect to all drawings produced as part of the Documentation are computer generated and capable of being transferred into 'tiff', 'pdf, and 'dwg' formats or other format approved by the Employer. The Consultant shall send and receive written correspondence, drawings, schedules and specifications and any other relevant documentation by a controlled web based document management system (Aconex) in

accordance with the rules and procedures (updated from time to time) as provided by the Employer.

h) In reference to the specifications as referred to in the definition of Documentation are in A4, double sided and comprising of two bound copies and one copy on a portable memory storage device. The Consultant shall also upload one copy onto a web based document control system (Aconex). The specifications shall be in full compliance with the Project requirements and shall be complete and coordinated with all other consultants in a format agreed by the Employer. The specifications shall be in trade sections and capable and suitable for the Employer to invite tenders for the various packages of work and for the subsequent construction and completion of the Project. The specifications shall also incorporate, but not be limited to, materials, finishes workmanship and quality standards and other items as may be reasonably required by the Employer.

i) Include all those duties that are set out in this Schedule together with those duties that can be reasonably expected from the Consultant, preparing design and documentation for works of a similar size, scope, nature, value and complexity of the Project.

j) Specify the materials and its method of use, fixing or working that do not infringe any patent, registered design, copyright or other protection rights.

k) Review and comment on all relevant temporary works as reasonably requested by the Employer in completing the Project.

l) Send, receive, review and comment all information in relation to O&M manuals which may be by a controlled web based management system.

m) Provide advice and documents as required to assist the Employer in the maintenance of the building to ensure whole-life costs are minimised.

n) Provide information as requested by the Building Owner, Funders, Facilities Manager, Operators and the like.

o) Coordinate, incorporate and document where relevant to the building services, all fire protection and acoustic treatment measures in consultation with the Fire Engineer and Acoustic Engineer respectively.

p) Proactively endeavours to maximise the BREEAM rating of the Project and develop energy efficient strategies.

q) Evaluate, design, specify and document Secure by Design, acoustical and fire protection measures related to their Services and where applicable to satisfy building insurance requirements. Should there be exceptional insurance requirements, such information to be made available to the Consultant in a timely manner during the design period.

r) In reference to CDM 2007 Regulations and in particular Regulation 11 that requires the Designers to eliminate hazards which may give rise to risks to those undertaking construction work or subsequently using the building, and to reduce any hazards which cannot be eliminated. The Consultant shall produce information to the Employer, other Designers and Contractors in this regard and where possible this information shall be included in all Documentation especially the drawings issued by the Consultant.

s) Submit evidence of competence to comply with the CDM 2007 Regulations as per Regulation 4 and as set out in Appendix 4 of the Regulations.

t) In providing the Services, the Consultant shall aim to minimise any adverse impacts that construction has on the environment. This shall be through the design process, materials selection, construction techniques and operational methods. Specific information on the Employer's policy which the Consultant is required to comply is set out in the Environmental Policy Statement (refer Schedule 5 of the Consultants Appointment).

The Consultant shall work towards to reduce waste and use materials efficiently and proactively assist in reaching the Employer's objective as outlined in the Waste Policy Statement (as set out below).The Consultant shall support this Policy by:

- Assist in developing the Site Waste Management Plan from an early design stage, including waste forecasts and data on reduction targets and actions.
- Assist in implementing the Site Waste Management Plans throughout the design and construction period that comply with the applicable Regulatory requirements and include in such Plans project-specific targets for waste recovery and reused and recycled content and for waste reduction;
- Identifying methods to reduce waste and waste to landfill and increase reused and recycled content, throughout the duration of providing the Services and report to the Employer. In this regard, the Consultant shall use site waste management software nominated by the Employer which shall be WRAP's Designing out Waste Tools or Net Waste Tool (accessible at www.wrap.org.uk/nwtool) unless notified otherwise;
- Work with the Project team to ensure that design actions to reduce construction waste and increase reused / recycled content are implemented;
- Agree with the Employer which level of waste reduction and reuse to pursue.

Note: The Consultant should refer to the WRAP Designing out Waste guidance to identify, prioritise and implement ways of meeting Project targets for waste.

Meetings

1.12 The Consultant shall:

a) Attend and issue records of the meetings and workshops for those in relation to the design, construction, value engineering, risk management and co-ordination of the building services as required by the Employer.

b) Attendance may be required for factory visits and design and or construction meetings at off site locations.

c) Attend and issue records of the design meetings with other consultants as necessary to integrate, coordinate and clarify the Works during the Project as reasonably required by the Employer.

d) Attend and issue records of the meetings with Statutory Authorities as reasonably required by the Employer.

e) Attend and issue records of the meetings with the Employer as reasonably required on all relevant Project issues.

f) Provide draft minutes for all of the above meetings, workshops and the like as required for review by the Employer or distribute as requested by the Employer.

Reports

1.13 The Consultant shall:

a) Provide periodic status reports (fortnightly and/or monthly to be agreed with the Employer) in a form reasonably required by the Employer which shall include as a minimum, a summary documenting the progress of the Services against the Design Programme and Documentation Schedules. Highlight areas of difficulty being experienced with progress of the Services, design co-ordination issues, Statutory Authority approvals status and the like including the proposed mitigating measures.

b) Undertake site inspection as reasonably required or as requested by the Employer and provide inspection reports including tracker schedules to monitor close-out of issues identified which will require revisiting the site.

c) Prepare report or documentation required (on a reasonable and realistic basis) for the assessment of design alternatives and in contemplation of envisaged change to the Project requirements.

d) Not used.

e) Progressively compile and provide design risk registers.

f) Provide compliance reports confirming compliance with the Project documents such as the Employer's Requirements and other compliance reports as requested by the Employer.

g) Provide non compliance reports in relation to the construction works when requested by the Employer in a workable electronic format including photographs.

h) Provide draft reports for all of the above for review by the Employer prior to the formal issue.

i) Not used.

j) Provide reports on energy performance during the 12 months Defect Liability Period based on the information provided by the Employer.

Certification

1.14 On a periodic basis (once a month as a minimum) or when requested by the Employer, provide a progress certification that the design and documentation work done to that period is in accordance with and complies with the Project requirements such as the Employer's Requirements, the Cost Plan, the Programme, Contractor's Proposals and with all relevant Statutory Authority requirements.

Authorities

1.15 The Consultant shall:

a) Liaise with the Employer, other consultants and all relevant Statutory Authorities for the purpose of confirming that the design complies with all Planning consent conditions.

b) Liaise with the Employer, other consultants, and others involved in the Works, including without limitation the CDM Coordinator, subcontractors and all relevant Statutory Authorities for the purpose of confirming that the design complies with all relevant Statutory Authority requirements and for obtaining all necessary permits and approvals. Incorporate all relevant Statutory Authority requirements into the design and documentation.

c) Advise on the need to obtain further Planning permissions, Building Regulation approvals and any other Statutory approvals and prepare all necessary associated applications for consideration by the Employer.

d) Liaise closely with all relevant utility companies, service providers and others involved in the identification, relocation and modification of utility services affected by the Project.

e) Prepare coordinated Documentation in conjunction with other consultants for submission to the relevant Authorities. All such Documentation is to be discussed with the Employer prior to submission to the Statutory Authority.

f) Revise and re-submit submissions to the Planning Authority as required where the development of the design has varied from the original Planning consented scheme. Amend Documentation in conjunction with other consultants for resubmission to other relevant Statutory Authorities arising from any directives, requirements or comments from the Employer or Statutory Authorities including those on the previous submissions.

g) Review all relevant Statutory Authority approvals and conditions. Contribute toa schedule/checklist for review by the Employer to monitor timely discharge of all conditions and actions to be carried out by the Consultant in conjunction with other consultants and to be incorporated into the Project.

h) Liaise with all relevant Authorities for expeditious approval and attend all meetings as required by the Employer. Update and amend documentation in conjunction with others as required, to obtain all regulation modifications, approvals and permits.

i) Highlight opportunities to the Employer in respect to alternative means of achieving the Statutory compliance for the benefit of the Project including waivers, relaxations and dispensations. Where requested by the Employer, negotiate the same with the Authorities.

j) Revise documentation as necessary to reflect the outcome of the negotiations with the Statutory Authorities.

k) Assist the Employer with any relevant tests and inspections required by the Statutory Authorities and in obtaining all permits, approvals and certificates required for the lawful use of the Project.

l) Complete all relevant certificates associated with the Services as and when required by the Employer and liaise with Statutory Authorities for the purpose of assisting in obtaining staged building permits and other approvals.

m) Prepare design certification necessary for the completion of the Project and/or the granting of relevant Statutory Authority for Completion, occupancy and title.

n) Provide coordinated sections & plans relating to Service strip requirements, including existing services.

Specific Designs

1.16 The Services to be provided by the Consultant shall include the design and documentation for the following elements of the Worksbut not necessarily be limited to:

Mechanical and Public Health Systems

The Consultant's design shall cover all works associated with the mechanical and public health systems to comply with the fire strategy, acoustic requirements and all systems necessary as set out below for a fully operational building.

- Chilled water system including high efficient chillers, pumps, heat exchangers etc.
- MTHW & LTHW systems including plant and equipment, valves and pipe systems and interfaces with the RIE Link Corridor.
- CHP system with all plant and equipment.
- Condensate drainage systems including all condensate pumps, pipework and traps.
- Air conditioning systems including all air handling units, chilled beams, fan coil units, distributed ducted system, diffusers, return air plenums, fresh air intake and exhaust etc.
- Under floor heating systems including all pipework and valves.
- Thermal insulation applied to the engineering services systems.
- Heat recovery systems.
- Consideration of borehole water, ground source energy.
- Renewable energy systems integrated with electrical systems including wind turbines, photovoltaic systems and the like.
- Generator cooling.
- Lift pressure relief and pressurisation systems as required.
- Staircase pressurisation systems as required.
- Lift motor room cooling systems.
- Electrical and UPS ventilation and cooling systems.
- Packaged split air conditioning systems including all pipework, electrical systems between fan coil and condenser units.
- Communications rooms and ICT Node rooms cooling systems and ventilation.
- The main communications and secondary communication rooms containing network core switches and main servers to be provided with positive pressurised filtered fresh air systems.
- High specification air conditioning systems.
- Smoke extract system including all fire rated ductwork, smoke dampers, and smoke damper control and power interface with the fire alarm system.
- Misc ventilation systems such as toilets, storage areas, plant rooms, generator ventilation, and gas meter room etc.
- Local exhaust ventilation systems.
- Basement mechanical ventilation systems including all plant, equipment, ductwork, dampers.
- Natural ventilation systems where practical.
- Water filtration systems.

- Hot water calorifiers, pumps, valves, piped distribution systems and dead leg (legionnaires) protection.
- Cold water storage tanks, pumps, valves and piped distribution systems including dead leg (legionnaires) protection.
- Mechanical water systems, including all pipework and valves.
- Softened water treatment systems where required.
- Rainwater and roof drainage systems including all pipework, roof outlets.
- Power, water and drainage to Green roof water feed and any fertiliser systems as required by the Green roof specialist.
- Landscape water supply and drain systems (if necessary) including automatic irrigation system.
- Internal soil vent, waste drainage systems including acid resistant systems connected to below ground drainage connections points provided.
- Basement level drainage systems including all sump pumps, pipework and control system, incorporating all above slab drainage with the civil and structural consultant detailing below slab drainage and any sump pumps for which the services consultant would get location and duties etc. of any power supplies and if required discharge pipework.
- Assist in designing the integrated plumbing solutions systems, if any.
- Above ground specialist drainage systems.
- Floor wastes in suspended floors for all wet areas, design coordinated with plant locations etc.
- Automatic flushing systems, pipework, valves and sensors.
- Gas suppression system serving communication and ICT nodal rooms as required.
- Helipad intrinsically safe electrical and fire protection systems.
- Any special medical fixtures and fittings (eg. Pendants).
- Bulk fuel oil storage system including all pipework, valves, filling points and control system.
- Gas distribution systems.
- Compressed air systems.
- Distributed medical gas systems.
- Steam and condensate systems as required.
- Cleaning, flushing and treatment systems.
- Acoustic and vibration treatments and systems.
- Utilities gas, water including interface with existing service strip.

Electrical Systems

The Consultant's design shall cover all works associated with the electricity supply and reticulation including incoming supply, all ducting and supply from the Supply Authority's network. The incoming supplies from the Supply Authority's network are to be reviewed for the substation requirements and mains, power factor correction and power quality. The electrical reticulation system will be provided with an electrical management control system.

- HV electrical systems from primary substation HV switchboard including protection requirements and coordination with utility provider and local authority requirements.
- HV consumer network electrical systems including all protection, electrical distribution system, cables/busbar, switchgear, distribution boards etc.
- LV electrical systems including all busbar/cables, distribution boards etc.
- Electrical HV / LV management control systems.
- Earthing & bonding systems.
- Lightning protection system.
- Power factor and power quality requirements.
- HV Generators and LV to HV step up transformers for temporary LV generator interface with electrical system.
- Lighting control system using presence and absence lighting control.
- Emergency lighting.
- Aircraft warning lights system.
- External lighting and secondary external lighting system.
- Electrical and control systems containment.
- BMU (Cradle) power and water supplies and communications systems (terminated at BMU landing points).
- Services to the automatic barriers where relevant.
- Telephone Communications
- IT
- Small Power, Fire, ICT, Door Access with the RIE Link Corridor
- RIE interface with Fire, ICT and PTS Systems

Other

The Consultant shall contribute to the design coordination and documentation including all interface requirements and Technical Advice for the following, but not necessarily be limited to:

- Group 1, 2 and interface where applicable with Group 3 Equipments.
- Lighting layout design.
- Development of reflective ceiling plans.
- Pneumatic tube system.
- Medical gas.
- Renal water systems including de-ionised water systems.
- Coordination with Radiation protection specialist requirements.
- X-ray systems interface including all associated systems such as warning lights.
- Catering equipment and layout.
- Robotics.
- Food waste processing system.
- Vertical transportation systems.
- Sprinkler protection system, including all plant and equipment, pipework and valves.
- Gas suppression systems electrical rooms including; all plant and equipment, gas bottles, and control systems.
- Wet / Dry riser systems including all plant and equipment, pipework and valves.
- Sprinkler and wet riser water storage tanks including water level control.
- Fire protection electrical installation from control panels to all plant and equipment.
- Main and secondary fire control panels.
- Fireman's general smoke ventilation override system and panel.
- Cause and effect matrix developed byrelevant subcontractor(s) which is to outline the interfaces with the relevant systems such as the mechanical control panels, control of smoke dampers, generator control panel, security Access Control remote panels, sprinkler system, building management control system, electrical management control system, disabled alarm system, lift and escalator control systems etc.
- Fire Hydrants.
- Fire alarms and detection system
- Integrated extra low voltage systems.

- Information communication technology and distribution systems.
- Access control and Intruder detection system.
- External and Internal CCTV.
- Building Management Control system Interfaces with the building management control system, fire alarm system and the like
- Mechanical electrical systems including motor control panels etc.
- Public Address
- Telecommunication systems.
- Optic fibre backbone network system.
- IT / Data systems network and systems.
- Telephone communications and distribution system including the fire telephone system.
- Equipment alarms systems.
- Nurse call system.
- Disabled alarm system interfaced with the fire alarm network.
- Induction loops and hand held portable system.
- Television system.
- Central dictation systems.
- Paging and personal attack system.
- Tagging system.
- Telemedicine system.
- Leak detection system.
- Energy metering management system.
- Cold rooms including all plant and equipment
- CPC Assessment
- Weight Schedule
- Minor/Major Equipment Schedule
- Clinical Risk/Category Drawings
- VIE
- Environmental Data Sheets
- Leading M&E RDD Process

- Building Leakage & Pressure Testing

1.17 HELIPAD

The Consultant shall be responsible for elements of the helipad design as per the following:

Scope Item Description	Design Responsibility	Installation By
Helipad Pancake, Perimeter Gutter & Drainage Outlets	**Product Warrant by specialist backed up by RBG**	**Specialist**
Drainage under Pancake connecting with Foam Collection tank	**M&E Consultant**	**Specialist**
Hot Rolled Supporting Structure off DCN Core	**RBG**	**Steelwork S/C**
Foam/Fuel Collection Tank	**M&E Consultant**	**Specialist**
Helideck Lighting & Floodlights	**M& E Consultant**	**Specialist**
Aviation Lights	**M&E Consultant**	**MERCURY**
Fire Fighting Monitors & Foam Generating Pumps, Kit	**Performance Specification from M&E Consultant**	**Specialist**
Access/Egress Ramp 1:12, Supporting Structure & Decking	**HLM design intent/ RBG supporting structure and Aluminium Decking by Specialist**	**Specialist**
Ramp Lighting & Emergency Lighting	**M&E Consultant**	**MERCURY**
Wind Sock	**RBG**	**Specialist**
CCTV **Fire Rated Power Wiring to Helipad Kit & DB's including controls, BMS,Auto Change/Over**	**M&E Consultant**	**Specialist or Mercury still to be decided**

Fire Detection	**M&E Consultant**	**MERCURY**
Trace Heating	**M&E Consultant**	**MERCURY**
Main DB Panel & Lighting Panel	**M & E Consultant**	**MERCURY**

Compliance and Compatibility

The Consultant's design and documentation shall ensure compliance with and/or encompass the following, but not necessarily be limited to:

- Employer's Requirements.
- Compliance with Health Service Notes and Memorandums such as the SHTM's, HTM's, HBN's, SHBN's, SHGN's SHPN's and HGN's.
- Codes and Standards.
- Local authority requirements.
- CIBSE guides.
- IEE regulations.
- Utility provider requirements.
- Compliance with Planning and Building Regulations.
- HVCA TR17.
- Health & Safety.
- Aircraft authority and specialist.
- Specialist medical.
- NHS/ Board objectives.
- Quality Assurance and Quality Control.
- Environmental management plan including WRAP waste management organisation system.
- Fire strategy.
- Cold water system to comply with Hai-Scribe infection control requirements.
- Acoustic and vibration requirements.
- Radio Frequency and Electro Magnetic Frequency requirements.
- Carbon foot print compliance.

- BREEAM Very good rating compliance.
- Input to life cycle analysis and selection and agreement with FM Partners.
- Interface with RIE.
- Energy Model Simulation & Compliance
- MEP building services systems configured to promote flexibility to enable future maintenance, re-modelling, re-planning and replacement without disruption to adjacent areas.
- Electromagnetic Compatibility

2. ITPD and Preferred Bid Design and Design Development

Overview

2.1 It is a fundamental requirement that all Documentation produced during the Concept Design and Design Development stages are in full compliance with the parameters of the Project requirements such as the Planning consents, the Employer's Requirements, the Cost Plan and the Programmes as these may be amended from time to time.

2.2 The Design Development stage involves the development of the Concept Design and enables the tendering and construction of the Project to be executed, particularly for the enabling works and the early release packages. Consequently the particulars highlighted below require the Consultant to undertake iterative Services and revisit the work carried out under Concept Design which must be amended or otherwise.

Tasks

The Consultant shall:

2.3 Supplement Project details provided by the Employer by sourcing relevant information about the Site. Based on these documents make appraisals and establish constraints for the Works.

2.4 Seek clarification or direction on Project requirements as necessary.

2.5 Visit site in addition to as requested by the Employer.

2.6 Contribute to site appraisals and surveys and (re)evaluate Project requirements including the preparation of options/recommendations for consideration by the Employer highlighting advantages and disadvantages (financial and technical) and where relevant any long lead-in procurement building elements.

2.7 Evaluate any amendments to the Project requirements and advise the Employer on options for development of the design having regard to the effect on the Employer's Requirements, the Cost Plan, the Programme and any other relevant Statutory Authority requirements.

2.8 As when requested by the Employer, provide a Documentation Schedule for review by the Employer. This Documentation Schedule shall support the Full Business Case timeline, the Employer's tender letting schedule and construction programme and shall set out the Documentation to be produced by the Consultant including the sequence and the dates for the production of same.

2.9 Update or amend the Documentation Schedule as required by the Employer. Complete/populate the master documentation matrix if utilised by the Employer. This matrix indicates to which tender package each of the Consultant's documents relates to.

2.10 Provide assistance and support the Architect, Structural Engineer and other consultants in the preparation, design, specification and installation details of their respective discipline.

2.11 Prepare the Documentation incorporating the architectural, structural and other consultants' requirements and/or information into the building services design having regards at all times to the Planning constraints, the Employer's Requirements, the Cost Plan and the construction programme. In conjunction with the other consultants, establish all relevant Statutory Authority requirements and incorporate into the design.

2.12 Prepare design studies and make presentations to the Employer. The Consultant shall take account of any comments from the Employer and amend the Documentation as necessary. The Consultant shall also consult with local or other Statutory Authorities and with other interest groups as reasonably required by the Employer.

2.13 In accordance with the agreed Documentation Schedule, prepare and submit to the Employer in a timely manner, the adequately coordinated and progressed design and as the Lead Consultant for the specific design responsibilities, coordinate tasks and submissions from other consultants. Note: all CAD drawings are to be at an appropriate scale as reasonably required by the Employer.

2.14 In conjunction with the other consultants, develop the design incorporating the design solutions and where required, provide documentation for submissions to the relevant Statutory Authorities including for the discharge of Planning consent conditions and/or to seek conditions of approval for Building Regulations compliance.

2.15 Liaise with other consultants and coordinate the provision of information and data as reasonably required by the Cost consultant and the Employer for use in connection with the Cost Plan.

2.16 Prepare and provide Documentation (on a reasonable and realistic basis) in respect of alternative designs and/or construction solutions for the purpose of value engineering and reviewing costs. Repeat the process as reasonably required by the Employer in terms of the construction costs remaining within the Cost Plan.

2.17 Assess and provide comment on alternatives offered by the Employer, its subcontractors and suppliers. Provide design details and information as required by the Cost consultant in pricing options / alternatives. This may be subject to additional fee to be discussed and agreed between the Consultant and the Employer on a case by case basis.

2.18 Provide studies and information on maintenance, lifecycle and other costs for the Project as required by the Employer.

2.19 Assist the Employer in the preparation of Scope of Work packages on a trade by trade basis for inclusion in subcontract and supply procurement.

2.20 Prepare and issue drawings, specifications, schedules and the like as required by the Employer for market testing, tender and costing purposes. The specification is to include the requirements for testing, commissioning, benchmarks and workmanship standards.

2.21 Prepare schedules, perspectives, computer generated images and other similar presentation materials as reasonably required by the Employer to illustrate the proposed design.

2.22 Review and comment on the temporary works in relation to such activities as the crane locations, materials handling areas, storage and compound areas and the like. It is noted that the Consultant have made allowances in the permanent state design to accommodate the normally envisaged temporary loads during the course of the construction works.

2.23 Continuously review the design against the Project requirements including the Employer's Requirements and all relevant Statutory Authority requirements and immediately notify the Employer of any non-compliance together with associated remedial recommendations.

2.24 Prepare and issue a fully coordinated set of Documentation for these design stages in a report format to the Employer. The Documentation shall be at suitable including coordination information such as the overlay drawings as requested by the Employer.

3. CONSTRUCTION DOCUMENTATION AND CONSTRUCTION PHASE

Overview

3.1 This Work Stage shall be the Construction Documentation and Construction Phase of the Project. This Work Stage continues from the Concept Design and Design Development Work Stage and shall enable the remaining tendering and construction of the Project to be progressed. Where necessary, this Work Stage is undertaken in conjunction with the ongoing design development tasks. Consequently all items scheduled below are a continuation of and are in addition to the items scheduled in the Design Development (and where necessary, Concept Design) Work Stage(s) and to the extent that any of the Services carried out under Design Development (and where necessary, Concept Design) must be amended or otherwise, such work shall be deemed to be part of/concurrent to this Work Stage.

3.2 It is a fundamental objective of the Employer that all Documentation produced during this Work Stage is suitable for properly constructing the Project and shall fully reflect the developed design in full compliance with the parameters of the Project requirements such as the Planning consents, Employer's Requirements, the Cost Plan and the Programme as these may be amended from time to time, especially the construction programme.

Tasks

The Consultant shall:

3.3 Receive further Project details and requirements from the Employer if any and together with other relevant information sourced by the Consultant, make further appraisals of Project constraints.

3.4 Evaluate any amendments to the Project requirements and advise on options for consideration by the Employer having regard to the effect on the Employer's Requirements, the Cost Plan, the Programme and any other relevant Statutory Authority requirements

3.5 Visit site in addition to as requested reasonably by the Employer.

3.6 As when requested by the Employer, update and issue the Documentation Schedule for review by the Employer. The Documentation Schedule shall be consistent with the Employer's construction programme and shall set out the Documentation to be produced by the Consultant including the sequence and the dates for production of same.

3.7 Liaise with other consultants to provide integrated and coordinated design information and data as required by the Employer to comply with the Employer's tender letting schedule and with the construction programme to ensure that there is no delay in providing information to subcontractors or in constructing the Works.

3.8 Update or amend the Documentation Schedule as required by the Employer. Update the master documentation matrix in a format requested by the Employer.

3.9 Produce a monthly update of the Documentation Schedule, or at other times as reasonably required by the Employer, showing the Consultant's actual and proposed delivery against the programmed issue dates for each Documentation including the details of the mitigation measures where the Consultant has fallen behind in providing the design information and/or the Documentation was inadequate.

3.10 Provide Documentation in accordance with the Documentation Schedule. All Documentation to be in compliance with the Project requirements. The Documentation shall be suitable of being used for preparing trade packages (including trade bills of quantities) and used for inviting tenders from trade subcontractors and updated to provide adequate details to allow each design element to be constructed which must for example, take due

regard of good health and safety practices, buildability requirements such as construction sequencing and access and construction tolerances.

3.11 Review all relevant subcontractors and/or suppliers' submissions of samples and technical data as requested and report to the Employer in respect of compliance with the Project requirements.

3.12 Evaluate alternatives proposed by the trade subcontractors and in conjunction with other consultants, coordinate and integrate all such preferred alternatives into the Documentation as requested by the Employer. This may be subject to additional fee to be discussed and agreed between the Consultant and the Employer on a case by case basis.

3.13 In conjunction with the other consultants, review and comment on shop drawings, specifications, prototypes, samples and technical data submissions and other information prepared by potential and/or engaged subcontractors or suppliers for compliance with the Project requirements where relevant to the building services design. Provide such comments within7 days of receipt. However, the Consultant shall endeavour to review, comment and return such submissions earlier should the specific need arise as to be discussed between the Consultant and the Employer.

3.14 Review and comment on the documentation of other consultants and subcontractors within 7 days of receipt and where warranted, fully update all Consultant's Documentation where necessary. However, the Consultant shall endeavour to review, comment and return such submissions earlier should the specific need arise as to be discussed between the Consultant and the Employer.

3.15 Notify the Employer in writing, once the Consultant becomes aware of any amendments or additions/deletions in the Documentation which may increase the cost of construction and/or whole life cost of the Project.

3.16 Not used.

3.17 Provide updated, coordinated and dimensioned drawings at suitable scales showing all major in a timely manner for services and other builder's works in connection details including coordination information such as the overlay drawings as requested by the Employer.

3.18 Produce supplementary documentation as may be required by the Employer to clarify the Documentation during construction, including issuing sketches, details, clarifications, further Documentation, investigating site based construction issues related to the Documentation and preparing and issuing design solutions in conjunction with other consultants where applicable.

3.19 Provide Construction Documentation ("For Contract") drawings incorporating all information issued as advices or sketches so that the latest information is shown on the Documentation to be used for construction. All Documentation must be completed and issued in compliance with the Programme and with the general progress of the Works to ensure that such progress is not delayed and/or disrupted.

3.20 Issue updated drawings, specifications, schedules, details and other design information as the Employer may require.

3.21 Revise and resubmit Planning consent submissions to the Planning Authority as required where the progressed design has varied from the original permit approval.

3.22 Regularly check the Documentation against the Project requirements such as the Employer's Requirements all relevant Statutory Authority requirements and immediately notify the Employer of any non-compliance together with associated remedial recommendations.

3.23 Assist in the updating of design and construction programmes as required by the Employer.

3.24 Respond to all correspondence including (but not limited to) Requests for Information within 5 days. However, the Consultant shall endeavour to review, comment and return such submissions earlier should the specific need arise as to be discussed between the Consultant and the Employer.

3.25 Undertake any off-site inspections reasonably requested by the Employer.

3.26 Review mock-ups and samples for compliance with the Project requirements such as the Planning consent and the Employer's Requirements and recommend benchmarks for finish and workmanship with the Employer in respect of subcontractors, suppliers and manufacturers.

3.27 Undertake regular inspections of the Works and provide non conformance report on same to the Employer.

3.28 Assist in the preparation of full documentation and detailing for a marketing and display facilities as appropriate for the Project or as reasonably required by the Employer.

4. DOCUMENTATION DELIVERABLES

Overview

4.1 The Employer intends to engage specialist subcontractors for the following trades to design (For Construction details only) and construct that form part of the Works. Some of these are early release packages. For these trades, the Consultant is to provide documentation that outline the design intent and the performance requirements from which the subcontractor(s) will prepare their construction design (ie. shop drawings):

- Piling
- Structural steel (connection design only)
- Precast concrete
- Major building (M&E) services, (refer MEP Design Demarcation Matrix)
- Lifts, (lift core structure, (to support all kit / railing / beams provided by the lift sub contractor), shall remain with the Consultants)
- Curtain walling system and all associated bracketry and secondary steel
- Aluminium windows & entrance doors
- SFS
- External canopies
- Facade cladding, (excluding render)
- External louvres
- Secondary steelwork generally including wind-posts, masonry fixings, bed joint reinforcement and the like
- ETFE roof coverings
- Roofing, (except green roof)
- Helipad (Deck / pancake and safety systems only; excluding M&E and structural support to underside of deck support which remains with the Consultants, refer to 1.17)
- Glazed balustrades
- Catering

The Lead Consultant for a given package (refer to the Design Consultant Responsibility Matrix) is to coordinate with other consultants in reviewing the design by these specialist subcontractors and confirm that they are acceptable for coordination with the Services and that the design intent and performance specification has been satisfied.

4.2 In some instances, it is intended that elements of the design are undertaken by specialist subcontractors whereby the subcontractor will assume responsibility for the installation documentation of the Consultant's design intent. However, the Consultant will retain responsibility to review and comment on such design proposals and documentation. For example:

- Spatial coordination – The Consultant shall provide in sufficient detail to establish and confirm the coordinated zoning requirement such as the ceiling voids, risers and the like. The detailed design information from the Consultant is to show the spatial inter-relationship of the engineering systems for the production of installation drawings by the relevant subcontractor(s).

- Selection plant and equipment – The Consultant shall provide a description of the main/critical performance requirements and essential design features of plant and equipment. For example: Input/output capacities of plant, the range of operating duties, details of the required quality of construction and finishes, any essential energy saving features, the acoustic performance and the availability of spares. Based on these parameters, the relevant subcontract(s) will propose their plant and equipment selection.

- Commissioning – The Consultant shall incorporate into various systems designs and provide specifications outlining the essential components and features necessary to enable proper preparation and commissioning of the building services.

- Handover information – The Consultant shall provide specifications that define the scope, content and format of operating and maintenance manuals and record drawings appropriate to the Project. The Consultant shall also define the level of documentation, commissioning results and other information to be made available by the relevant subcontract(s) for a proper handover of the Works.

The MEP Design Demarcation Matrix between the (MEP) Services Engineer and the MEP subcontractor(s) is included within the attached Appendix A.

Documentation

4.3 The Documentation Deliverables shall be fully coordinated with other consultants and other relevant parties prior to issue. The Deliverables are to be provided in trade package format.

In addition to the above, please note the following general principal requirements:

a) Drawings are to be prepared in a digital form on standard A size sheet (ie. A0, A1, A2, A3). Drawings are not to be any larger than the A0 size.

b) Building Orientation: North to top of sheet, part floors details to be drawn with North to top of sheet. North arrow must be shown on the drawing title block.

c) Each Documents must contain/show:

- Unique document number
- Full title with no abbreviation
- Drawn (or prepared) by and checked by – sign offs
- All details to have scale identified for each
- Denote full (sheet) size
- Changes from the previous drawing revision are to be numbered individually and highlighted with a bold cloud. Once the drawing is revised again, these clouds will be removed and new/latest clouds added to highlight the new drawing amendments
- Detailed description of the change(s) under each number with a date in the title block (to match the cloud number) so that the change(s) can be easily understood from the previous issue

- All documents to be prepared in black and white and not colour unless advised otherwise by the Employer

- The orientation of all drawings when submitted electronically shall be checked that they are landscape and uploaded in the correct orientation (e.g. not scanned upside down)

d) The text on all Documents including the drawings shall be in UK English. All dimensions shall be given in metric format. Calendar dates shall follow the Day/Month/Year format.

e) When revising a document, such as specifications, the full version is to be issued (ie. do not issue just an addenda/extract of the pages that changed).

f) Revisions to text documents will have the revised text in bold and italics (**this is an example**).Text that has been deleted will be in italics and struck through (~~another example~~).The Table of Contents shall also highlight in bold italic sections modified. Revised text highlighted must be removed by the Originator prior to issuing the next revision or prior to issuing a document For Tender/Contract and For Construction purposes.

g) Text documents will be prepared on standard A4 size sheets. All text documents will have a title page displaying the relevant information. Each page of the document must show (as a minimum) - document number and its revision, the page number and the total number of pages (ie. page X of Y).

4.4 The following sample list of documents for the building services design as provided by the Consultant indicates the level of design documentation proposed. However, the Consultant shall provide any additional documentation which is not listed below which would be required by the Employer to construct the Works in addition to the Design Development and Overall Design Document Deliverables required by the Board.

Documentation	Scale (indicative refer to BCRs)

5. COMMISSIONING, COMPLETION AND POST COMPLETION

Overview

5.1 This Work Stage shall be the Commissioning, Completion and Post Completion Phase of the Project and shall enable the Project to be commissioned and occupied. Consequently all items scheduled below are a continuation of and are in addition to the items scheduled in the Design Development, the Construction Documentation and the Construction Phases Work Stages.

5.2 It is a fundamental objective of the Employer that all Documentation produced during this Work Stage are suitable for properly constructing, commissioning and completing the Project in full compliance with the Project requirements such as the Planning consents, the Employer's Requirements, the Cost Plan and the construction and completion programmes.

Tasks

The Consultant shall:

5.3 Receive further Project details and requirements from the Employer if any and together with other relevant information sourced by the Consultant, make further appraisals of Project constraints.

5.4 Visit site in addition to as requested reasonably by the Employer.

5.5 Evaluate any amendments to the Project requirements and advise on options for consideration by the Employer having regard to the effect on the Employer's Requirements, the Cost Plan, the Programme and any other relevant Statutory Authority requirements.

5.6 In conjunction with the other consultants, review as reasonably required by the Employer all subcontractor proposed commissioning procedures and report to the Employer.

5.7 Not used.

5.8 Review and comment on all relevant guarantees, warranties and O & M manuals prepared by subcontractors and suppliers.

5.9 In preparation for Completion, inspect the benchmark areas as required by the Employer and prepare non conformance reports to describe in the opinion of the Consultant the Works that may prevent them to be certified as completed together with recommendations for rectification of them. If required by the Employer and in conjunction with the Employer, the Consultant shall re-inspect the Works to verify that the non conformances have been rectified. These tasks are to be provided in a timely manner and where requested by the Employer, make appropriate representations on Employer's behalf to the Board in regards to the non conformances and their remedial works.

5.10 Review and comment within 7 days, all relevant "As-Built" documents as prepared by the other consultants and/or subcontractors including drawings, specifications, schedules, manuals and maintenance instructions or any other documents as required by the Employer.

5.11 Attend commissioning and witness testing to review the satisfactory function and completion of relevant systems for compliance with the Consultant's design intent and specifications in accordance with the Project requirements.

5.12 Assist the Employer with the preparation and provision of the Project operation and maintenance manuals and as-built record information and the like as necessary for the Completion of the Project.

5.13 Assist in the preparing and updating of completion programmes as required by the Employer.

5.14 Liaise with other consultants and coordinate the provision of information and data as required by the Employer to comply with the construction and/or commissioning programme to ensure that there is no delay in providing information to the relevant parties.

5.15 Check the Documentation produced during this Work Stage against the Planningconsents and other Project requirements such as the Employer's Requirements.Report on any non-compliance and provide mitigation recommendations on same.

5.16 Provide all necessary information to the CDM Coordinator to be included in the Health and Safety File for the purposes of the CDM Regulations.

5.17 Provide the updated specifications to reflect the as-built building services works.

5.18 Not used.

5.19 Provide the Employer with a written statement certifying that the Works are consistent with the Consultant's latest design Documentation and the Project requirements such as the Employer's Requirements as demonstrated on the testing and commissioning results.

5.20 Participate in inspections which shall be conducted at reasonable points during the first 52 weeks, if not at 52 weeks after the date of Completion.

5.21 Reasonably assist the Employer in the settlement of differences in relation to the building services works that may arise between the Board and the Employer or between the Employer and any subcontractor or supplier. Should such differences enter into adjudication or arbitration, the Consultant's assistance may be subject to additional fee which is to be discussed and agreed between the Consultant and the Employer on a case by case basis.

APPENDIX A

MEP Design Demarcation Matrix

SCHEDULE 3

CONSULTANT'S WARRANTY

DATED 2014

[CONSULTANT]

- and -

[BENEFICIARY] [1]

COLLATERAL WARRANTY

relating to
the design and construction of
the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service
and the Department of Clinical Neurosciences in a single building adjoining
the Royal Infirmary of Edinburgh at Little France, Edinburgh

---

[1] Parties to collateral warranty to change dependent on beneficiary

COLLATERAL WARRANTY

AMONG:

LOTHIAN HEALTH BOARD, a health board constituted in Scotland under the National Health Service (Constitution of Health Boards) (Scotland) Order 1974 (S.I. 1974/267) as amended by the National Health Service (Constitution of Health Boards) (Scotland) Amendment Order 2003 (S.S.I. 2003/217) pursuant to Section 2 of the National Health Service (Scotland) Act 1978 as amended by section 28 of the National Health Service and Community Care Act 1990 and having its principal address at Waverley Gate, 2-4 Waterloo Place, Edinburgh EH1 3EG (the "**Beneficiary**" which expression shall include its successors in title or permitted assignees under this Agreement and for the Design Build Finance and Maintain Agreement and/or the Beneficiary's appointee);

and

[**Project Co**], a company incorporated in Scotland under the Companies Acts (Registered Number [ ]) and having its Registered Office at **[ ]** ("**Project Co**" which expression shall include its successors in title or permitted assignees under this Agreement);

and

BROOKFIELD MULTIPLEX CONSTRUCTION EUROPE LIMITED, a company incorporated in England and Wales under the Companies Acts (Registered Number 03808946) and having its Registered Office at 99 Bishopsgate, London EC2M 3XD (the "**Contractor**" which expression shall include its successors in title or permitted assignees under this Agreement).

and

[ ] LIMITED, a company incorporated in [Scotland/England and Wales/Northern Ireland] under the Companies Acts (Registered Number [ ]) and having its Registered Office at [ ] (the "**Consultant**").

WHEREAS:

(A) The Beneficiary and Project Co have entered into an agreement for the design, build, finance and maintenance of a project to re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Service and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France (the "**Project**") on or about the date hereof (the "**DBFM Agreement**").

(B) Project Co and the Contractor have entered into a contract (the "**Construction Contract**") on or about the date hereof for the design and construction of the Project (the "**Contract Works**").

(C) The Contractor has entered or intends to enter into an agreement with the Consultant whereby the Consultant will provide certain design services (the "**Services**") in connection with the Project ("**the Appointment**") as more particularly described in the Appointment.

(D) It is a condition of the Appointment that the Consultant enters this Agreement with the Beneficiary.

(E) The Beneficiary shall be entitled to rely and is deemed to have relied on the Consultant's reasonable skill, care and diligence in respect of all matters covered by this Agreement insofar as they relate to the Services provided by the Consultant under the Appointment.

NOW IT IS AGREED as follows:

1 WARRANTY AND UNDERTAKING

1.1 The Consultant warrants and undertakes to the Beneficiary that it has complied and will continue to comply with all the terms and obligations and duties under or arising out of the Appointment on the Consultant's part to be performed and observed and shall complete the Services in accordance with the Appointment.

1.2 Without prejudice to Clause 1.1 of this Agreement, the Consultant further warrants and undertakes to the Beneficiary that:

1.2.1 it has exercised and will continue to exercise all the due skill, care and diligence of a properly qualified and competent consultant experienced in providing design services on projects similar in nature, size and complexity to the Project in:

(a) the design of the Contract Works;

(b) the materials selected or specified by or on its behalf for use in the Contract Works (or any part or parts thereof) are in accordance with the guidance contained in the Good Practice Guidance and this Clause 1.2.1(b); and

(c) only materials and goods which are new and of sound and

satisfactory quality shall be specified for use in connection with the Contract Works; and

(d) there shall not be specified for use in connection with the Contract Works any materials or substances which are expressly prohibited by the Construction Contract or which are generally known not to be in accordance with British or European Standards and Codes of Practice at the time of specification or use (as applicable), or any materials or substances which are deleterious to health and safety or to the durability of buildings and/or other structures and/or finishes and/or plant and machinery in the particular circumstances in which they are used, or any materials or substances identified as deleterious, unsatisfactory or unsuitable in the relevant circumstances in the Good Practice Guidance and, in addition to and separate from the foregoing, any substances or combination of substances publicised prior to the time of construction in any Building Research Establishment Limited ("BRE") publications issued as part of the BRE Professional development service which the BRE recommend are not used for building purposes or for the type of buildings comprised in the Project.

(e) the performance of the Services to the Contractor under the Appointment;

For the purposes of Clause 1.2.1, "**Good Practice Guidance**" means the edition of the publication entitles "Good practice in the selection of construction materials" (British Council for Offices (BCO): 2011) or any amended or updated version as at the Commencement Date (as such term is defined in the DBFM Agreement):

1.2.2 the final design and all materials and goods specified therein will correspond as to description, quality and condition with the requirements of the Construction Contract;

1.2.3 the final design will at practical completion or its equivalent under the Construction Contract, as the case may be, comply with all relevant legislation and Good Industry Practice;

2 INSURANCE

2.1 The Consultant shall maintain throughout the duration of provision of the Services and for a period of 12 years after the date of practical completion or

its equivalent under the Construction Contract, professional indemnity insurance in an amount of not less than fifteen million pounds (£15 ,000,000) sterling on an each and every claim basis and for any one occurrence or series of occurrences arising out of any one event with insurers of good repute carrying on business in the European Union provided always that such insurance is available at rates which are commercially reasonable to consultants.

2.2 In determining whether or not insurance is available as aforesaid, the financial characteristics and claims' record of the Consultant shall be ignored.

2.3 The Consultant shall immediately inform the Beneficiary if such insurance ceases to be available at rates which are commercially reasonable in order that the Consultant and the Beneficiary can consider alternative means of best protecting their respective positions in respect of the Project in the absence of such insurance provided that the Beneficiary shall be entitled to require the Consultant to maintain such lesser amount of Professional Indemnity Insurance as is available to the Consultant at rates which are commercially reasonable.

2.4 As and when it is reasonably requested to do so by the Beneficiary the Consultant shall produce for inspection documentary evidence satisfactory to the Beneficiary (acting reasonably) that its Professional Indemnity Insurance is being maintained.

2.5 The Consultant confirms that this Agreement has been disclosed to and has been approved by the Consultant's Professional Indemnity Insurers or Underwriters.

2.6 Should the Consultant be in breach of any of its obligations under this Clause 2 (Insurance), the Beneficiary may itself insure against any risk with respect to which the breach shall have occurred and may recover such sum or sums from the Consultant as a debt.

3 COPYRIGHT

3.1 The Consultant hereby grants to the Beneficiary or its appointee and all those authorised by the Beneficiary an irrevocable, transferable, non-exclusive and royalty-free licence (which shall be capable of assignation) to use and reproduce all information (whether or not stored in computer systems), drawings, models, bills of quantities, specifications, schedules, details, plans, programmes, budgets, reports, calculations or other documents, work or things including all applicable passwords or access codes whatsoever

provided or to be provided by the Consultant in connection with the Services (the "**Documents**") for such purposes as the Beneficiary may at its sole discretion require.

3.2 Such licence shall carry the right to grant sub-licences and shall subsist notwithstanding that the Appointment is terminated or the obligations and duties there under have been completed. For the avoidance of doubt, the grant of such licence or sub-licences shall not impose any additional liability on the Consultant.

3.3 The Consultant shall on reasonable demand provide to the Beneficiary or its appointee and those authorised by the Beneficiary additional copies of any documents on receipt of reasonable copying costs. The Consultant will not be liable for any use by the Beneficiary or any appointee or sub-licensee of any of the Documents for any purpose other than that for which the same were prepared and provided by the Consultant or for any improper or negligent use by the Beneficiary or any appointee or sub-licensee.

3.4 The Consultant agrees to indemnify and keep indemnified the Beneficiary from and against all loss, damage, cost, expense, liability or claim in respect of breach of the copyright or other intellectual property rights of any third party caused by or arising out of the carrying out of the Services or the use of the licence.

4 ASSIGNATION

4.1 This Agreement may be assigned or otherwise transferred, novated, in whole or in part by the Beneficiary to any successor to the Beneficiary's interest in the Project or any part thereof without the consent of the Consultant being required and such assignation shall be effective upon written notice thereof being given to the Consultant. No assignation of this Agreement by any other party shall be permitted.

[Notwithstanding the foregoing, the Beneficiary shall at any time be fully entitled to assign or transfer its rights under this Agreement any number of times without the consent of the Contractor or the Consultant to any undertaking which is a group undertaking in relation to the Beneficiary and/or to any other undertaking in which the Beneficiary or any other group undertaking holds more than 25 per cent of the shares. For these

purposes the expressions "undertaking", "group undertaking" and "shares" have the meanings given in section 1161 of the Companies Act 2006.][2]

4.2 The Consultant agrees that it shall not at any time assert that any permitted assignee in terms of this Agreement is precluded from recovering any loss resulting from any breach of this Agreement by reason that such assignee is not an original party to this Agreement or that no less or a different loss has been suffered by such assignee.

5 NO WAIVER OR VARIATION

5.1 No failure, approval, act or forbearance on the part of the Beneficiary in respect of any right of the Beneficiary pursuant to this Agreement shall constitute any waiver of any right of the Beneficiary under or arising out of this Agreement nor relieve the Consultant of any of its duties or obligations under or arising out of this Agreement.

5.2 The Consultant will not seek to modify or vary any of the obligations for which it is responsible under the Appointment in any respect if that modification or variation will be detrimental to the Beneficiary or affects the Beneficiary's rights or obligations under the DBFM Agreement, the Construction Contract or this Agreement or affects the Consultant's obligations under this Agreement.

6 EQUIVALENT RIGHTS

The obligations of the Consultant under this Agreement shall be no greater in extent or quantity than if the Beneficiary had been named as joint employer with the Contractor under the Appointment. The Consultant shall be entitled in any action or proceedings by the Beneficiary to rely on any limitation in the Appointment and to raise the equivalent rights in defence of liability as it would have against the Contractor under the Appointment (other than retention, counterclaim, set-off or to state a defence of no loss or a different loss has been suffered by the Contractor)

7 NOTICES

7.1 Any notice, consent or demand to be given or made by any party under this Agreement (hereinafter called a "Notice") shall only be validly served if in writing and delivered personally or sent by pre-paid first class recorded delivery post or sent by fax to the following address and marked for the

[2] To be inserted in Project Co's collateral warranty

attention of the following person in the case of each party:

Party	Address	Fax Number	Person
The Beneficiary	[•]	[•]	[•]
Project Co	[•]	[•]	[•]
The Contractor	[•]	[•]	[•]
The Consultant	[•]	[•]	[•]

Any party may by Notice to the other party/parties change its address, fax number or the title of the person for whose attention Notices are to be given or made pursuant to this Clause. Any such Notice shall be deemed to have been received:

7.1.1 if delivered personally, at the time of delivery;

7.1.2 in the case of pre-paid first class recorded delivery post, on the first Business Day after the date of posting; and

7.1.3 in the case of a fax, at the time of transmission.

7.2 If any Notice is delivered or faxed after 5 p.m. on a Business Day, or at any time during a day which is not a Business Day, that Notice shall be deemed to have been received at 9 a.m. on the next Business Day.

7.3 For the purposes of this Clause 7 (*Notices*), "Business Day" means any day which is not a Saturday, a Sunday or a public holiday in Scotland. In proving service it shall be sufficient to prove that the envelope containing such Notice was properly addressed to the relevant party and either delivered personally to that address or delivered into the custody of the postal authorities as a pre-paid first class recorded delivery letter, or that such Notice was transmitted by fax to the correct fax number of the relevant party (as demonstrated by the transmission slip). For the avoidance of doubt, Notices shall not be validly served if sent by e-mail.

7.4 The definitions of words and phrases used in this Agreement shall be those set out in the Construction Contract and Appointment except where expressly

defined in this Agreement.

7.5 This Agreement shall be governed by and construed in accordance with Scots Law and the parties hereto submit to the exclusive jurisdiction of the Scottish Courts.

7.6 Save to the extent expressly provided in this Agreement no provision of this Agreement is intended to or does confer upon any third party any benefit or right enforceable at the option of that third party or any liability whatsoever to any third party, and without prejudice to the generality of the foregoing, there shall not in any circumstances be created by this Agreement a jus quaesitum tertio in favour of any person whatsoever.

[3][8 **STEP IN RIGHTS**

8.1 The Consultant acknowledges that the Contractor has paid all fees and expenses properly due and owing to the Consultant under the Appointment up to the date of this Agreement. The Beneficiary has no liability to the Consultant in respect of fees and expenses under the Appointment unless and until the Beneficiary has given notice under clauses 8.2 or 8.4.

8.2 If so required by notice in writing given by the Beneficiary and subject to clause 8.4 the Consultant agrees that it will, accept the instruction of the Beneficiary or its appointee which, for the avoidance of doubt, and without limitation, may include a third party appointed by the Beneficiary on a commercial arm's length basis, to act as the contractor under the Appointment to the exclusion of the Contractor in respect of the Services upon the terms and conditions of the Appointment. The Contractor acknowledges that the Consultant shall be entitled to rely on a notice given to the Consultant by the Beneficiary under this clause 8.4.

8.3 The Consultant shall not without first giving the Beneficiary not less than twenty eight days written notice exercise or seek to exercise any rights it may have to determine its employment under the Appointment or treat it as having been determined or repudiated by the Contractor (which expression in this and the succeeding clause shall include the appointment of a liquidator, receiver, administrator, administrative receiver or manager of the Contractor) or to discontinue performance of any service or obligations thereunder or to discontinue performance of the Services. The Consultant agrees that any period stipulated in the Appointment for the exercise any the Consultant of a right of termination shall nonetheless be extended as may be necessary to take account of the period of notice required under this clause 8.3.

8.4 The Consultant acknowledges that its right to determine its employment under the Appointment or treat it as determined by or repudiated by the Contractor or to discontinue performance as aforesaid shall cease if within the said period of twenty eight days referred to in clause 8 hereof the Beneficiary:

---

[3] Clause 8 to be included in Project co and Security Trustee warranties only

8.4.1 gives the Consultant written notice requiring the Consultant to fulfil the terms of the Appointment as if it and not the Contractor were its employer thereunder; and

8.4.2 acknowledges in such notice that it is assuming all of the obligations of the Contractor under the Appointment, including without prejudice to the foregoing generality payment of any monies due outstanding at the date of the notice or which may subsequently become due under the Appointment.

8.5 In the event of notice being given by the Beneficiary as aforesaid, the Appointment will continue in full force and effect as if no right to determine the Appointment or treat it as determined had arisen. The Consultant shall, where the Beneficiary has given notice under Clause 8.4.1 hereof, assume liability to the Beneficiary in terms of the Appointment in lieu of the liability to the Contractor.

8.6 The Consultant shall, if so required by the Beneficiary following determination of the Appointment, contract direct with the Beneficiary or its nominees by novation or otherwise on the same terms, mutatis mutandis, as are contained in the Appointment provided that the Beneficiary gives the Consultant written notice requiring the Consultant to do so within a period of twenty eight days from the date of determination of the Appointment.

8.7 [The Beneficiary acknowledges that Prudential Trustee Company Limited shall take priority over the rights and benefits available to the Beneficiary under this Agreement.] [If two or more valid notices claiming the benefit of a step in right relating to the Appointment and/or a right to issue instructions to the Consultant are received by the Consultant the deemed order of priority of such notices shall be that issued hereunder by the Beneficiary before any issued by any other party. Only the notice deemed to have first priority shall take effect and no other relevant notice shall bind the Consultant and it is agreed the Beneficiary under this warranty will take priority over IHS Lothian Limited.]

8.8 The Contractor has agreed to be a party to this Agreement for the purposes of acknowledging that the Consultant shall not be in breach of the Appointment by complying with the obligations imposed on it by clauses 8.2 or 8.4.]

IN WITNESS WHEREOF this Agreement consisting of this and the preceding [ ] pages is executed as follows:

SCHEDULE 4

THIRD PARTY AGREEMENTS

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

- The Project Agreement (including any document referred to therein either expressly or implied)
  - BCR's
  - PCP's
- Planning permission; property documents
- The Building Contract and the Performance Guarantees
- The Service Contract and the Performance Guarantees, all as the same may be amended or replaced from time to time

SCHEDULE 5

PROJECT SPECIFIC DATA

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

The following ITPD data has been in the possession of the Consultant and has been taken into account in the formation of Fee and Programme. It must be noted that internal layouts are not fixed in these drawings and are subject to further review. This will not be considered as a variation to Fee]: The ITPD comprises four volumes of information as follows:

Volume 1 contains background information on the Project, the conditions of participation, the arrangements for the Dialogue, the Informal Submissions that Bidders must provide during the Dialogue Period, Draft Final Tender requirements, envisaged Final Tender requirements and how the Board intends to evaluate the Final Tender, award the Project and communicate with Bidders.

Volume 2 contains the contractual requirements which are set out in the NPD Project Agreement and schedules, (which include the draft Payment Mechanism) and Articles of Association.

Volume 3 contains the specific technical requirements of the Board for the Project including construction (clinical and non-clinical) requirements and Facilities standards, equipping requirements and facilities management requirements.

Volume 4 comprises of details of the Data Room available to Bidders during the Tender Period.

- Volume 1, Project Bid Information

2 Financial Proformas - Annex 1 to Appendix B_iss1_rev
3 Technical Cost Proformas - Annex 1 to Appendix A
ITPD Volume 1 Revision B FINAL_iss1_rev

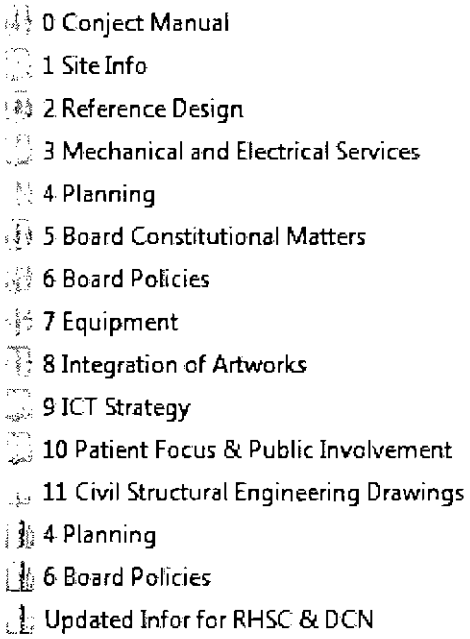
- Volume 2, Contractual Requirements

1 Schedule Part 27 Plans
2 Project Agreement
3 NPD Articles of Association

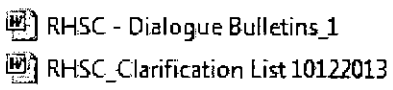
- Volume 3, Technical Requirements

1.1 Board's Construction Requirements
1.2 Service Level Specification
1.3 Equipment

- Volume 4, Data Room



- General ITPD Documents / Trackers:



- Schedule 5 DRAWINGS_SPECS IHSL-XX-XX-DC-4.24
- Building Warrant Tracker IHSL-XX-XX-SH-002 Rev 05
- Contractors Requirements Part 1 & Appendices

SCHEDULE 6

DELIVERABLES TIMETABLE

The Consultant is required to carry out services in conjunction with Schedule 2 (Scope of Services) in accordance with the Building Warrant Matrix (Schedule 5), The Planning Conditions as identified in the Project Agreement (Schedule Part 29) and the following programme documents:

- Schedule 6 141205 HLM - Design Programme FC to Completion Rev01
- Schedule 6 141208 HLM - 1to50 Equipment Layouts and C-Sheets Programme
- Schedule 6, 18 12 14 RHSCDCN_M E_DesignSchedule_Rev00 (2)
- Schedule 6, RBG Deliverables 28th October - T3 coordinated with Dunne IRS Rev 14 corrected RBG Comments
- Schedule 6, RHSC, Design Team Meeting Schedules

SCHEDULE 7

DESIGN CONSULTANT RESPONSIBILITY MATRIX

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

- Design Consultant Responsibility Matrix Schedule

SCHEDULE 8

COST PLAN

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

- RHSC and DCN Cost Plan

SCHEDULE 9

BREEAM REPORT

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

- IHSL-XX-XX-DC-4.11

SCHEDULE 10

BIM PROTOCOL

The following schedule and contents listed was issued to the Consultant via Aconex Transmission BMCE-TRANSMIT-001242 dated 2 February 2015 from Liane Edwards-Scott timed at 13:20 GMT.

ADB	Schedule of Components by Room	B1609-01

Project: 11072 RHSC & DCN
Department: B1 PICU and HDU's - 24 Beds
Room: B1609-01 Open Plan Bay (4 beds)
Room Number: 1-B1-031
Revision Date: 09/09/2014

Quantity					Alt. Code	Grp
New	Trans	Total	Code	Description		
8		8	OUT900	Data Input Box for CIS with 16 input channels (Lantronix): uses 1 plug, 1 data point		3
4		4	PEN1000L	PENDANT; critical care; twin arm; left hand monitor arm, with elbow joints; multi movement.		1
4		4	PEN1000R	PENDANT; critical care; twin arm; right hand monitor arm, with elbow joints; multi movement.		1
4		4	PEN1004	PENDANT; critical care; CIS; single arm with elbow joints; multi movement (to NHSL specification).		1
4		4	PRI015	PRINTER; label; portable		3
8		8	RAI900	Lower Medirail with mounts for suction pressure, suction control unused suction catheters.		1
4		4	RAI901	Monitor module rack pole mounted plus CO2/Press.		1
4		4	RAI903	Shelf and mount for monitor (tilt and swivel of screen required)		1
4		4	RAI904	Integral drip stand for transducers with hooks		1
8		8	SHE900	Shelf for airway consumables		1
4		4	SHE901	Lower height adjustable shelf for small monitors.		1
2		2	SUP2500	SUPPORT LEG; for 920 high worktop		1
1		1	SUP2501	SUPPORT LEG; for 720 high worktop		1
4		4	SUR985	Humidifier: 1 plug, 1 Data (Lantronix) cable		3
4		4	SUR986	Docking station with 7 volumetric pumps: 1 plug, I Data (Lantronix) cable		3
4		4	SUR987	Nebuliser mounted on Medirail : 1 plug		3
8		8	SUR989	Alaris volumetric pumps: 2 plugs		3
4		4	SUR991	Double oxygen flow meter: Upper Medirail mounted		3
4		4	SUR992	Air flow meter: Upper Medirail mounted		3
4		4	SUR993	Airway pressure monitor: Upper Medirail mounted		3
4		4	SUR999	Enteral feed pump		3
1		1	SWC025	SWITCH, light		1
4		4	SWC034	SWITCH, dimmer, modulating		1
4		4	SYR004	SYRINGE pump; anaesthetic use; with diprifusor; 115H 400W 180D		3
4		4	TAP894	TAP bib; hospital pattern; integral thermostatic mixer; HTM64		1
4		4	TEL1000	TELEPHONE; handset.		3
4		4	TRA1003	TRACK; curtain; bed/trolley; length and shape as drawn.		1
4		4	TRO131	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 450W 450D		3
4		4	UPS003	Uninterrupted power supply (UPS).		1
4		4	WAS100	WASTE, unslotted flush-grated, metal, 1.1/4 in		1
4		4	WAS1000	TRAP; concealed waste; for back outlet basins.		1
1		1	WKT1003H	WORKTOP; 920 high 600 deep 40mm thick; with 50mm upstand; length as drawn.		1

ADB	Room Data Sheet	G0510-01

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	G0510-01	Gowning Lobby: Isolation Room		
Room Number:	1-B1-033		**Revision Date:**	18/09/2014

Activities:	1) Clinical handwashing 2) Dispensing disposable aprons. 3) Dispensing disposable gloves. 4) Disposal of non-clinical waste 5) Donning gown and gloves. 6) Removal and disposal of gown and gloves			
Personnel:	1 x persons			
Planning Relationships:	Direct access to single-bed room.			
Space Data:	**Area (m²):**		**Height (mm):**	2,700
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

ADB	Room Environmental Data	G0510-01

Project:	11072	RHSC & DCN
Department:	01	Key Rooms (Financial Close)
Room	G0510-01	Gowning Lobby: Isolation Room
Room Number:	1-B1-033	**Revision Date:** 18/09/2014

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 25
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):	69.0	Ventila ion Type: Central Supply HBN4 Dependant
Mechanical Ventilation (Extract ac/hr):		Ventila ion Type: HBN4 Dependant
Pressure Relative to Adjoining Space:	Positive	
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating type: Warm Air - Reheat Battery with local / BMS Adjustable Sensor Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	200	@ Floor
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):		None
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control Presence Detection

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	30	Intrusive Noise: SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
Intrusive Noise (NR Leq):		40:daytime / 35:nightime (LAeq,1hr) and 45 nightime (LAmax,f).
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY	
Hot Surface Max. Temp (DegC):	43
Hot Water Max. Temp (DegC):	41

General Notes: Maximum cold water discharge temperature (degC): 20

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

ADB	Room Design Character	G0510-01

Project	11072	RHSC & DCN
Department:	01	Key Rooms (Financial Close)
Room:	G0510-01	Gowning Lobby: Isolation Room
Room Number:	1-B1-033	**Revision Date:** 18/09/2014

Walls:	Refer to HLM 330 series of drawings
Floor:	Refer to HLM 330 erie of drawing
Ceiling:	Refer to HLM 332 series of drawings
Doorsets:	Refer to HLM 322 series of drawings for location / type.
Windows:	N/A
Internal Glazing:	Refer to HLM 322 series for door and screen types.
Hatch:	N/A

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 28
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):	10.0	Ventila ion Type: Central Supply Air
Mechanical Ventilation (Extract ac/hr):		
Pressure Relative to Adjoining Space:	Positive	
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating Type: Radiant Panels with TRV Remote Head Adj. Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	500	
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):	1,000.0	@ Bed/trolley 1450 AFFL
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	35	Intrusive Noise: SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
Intrusive Noise (NR Leq):		40:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):	41	

General Notes: Maximum cold water discharge temperature (degC): 20

FIRE

Enclosure:

Automatic Detection:

Project: 11072 RHSC & DCN
Department: P1 Operating Theatres & RHSC Surgical Day Case Unit
Room: N0305-01 Anaesthetic Room 2 (DCN)
Room Number: 1-P1-069 **Revision Date:** 09/09/2014

Quantity					Alt. Code	Grp
New	Trans	Total	Code	Description		
1		1	ANA001	ANAESTHETIC MACHINE/WORKSTATION electrically powered piston ventilator, mobile, 1350H 750W 650D		3
1		1	BOA034	BOARD; marker; whiteboard; dry-wipe; with pen holder; wall mounted; 600H 900W.		1
1		1	CHA024	CHAIR, anaesthetist, height adjustable		3
1		1	CLO003	CLOCK synchronous with second sweep hand, wall mounted		1
1		1	COM033	COMPUTER KEYBOARD		3
1		1	COM1000	COMPUTER MONITOR; TFT; Sunray digital flat panel display; desk top		3
2		2	CUP2510	CUPBOARD; base unit; LH door; ; 600mm.		1
1		1	CUP2519	CUPBOARD; wall unit; LH door; 600h; lockable; 500mm.		1
1		1	CUP2551	CUPBOARD; wall unit; 2 glass door; 600h; lockable; 1000mm.		1
2		2	CUP2566	CUPBOARD; base unit; RH door; 500mm.		1
2		2	CUP2572	CUPBOARD; base unit; 4 drawer; 500mm.		1
1		1	DIS013	DISPENSER, paper towel, wall mounted		2
1		1	DIS030	DISPENSER, soap, disposable single cartridge, lever action, wall mounted		2
1		1	DIS2500	DISPENSER; danicentre; combined glove/apron.		2
1		1	DIS2503	DISPENSER; alcohol gel; disposable single cartridge; wall mounted.		2
2		2	HOL005	HOLDER; bin; medium; capacity 70 litres; freestanding.		3
1		1	LIG081	LUMINAIRE fitted with single fluorescent lamp with switch; below drug cupboard; 8watt; 400mm.		1
1		1	LIG963	LUMINAIRE; examination; ceiling; adjustable.		1
1		1	MON904	MONITOR; High end multi-functionality for ITU/Theatre/High Acuity		3
1		1	OUT005	SOCKET outlet, switched, 13amp, single		1
19		19	OUT012	SOCKET outlet switched 13amp twin; trunking/pendant mounted.		1
1		1	OUT049	CONNECTION UNIT, switched, 13amp, flex outlet		1
1		1	OUT050	OUTLET, controlled drugs cupboard		1
1		1	OUT054	CONNECTION UNIT, unswitched, 13 amp, neon indicator		1
4		4	OUT121	SOCKET outlet; computer data; double.		1
1		1	OUT215	SOCKET outlet, telephone		1
1		1	OUT453	OUTLET, 4kPa compressed air, medical		1
1		1	OUT461	OUTLET, nitrous oxide, medical		1
2		2	OUT470	OUTLET, oxygen, medical		1
2		2	OUT475	OUTLET, vacuum, medical		1
1		1	OUT480	OUTLET, gas scavenging (AGS), medical		1
1		1	REF091	REFRIGERATOR; drug; capacity 35 litres; external temperature gauge; lockable; wall mounted; 510H 380W 445D		2
1		1	STA142	STAND; infusion; twin hook; breaks; mobile		3
2		2	STA2509	STAND; sharps bin, mobile, 30 litre		3
2		2	STF290	STORAGE UNIT; upper; cupboard; controlled drugs; 1 door; lockable; with inner lockable cupboard and warning light; 550H 600W 300D		1
1		1	SUP2500	SUPPORT LEG; for 920 high worktop		1
1		1	SWC025	SWITCH, light		1

New	Trans	Total	Code	Description		
2		2	SYR004	SYRINGE pump; anaesthetic use; with diprifusor; 115H 400W 180D		3
1		1	TAP892	TAP, bib, 2x8 mm thermostatic mixer, automatic action, sensor operated, non-touch		1
1		1	TEL2500	TELEPHONE; handset, wall mounted.		2
2		2	TRO021	TROLLEY; 4 sets of runners; 850H 600W 600D		3
1		1	TRO131	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 450W 450D		3
1		1	TRO204	TROLLEY instrument tray MAYO, 650W 450D		3
1		1	TRO282	TROLLEY PATIENT; accident; image top; with tilt and brakes; 540-1000H 740W 2110D		3
1		1	TRO601	TROUGH scrub-up; hospital pattern; stainless steel; single; 75mm upstand; 800W 450D. HTM64SUH1.		1
2		2	TRU1000	TRUNKING; Power and Data trunking; length as drawn.		1
1		1	TRU1001	MEDICAL SERVICE TRUNKING; horizontal; length as drawn.		1
1		1	UPS003	Uninterrupted power supply (UPS).		1
1		1	WAS102	WASTE, unslotted flush-grated, metal, 1.1/2 in		1
1		1	WAS108	TRAP, bottle, 1.1/2 in, plastic resealing		1
1		1	WKT1006H	WORKTOP; 920 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1

ADB	Room Data Sheet	N0106-03

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	N0106-03	Operating theatre: DCN		
Room Number:	1-P1-070		**Revision Date:**	18/09/2014

Activities:

1) Connection of patient to anaesthetic machine
2) Assembly and connecting of mobile equipment
3) Use of surgical instruments on instrument trolley
4) Surgical procedures performed under local or general anaesthetic
5) Viewing film and/or computer generated images
6) Checking, weighing and recording used swab
7) Displaying operating lists
8) Recording of patient data/notes
9) Transfer of patient from operating table to bed/trolley
10) Computer information accessed
11) Assessment / updating of electronic patient records (EPRs)
12) Maintenance of general anaesthesia
13) Use of mobile image intensifier
14) Use of monitoring/diagnostic or therapeutic equipment

Personnel:

1 x patient
7 x staff

Planning Relationships:

Direct access to preparation room.
Direct access to anaesthesia room (when provided).
Direct access or adjacent to scrub-up room.
Direct access to utility room.
Direct access to corridor/exit bay.

Space Data:

Area (m^2):		Height (mm):	3,000

Refer to HLM-SZ-SL-SH-200-001 for room areas.

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

ADB	Room Environmental Data	N0106-03

Room Number:	1-P1-070		**Revision Date:**	18/09/2014

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 25
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):		Ventila ion Type: Central Supply and Extract
Mechanical Ventilation (Extract ac/hr):		In line with SHTM 03-01
Pressure Relative to Adjoining Space:		
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating Type: Warm Air via AHU Battery with Local / BMS Adjustable Sensor. Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	500	
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):		10,000 - 100,000 @ Bed / Trolley 1450 AFFL
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	50	Intrusive Noise:
Intrusive Noise (NR Leq):		SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
		50:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):	41	

General Notes: Maximum cold water discharge temperature (degC): 20

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

New	Trans	Total	Code	Description		
1		1	PAN053	PANEL operating theatre; to meet the theatre requirements.		1
1		1	PEG002	PEGS; equipment; medium; 2; wide spacing; wall mounted.		1
3		3	PEN002	PENDANT; Anaesthetic; medical & power supply unit; vertical movement; ceiling mounted; outlets comprising.		1
1		1	PEN006A	PENDANT SURGICAL; touch screen monitor; medical and power supply unit; tandem; lateral and vertical movement; ceiling mounted; outlets comprising.		1
3		3	PLA002	PLATFORM; step-stand; stackable; portable; 130H 480W 330D		3
1		1	PRI015	PRINTER; label; portable		3
1		1	SCA012	SCALE; swab; includes Mains adaptor		3
1		1	SCA2503	SCALPEL; harmonic		3
2		2	STA101	STAND; lotion bowl; single; stainless steel; (Bowls not included)		3
2		2	STA142	STAND; infusion; twin hook; breaks; mobile		3
2		2	STA2509	STAND; sharps bin, mobile, 30 litre		3
3		3	STO006	STOOL, surgeon/anaesthetist, height adjustable, includes anti-static seat pads		3
2		2	SUC002	SUCTION UNIT; pipeline; high pressure; theatre		3
2		2	SUP2500	SUPPORT LEG; for 920 high worktop		1
1		1	SUR971	Swab bucket		3
2		2	SWC025	SWITCH, light		1
3		3	SYR004	SYRINGE pump; anaesthetic use; with diprifusor; 115H 400W 180D		3
2		2	TEL2500	TELEPHONE; handset, wall mounted.		2
1		1	TRF002	AUTOTRANSFUSION cell separator; mobile; built in air and foam detector; 1620H 270W 585D		3
2		2	TRO021	TROLLEY; 4 sets of runners; 850H 600W 600D		3
4		4	TRO131	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 450W 450D		3
2		2	TRO133	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 750W 450D		3
2		2	TRO201	TROLLEY, instruments, stainless steel, buffered, 870H 920W 620D		3
1		1	TRO204	TROLLEY instrument tray MAYO, 650W 450D		3
1		1	TRU1000	TRUNKING; Power and Data trunking; length as drawn.		1
1		1	UPS003	Uninterrupted power supply (UPS).		1
1		1	WAR053	WARMER, blood/fluid, maintains temperature between 36 and 43 deg.C at flow rates up to 500 ml/min, 35H 235W 273D		3
1		1	WKT1006H	WORKTOP; 920 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1

ADB	Room Data Sheet	E0311

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	E0311	Angiography Procedures Room		
Room Number:	1-P1-093		**Revision Date:**	18/09/2014

Activities:	1) Patient is positioned or repositioned for examination 2) Use of radiation protection equipment 3) Imaging x-ray examination of patient 4) Use of oxygen and vacuum services for resuscitation 5) Storage of small items of equipment 6) Storage of Positioning aids e.g. wedges pillows and other immobilisation devices 7) Clinical handwashing			
Personnel:	1 x patient 4 x staff			
Planning Relationships:	Adjacent to viewing/reporting area.			
Space Data:	**Area (m²):**		**Height (mm)**	3,000
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

Radiation protection requirements are subject to RPA advice upon selection of equipment.

The "radiation in use" warning lamp should be installed at eye level outside the entrance(s) to the room.

1		1	PLA002	PLATFORM; step-stand; stackable; portable; 130H 480W 330D		3
2		2	RAC360	RACK; catheter and guide wire storage; rotary; mobile; wire basket; top 600x600mm; 800mm dia. 230H 600W 600D		3
1		1	SCR066	SCREEN shielding; radiation protection; lead sheets; mobile; 1140H 1070L; lead equivalent 0.8 mm Pb @ 110 keV.		5
1		1	SLI2500	PATSLIDE		3
1		1	STA2504	STAND; Roll stand for monitor		3
3		3	STO002	STOOL, height adjustable, 380H 480 dia.		3
2		2	SWC031	SWITCH; light; dimmer to M&E design.		1
1		1	SYR001	SYRINGE INJECTOR, automatic, high pressure injection, contrast media.		5
1		1	TAP894	TAP bib; hospital pattern; integral thermostatic mixer; HTM64		1
2		2	THE900	THERMOMETER; Tympanic		3
1		1	TRO070	TROLLEY, for single cylinder, type F or G, 1155H 510W 405D		3
2		2	TRO131	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 450W 450D		3
2		2	TRO133	TROLLEY, dressing/instrument, stainless steel, buffered, 870H 750W 450D		3
4		4	TRO901	TROLLEY; Coil cupd		3
1		1	WAS100	WASTE, unslotted flush-grated, metal, 1.1/4 in		1
1		1	WAS1000	TRAP; concealed waste; for back outlet basins.		1
1		1	WKT1006H	WORKTOP; 920 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1
2		2	XRA018	X-RAY CS RAIL; ceiling suspensions; 2455mm (3655 w/optional extension rail)		5

ADB	Room Data Sheet	X1026

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	X1026	Control room: Angiography Procedures		
Room Number:	1-P1-094		**Revision Date:**	18/09/2014

Activities:	1) Radiographers operate orthovoltage/superficial machine seated at control desk. 2) Displays of patient data and position on treatment couch are monitored via CCTV - this must be screened from public view 3) Viewing of X-ray films 4) Use of computer workstation(s) 5) Holding patient notes / images 6) Accommodation of computer equipment and operator of the Verification Control and Record (VCR) equipment. 7) Audible warning may be given as per approved code of practice of the Ionising Radiations Regulation 1985, page 29, Para 22			
Personnel:	2 x Staff			
Planning Relationships:	Adjacent to orthovoltage/superficial treatment room.			
Space Data:	**Area (m²):**		**Height (mm):**	2,700
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

Quantity					Alt. Code	Grp
New	Trans	Total	Code	Description		
1		1	BAS101	BASIN, medium, hospital pattern, vitreous china, no tap holes, no overflow, intefral back outlet, 500W 400D		1
5		5	BED2502	BED HEAD BUFFER; bed and wall protection; vertical; wall mounted.		1
1		1	BRA013	BRACKET; TV; height adjustable; wall mounted.		1
1		1	CAL047	PUSH BUTTON staff emergency call; reset and integral/adjacent indicator lamp; trunking mounted.		1
1		1	CHA002	CHAIR; height adjustable; medium back; swivel; 5 star base; on castors		3
7		7	CHA017	CHAIR; upright; upholstered; stacking		3
5		5	CHA091	CHAIR; easy; reclining; 1000H 630W 1880D		3
1		1	COM033	COMPUTER KEYBOARD		3
1		1	COM1000	COMPUTER MONITOR; TFT; Sunray digital flat panel display; desk top		3
1		1	DIS013	DISPENSER, paper towel, wall mounted		2
1		1	DIS030	DISPENSER, soap, disposable single cartridge, lever action, wall mounted		2
1		1	DIS2500	DISPENSER; danicentre; combined glove/apron.		2
6		6	DIS2503	DISPENSER; alcohol gel; disposable single cartridge; wall mounted.		2
2		2	HOL005	HOLDER; bin; medium; capacity 70 litres; freestanding.		3
1		1	HOL020	HOLDER, sharps box, up to 7 litre capacity, rail/trolley hang or wall mounted, 170H 125W 100D		3
4		4	LOC008	LOCKER clothes; single; 2 compartments; 1800H 300W 550D		3
2		2	MSC2508	CABINET top; 600mm facing; (600x400 inserts); with formed plastic liners; shelves; 1 door hinged left; wall mounted.		1
2		2	MSC2510	CABINET base; 1000mm facing; (1000x400 inserts); with formed plastic liners; 1 door hinged right; on plinth; o/a height 900.		1
2		2	OUT005	SOCKET outlet, switched, 13amp, single		1
6		6	OUT010	SOCKET outlet, switched, 13amp, twin		1
2		2	OUT012	SOCKET outlet switched 13amp twin; trunking/pendant mounted.		1
2		2	OUT121	SOCKET outlet; computer data; double.		1
1		1	OUT131	SOCKET outlet double data/voice; wall/trunking mounted.		1
1		1	OUT206	SOCKET outlet television aerial; single; wall mounted.		1
1		1	RAC440	RACK; leaflet; wall mounted; 915H 250W 105D.		1
1		1	SUP2500	SUPPORT LEG; for 920 high worktop		1
2		2	SWC031	SWITCH; light; dimmer to M&E design.		1
1		1	TAP894	TAP bib; hospital pattern; integral thermostatic mixer; HTM64		1
1		1	TEL1000	TELEPHONE; handset.		3
4		4	TRA1003	TRACK; curtain; bed/trolley; length and shape as drawn.		1
1		1	TRU1000	TRUNKING; Power and Data trunking; length as drawn.		1
1		1	TVM006	TELEVISION monitor; colour; 585mm		3
1		1	WAS100	WASTE, unslotted flush-grated, metal, 1.1/4 in		1
1		1	WAS1000	TRAP; concealed waste; for back outlet basins.		1
1		1	WKT1006H	WORKTOP; 920 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1

ADB	Room Data Sheet	N0106-01

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	N0106-01	Operating theatre: RHSC		
Room Number:	1-P1-131		**Revision Date:**	18/09/2014

Activities:	1) Connection of patient to anaesthetic machine 2) Assembly and connecting of mobile equipment 3) Use of surgical instruments on instrument trolley 4) Surgical procedures performed under local or general anaesthetic 5) Viewing film and/or computer generated images 6) Checking, weighing and recording used swab 7) Displaying operating lists 8) Recording of patient data/notes 9) Transfer of patient from operating table to bed/trolley 10) Computer information accessed 11) Assessment / updating of electronic patient records (EPRs) 12) Maintenance of general anaesthesia 13) Use of mobile image intensifier 14) Use of monitoring/diagnostic or therapeutic equipment
Personnel:	1 x patient 7 x staff
Planning Relationships:	Direct access to preparation room. Direct access to anaesthesia room (when provided). Direct access or adjacent to scrub-up room. Direct access to utility room. Direct access to corridor/exit bay.

Space Data:	**Area (m²):**		**Height (mm):**	3,000
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 25
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):	8.0	Ventila ion Type: Central Supply and Extract
Mechanical Ventilation (Extract ac/hr):	8.0	
Pressure Relative to Adjoining Space:	Balanced	
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating type: Warm Air - Reheat Battery with BMS Adjustable Sensor Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	300	
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):	1,000.0	@ General working plane 1000 AFFL
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch/ Dimmer

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	35	Intrusive Noise: SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
Intrusive Noise (NR Leq):		40:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):	41	

General Notes: Maximum cold water discharge temperature (degC): 20

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

2		2	COM2509	INTERCOM two way communication system; wall mounted (flush).		1
1		1	CUP2569	Generator Cabinet.		5
2		2	DIS013	DISPENSER, paper towel, wall mounted		2
2		2	DIS030	DISPENSER, soap, disposable single cartridge, lever action, wall mounted		2
2		2	DIS2500	DISPENSER; danicentre; combined glove/apron.		2
1		1	DIS2503	DISPENSER; alcohol gel; disposable single cartridge; wall mounted.		2
4		4	HOL005	HOLDER; bin; medium; capacity 70 litres; freestanding.		3
2		2	INF001	INFUSION volumetric pump; 356H 178W 178D		3
2		2	LIG074	ILLUMINATED SIGN DO NOT ENTER		1
2		2	LIG081	LUMINAIRE fitted with single fluorescent lamp with switch; below drug cupboard; 8watt; 400mm.		1
2		2	MON904	MONITOR; High end multi-functionality for ITU/Theatre/High Acuity		3
2		2	MON906	MONITOR; Clinical slave		2
2		2	MSC127	CABINET top; 600mm facing; (600x400 inserts); with formed plastic liners; 1 door hinged right; wall mounted.		1
2		2	MSC128	CABINET top; 600mm facing; (600x400 inserts); with formed plastic liners; 1 door hinged left; wall mounted.		1
4		4	MSC981	CABINET base; 600mm facing; (600x400 inserts); with formed plastic liners; vertical tambour front; on plinth; o/a height 880		1
4		4	MST001	TROLLEY; single open frame; with handle; up to 5 sets of runners; 600mm facing; approx 850H 730W 450D		3
4		4	MST005	TROLLEY; half size open frame; up to 5 sets of runners; 400mm facing; approx 850H 450W 350D		3
2		2	OUT005	SOCKET outlet, switched, 13amp, single		1
2		2	OUT006	SOCKET outlet unswitched 13amp single; wall mounted.		1
13		13	OUT010	SOCKET outlet, switched, 13amp, twin		1
16		16	OUT012	SOCKET outlet switched 13amp twin; trunking/pendant mounted.		1
2		2	OUT050	OUTLET, controlled drugs cupboard		1
2		2	OUT059	CONNECTION UNIT switched 13amp, indicator light		1
8		8	OUT121	SOCKET outlet; computer data; double.		1

ADB	Schedule of Components by Room	X0242-06

Project: 11072 RHSC & DCN
Department: A1 Emergency Department
Room: X0242-06 Resuscitation Room: 2 places
Room Number: G-A1-029 **Revision Date:** 09/09/2014

Quantity					Alt. Code	Grp
New	Trans	Total	Code	Description		
8		8	OUT131	SOCKET outlet double data/voice; wall/trunking mounted.		1
2		2	OUT210	SOCKET outlet two-way communication system (intercom), wall mounted		1
4		4	OUT453	OUTLET, 4kPa compressed air, medical		1
4		4	OUT461	OUTLET, nitrous oxide, medical		1
8		8	OUT470	OUTLET, oxygen, medical		1
4		4	OUT475	OUTLET, vacuum, medical		1
4		4	OUT480	OUTLET, gas scavenging (AGS), medical		1
4		4	PEN900	PENDANT RESUSCITATION, medical gases and power supply unit, fixed location, ceiling mounted, medical gases and power outlets comprising:		1
2		2	PRI015	PRINTER; label; portable		3
1		1	RAC196	RACK, x-ray lead apron, 5 hangers hinged, wall mounted		2
2		2	REF062	REFRIGERATOR, capacity 82 litres, external temperature gauge, lockable, 660H 500W 510D		3
1		1	RSU011	DEFIBRILLATOR; Manual with pacing capability		3
3		3	SCR066	SCREEN shielding; radiation protection; lead sheets; mobile; 1140H 1070L; lead equivalent 0.8 mm Pb @ 110 keV.		5
2		2	STA142	STAND; infusion; twin hook; breaks; mobile		3
2		2	STA2504	STAND; Roll stand for monitor		3
2		2	STF290	STORAGE UNIT; upper; cupboard; controlled drugs; 1 door; lockable; with inner lockable cupboard and warning light; 550H 600W 300D		1
2		2	STO006	STOOL, surgeon/anaesthetist, height adjustable, includes anti-static seat pads		3
1		1	SWC025	SWITCH, light		1
1		1	SWC062	EMERGENCY STOP switch button, wall mounted		1
4		4	SYR004	SYRINGE pump; anaesthetic use; with diprifusor; 115H 400W 180D		3
2		2	TAP894	TAP bib; hospital pattern; integral thermostatic mixer; HTM64		1
2		2	TEL2500	TELEPHONE; handset, wall mounted.		2
2		2	TRO2507	TROLLEY; control; including PC		3
2		2	TRO282	TROLLEY PATIENT; accident; image top; with tilt and brakes; 540-1000H 740W 2110D		3
1		1	UPS003	Uninterrupted power supply (UPS).		1
1		1	WAR053	WARMER, blood/fluid, maintains temperature between 36 and 43 deg.C at flow rates up to 500 ml/min, 35H 235W 273D		3
2		2	WAS100	WASTE, unslotted flush-grated, metal, 1.1/4 in		1
2		2	WAS1000	TRAP; concealed waste; for back outlet basins.		1
2		2	WKT1003H	WORKTOP; 920 high 600 deep 40mm thick; with 50mm upstand; length as drawn.		1
1		1	XRA010	X-RAY CS; ceiling suspensions; with telescopic tube of column and rotating/tilting arm		5
4		4	XRA015	X-RAY CS RAIL; ceiling suspensions; 6280mm; (Part of XRA010)		5
1		1	XRA040	X-RAY Resus equipment		5

Room Number:	G-D5-008	**Revision Date:** 18/09/2014

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 25
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):		Ventila ion Type: Central Supply and Extract
Mechanical Ventilation (Extract ac/hr):		In line with SHTM 03-01
Pressure Relative to Adjoining Space:	0	
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating Type: Warm Air via Reheat Battery with local BMS Adjustable Sensor. Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	500	
Service Illumination Night (Lux):		
Local Illumination (Lux):		Range from 10000 to 100000 @ Bed/trolley 1450 AFFL
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	40	Intrusive Noise:
Intrusive Noise (NR Leq):		SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
		40:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):	41	Not applicable

General Notes: Maximum cold water discharge temperature (degC): 20

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

AIR	Requirements	Notes
Winter Temperature (DegC):		Permissible space temperature range (dry bulb) (degC) : 18 - 28
Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):	5.0	Ventila ion Type: Central Supply and Extract
Mechanical Ventilation (Extract ac/hr):	5.0	
Pressure Relative to Adjoining Space:	Balanced	
Filtration (%DSE and % Arrestance):	/	G4 - minimum
Humidity (%RH):		

General Notes: Heating Type: Radiant Panels with TRV Remote Head Adj. Cooling: Comfort Cooled Fresh Air

LIGHTING		
Service Illumination (Lux):	300	@ Floor
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):		None
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	40	Intrusive Noise: SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
Intrusive Noise (NR Leq):		50:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	N	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):		

General Notes:

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

ADB	Room Data Sheet	E0716

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	E0716	Imaging Room: Gamma Camera		
Room Number:	G-Q1-039		**Revision Date:**	18/09/2014

Activities:	1) Patient is positioned or repositioned for examination 2) Use of radiation protection equipment 3) Imaging x-ray examination of patient 4) Use of oxygen and vacuum services for resuscitation 5) Storage of small items of equipment 6) Storage of Positioning aids e.g. wedges pillows and other immobilisation devices 7) Clinical handwashing			
Personnel:	1 x patient 2 x staff 2 x escort			
Planning Relationships:	Adjacent to viewing/reporting area. Direct access from changing cubicles - optional.			
Space Data:	**Area (m²):**		**Height (mm):**	2,700
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

Radiation protection requirements are subject to RPA advice upon selection of equipment.

The "radiation in use" warning lamp should be installed at eye level outside the entrance(s) to the room.

ADB	Room Data Sheet	E0601

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	E0601	CT Room DCN		
Room Number:	G-Q1-059		**Revision Date:**	18/09/2014

Activities:	1) Patient may arrive on foot in a wheelchair or on a trolley 2) Patient undergoes examination with diagnostic x-rays to localise tumour and verify proposed treatment method. 3) Storage of Positioning aids e.g. wedges pillows and other immobilisation devices 4) Clinical hand washing 5) Use of computer workstation(s) 6) Contrast media, I.V. injections and other sterile procedures may be prepared 7) Use of radiation protection equipment 8) Radiation measurement will be used 9) Parking, storage of patients' trolley(s)			
Personnel:	1 x Patient 4 x Staff			
Planning Relationships:	Direct access to/from control room. Close to sub-waiting area. Adjacent to changing facilities (direct access optional).			
Space Data:	**Area (m²):**		**Height (mm):**	3,100
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

Radiation protection requirements are subject to RPA advice upon selection of equipment.

The "radiation in use" warning lamp should be installed at eye level outside the entrance(s) to the room.

1		1	ULT904	TROLLEY: U/S machine (micromax & multidop) to sit on.		3
1		1	WAR051	WARMER, ultrasound couplant gel, 200H 100W 150D		3
1		1	WAS100	WASTE, unslotted flush-grated, metal, 1.1/4 in		1
1		1	WAS1000	TRAP; concealed waste; for back outlet basins.		1
1		1	WKT1003L	WORKTOP; 720 high 600 deep 40mm thick; with 50mm upstand; length as drawn.		1
1		1	WKT1006H	WORKTOP; 920 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1
1		1	WKT1006L	WORKTOP; 720 high 800 deep 40mm thick; with 50mm upstand; length as drawn.		1

ADB	Room Data Sheet	E0715

Project:	11072	RHSC & DCN		
Department:	01	Key Rooms (Financial Close)		
Room:	E0715	Injection Room: DCN MRI		
Room Number:	G-Q1-108		**Revision Date:**	18/09/2014

Activities:	1) Assessment / updating of electronic patient records (EPRs) 2) Storage of sterile supplies and consumables on a trolley 3) Use of monitoring/diagnostic or therapeutic equipment 4) Use of computer workstation(s) 5) Patient is positioned or repositioned on examination/treatment couch or in a chair 6) Clinical hand washing 7) Contrast media, I.V. injections and other sterile procedures may be prepared			
Personnel:	1 x patient 2 x staff			
Planning Relationships:	Close to a clean utility room. Close to a dirty utility room.			
Space Data:	**Area (m^2):**		**Height (mm)**	2,700
	Refer to HLM-SZ-SL-SH-200-001 for room areas.			

Notes:

Refer to ME 571 series of drawings for access control (PCP 4.17)

Refer to HLM-SZ-00-PL-331-001 Anti-ligature Strategy for anti-ligature provision

Summer Temperature (DegC):		
Mechanical Ventilation (Supply ac/hr):	8.0	Ventila ion Type: Central Supply and Extract
Mechanical Ventilation (Extract ac/hr):	8.0	
Pressure Relative to Adjoining Space:	Balanced	
Filtration (%DSE and % Arrestance):	/	F7 - minimum
Humidity (%RH):		

General Notes: Heating Type: Warm Air - Reheat Battery with BMS Adjustable Sensor. Cooling: Comfort Cooled

LIGHTING		
Service Illumination (Lux):	300	
Service Illumination Night (Lux):		Not Applicable
Local Illumination (Lux):	1,000.0	@ General working plane 1000 AFFL
Colour Rendering Required:	Y	Colour rendering characteristics (Ra):80
Standby Lighting Grade:	A	Lighting of the level and quality equal or nearly equal to that provided by normal lighting

General Notes: Control: Switch / Dimmer

NOISE		
Privacy Factor Required (dB):		
Mechanical Services (NR):	35	Intrusive Noise: SHTM 08-01 noise intrusion from external noise sources is not given in NR values but instead in LAeq,1hr and LAmax,f.
Intrusive Noise (NR Leq):		40:daytime (LAeq,1hr)
***Acceptable Sound Level [L10dB(A)]:**		
***Speech Privacy Required:**	Y	
***Quality Which Cannot Be Tolerated:**		
(* alternative format)		

General Notes: Refer to HLM 252 series of drawings for partition types and Acoustic Report (PCP 4.13)

SAFETY		
Hot Surface Max. Temp (DegC):	43	
Hot Water Max. Temp (DegC):		

General Notes:

FIRE

Enclosure:

Automatic Detection:

Refer to HLM 572 series of drawings and Fire Strategy Report (PCP 4.12)

Subject: Re: 12.04.18 4 Bed Workshop Summary

Hi Ronnie

4ACH is the brief - supply and extract. The rev 05 schedule is the previous schedule tabled from last year. If you use this schedule at this stage purely as identifying the room numbers for the 14 rooms so that TUV SUD are updating/changing the design to the correct 14 rooms.

The schedule will be reissued to Rev 06 capturing the revised design intent as part of the RDD process pack being pulled together following the site survey to assess feasibility of what was tabled last Thursday.

Regards

Ken

Subject: Re: 12.04.18 4 Bed Workshop Summary

Hi Ken,

I note the attched schedule rev 05 still refers to Air Change rates between 2.7 & 3.5, we are seeking design for 4 Air Changes to all 14 rooms. Can you confirm that this is the brief to WW

Regards

Ronnie

Mail Number: MPX-MM-000503
Subject: 12.04.18 4 Bed Workshop Summary

Confirmation of Key Points discussed.

Attendees: as attached.
Marked Up Drawings Tabled: as attached.
Agenda: as below - (MPX-GC-026334)
Date and Time: 12.04.18 @ 13.00Hrs

1.0 SM noted concerns on agreement from the previous workshop No1 that the objective of workshop No2 was to obtain agreement in principle on the draft drawings being tabled to allow progress to continue on 4 bed design. This was due to NHSL held up at another meeting, and no delegated authority at the workshop.

Action. Concerns resolved as Ronnie Henderson joined the workshop at 13.30.

A. 4 BED Agenda Item

2.0 14 Rooms in question tabled based on the previous Rev 05 schedule. Rooms cross referenced drawings against the schedule. See attached schedule and drawings over viewed.

3.0 Room "M" type. NHSL noted environmental matrix notes supply and extract. Drawing tabled and site inspection has no changes to the extract.

Action: TUV SUD to confirm design intent to comply with the environmental matrix.

4.0 Area I + J. NHSL requested actual air change rates be confirmed given the increase in one extract system rather than perhaps introducing it across the 3 systems in the locale.

Action: Increase in air change rate(s) to be identified due to noise concerns.

5.0 Physical sizes of all increased duct sizes to be verified at site to confirm any spatial constraints.

Post meeting note: Surveys confirmed to proceed 18.04.18. Findings to be shared with NHSL.

6.0 NHSL confirmed agreement in principal to the strategy tabled, and to proceed to the next stage of site survey based on drawings tabled. Thereafter RDD pack to be submitted for speedy approval.

7.0 Spare capacity. TUV SUD tabled the initial draft assessment:

Supply: No impact as being maintained at 4ACH as per the Environmental Matrix.

Extract: AHU-04-06: extract up by 23%.
Extract: AHU-04-07: extract up by 10%.
Extract: AHU-04-08: extract up by 15%.
Extract: AHU-02-23: extract up by 36%.
Extract: AHU-04-04: extract up by 6%.

TUV SUD noted dialogue with Supplier of AHU being undertaken.

Action: Spare capacity impact analysis document to be issued after site checks carried out on spatial review to identify impact on current spare capacity to allow NHSL to consider if the design can proceed on this basis.

B. Spare Capacity Document

NHSL noted receipt of spare capacity document. Comments on the document to be tabled at next workshop.

8.0 NHSL noted the document issued per department had the comments removed that were in the original spare capacity document issued. Specifically for example the fans in relation to 10% spare capacity comment. NHSL reiterated clarity if the fans had 25% spare capacity, this was confirmed by TUV SUD.

Action: TUV SUD to confirm statement made at the meeting, ventilation 25% design spare capacity on the fans.

C. Schneider Agreement

9.0 TUV SUD statement distributed at the meeting,

Action: NHSL to feedback at next workshop.

D AOB

10.0 NHSL requested Thursday meetings continue, perhaps alternated mechanical and electrical depending on topics to be resolved.

11.0 TUV SUD queried if generator load profile document had been returned by NHSL / MPX.

MPX confirmed after meeting TUV SUD were issued the document on 10.04.18.

Action: TUV SUD to confirm feedback on NHSL comments received.

12.0 NHSL noted query regarding earth cable and fire rated cabling. To be discussed and agreed at next workshop. NHSL requested formal confirmation to the points raised within original calculations feedback.

Action: TUV SUD to respond to Aconex MPX-GC-026161 dated 29.03.18.

Next meeting: Thursday 19.04.18, agenda to be issued prior to meeting.

MARKED UP AT MEETING 24/02/17

General Ward – Ventilation Amendment Proposal to achieve Room Balance

Wallace Whittle

Proposed Solution To Rooms Identified As Being Of Concern

Room Reference Location	Ventilation Layout Drawing Number	Room Number	Room Description	Proposed Solution	Severity of Works			Ductwork Fabricated
					Local	Medium	Major	Yes/No
A	WW-Z4-00-PL-524-001I	G-A2-054 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 2.7ac/hr, increase dirty extract for en-suite and WC from 10ac/hr to 17ac/hr, branch ductwork and grilles to be increased in size. This will achieve a balanced room pressure. Branch ducts have long runs across the width of the floor plate to get back to the main duct.		✓		Yes
B	WW-Z4-00-PL-524-001I	G-A2-046 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 2.7ac/hr, increase dirty extract for en-suite and WC from 10ac/hr to 17ac/hr, branch ductwork and grilles to be increased in size. This will achieve a balanced room pressure. Branch ducts have long runs across the width of the floor plate to get back to the main duct.		✓		Yes
C	WW-Z4-00-PL-524-002G	G-A2-028 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 2.7ac/hr, increase dirty extract for en-suite and WC from 10ac/hr to 17ac/hr, branch ductwork and grilles to be increased in size. This will achieve a balanced room pressure. Branch ducts have long runs back to the main duct within the corridor.		✓		Yes
D	WW-Z4-01-PL-524-001H	1-B1-063 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 3ac/hr, introduce a general extract ductwork branch and grille and connect into the duct main branch. This will achieve a balanced room pressure. The branch duct will require to be increased in size and has a long run back to the main.		✓		Yes
E	WW-Z4-01-PL-524-001H	1-B1-031 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 3ac/hr, introduce a general extract ductwork branch and grille and connect into the duct branch. This will achieve a balanced room pressure. The branch duct will require to be increased in size and has a long run back to the main.		✓		Yes
F	WW-Z4-01-PL-524-001H	1-B1-009 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 3ac/hr, increase the main branch size and introduce a general extract duct branch and grille within the room. This will achieve a balanced room pressure. The branch duct will require to be increased in size and has a long run back to the main.		✓		Yes
G	WW-Z3-03-PL-524-001F	3-C1.3-011 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 3ac/hr, increase dirty extract for en-suite from 10ac/hr to 17ac/hr, branch ductwork and grille to be increased in size. Wet room to increase to 17ac/hr with new ductwork and grille being introduced and connect into the duct main. This will achieve a negative room pressure. En-suite ductwork has a long run to get back to the main, additional wet room branch is local.	✓			Yes
~~H~~	WW-Z3-03-PL-524-001F	3-C1.3-013 ESSENTIAL	Multi Bed (4)	Reduce supply ventilation down to 3ac/hr, increase dirty extract for en-suite from 10ac/hr to 17ac/hr, branch ductwork and grille to be increased in size. Wet room to increase to 17ac/hr with new ductwork branch and grille being introduced and connect into the duct main. This will achieve a negative room pressure. (1) LOTHIAN HEALTH BOARD

(2) IHS LOTHIAN LIMITED

SETTLEMENT AGREEMENT AND SUPPLEMENTAL AGREEMENT RELATING TO THE PROJECT AGREEMENT FOR THE PROVISION OF RHSC AND DCN AT LITTLE FRANCE

Pinsent Masons

CONTENTS

THIS SA1 is made the 22 February 2019

BETWEEN:

(1) **LOTHIAN HEALTH BOARD**, a health board constituted in Scotland under the National Health Service (Constitution of Health Boards) (Scotland) Order 1974 (S.I. 1974/267) as amended by the National Health Service (Constitution of Health Boards) (Scotland) Amendment Order 2003 (S.S.I. 2003/217) pursuant to Section 2 of the National Health Service (Scotland) Act 1990 and having its principal address at Waverley Gate, 2-4 Waterloo Place, Edinburgh, EH1 3EG (hereinafter referred to as the **"Board"**); and

(2) **IHS LOTHIAN LIMITED** (registered under number SC493676) whose registered office is 13 Queen's Road, Aberdeen, AB15 4YL (**"Project Co"**).

WHEREAS

A. A Project Agreement was entered into between the Board and Project Co dated 12th and 13th February 2015 setting out the terms and conditions of a project for the design, build, finance and maintenance of a project to re-provide services from the Royal Hospital for Sick Children, Child and Adolescent Mental Health Department and the Department of Clinical Neurosciences in a single building adjoining the Royal Infirmary of Edinburgh at Little France as amended by the Amendment Agreement between the Board and Project Co dated 19th December 2018.

B. The Board and Project Co entered into settlement discussions regarding various matters relating to the Project and the terms of this SA1 reflect the outcome of those settlement discussions.

C. Project Co has requested in terms of a Project Co Change that certain amendments to the Project Agreement are made to provide for the amendment to the rights of access and use of areas of land for the construction, installation, maintenance, repair and renewal of the CCTV Works and CCTV Infrastructure. The Board has requested in terms of a Board Change that certain amendments to the Project Agreement are made to accommodate a revised table of Gross Service Units.

D. The Parties understand that the Independent Certifier has completed the tests on completion in respect of the Works (other than the Post Completion Works and Outstanding Works) and, subject to: (i) the terms of the Project Agreement as supplemented by this SA1); and (ii) the conditions set out in the Independent Tester's letter to Project Co dated 7 February 2019; is ready to issue a Certificate of Practical Completion on or about the SA1 Effective Date.

THE PARTIES AGREE AS FOLLOWS:-

1. **DEFINITIONS**

1.1 This SA1 is supplemental to and amends the Project Agreement, and from the SA1 Effective Date, the Project Agreement shall be read and construed as supplemented by the provisions of this SA1. Save where expressly stated to the contrary herein, where words and expressions appear in capitalised terms in this SA1, such words and expressions shall have the same meaning as is given to such words and expressions under the Project Agreement. In the event of any inconsistency existing between the provisions of this SA1 and any provision of the Project Agreement, the provision of this SA1 shall (in such case) prevail.

1.2 Reference to a document being in the Agreed Form is a reference to the form of the relevant document (or where appropriate, the form of relevant document on USB memory stick) agreed between the parties and for the purpose of identification initialled by each of them or on their behalf.

1.3 In this SA1 the following words and expressions shall have the following meanings:

"Agreed Resolution"	means the technical solution required to resolve the Dispute (other than the Post Completion Disputed Works) and the obligations on each Party to meet (or procure the meeting of) that agreed technical solution all as detailed in the column entitled "Description of Agreed Resolution" in Part 1 of the Schedule (Technical Schedule);
"Concrete Specification"	means the dispute between the Parties regarding whether the concrete used during the Works for waterproofing as set out in the RBG-SZ-XX-SP-260-001 concrete specification is compliant with Section 5.1 (Schedule of Life Expectancies) of the Board's Construction Requirements or IHSL-ARC-041 (4.32 Schedule of Derogations);
"Construction Contract Supplemental Agreement"	means the amendment to the Construction Contract dated the same date as this SA1 between Project Co and the Contractor which as at the SA1 Effective Date is in the Agreed Form;
"**CCTV Infrastructure**"	means the infrastructure resulting from the CCTV Works;
"**CCTV Infrastructure Sites**"	means the Sites of the CCTV Infrastructure shown indicatively as a "Po" on drawing number ME-EW-XX-PL-571-001 version E, which forms part of the CCTV Works Proposal or such other sites as are otherwise agreed between the Parties;
"CCTV Works"	means the design (including preparation of all Design Data), construction, testing, commissioning and completion of the CCTV Infrastructure and thereafter maintaining, repairing and renewing the CCTV Infrastructure at the CCTV Infrastructure Sites in the Yellow Area, as described in the CCTV Works Proposal;
"**CCTV Works Proposal**"	means the information for the design and construction of the CCTV Works detailed in Part B of Part 3 of the Schedule (CCTV Works Proposal) as amended from time to time in accordance with the Project Agreement;
"De-watering"	means the temporary deepwell de-watering exercise undertaken on behalf of Project Co between April 2015 and April 2016 for the purposes of excavating the basement because the designed basement levels were below the groundwater table, including the design, installation, operation and removal and demobilisation of the de-watering system as referred to in, inter alia, Aconex Reference BMCE-TRANSMIT-004045, Document Reference BMCE-XX-XX-DC-014 Rev 00;
"Dispute"	means: (i) all claims, disagreements and disputes between the Parties arising out of or in connection with the matters which are set out in the column entitled "Dispute" in Part 1 of the Schedule (Technical Schedule); and/ or (ii) the Post Completion Disputed Works;
"Drainage Works"	means the drainage works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works);

"Drainage Completion Criteria"	means the drainage completion criteria as set out in Part C of Part 5 of the Schedule (Post Completion Works);
"Energy Centre Lighting Calcs"	means the dispute between the parties regarding compliance with LG2 in relation to Zone 5 Energy Centre Lighting Calculation as set out in Document Number: ME-XX-XX-DC-400-104 Rev 4;
"Failed Instalment"	has the meaning given in Clause 4.1 (Payment);
"Future Claim"	means (other than the Released Claims), as the context requires, any actions, claims, liabilities, rights, demands and set-offs, counterclaims whether in this jurisdiction or any other, including but not limited to claims arising from rights acquired from third parties, whether currently known to the parties or not and whether in law or equity, that it, its parent, subsidiaries, assigns, successors, transferees, novatees, representatives, principals, agents, contractors, subcontractors of any tier, officers, employees or directors, or any of them ever had, may have or hereafter can, shall or may have against the other Party or any other of its present and former parent, subsidiaries, assigns, successors, transferees, novatees, representatives, principals, agents, contractors, subcontractors of any tier, officers, employees or directors, arising after 21st February 2019: (a) available to either party arising out of or in any way connected with any act, omission, breach, default, negligence or failure to comply with the Project Agreement (as revised pursuant to this SA1), as measured (where appropriate) against the technical solution set out in: (i) the Agreed Resolution; (ii) the Post Completion Works Agreed Resolution; and/or (iii) the Outstanding Works Completion Criteria (b) available to the Board arising out of or connected with the Board's whole rights, remedies and pleas pursuant to the Project Agreement (as revised pursuant to this SA1) including rectification of Defects, rectification of Snagging Matters, rights of inspection, rights to issue Warning Notices, the rights and remedies set out in the Payment Mechanism and any other rights and remedies available to the Board set out in the Project Agreement (as revised pursuant to this SA1), all as measured (where appropriate) against the technical solution set out in: (i) the Agreed Resolution; (ii) the Post Completion Works Agreed Resolution; and/ or (iii) the Outstanding Works Completion Criteria;

(c) available to the Board, arising out of or in any way connected with any act, omission, breach, default, negligence or failure by Project Co to comply with the Project Agreement (as revised pursuant to this SA1) including for the avoidance of any doubt:

(i) all rights remedies and pleas available to the Board in connection with rectification of Defects and rectification of Snagging Matters; and

(ii) all rights, remedies and pleas available to the Board in connection with the following items of works: the Concrete Specification, De-Watering, Geotechnical Reports and Submains Schedule; excepting that (without prejudice to the Board's rights to claim that the design and/ or construction of the Concrete Specification, De-Watering, Geotechnical Reports and Submains Schedule are non-compliant with the relevant provisions of the Project Agreement) the Board's rights to make a "Future Claim" shall exclude any right to claim that Project Co failed to comply with the process for review of the RDD Status C Submitted Items and, in particular, that Project Co should not have acted upon the RDD Status C Submitted Items pursuant to Schedule Part 8, Paragraph 4.3 of the Project Agreement, and/ or claim that the RDD Status C Submitted Items ought to have been re-submitted to the Board's Representative in accordance with Schedule Part 8, Paragraph 4.4 of the Project Agreement;

(d) except where excluded pursuant to this SA1 (including pursuant to limb (f) of Released Claims), available to Project Co pursuant to Clause 29 of the Project Agreement (Delay Events) and/ or Clause 30 of the Project Agreement (Relief Events);

"Geotechnical Reports" means the geotechnical interpretative report Aconex Reference MPX-TRANSMIT-010922, Document Reference RBG-SZ-XX-DC-100-001 Rev 1 and geotechnical design report Aconex Reference MPX-TRANSMIT-010922, Document Reference RBG-SZ-XX-DC-100-002 Rev 1 both dated 17 May 2016 and produced by Robert Bird Group;

"Heater Battery Completion Criteria" means the heater battery completion criteria as described in Part C of Part 5 of the Schedule (Post Completion Works);

"Heater Battery Works" means the heater battery works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works);

"Independent Tester Varied Services Letter" means the letter signed by Project Co's Representative and the Board's Representative jointly instructing the Independent Tester to provide the Varied Services issued pursuant to Clause 3.4 of this SA1 in the form contained in Part 9 of the Schedule (Independent Tester Varied Services Letter);

"Joint Completion Programme" means the joint completion programme set out in Part 4 of the Schedule (Joint Completion Programme) in the Agreed Form as amended from time to time;

"Milestone 1"	has the meaning given to it in Part 7 of the Schedule (Payment and Milestones);
"Milestone 2"	means completion of the Drainage Works in accordance with the Drainage Completion Criteria;
"Milestone 2 Completion Date"	means the actual date Project Co met Milestone 2 as certified by the Independent Tester;
"Milestone 2 Target Completion Date"	means 24 May 2019;
"Milestone 3"	means completion of the Void Detection Works in accordance with the Void Detection Completion Criteria;
"Milestone 3 Completion Date"	means the actual date Project Co met Milestone 3 as certified by the Independent Tester;
"Milestone 3 Target Completion Date"	means 13 June 2019;
"Milestone 4"	means completion of the Heater Battery Works in accordance with the Heater Battery Completion Criteria;
"Milestone 4 Completion Date"	means the actual date Project Co met Milestone 4 as certified by the Independent Tester;
"Milestone 4 Target Completion Date"	means 27 May 2019;
"Outstanding Works"	means the works set out in Part 6 of the Schedule (Outstanding Works) which the Parties have agreed will be completed after the Actual Completion Date, including the Outstanding Works Exclusions;
"Outstanding Works Completion Criteria"	means the Outstanding Works completion criteria as set out in Part B of Part 6 of the Schedule (Outstanding Works);
"Outstanding Works Exclusions"	means the Outstanding Works which are noted as "Outstanding Works Exclusions (post 27 May 19)" in Part A of Part of the Schedule 6 (Outstanding Works)
"Outstanding Works Target Completion Date	means: (i) in relation to the Outstanding Works (other than the Outstanding Works Exclusions), 27 May 2019; and (ii) in relation to the Outstanding Works Exclusions, the relevant dates set out in Part A of Part 6 of the Schedule (Outstanding Works);
"Party"	means a party to this SA1;
"Post Completion Disputed Works"	means all claims, disagreements and disputes between the Parties arising out of or in connection with the matters which are set out in the column entitled "Post Completion Disputed Works" in Part A of Part 5 of the Schedule (Post Completion Works);
"Post Completion Works"	means the Drainage Works, Void Detection Works and Heater Battery Works all as described in Parts A and B of Part 5 of the Schedule (Post Completion Works) in the Agreed Form;

"Post Completion Works Agreed Resolution"	means the technical solution required to resolve the Dispute in respect of the Post Completion Disputed Works and the obligations on each Party to meet (or procure the meeting of) that agreed technical solution to meet the Post Completion Works Completion Criteria all as detailed in the column entitled "Description of Post Completion Works Agreed Resolution" in Part A of Part 5 of the Schedule (Post Completion Works);
"Post Completion Works Completion Criteria"	means the Drainage Completion Criteria, the Void Detection Completion Criteria and the Heater Battery Completion Criteria as set out in Part C of Part 5 of the Schedule (Post Completion Works);
"Post Completion Works Longstop Date"	means 26th July 2019 or such later date as may be specified by the Board's Representative pursuant to Clause 29 (Delay Events) of the Project Agreement or such other date as may be agreed by the Parties;
"RDD Status C Submitted Items"	means the documentation submitted by Project Co for review under Schedule Part 8 (Review Procedure) of the Project Agreement which has been endorsed Level C by the Board in relation to: (i) De-Watering; (ii) Geotechnical Reports; (iii) the Concrete Specification; (iv) the Submains Schedule; and (v) Energy Centre Lighting Calcs;
"Released Claims"	subject to Clause 3.9, any actions, claims, liabilities, rights, demands and set-offs, counterclaims whether in this jurisdiction or any other, including but not limited to claims arising from rights acquired from third parties, whether known to the Parties or not and whether in law or equity, that it, its parent, subsidiaries, assigns, successors, transferees, novatees, representatives, principals, agents, contractors, subcontractors of any tier, officers, employees or directors, or any of them ever had, may have or hereafter can, shall or may have against the other Party or any other of its present and former parent, subsidiaries, assigns, transferees, representatives, principals, agents, contractors, officers or directors arising out of or connected with: (a) the Dispute; (b) the underlying facts relating to the Dispute; (c) any act, omission, breach, default, negligence or failure to comply with the Project Agreement (as revised pursuant to this SA1) in relation to the Dispute; (d) the Agreed Resolution (save that nothing in this provision is intended to release Project Co's obligation to carry out and complete the technical solution required in order to achieve the Agreed Resolution);

(e) the Post Completion Works Agreed Resolution (save that nothing in this provision is intended to release Project Co's obligation to carry out and complete the technical solution required in order to achieve the Post Completion Works Agreed Resolution);

(f) subject to Clauses 3.9.5, 3.9.6 and 3.9.7, any relief available to Project Co pursuant to Clause 29 of the Project Agreement (Delay Events) and/ or Clause 30 of the Project Agreement (Relief Events) arising prior to the SA1 Effective Date including (without limitation) all notifications issued pursuant to Clause 29.4 of the Project Agreement (Delay Events) by Project Co prior to 21 February 2019;

"SA1"	means this supplemental agreement to the Project Agreement including the Schedule;
"SA1 Effective Date"	has the meaning given to Clause 2.1;
"Schedule"	means the schedule (in 10 parts) annexed to this SA1;
"Settlement Sum"	has the meaning given in Clause 4.1 (Payment);
"Submains Schedule"	means the dispute between the Parties relative to whether the low voltage cable design and supporting calculations fully comply with BS7671;
"Void Detection Completion Criteria"	means the void detection completion criteria as set out in Part C of Part 5 of the Schedule (Post Completion Works);
"Void Detection Works"	means the void detection works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works).

2. COMMENCEMENT AND DURATION

2.1 This SA1 and the rights and obligations of the Parties shall commence on the date of effectiveness as provided for in Clause 15 (Counterparts and Delivery) ("**SA1 Effective Date**") and, without prejudice to Clause 47.6 (Continuing Obligations) of the Project Agreement, shall terminate automatically on the expiry of the Project Term or earlier termination of the Project Agreement, as applicable.

DELIVERY OF DOCUMENTS

2.2 On or prior to the execution of this SA1, the Board shall deliver to ProjectCo the following documents (unless the requirement to deliver any such document is waived by ProjectCo by written notice to the Board):

2.2.1 A certified copy of the resolution of the Board approving the amendments to the Project Agreement and authorising a named person to execute this SA1 and documents to be delivered by it pursuant thereto;

2.2.2 A certificate of the relevant officer of the Board setting out the names and specimen signatures of the person or persons named in the resolution of the Board referred to in Clause 2.2.1 above;

2.2.3 An externally financed development agreement certificate under the National Health Service (Private Finance) Act 1997;

2.2.4 A counterpart of the supplemental agreement to the Funders' Direct Agreement signed by the Board.

2.3 On or prior to the execution of this SA1, ProjectCo shall deliver to the Board the following documents (unless the requirement to deliver any such document is waived by the Board by written notice to ProjectCo):

2.3.1 Extracts of the minutes of the meeting of the board of directors (certified as true and accurate by the company secretory, director or authorised signatory) of Project Co at which resolutions were passed approving the amendments to the Project Agreement, the Ancillary Documents and the Initial Funding Documents and approving the execution, delivery and performance of this SA1 and the Construction Contract Supplemental Agreement by Project Co and in each case authorising a named person or persons to execute and deliver each such document and any other documents to be delivered by it pursuant to it;

2.3.2 A certificate, certified by the company secretary, director or authorised signatory of Project Co, setting out the names and specimen signatures of the person or persons named in the relevant certified extract;

2.3.3 Extracts from the minutes of the meeting of the board of directors (certified as true and accurate by the Secretary, Director or authorised signatory) of the Contractor at which resolutions were passed approving the execution, delivery and performance of the Construction Contract Supplemental Agreement and authorising a named person or persons to execute and deliver such document and any other documents to be delivered by it pursuant to it;

[redacted] 2.3.4 Copies of consents from Project Co's shareholders including Hold Co and Top Co (certified as true and accurate by the company secretory, director or authorised signatory to Project Co) approving the execution, delivery and performance of each relevant document to which such entity is expressed to be a party;

2.3.5 Counterparts of the supplemental agreement to the Funders' Direct Agreement signed by the Security Trustee and Project Co.

2.4 Following signature of this SA1, Project Co shall provide the Board with copies of the following documentation:

2.4.1 certified true copy of consent from the Senior Funders to the amendments to the Project Agreement, the Construction Contract and the Initial Funding Documents;

2.4.2 certified true copy of the Construction Contract Supplemental Agreement.

2.4.3 executed side letter to the Performance Guarantee entered into in relation to the Construction Contract Supplemental Agreement.

3. SETTLEMENT AND RELEASE

3.1 In respect of the Agreed Resolution:

3.1.1 subject to:

(a) Clause 29 (Delay Events) of the Project Agreement and Clause 30 (Relief Events) of the Project Agreement;

(b) any future amendment of this SA1 (which shall be agreed by both Parties in writing); and/or

(c) Clause 3.9.4 (Settlement and Release);

Project Co shall design, construct, test, commission and complete the Works (other than the Post Completion Works and Outstanding Works) and Facilities in accordance with the Project Agreement as amended by the Agreed Resolution so as to satisfy the Completion Criteria as amended by the Agreed Resolution and all other terms of the Project Agreement (as revised pursuant to this SA1) and this SA1;

3.1.2 without prejudice to Project Co's rights in respect of Future Claims, Clause 3.9.5, Clause 3.9.6, Clause 3.9.7 and/ or Clause 4 (Payment), Project Co waives any and all actions, claims, liabilities, rights, demands, set-offs and counterclaims to additional payment (including without limitation any adjustment to the Annual Service Payment and/or a Monthly Service Payment and/ or Capital Expenditure) and/ or any extension of time to the Completion Date arising out of or in any way connected with the Agreed Resolution; and

3.1.3 the Board shall comply with any obligations it has pursuant to Part 1 of the Schedule (Technical Schedule).

3.2 The Board and Project Co agree that the Agreed Resolution:

3.2.1 resolves the Dispute (with the exception of the Post Completion Disputed Works) between the Board and Project Co;

3.2.2 shall be used by the Independent Tester for the purposes of interpreting the relevant aspects of the Completion Criteria as amended by the Agreed Resolution for those parts of the Works (other than the Outstanding Works and the Post Completion Works) detailed in Part 1 of the Schedule (Technical Schedule) which are the subject of the Dispute (other than the Post Completion Disputed Works), and, for the avoidance of doubt, the provisions of Clause 17 (Pre-Completion Commissioning and Completion) of the Project Agreement apply (subject to Clause 3.5) mutatis mutandis to the Works as amended by the Agreed Resolution (other than the Outstanding Works and the Post Completion Works) for the purposes of the Independent Tester issuing the Certificate of Practical Completion for the Works as amended by the Agreed Resolution (other than the Outstanding Works and the Post Completion Works);

3.2.3 shall not dilute:

(a) Project Co's obligation to continue to comply with all relevant obligations relative to the Project Operations pursuant to the Project Agreement (as revised pursuant to this SA1), including for the avoidance of doubt Clause 12.3 (Design responsibility) of the Project Agreement, Snagging Matters, Defects, obligations under Schedule Part 31 of the Project Agreement and/or any other obligations of Project Co relative to the Project Operations in respect of the Project Agreement (as revised pursuant to this SA1); and/or

(b) the Board's rights pursuant to the Project Agreement (as revised pursuant to this SA1), including for the avoidance of doubt rights of inspection, rights to issue Warning Notices, rights and remedies of the Board pursuant to the Payment Mechanism and/or any other rights and remedies of the Board relative to the Project Operations in respect of the Project Agreement (as revised pursuant to this SA1); and/or

(c) the Completion Criteria for those parts of the Works which are not the subject of the Dispute and which are not part of the Post Completion Works or Outstanding Works; and/or

(d) the Parties rights and/or obligations in respect of the Outstanding Works and the Post Completion Works;

3.2.4 for the avoidance of doubt, is a variation to the Works as varied, amended or supplemented in accordance with this SA1 (save that such variation shall not entitle

Project Co to any additional payment and / or extension of time other than to the extent set out in this SA1).

3.2A Notwithstanding the RDD Status C Submitted Items, the Parties shall procure that the Independent Tester shall issue a Certificate of Practical Completion for the Works in accordance with Clause 3.3.1. Except as amended in this SA1, all other rights and obligations in relation to the Concrete Specification, De-Watering, Geotechnical Reports and Submains Schedule are wholly reserved.

3.3 Pursuant to paragraph 3.1 (Varied Services) of the Independent Tester Contract, Project Co undertakes and agrees to instruct Project Co's Representative and the Board undertakes and agrees to instruct the Board's Representative, to jointly instruct the Independent Tester to procure that the Independent Tester shall provide the following Varied Services:

3.3.1 issue the Certificate of Practical Completion pursuant to Clause 17.12 (Completion Certificate) of the Project Agreement (as revised pursuant to this SA1) when he is satisfied that the Facilities and the Retained Estate Handback Infrastructure are complete in accordance with the Completion Criteria as amended pursuant to this SA1 and the other relevant provisions of the Project Agreement (as revised pursuant to this SA1) notwithstanding:

(a) any requirement to procure the completion of: (i) the Outstanding Works in accordance with Clause 6.14; (ii) the Post Completion Works in accordance with Clause 6.11; and/ or (iii) the RDD Status C Submitted Items;

(b) the dispute between the Parties regarding the Concrete Specification, De-Watering, Geotechnical Reports, Submains Schedule and the Energy Centre Lighting Calcs; and

(c) that there are Snagging Matters;

3.3.2 certify the relevant works comprising Milestone 2, Milestone 3 and/ or Milestone 4 as the case may be as complete when the Independent Tester is satisfied that the works comprising Milestone 2, Milestone 3 and/ or Milestone 4 as the case may be are complete in accordance with the relevant Post Completion Works Completion Criteria and all other provisions of the Project Agreement (as amended by SA1) notwithstanding:

(a) any requirement to procure the completion of: (a) the other Post Completion Works (to the extent not yet complete); (b) the Outstanding Works (to the extent not yet complete); and/or (c) the RDD Status C Submitted Items;

(b) the dispute between the Parties regarding the Concrete Specification, De-Watering, Geotechnical Reports, Submains Schedule, the Energy Centre Lighting Calcs any other disputes which arise after the SA1 Effective Date or any Future Claims;

(c) that there are Snagging Matters;

(d) that there are any defects in the Works not forming part of the applicable Post Completion Works;

3.3.3 issue certificates to the Board and Project Co confirming achievement of Milestone 2, Milestone 3 and Milestone 4;

3.3.4 certify the relevant works comprising the Outstanding Works as complete when the Independent Tester is satisfied that the Outstanding Works are complete in accordance with the Outstanding Works Completion Criteria and all other relevant provisions of the Project Agreement (as amended by SA1) notwithstanding:

(a) any requirement to procure the completion of: (a) the Post Completion Works (to the extent not yet complete); (b) the Outstanding Works Exclusions; and/or (c) the RDD Status C Submitted Items;

(b) the dispute between the Parties regarding the Concrete Specification, De-Watering, Geotechnical Reports and Submains Schedule, any other disputes which arise after the SA1 Effective Date or any Future Claims;

(c) that there are Snagging Matters;

(d) that there are any defects in the Works not forming part of the applicable Outstanding Works;

3.3.5 perform the other Independent Tester Services as detailed in the Independent Tester Varied Services Letter in Part 9 of the Schedule (Independent Tester Varied Services Letter).

3.4 Project Co undertakes and agrees to instruct Project Co's Representative and the Board undertakes and agrees to instruct the Board's Representative to sign and issue the Independent Tester Varied Services Letter to the Independent Tester on the SA1 Effective Date.

3.5 The Parties agree that the Independent Tester Varied Services Letter shall be deemed to be sufficient notification to the Independent Tester pursuant to Clause 17.5 (Pre-Completion Commissioning and Completion) of the Project Agreement of the date when Project Co believes (acting reasonably) that the Works as amended by the Agreed Resolution (other than the Post Completion Works and Outstanding Works) shall be complete.

3.6 The fee for the Varied Services which, for the avoidance of doubt, shall apply from the Actual Completion Date, shall be shared equally between the Board and Project Co.

3.7 The Settlement Sum shall not be adjusted or altered in any way whatsoever otherwise than in accordance with this SA1 and/ or the Project Agreement (as revised pursuant to this SA1).

3.8 This SA1 is in full and final settlement and full satisfaction of, and each Party hereby releases and forever discharges, all Released Claims.

3.9 For the avoidance of doubt, Released Claims shall not include:

3.9.1 any claim arising out of the Parties' rights and obligations under this SA1;

3.9.2 any Future Claim;

3.9.3 any issues, claims and disputes between the Parties arising out of or in connection with the water damage following the burst pipe which occurred at the Facilities on Thursday 7 June 2018 ("Water Damage"), including any entitlement of any Insureds (pursuant to Section 1 of Schedule Part 15 (Insurance Requirements)) of the Project Agreement to insurance proceeds under the Insurances set out in Section 1 of Schedule Part 15 (Insurance Requirements) of the Project Agreement in relation to the Water Damage, provided that (without prejudice to the Board's position as to whether there is an entitlement to a Relief Event pursuant to the Project Agreement) any claim under the Project Agreement for a Relief Event in respect of the Water Damage shall not result in any relief from the obligations of Project Co pursuant to the Project Agreement, including (without limitation) their rights pursuant to Clause 40.1.2 (Longstop) of the Project Agreement;

3.9.4 any issues, claims and disputes between the Parties arising out of or in connection with defective workmanship, defective installation, latent defects, faults and/or Snagging Matters, whether or not currently known or unknown to the Parties;

3.9.5 in connection with the Board Changes listed in Part 1 of Schedule Part 8 (Board Changes):

(a) if the Board Change is agreed and instructed by 28 February 2019, and the scope of the Board Change has not materially changed from that reviewed by Project Co as at 21 February 2019, Project Co's rights to any Change in Costs set out at limb (g) and (h) only of Section 1 of Schedule Part 16 (Change Protocol); or

(b) if Clause 3.9.5(a) above does not apply, Project Co's rights to any Change in Costs set out at Section 1 of Schedule Part 16 (Change Protocol);

3.9.6 in connection with the Board Changes listed in Part 2 of Schedule Part 8 (Board Changes) any Change in Costs set out at limb (g) only of Section 1 of Schedule Part 16 (Change Protocol);

3.9.7 any rights, obligations, reliefs or liabilities of the Parties pursuant to Schedule Part 16 (Change Protocol) or otherwise arising as a result of Board Change reference 172 (hospital square and toucan crossing installation).

3.9A In connection with the Board Changes listed in Part 1 of Schedule Part 8 (Board Changes), if the Board Change is agreed and instructed by 28 February 2019 and the scope of the Board Change has not materially changed from that reviewed by Project Co as at 21 February 2019, Project Co shall complete said Board Change by 13 June 2019 or such other date as the Parties agree (acting reasonably).

3.10 This SA1 and its terms and provisions are made and agreed without any admission by the Parties of liability, obligation or fact of any nature or kind whatsoever.

3.11 Not used.

3.12 The Parties shall comply with the provisions of Part 10 of the Schedule (Independent Tester Representations) in respect of the matters detailed therein provided that the Independent Tester agrees to the variation of services pursuant to the Independent Tester Varied Services Letter in Part 9 of the Schedule (Independent Tester Varied Services Letter).

4. PAYMENT

4.1 In consideration of: (i) Project Co carrying out its obligations in compliance with Clause 3.1.1 and clause 6.11; (ii) the costs of the Agreed Resolution; (iii) associated on-site costs; and (iv) senior debt funding payable by Project Co pursuant to the Common Terms Agreement in the period from 20 April 2018 to 31 October 2018; the Board shall pay £11,600,000 plus VAT (the "**Settlement Sum**") to Project Co in instalments on the payment dates set out in Part 7 of the Schedule (Payment and Milestones).

4.2 If the Board fails to pay any instalment of the Settlement Sum by the payment date for that instalment as set out in Part 7 of the Schedule (Payment and Instalments) (a "**Failed Instalment**"), Project Co shall notify the Board in writing that there has been a Failed Instalment as soon as reasonably practicable after it becomes aware that a Failed Instalment has occurred. Unless the Board pays that Failed Instalment within seven (7) days of the date of the notice, the Failed Instalment shall become immediately payable by the Board in full. The Board shall pay interest on any Failed Instalment in accordance with Clause 34.5 (Late Payment) of the Project Agreement.

4.3 On the occurrence of a failure by the Board to pay a Failed Instalment in accordance with Clause 4.1, Project Co:

4.3.1 may suspend performance by it of its obligations under this SA1 and the Project Agreement (as revised pursuant to this SA1) until such time as the Board has rectified such failure; and

4.3.2 shall be entitled to claim a Delay Event and (subsequently) a Compensation Event in accordance with Clause 29 of the Project Agreement (Delay Events), and the calculation of the relevant compensation pursuant to Clause 29.11 of the Project Agreement shall include (without limitation) the debt service costs payable by Project Co during such period of suspension.

4.4 Without prejudice to Clause 4.1, the Parties will each bear their own costs in relation to the Dispute and the negotiation, execution and implementation of this SA1.

4.5 Given that reasonable costs and expenses were to be due:

4.5.1 to the Board from Project Co, in relation to assessing and amending the Project Co Change for the CCTV Works, assessing and amending the CCTV Works Proposals and assessing and amending any provisional Amended Proposal and/or final Amended Proposal to the extent not already covered by the CCTV Works Proposal with regard to the CCTV Works in the Yellow Area; and

4.5.2 to Project Co from the Board, in relation to drafting and negotiating the element of this SA1 which relates to Gross Service Units;

the Parties have agreed that in consideration of the net effect of these costs, it would be prudent for each Party to be responsible for paying its own costs and expenses incurred in connection with Clauses 4.5.1 and 4.5.2.

5. AGREEMENT NOT TO SUE

5.1 Each Party agrees, on behalf of itself and on behalf of its parent, subsidiaries, assigns, successors, transferees, novatees, representatives, principals, agents, contractors, subcontractors of any tier, officers, employees or directors, not to sue, commence, voluntarily aid in any way, prosecute or cause to be commenced or prosecuted against the other Party or its parent, subsidiaries, assigns, successors, transferees, novatees, representatives, principals, agents, contractors, subcontractors of any tier, officers, employees or directors, any action, suit or other proceedings concerning the Released Claims, in this jurisdiction or any other.

5.2 Any Party in default of the agreement in Clause 5.1 above will fully indemnify the other Party against all losses, liability (including without limitation liability in damages, liability to make a contribution, liability to indemnify and liability to pay any sum or incur any expense), costs and expenses of whatever nature sustained by them by reason of such default.

5.3 For the avoidance of doubt, the provisions of this Clause 5 shall not affect the Parties' rights to enforce the terms of this SA1 and/or the Project Agreement (as revised pursuant to this SA1) including their respective rights, claims and entitlements under or arising out of this SA1 and/or the Project Agreement (as revised pursuant to this SA1) and to insist on performance by the other Party of its obligations and liabilities under or arising out of this SA1 and/or the Project Agreement (as revised pursuant to this SA1).

6. AMENDMENTS TO PROJECT AGREEMENT

6.1 The Parties agree that in order to give effect to this SA1, the provisions of the Project Agreement and other documents referred to in Part 1 of the Schedule (Technical Schedule) and Parts A and B of Part 5 of the Schedule (Post Completion Works) shall be:

6.1.1 supplemented and amended as set out in Part 1 of the Schedule (Technical Schedule), Part A of Part 3 of the Schedule (Other Project Agreement Amendments) and/or Parts A and B Part 5 of the Schedule (Post Completion Works) as appropriate; and/ or

6.1.2 (where no express supplement or amendment is set out in Part 1 of the Schedule (Technical Schedule) and/or Parts A and B of Part 5 of the Schedule (Post Completion Works) deemed to have been supplemented and amended in order to give effect to the Agreed Resolution and/or the Post Completion Works Agreed Resolution;

with effect from the SA1 Effective Date.

6.1A The Parties agree that in order to give effect to the Project Co Change in respect of the CCTV Works and the amendment to the GSU table (in respect of Part D of Schedule Part 3 only), the provisions of the Project Agreement shall be supplemented and amended as follows with effect from the SA1 Effective Date:

(a) new amendments shall be inserted into the Project Agreement, as set out in Parts B, C and D of Schedule Part 3 (Other Project Agreement Amendments) of this SA1;

(b) without limitation, the CCTV Works Proposal shall apply to the CCTV Works;

(c) the TMS and Construction Access Strategy shall be deemed to apply to the CCTV Works; and

(d) the CCTV Works Proposal shall be deemed to be the relevant Access Strategy for the purpose of Part 2 of Schedule Part 31 (Consort Interface with Campus Site and/ or Campus Facilities) of the Project Agreement.

6.1B Project Co shall procure that the Contractor shall issue commissioning and testing methodology for the Post Completion Works to the Independent Tester and the Board's Representative not less than five (5) Business Days prior to the date when Project Co (acting reasonably) considers that the Contractor shall commence the Post Completion Works commissioning.

6.1C Project Co shall give the Independent Tester and the Board's Representative not less than three (3) Business Days notice of the date upon which Project Co considers that the Outstanding Works (other than the Outstanding Works Exclusions), Drainage Works, Void Detection Works or Heater Battery Works will be complete and the relevant tests on completion will be carried out. Following receipt of such notice, the Board's Representative and the Independent Tester shall be entitled to inspect the Outstanding Works (other than the Outstanding Works Exclusions), Drainage Works, Void Detection Works or Heater Battery Works (as the case may be) on the date or dates reasonably specified by Project Co, and to attend any of the tests on completion. Project Co shall, if so requested, accompany the Board's Representative and the Independent Tester on any such inspection.

6.1D Subject to Clause 3.3, the Parties shall procure that the Independent Tester, within three (3) Business Days of any inspection made pursuant to Clause 6.1C, notifies Project Co and the Board of any outstanding matters which are required to be attended to before the Outstanding Works (other than the Outstanding Works Exclusions), Drainage Works, Void Detection Works or Heater Battery Works (as the case may be) can be considered to be complete. Project Co shall attend to such matters.

6.1E Any:

(a) failure by the Independent Tester to comply with Clauses 6.1C or 6.1D above, or to certify or issue a certificate in respect of the Post Completion Works pursuant to Clause 3.3.2 or Outstanding Works pursuant to Clause 3.3.4;

(b) assertion by the Independent Tester pursuant to Clause 6.1D that the relevant Post Completion Works Completion Criteria or Outstanding Works Completion Criteria has not been met;

shall be deemed to be confirmation that the Independent Tester does not agree that the relevant Post Completion Works Completion Criteria or Outstanding Works Completion Criteria has been met, and such dispute shall be capable of reference by Project Co to the Dispute Resolution Procedure.

6.2 The Parties agree that all such supplements and amendments as set out in this SA1:

6.2.1 shall, in the event of any inconsistency with the provisions of the Project Agreement or other document referred to in Part 1 of the Schedule (Technical Schedule) and/or Parts A and B of Part 5 of the Schedule (Post Completion Works), take precedence over the Project Agreement or other such document; and

6.2.2 shall be deemed to have been agreed in accordance with the Project Agreement, and that the entry into of this SA1 shall not constitute a breach by either Party of the Project Agreement.

6.3 Project Co shall carry out its obligations pursuant to the Project Agreement as supplemented and amended by this SA1.

6.4 The Parties agree that the design of:

6.4.1 the works set out in Part 1 of the Schedule (Technical Schedule);

6.4.2 the works set out in Parts A and B of Part 5 of the Schedule (Post Completion Works);

6.4.3 the Outstanding Works; and

6.4.4 the CCTV Works;

shall be deemed to have been submitted and reviewed in accordance with Clause 12 (The Design Construction and Commissioning Process) of the Project Agreement and that the Board has confirmed that Project Co is entitled to proceed with construction. Any such design shall be deemed to be an Approved RDD Item. Notwithstanding Clause 12 (The Design Construction and Commissioning Process) of the Project Agreement, such design shall not need to be submitted to the Board for review under Schedule Part 8 (Review Procedure) of the Project Agreement.

6.5 In relation to the Agreed Resolution and the Post Completion Works Agreed Resolution, the Board shall not be entitled to make a finding pursuant to Clause 12.7 (Rectification of Project Co's Proposals) of the Project Agreement that Project Co's Proposals do not fulfil the Board's Construction Requirements to the extent that Project Co's Proposals have been amended or supplemented pursuant to this SA1.

6.6 The Parties agree that the Joint Completion Programme:

6.6.1 is the revised Programme for the purposes of the Project Agreement (as revised pursuant to this SA1);

6.6.2 meets the requirements of, and have been agreed in accordance with, Clause 14 (Programme and Dates for Completion) of the Project Agreement; and

6.6.3 notwithstanding Clause 14 (Programme and Dates for Completion) of the Project Agreement, does not need to be submitted to the Board for review under Schedule Part 8 (Review Procedure) of the Project Agreement.

6.7 The Parties agree that the Joint Completion Programme:

6.7.1 is the revised Final Commissioning Programme for the purposes of the Project Agreement (as revised pursuant to this SA1);

6.7.2 meets the requirements of, and have been agreed in accordance with, Clause 17 (Programme and Dates for Completion) of the Project Agreement; and

6.7.3 notwithstanding Clause 17 (Programme and Dates for Completion) of the Project Agreement, does not need to be submitted to the Board for review under Schedule Part 8 (Review Procedure) of the Project Agreement.

6.8 Project Co shall issue the Joint Completion Programme to the Independent Tester on or about the SA1 Effective Date failing which the Board shall be entitled to do so.

6.9 Save as amended and supplemented in accordance with this SA1, the Project Agreement shall continue in full force and effect.

6.9A For the avoidance of doubt, Project Co shall act as "client" and Project Co shall procure that the Contractor shall act as "principal contractor" and "principal designer" for the purposes of the CDM Regulations for the works which form part of the Post Completion Works or Outstanding Works or works which are included in the Joint Completion Programme until completion of the Post Completion Works and the Outstanding Works. Unless and / or until the Post Completion Works Longstop Date, no works additional to those specified in the Joint Completion Programme shall be undertaken by the Board at the Site prior to completion of the Post Completion Works without the prior consent of Project Co (which consent shall not be unreasonably withheld). Unless and / or until the Post Completion Works Longstop Date, no agents, contractors or sub-contractors of any tier of the Board shall access the Site prior to completion of the Post Completion Works without the prior consent of Project Co (which consent shall not be unreasonably withheld).

6.10 Project Co shall procure that the Project insurances which Project Co is obliged to procure pursuant to Clause 53 (Insurance) of the Project Agreement shall apply equally to the works which form part of the Agreed Resolution, the Post Completion Works and the Outstanding Works.

Post Completion Works and Outstanding Works

6.11 Project Co shall design, construct, test, commission and complete the Post Completion Works as follows:-

Milestone 2 by Milestone 2 Target Completion Date;

Milestone 3 by Milestone 3 Target Completion Date; and

Milestone 4 by Milestone 4 Target Completion Date;

all in accordance with the Project Agreement as amended by this SA1 and the Post Completion Works Agreed Resolution so as to satisfy the Post Completion Works Completion Criteria and all other terms of the Project Agreement (as revised pursuant to this SA1) and this SA1.

6.12 For the avoidance of doubt:

6.12.1 completion of the Post Completion Works and the Outstanding Works shall not be a requirement for the issue of a Certificate of Practical Completion by the Independent Tester pursuant to Clause 17.12 (Completion Certificate) of the Project Agreement or the occurrence of the Actual Completion Date, and the Certificate of Practical Completion shall be issued notwithstanding the dispute between the Parties regarding the Concrete Specification, De-Watering, Geotechnical Reports, Submains Schedule and the Energy Centre Lighting Calcs;

6.12.2 the Independent Tester shall certify the relevant works comprising:

(a) Milestone 2, Milestone 3 and/ or Milestone 4 as the case may be each in accordance with Clause 3.3.2; and

(b) the Outstanding Works in accordance with Clause 3.3.4;

and in accordance with Schedule Part 9 (Independent Tester Varied Services Letter)the Independent Tester shall issue the Certificate of Practical Completion in accordance with Clause 3.3.1;

6.12.3 the Post Completion Works and the Outstanding Works form part of the Facilities; and

6.12.4 the provisions of Clause 29 (Delay Events) and Clause 30 (Relief Events) of the Project Agreement shall apply mutatis mutandis to the Post Completion Works and Outstanding Works, provided that the Milestone 2 Target Completion Date and/or Milestone 3 Target Completion Date and/or Milestone 4 Target Completion Date and/ or the Outstanding Works Target Completion Date (as applicable) and/ or, in respect of the Post Completion Works only, the Post Completion Works Longstop Date (rather than the Completion Date) shall be revised in such circumstances.

6.13A The Board shall comply with any obligations it has pursuant to Parts A and B of Part 5 of the Schedule (Post Completion Works).

6.13 The Board and Project Co agree that the Post Completion Works Agreed Resolution:

6.13.1 resolves the Dispute between the Board and Project Co in respect of the Post Completion Disputed Works;

6.13.2 for the avoidance of doubt, is a variation to the Works as varied, amended or supplemented in accordance with this SA1; and

6.13.3 shall not dilute Project Co's obligation to continue to comply with all relevant obligations relative to the Project Operations pursuant to the Project Agreement (as revised pursuant to this SA1), including for the avoidance of doubt Clause 12.3 (Design responsibility) of the Project Agreement, Snagging Matters, Defects, obligations under Schedule Part 31 of the Project Agreement and/or any other obligations of Project Co relative to the Project Operations in respect of the Project Agreement (as revised pursuant to this SA1).

6.14 Project Co shall carry out and complete the Outstanding Works by the Outstanding Works Target Completion Date all in accordance with the Project Agreement as amended by Schedule Part 6 (Outstanding Works), the Outstanding Works Completion Criteria and all other terms of the Project Agreement (as revised pursuant to this SA1) and this SA1.

6.14A Without prejudice to Project Co's rights in respect of Future Claims, Clause 3.9.5 (Settlement and Release), Clause 3.9.6 (Settlement and Release), Clause 3.9.7 (Settlement and Release), Clause 4 (Payment) and/or Clause 6.17, Project Co waives any and all actions, claims, liabilities, rights, demands, set-offs and counterclaims to additional payment (including without limitation any adjustment to the Annual Service Payment and/or a Monthly Service Payment and/ or Capital Expenditure) and/ or any extension of time to the Completion Date arising out of or in any way connected with the Post Completion Works Agreed Resolution or the Outstanding Works.

6.15 Project Co shall not be obliged to provide any Services to any part of the Facilities directly affected by the carrying out of the Drainage Works providing that such relief shall only apply from the Actual Completion Date until the Milestone 2 Completion Date. The Parties shall agree a process for access to areas of the Facilities in accordance with the Joint Completion Programme where Post Completion Works and/ or Outstanding Works require to be undertaken.

6.16 No Deduction shall apply and the Board shall not issue a Warning Notice or exercise a right of termination pursuant to Clause 40.1.8 (Deductions) or Clause 40.1.9 (Warning Notices) of the Project Agreement where such Deduction, Warning Notice or right of termination arises solely as a result of the carrying out of the relevant Post Completion Works or Outstanding Works providing that such relief shall only apply from the Actual Completion Date until the Milestone 2 Target Completion Date (in respect of the Drainage Works) and / or Milestone 3 Target Completion Date (in respect of the Void Detection Works) and / or Milestone 4 Target Completion Date (in respect of the Heater Battery Works) and/ or the Outstanding Works Target Completion Date (in respect of the Outstanding Works).

6.17 From the Actual Completion Date until the Milestone 2 Completion Date, Milestone 3 Completion Date, Milestone 4 Completion Date and completion of the Outstanding Works (as applicable); or (if earlier) the Post Completion Works Longstop Date, where there is any joint occupation of the Facilities, the Board shall not, and shall procure that any Board Parties shall not, prevent or impede Project Co or any Project Co Party carrying out the Post Completion Works and Outstanding

Works, except where such prevention or impediment is necessary as a result of an act, omission, breach or default by Project Co or any Project Co Party which entitles the Board to take any action pursuant to the Project Agreement (as amended by this SA1). Where such prevention or impediment occurs, Project Co shall be entitled to claim a Delay Event pursuant to Clause 29.3.2 (Delay Events) of the Project Agreement and a Compensation Event in accordance with Clause 29 (Delay Events) of the Project Agreement provided that the Milestone 2 Target Completion Date and / or Milestone 3 Target Completion Date and / or Milestone 4 Target Completion Date and / or the Outstanding Works Target Completion Date (as applicable) and, in respect of the Post Completion Works only, the Post Completion Works Longstop Date (rather than the Completion Date) shall be revised in such circumstances.

6.18 From the Actual Completion Date until Milestone 2 Completion Date, Milestone 3 Completion Date, Milestone 4 Completion Date and completion of the Outstanding Works (as applicable), where there is any period of joint occupation of the Facilities, Project Co and Project Co Parties shall not prevent or impede the Board carrying out the Board's Post Completion Commissioning. Where Project Co or a Project Co Party prevents the Board from carrying out key elements of the Board's Post Completion Commissioning on the dates specified in the Joint Completion Programme, Project Co shall indemnify the Board against all reasonable and properly incurred Direct Losses sustained by the Board as a result of such prevention.

6.19 Subject to the terms of this SA1, any and all rights and entitlements of the Board, the Board's Representative and the Independent Tester and the obligations of Project Co that apply to the Works, prior to the Actual Completion Date, shall continue to apply in respect of the Post Completion Works and the Outstanding Works until the Milestone 2 Completion Date, Milestone 3 Completion Date, Milestone 4 Completion Date and completion of the Outstanding Works (as applicable).

6.20 **Project Co Changes**

Notwithstanding the express terms of the Board's acceptance of the Project Co Change acceptances provided to Project Co prior to the SA1 Effective Date, the Parties agree that such Project Co Changes are: (1) approved by Board pursuant to Section 5 of Schedule Part 16 of the Project Agreement (Change Protocol); and (2) accepted by Board as an Approved RDD Item in accordance with Schedule Part 8 of the Project Agreement (Review Procedure). The Board's right to make a Future Claim in relation to any such Project Co Change is however wholly reserved.

6.21 **Water Testing**

6.21.1 As per the requirements of SHTM 04-01 and L8, Project Co shall undertake a full suite of water analysis for all relevant water systems including storage tanks, domestic water, mains water, hot and cold water, and category 5 water systems in full compliance with SHTM04-01, and using the methodology of water testing undertaken by Project Co in January 2019, including any further points agreed with the Board. The foregoing tests shall be undertaken by Project Co on or before 27 February 2019 ("Water Tests").

6.21.2 The indicative results of the Water Tests shall be made available to the Board by Project Co on or before 5 March 2019. The complete results of the Water Tests shall be made available to the Board by Project Co on or before 8 March 2019.

6.21.3 If the Water Tests results identify any non-compliance with SHTM 04-01, or give reasonable cause for concern by the IT that a future non-compliance may occur, Project Co undertake to address said non-compliance and / or potential non compliance as a matter of urgency in accordance with Project Co's obligations pursuant to the Project Agreement (as amended by this SA1), taking account of any submissions from the Board's Representative.

6.22 **L8 risk assessment**

6.22.1 In accordance with SHTM 04-01, Project Co shall provide a suitable and sufficient water safety management risk assessment to the Board's Representative for review under Schedule Part 8 (Review Procedure) by 11 March 2019.

6.23 **L8 water management regime**

6.23.1 In accordance with SHTM 04-01, Project Co shall provide a suitable and sufficient water safety management regime, specifying the water safety management regime applicable to the following periods of the Operational Term:-

(a) The commissioning period – 22 February 2019 - 5 July 2019; and

(b) The period following full occupation of the Facilities by patients and staff – 5 July 2019 onwards,

to the Board's Representative for review under Schedule Part 8 (Review Procedure) by 11 March 2019.

6.24 Project Co shall include in the water safety management regime a flushing regime during the Board's commissioning period which ensures there are no Little Used Water Outlets on the system.

7. **AMENDMENTS TO OTHER PROJECT DOCUMENTS**

7.1 The Board acknowledges and consents (for all purposes of the Project Agreement (as revised pursuant to this SA1)) to Project Co entering into the Construction Contract Supplemental Agreement and the Performance Guarantee side letter in connection with this SA1 and confirms that Project Co entering into the Construction Contract Supplemental Agreement and Performance Guarantee side letter shall not constitute a breach of Project Co's obligations under the Project Agreement (as revised pursuant to this SA1). Project Co has provided the Board with copies of such supplemental agreement and side letter for their review prior to the SA1 Effective Date. The Board confirms that, notwithstanding the provisions of Clause 4.1 of the Project Agreement, such supplemental agreement and side letter do not need to be submitted to the Board for review under Schedule Part 8 (Review Procedure) of the Project Agreement.

7.2 The Board acknowledges and consents (for all purposes of the Project Agreement (as revised pursuant to this SA1)) to Project Co entering into agreements which are supplemental to the Funding Agreements and new Funding Agreements in connection with this SA1 and confirms that Project Co entering into such supplemental agreements and new Funding Agreements shall not constitute a breach of Project Co's obligations under the Project Agreement (as revised pursuant to this SA1). Project Co has provided the Board with copies of such supplemental agreements and new Funding Agreements for their review prior to the SA1 Effective Date. The Board confirms that, notwithstanding the provisions of Clause 4.6 of the Project Agreement, such supplemental agreements and new Funding Agreements do not need to be submitted to the Board for review not less than ten Business Days before signature of the relevant agreement.

7.3 Without prejudice to the generality of Clauses 7 and 7.2, the Board:

7.3.1 consents for the purposes of Clause 4.1 (Ancillary Documents) of the Project Agreement to making and agreeing material variations to any Ancillary Document, departing from its obligations (or waiving or allowing to lapse any rights it may have) or procuring that others depart from their obligations (or waiving or allowing to lapse any rights they may have) under any Ancillary Documents, and entering into (or permitting the entry into by any other person of) agreements replacing all or part of any Ancillary Document;

7.3.2 consents for the purposes of Clause 4.3 (Ancillary Documents) of the Project Agreement, to amendments of the Funding Agreements and Ancillary Documents which shall have the effect of increasing the Board's liabilities on early termination of the Project Agreement (as revised pursuant to this SA1), and the Board agrees that such documents, and any new Funding Agreements entered into in anticipation of this SA1, shall be deemed to be Subordinated Funding Agreements for the purposes of the Project Agreement (as revised pursuant to this SA1);

7.3.3 consents for the purposes of Clause 4.4 (Ancillary Documents) of the Project Agreement, to the variation, amendment, replacement and entry into of new Funding Agreements;

7.3.4 agrees for the purposes of Paragraph 8 of Schedule Part 23 (Refinancing) of the Project Agreement that it has been notified by Project Co of a Notifiable Financing, and waives any right it may have pursuant to Schedule Part 23 (Refinancing) of the Project Agreement in respect of such Notifiable Financing.

7.4 Based on the cashflows provided to the Board by Project Co on 12 January 2019:

7.4.1 Project Co warrants that the amendments and variations of the Funding Agreements entered into in anticipation of this SA1 shall not constitute a Refinancing and shall not result in a Refinancing Gain; and

7.4.2 the Board agrees that the amendments and variations of the Funding Agreements entered into in anticipation of this SA1 shall not result in a breach of Schedule Part 23 (Refinancing) of the Project Agreement.

7.5 Without prejudice to the terms of Clause 37 of the Project Agreement, both parties acknowledge that the Financial Model will require to be amended to reflect this SA1, the amendments to the Ancillary Documents and the amendments to the Funding Agreements ("**SA1 Financial Model Amendments**") and both parties undertake to work collaboratively and in good faith to reach agreement as soon as is reasonably practicable on the necessary SA1 Financial Model Amendments.

8. JOINT STEERING GROUP

8.1 The Parties and the Contractor shall establish a joint steering group to provide executive management and guidance over the key deliverables of the completion of the Works and the commissioning of the Facilities until completion of the Post Completion Works. The members of the joint steering group will meet at least once per month (or more or less regularly as required) to review progress against the Programme and the Joint Commissioning Programme set out in this SA1 and assist in resolving any matters which have become an issue or blockage in achieving the deliverables.

8.2 The initial members of the joint steering group shall be:

8.2.1 the Board: Jim Crombie and Susan Goldsmith;

8.2.2 Project Co: Richard Osborne, Tony Rose and/or Stephen Gordon; and

8.2.3 Contractor: Callum Tuckett and Ben Keenan.

8.3 Matt Templeton of Project Co will chair the joint steering group and will also be a member. No meeting shall proceed unless at least one member for the Board, one member for Project Co and one member of the Contractor is in attendance and in the case of Project Co, no more than two members shall attend any meeting. The Parties and the Contractor may remove their members and appoint replacements, by written notice delivered to the other Party at any time and in the case of the Contractor, Project Co shall or shall procure that the Board receives written notice. A member on the joint steering group may appoint and remove an alternate (who may be another representative of the applicable Party or the Contractor, as applicable) by written notice to all other members.

8.4 The joint steering group may adopt such procedures and practices for the conduct of the activities of the joint steering group as they consider appropriate, from time to time, provided that:

8.4.1 only decisions that are made unanimously by all of the members present at meetings shall have any effect;

8.4.2 the quorum for a meeting of the joint steering committee shall be two members comprising one member from each of the Board and Project Co.

8.5 Accurate written minutes of all quorate meetings of the joint steering group, which are approved by all members attending the applicable meeting shall be taken and kept by the joint steering group chair, and copies circulated promptly to the Parties. A full set of accurate and agreed written minutes shall be kept by Project Co and shall be open to inspection by the Parties and the Contractor at any time, upon request.

8.6 Neither the Board nor Project Co shall rely on any act or omission of the joint steering group nor any members acting in that capacity, so as to give rise to any waiver or personal bar in respect of any right, benefit, or claim and/or obligation and/or liability of any Party. Project Co shall ensure that the Contractor shall not rely on any act of omission of the joint steering group nor any members acting in that capacity, so as to give rise to any waiver or personal bar in respect of any right, benefit, or claim and/or obligation and/or liability of the Contractor.

9. CONTRACTS (THIRD PARTY RIGHTS) (SCOTLAND) ACT 2017

This SA1 does not create any rights in favour of third parties under the Contracts (Third Party Rights) (Scotland) Act 2017 to enforce or otherwise invoke any provision of this SA1.

10. VARIATION

Any variation of this SA1 shall be in writing and signed by or on behalf of each Party.

11. NON-REPETITION OF CLAIMS

Each Party withdraws all allegations and claims made by it in the Dispute or otherwise in any way related to the subject matter thereof against the other Party and undertakes not to repeat, or authorise the publication or repetition, of the same or any similar allegations or claims.

12. CONFIDENTIALITY

12.1 The fact, existence and terms of this SA1 and the negotiations which led to it are to remain confidential between the Parties save that they may be disclosed as follows:

12.1.1 the Board may make this SA1 freely available to the public (which may include, without limitation, publication on the Board's website pursuant to Clause 61.1. of the Project Agreement, but subject to the restrictions in Clause 61.2 of the Project Agreement which will apply *mutatis mutandis* to this SA1), and Project Co acknowledges and agrees that, subject to the exclusion of information referred to in Clause 61.2.2 of the Project Agreement, the provision or publication of this SA1 shall not give rise to any liability under the terms of this SA1 or the Project Agreement or otherwise. The Board shall notify Project Co in writing not less than ten (10) Business Days prior to any intended provision or publication of information pursuant to this Clause 12.1.1;

12.1.2 the parties agree that the provisions of this SA1, and the Construction Contract Supplemental Agreement which amends any Ancillary Document shall, subject to Clause 61.2.2 of the Project Agreement, not be treated as Confidential Information and may be disclosed without restriction and Project Co acknowledges that the Board shall, subject to Clause 61.2.2 of the Project Agreement be entitled to make this SA1 and the Construction Contract Supplemental Agreement which amends any Ancillary Document available in the public domain;

12.1.3 the Parties shall keep confidential all Confidential Information received by one party from the other party relating to this SA1 and the Construction Contract Supplemental Agreement which amends any Ancillary Document or the Project and shall use all reasonable endeavours to prevent their employees and agents from making any disclosure to any person of any such Confidential Information.

Permitted Disclosure

12.2 Clause 12.1.3 shall not apply to:

12.2.1 any disclosure of information that is reasonably required by any person engaged in the performance of their obligations under this SA1 for the performance of those obligations;

12.2.2 any matter which a party can demonstrate is already or becomes generally available and in the public domain otherwise than as a result of a breach of this Clause 12 and/or Clause 61 of the Project Agreement;

12.2.3 any disclosure to enable a determination to be made under the Dispute Resolution Procedure or in connection with a dispute between Project Co and any of its subcontractors;

12.2.4 any disclosure which is required pursuant to any Law or Parliamentary obligation placed upon the party making the disclosure or the rules of any stock exchange or governmental or regulatory authority having the force of law or, if not having the force of law, compliance with which is in accordance with the general practice of persons subject to the stock exchange or governmental or regulatory authority concerned;

12.2.5 any disclosure of information which is already lawfully in the possession of the receiving party, prior to its disclosure by the disclosing party;

12.2.6 any provision of information to the Parties' own professional advisers or insurance advisers or to the Senior Funders or the Senior Funders' professional advisers or insurance advisers or, where it is proposed that a person should or may provide funds (whether directly or indirectly and whether by loan, equity participation or otherwise) to Project Co to enable it to carry out its obligations under this SA1, or may wish to acquire shares in Project Co and/or Hold Co, Top Co and/or Mac Co in accordance with the provisions of this SA1 to that person or their respective professional advisers but only to the extent reasonably necessary to enable a decision to be taken on the proposal;

12.2.7 any disclosure by the Board of information relating to the design, construction, operation and maintenance of the Project and such other information as may be reasonably required for the purpose of conducting a due diligence exercise, to any proposed new contractor, its advisers and lenders, should the Board decide to retender the Project Agreement; or

12.2.8 any registration or recording of the Consents and property registration required;

12.2.9 any disclosure of information by the Board to any other department, office or agency of the Government or their respective advisers or to the Scottish Futures Trust or to any person engaged in providing services to the Board for any purpose related to or ancillary to this SA1;

12.2.10 any disclosure for the purpose of:

(a) the examination and certification of the Board's or Project Co's accounts;

(b) any examination pursuant to section 6(1) of the National Audit Act 1983 of the economy, efficiency and effectiveness with which the Board has used its resources;

(c) complying with a proper request from either party's insurance adviser, or insurer on placing or renewing any insurance policies; or

(d) (without prejudice to the generality of Clause 12.2.4) compliance with the FOI(S)A and/or the Environmental Information (Scotland) Regulations;

12.2.11 disclosure pursuant to Clause 61.1 of the Project Agreement or Clause 12.1 of this SA1; or

12.2.12 disclosure to the extent required pursuant to Clause 63.2 of the Project Agreement;

provided that, to avoid doubt, neither Clause 12.2.10(d) nor Clause 12.2.4 shall permit disclosure of Confidential Information otherwise prohibited by Clause 61.2.3 of the Project Agreement or Clause 12.1.3 of this SA1 where that information is exempt from disclosure under section 36 of the FOI(S)A.

12.3 Where disclosure is permitted under Clause 12.2, other than under Clauses 12.2.2, 12.2.4, 12.2.5, 12.2.8 and 12.2.10, the party providing the information shall procure that the recipient of the information shall be subject to the same obligation of confidentiality as that contained in this SA1.

12.4 Project Co shall not make use of this SA1 or any information issued or provided by or on behalf of the Board in connection with this SA1 otherwise than for the purpose of this SA1, except with the written consent of the Board.

12.5 Where Project Co, in carrying out its obligations under this SA1, is provided with information relating to any Board Party, Project Co shall not disclose or make use of any such information otherwise than for the purpose for which it was provided, unless Project Co has obtained the prior written consent of that person and has obtained the prior written consent of the Board.

12.6 On or before the Expiry Date, Project Co shall ensure that all documents or computer records in its possession, custody or control, which contain information relating to any patient or Board Party including any documents in the possession, custody or control of a Sub-Contractor, are delivered up to the Board.

12.7 The parties acknowledge that Audit Scotland has the right to publish details of this SA1 (including Commercially Sensitive Information) in its relevant reports to Parliament.

12.8 The provisions of this Clause 12 *(Confidentiality)* are without prejudice to the application of the Official Secrets Acts 1911 to 1989.

Announcements

12.9 Unless otherwise required by any Law or any regulatory or governmental authority (but only to that extent), neither Party shall make or permit or procure to be made any public announcement or disclosure (whether for publication in the press, the radio, television screen or any other medium) of any Confidential Information or in the case of Project Co of its (or any Project Co Party's) interest in the Project or, in any such case, any matters relating thereto, without the prior written consent of the other party (which shall not be unreasonably withheld or delayed).

13. NOT USED

14. ENTIRE AGREEMENT

14.1 Except where expressly provided otherwise in this SA1, this SA1 constitutes the entire agreement between the Parties in connection with its subject matter and supersedes all prior representations, communications, negotiations and understandings concerning the subject matter of this SA1.

14.2 Each of the Parties acknowledges that:

14.2.1 it does not enter into this SA1 on the basis of and does not rely, and has not relied, upon any statement or representation (whether negligent or innocent) or warranty or other provision (in any case whether oral, written, express or implied) made or agreed to by any person (whether a party to this SA1 or not) except those expressly repeated or referred to in this SA1 and the only remedy or remedies available in respect of any misrepresentation or untrue statement made to it shall be any remedy available under this SA1; and

14.2.2 this Clause shall not apply to any statement, representation or warranty made fraudulently, or to any provision of this SA1 which was induced by fraud, for which the remedies available shall be all those available under the law governing this SA1.

15. **COUNTERPARTS AND DELIVERY**

15.1 This SA1 may be executed in any number of counterparts and by each of the Parties on separate counterparts.

15.2 Where executed in counterparts:

15.2.1 this SA1 shall not take effect until both of the counterparts have been delivered; and

15.2.2 delivery will take place when the date of delivery is agreed between the Parties after execution of this SA1

15.3 Where not executed in counterparts, this SA1 shall become effective on the date agreed between the Parties.

16. **ASSIGNATION OF AGREEMENT**

16.1 This SA1 shall be binding on, and shall enure to the benefit of, Project Co (and, for the avoidance of doubt, any Suitable Substitute Contractor (if applicable)) and the Board and their respective statutory successors and permitted transferees and assignees. In the case of the Board, its successors shall include any person to whom the Scottish Ministers, in exercising their statutory powers to transfer property, rights and liabilities of the Board upon the Board ceasing to exist, transfers the property, rights and obligations of the Board under this SA1 and/or the Project Agreement (as revised pursuant to this SA1) and such other agreements in connection with the Project to which the Board and Project Co are both a party.

16.2 Project Co shall not, without the prior written consent of the Board, assign, novate, transfer, sub-contract or otherwise dispose of any interest in this SA1, and any other contract entered into by Project Co for the purposes of performing its obligations under or arising out of this SA1. To avoid doubt:

16.2.1 the Board agrees that Project Co shall be entitled to enter into the Construction Contract Supplemental Agreement and other contracts entered into by Project Co for the purposes of performing its obligations under or arising out of this SA1 on or around the SA1 Effective Date; and

16.2.2 the provisions of this Clause 16.2 do not apply to the grant of any security for any loan made to Project Co under the Initial Funding Agreements which grant was approved by the Board pursuant to clause 57.3.1 of the Project Agreement at Financial Close.

16.3 The Board shall be entitled to assign, transfer or dispose of the whole of this SA1 and/or of any agreement entered into in connection with this SA1 to which the Board and Project Co are both party to:

16.3.1 the Scottish Ministers, another Health Board or any other person or body replacing any of the foregoing (or to whom the Scottish Ministers exercising their statutory rights would be entitled to transfer such benefits) covered by the National Health Service (Residual Liabilities) Act 1996; or

16.3.2 any other person or body to whom the Project Agreement (as revised pursuant to this SA1) is being or has been assigned, transferred or disposed in accordance with Clause 57.4 of the Project Agreement; or

16.3.3 any other person or body with the prior written consent of Project Co (not to be unreasonably withheld or delayed);

provided that nothing in this Clause shall restrict the rights of the Scottish Ministers to effect a statutory transfer.

IN WITNESS WHEREOF these presents typewritten on this and the preceding 24 pages together with the Schedule in 10 Parts are executed by the Parties hereto as follows:

SIGNED for and on behalf of

SCHEDULE 1

PART 1

TECHNICAL SCHEDULE

Item	Dispute	Description of Agreed Resolution
1	**Lighting in fire fighting stairwells** The Board believes Project Co have designated_the 7 fire fighting shafts / stairwells for Emergency Evacuation as well as Fire Fighting. The Board believes this is confirmed in Project Co's Fire Strategy and MPX-RFI-002374. From a Fire Fighting perspective, the Board believes that as well as providing lighting for emergency evacuation, lighting is also required for life safety and fire fighting applications in accordance with BS 7671 and BS 5819. Project Co have not provided this lighting. Project Co's position is that the design and installation of the emergency lighting within the 7 fire fighting shaft / stairwells meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	For the lighting-lux levels in fire-fighting stairwells, Project Co have advised the Non-domestic Technical Handbook, clause 2.B.4 Escape lighting is the most appropriate guidance, and the Board agreed to proceed on that basis. Project Co are therefore required to procure approval to their lighting lux level proposal -in the 7 fire fighting shafts/stairwells from the Building Control Officer and the Independent Tester and Project Co will address any compliance requirements from Building Control Officer and the Independent Tester in accordance with the Project Agreement. Project Co are also required to procure approval from Building Control and the Independent Tester for any tests necessary for all stairwells to comply with the Non-domestic Technical Handbook, clause 2.B.4 Escape lighting. The testing information is as set out in Disputed Works Schedule Appendix 1 Item 4. The carrying out of such tests shall be witnessed by and all test results shall be shared with the Building Control Officer and the Independent Tester and the Board, and Project Co will address any compliance requirements from Building Control Officer and the Independent Tester (in accordance with the Project Agreement) arising from the testing.
2	**Non Fire rated IPS / UPS cabling** For compliance with BS 7671 and Guidance Note 7, and also BS 8519 circuits associated with essential life-support services should be either fire-rated or fire-protected. The implication of this is, in the event of a fire, power may be lost to essential life safety medical equipment in critical areas. The Board believes that Project Co has installed non fire rated cables to UPS boards serving critical areas. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). For the avoidance of doubt, this Dispute only relates to the fire	The agreed resolution of the Dispute submitted by Project Co through the Schedule Part 8 (Review Procedure) and agreed by the Board is set out below and has been given status Level A or Level B. Following a collaborative review of the design between the Board and Project Co, Project Co made changes to 11 Number sub mains cables from UPS switchboard to UPS distribution boards changing these to fire rated. The remaining UPS submains cables from UPS output board in the basement to the UPS distribution board were agreed by the Board and Project Co to be left unaltered. All as noted within Aconex chain of correspondence MPX-Transmit-010735 as set out in Disputed Works Schedule Appendix 1 Item 2. WW-SZ-B1-PL-531-101 Rev 1 UPS 1 Cable Route RDD Status A (13/4/18) WW-SZ-B1-PL-531-102 Rev 1 UPS 2 Cable Route RDD Status B (13/4/18) WW-SZ-B1-PL-531-103 Rev 1 UPS 3 Cable Route RDD Status B (13/4/18)

Item	Dispute	Description of Agreed Resolution
	rated cables serving the UPS output board in the basement to the UPS distribution board. All other IPS / UPS cabling is excluded from this Dispute. Each party disagrees with the other party's position and therefore a dispute has arisen.	WW-SZ-B1-PL-531-104 Rev 1 UPS 4 Cable Route RDD Status A (13/4/18) WW-SZ-B1-PL-531-105 Rev 1 UPS 5 Cable Route RDD Status B (13/4/18) WW-SZ-B1-PL-531-106 Rev 1 UPS 6 Cable Route RDD Status B (13/4/18) WW-SZ-B1-PL-531-107 Rev 1 UPS 7 Cable Route RDD Status A (13/4/18) WW-SZ-B1-PL-531-108 Rev 1 UPS 8 Cable Route RDD Status B (13/4/18) WW-SZ-B1-PL-531-109 Rev 1 Helipad Cable Route RDD Status A (13/4/18) WW-SZ-B1-PL-531-112 Rev 1 UPS 12 Cable Route RDD Status B (13/4/18) WW-SZ-B1-PL-531-114 Rev 1 UPS 14 Cable Route RDD Status A (13/4/18) WW-XX-XX-DC-XXX-010 Rev 3 IPS / UPS Cable Alternative RDD Status B (13/4/18) WW-XX-XX-SC-539-001 Rev G UPS System Schematic RDD Status A (13/4/18).
3	**No earth bonding in certain required areas** The Board's position is that no equipotential bonding has been installed in 180 Group 1&2 rooms. Equipotential bonding is required to prevent electric shock to patients, staff and visitors. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	In accordance with Schedule Part 8 (Review Procedure) the Room by Room Risk Profile as set out in Disputed Works Schedule Appendix 1 Item 3 produced by Project Co has been given status Level B, and the correct grouping and categorisation has been applied to the original 144 rooms mentioned in the description. In accordance with Schedule Part 8 (Review Procedure), the Board / Project Co agreed that a further 36 rooms will be modified. 35 to Group 1 Category 2, and 1 No Group 1 Category 3 in relation to providing equipotential bonding. Aconex MPX-TRANSMIT-010801 as set out in Disputed Works Schedule Appendix 1 Item 3 contains the Room by Room Risk Profile document at rev F and WW-SZ-SL-SH-500-011 Rev F Room by Room Risk Profile Reviewable Design Data Status B (4/5/18). Project Co to ensure all rooms are correctly categorised and grouped per SHTM 06-01 and BS 7671 Table 9.1 of Guidance Note 7. Exclusions are as set out in Disputed Works Schedule Appendix 1 Item 3.

Item	Dispute	Description of Agreed Resolution
4	**Bedroom ventilation pressure regime and air change rate in rooms for neutropenic patients** The Board's position is that the rooms for neutropenic patients should be designed as isolation rooms (+10 positive pressure). However, there are 12_single rooms which Project Co have designed to balanced pressure. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The design and construction solution for 12_single bed rooms within the Haematology and Oncology Department has been approved through Schedule Part 8 (Review Procedure) and agreed by Project Co and the Board as resolving the Dispute, as set out in Disputed Works Schedule Appendix 1 Item 4. For clarity it is confirmed that the balanced pressure solution agreed is in accordance with the schedules reproduced in Section 1 of Disputed Works Schedule Appendix 1 Item 4 (Formally Project Co Change 050) – Neutropenic Patients Ventilation
5	**25% spare capacity** The Board's position is that 25% spare capacity should be provided by Project Co in terms of main and sub main distribution containment, UPS boards, AHU, physical space in voids and ceilings, risers. The Board are of the opinion that it is apparent from Site visits that the spare capacity has not been provided. Project Co's position is that the design and installation meets the requirements of the Project Agreement, was based on the package approved through Schedule Part 8 (Review Procedure), and spare capacity had been allowed in compliance with the BCRs. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co have reviewed and commented upon the Spare Capacity Statement as set out in Disputed Works Schedule Appendix 1 Item 5. Medical Gas report dated 19 June 2018 as set out in Disputed Works Schedule Appendix 1 Item 5 was prepared by Project Co to respond to Board's comments. No adverse comments have been received from the Board in relation to this Report. The Board and Project Co have reached agreement on this matter all as recorded within Aconex MPX-GC-026751, NHSL-GC-003075 and MPX-GC-027180 as set out in Disputed Works Schedule Appendix 1 Item 5.

Item	Dispute	Description of Agreed Resolution
6	**HV distribution** In relation to system resilience, the Board believes Project Co's design for HV Distribution is non-compliant with the Board's Construction Requirements (BCR's), Project Co Proposal's (PCP's) and SHTM Guidance for the following elements; 1. Resilience of the HV main intake switch room, 2. HV cable distribution, 3. HV / LV substations. The Board believes the design currently creates single points of failure at the HV side of the electrical distribution network. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure), which was based on the Board's reference design. Each party disagrees with the other party's position and therefore a dispute has arisen.	The agreed resolution of the Dispute submitted by Project Co through the Schedule Part 8 (Review Procedure) and agreed by the Board, was for changes to be made to the switch panels within the energy centre to capture the generator panel as part of the ring. Fire protection has been applied to the fire hazard rooms. Drawings and schedules were updated and submitted through Schedule Part 8 (Review Procedure). Details of modifications to be carried out by Project Co are specified in the documents noted below. The Reviewable Design Data as set out below for this item has been given status Level A or Level B in accordance with Schedule Part 8 (Review Procedure). Gas suppression has been agreed to be provided within SS2A and SS2B. As set out within Aconex MPX-Transmit-010823 and MPX-GC-027179 as set out in Schedule Disputed Works Schedule Appendix 1 Item 6 and in the following drawings:- WW-XX-XX-SC-530-001 Rev I HV Distribution Schematic RDD Status B (11/5/18) WW-XX-XX-SC-530-102 Rev 1 Multiplex Alternative HV Room Configuration RDD Status A (11/5/18) WW-XX-XX-SC-530-103 Rev 1 Multiplex Alternative HV Ring Configuration RDD Status B (11/5/18) WW-XX-XX-SC-530-104 Rev 1 Multiplex Alternative HV Ring Configuration Protection System Schematic RDD Status B (11/5/18) WW-XX-XX-SC-530-105 Rev 1 Multiplex Alternative HV Ring Configuration Protection System Blocking Diagram RDD Status A (11/5/18) WW-XX-XX-SC-530-106 Rev 1 MV Cable Routing As Installed RDD Status A (11/5/18) WW-XX-XX-SC-530-107 Rev 1 G59 Connections RDD Status B (11/5/18) WW-XX-XX-SC-530-108 Rev 1 Generator System RDD Status B (15/5/18) WW-SZ-SL-SH-531-204 Rev 3 RHSC & DCN Gas Suppression Basement Substations RDD Status B.

Item	Dispute	Description of Agreed Resolution
7	**4 bed ventilation** In relation to ventilation pressure regimes, the Board believes Project Co's design for the 4 bed ventilation is non-compliant with the Board's Construction Requirements ("**BCRs**"), Project Co Proposal's ("**PCPs**"), SHTM Guidance, and also non-compliant with comments made by the Board on the Environmental Matrix in the Reviewable Design Data schedule at Financial Close, The Board also notes the Environmental Matrix was altered during Preferred Bidder to Financial Close period and was therefore not a direct copy of the reference design environmental matrix. In addition, the Board believe the intake air change rate and the extract air change rate are non-compliant. From a clinical perspective, the principal concern to the Board in continuing with Project Co's proposed pressure regime design means there is an unacceptable risk of the spread of bacterial airborne infections into corridors and surrounding patient rooms (positive to the corridor) The Board requires the pressure regime to be balanced or negative to the corridor. Project Co's position is that the design and installation meets the requirements of the Project Agreement, was based on the package approved through Schedule Part 8 (Review Procedure) which included the environmental matrix which had been discussed and was agreed pre Financial Close. The environmental matrix was a direct copy of the reference design environmental matrix developed during the preferred bidder period. No adverse comments were received prior to or at Financial Close. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Reviewable Design Data noted below for this item has been given status Level B in accordance Schedule Part 8 (Review Procedure). The resolution of the Dispute submitted by Project Co through the Schedule Part 8 (Review Procedure) and agreed by the Board, is for 14 No 4 bed rooms to be balanced or negative to the corridor at 4 ac/hr. The remaining 6No 4 bed wards remain as per the environmental matrix, WW-XX-XX-DC-XXX-001 Rev 11, and rev 07 of the schedule WW-SZ-XX-DC-XXX-010. All as noted within Aconex MM-GC-003999, & MPX-TRANSMIT-010869 as set out in Disputed Works Schedule Appendix 1 Item 7. All as noted on drawings:- WW-Z3-03-PL-524-001 Rev G Zone Z3 Level 03 Ventilation Distribution Sheet 1 of 2 RDD Status B (3/5/18) WW-Z4-00-PL-524-001 Rev K Zone Z4 Level 00 Ventilation Distribution Sheet 1 of 2 RDD Status B (3/5/18) WW-Z4-00-PL-524-002 Rev L Zone Z4 Level 00 Ventilation Distribution Sheet 2 of 2 RDD Status B (3/5/18) WW-Z4-01-PL-524-001 Rev J Zone Z4 Level 01 Ventilation Distribution Sheet 1 of 2 RDD Status B (3/5/18) WW-Z4-03-PL-524-001 Rev G Zone Z4 Level 03 Ventilation Distribution Sheet 1 of 2 RDD Status B (3/5/18) WW-Z4-03-PL-524-002 Rev G Zone Z4 Level 03 Ventilation Distribution Sheet 2 of 2 RDD Status B (3/5/18) WW-SZ-XX-DC-XXX-010 Rev 07 General Ward - Ventilation Amendments Proposal RDD Status B (31/5/18).

Item	Dispute	Description of Agreed Resolution
8	**Bedhead trunking earth bonding points** The Board's position is that all bedhead trunking installed in Group 2 Medical Locations is provided with only 2 supplementary equipotential bonding points. This is not in compliance with GN7, which requires minimum 4 for IPS sockets. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The Reviewable Design Data noted below for this item has been given status Level A or B in accordance with Schedule Part 8 (Review Procedure). The resolution to the Dispute agreed by the Board and Project Co required Project Co to provide a minimum 4 supplementary earthing points for medical IT sockets. All as noted within MPX-TRANSMIT-010733 & MPX-TRANSMIT-010714 as set out in Disputed Works Schedule Appendix 1 Item 8 All as per drawings:- WW-SZ-SL-SH-500-011 Rev F Room by Room Risk Profile RDD Status B (4/5/18) WW-Z3-00-PL-531-001 Rev M Zone Z3 Level 00 Small Power Layout Sheet 1 of 2 RDD Status B (13/4/18) WW-Z3-00-PL-531-002 Rev M Zone Z3 Level 00 Small Power Layout Sheet 2of 2 RDD Status B (13/4/18) WW-Z3-01-PL-531-001 Rev J Zone Z3 Level 01 Small Power Layout Sheet 1 of 2 RDD Status A (13/4/18) WW-Z3-01-PL-531-002 Rev P Zone Z3 Level 01 Small Power Layout Sheet 2 of 2 RDD Status B (13/4/18) WW-Z4-00-PL-531-002 Rev O Zone Z4 Level 00 Small Power Layout Sheet 2 of 2 RDD Status B (13/4/18) WW-Z4-01-PL-531-001 Rev K Zone Z4 Level 01 Small Power Layout Sheet 1 of 2 RDD Status A (13/4/18) WW-Z4-01-PL-531-002 Rev K Zone Z4 Level 01 Small Power Layout Sheet 2 of 2 RDD Status A (13/4/18) WW-Z4-03-PL-531-002 Rev I Zone Z4 Level 03 Small Power Layout Sheet 2 of 2 RDD Status A (13/4/18). Project Co to ensure (i) all rooms are correctly categorised and grouped as per SHTM 06-01 and BS 7671 Table 9.1 of Guidance Note 7; and (ii) all necessary associated works are completed.

Item	Dispute	Description of Agreed Resolution
9	**Lack of non IPS sockets in theatres** The Board's position is that all socket outlets within these departments except for Cleaners outlets and a limited number of "raw power" sockets in some areas, are Medical Equipment blue sockets. No provision has been made for equipment that should be plugged into an RCB protected outlet whilst in the patient zone. Also, no x ray sockets (dedicated socket). Project Co's position is the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The Reviewable Design Data as set out below for this item has been given status Level A or B in accordance with Schedule Part 8 (Review Procedure). Resolution of the Dispute agreed by the Board and Project Co includes provision for the equipment requiring to be plugged into RCB protected circuits. All as recorded within MPX-TRANSMIT-010733, MPX-TRANSMIT-010714 & MPX-GC-026898 as set out in Disputed Works Schedule Appendix 1 Item 9. All as per drawings:- WW-Z3-00-PL-531-001 Rev M Zone Z3 Level 00 Small Power Layout Sheet 1 of 2 RDD Status B (13/4/18) WW-Z3-00-PL-531-002 Rev M Zone Z3 Level 00 Small Power Layout Sheet 2 of 2 RDD Status B (13/4/18) WW-Z3-01-PL-531-001 Rev J Zone Z3 Level 01 Small Power Layout Sheet 1 of 2 RDD Status A (13/4/18) WW-Z3-01-PL-531-002 Rev P Zone Z3 Level 01 Small Power Layout Sheet 2 of 2 RDD Status B (13/4/18) WW-Z4-00-PL-531-002 Rev O Zone Z4 Level 00 Small Power Layout Sheet 2 of 2 RDD Status B (13/4/18) WW-Z4-01-PL-531-001 Rev K Zone Z4 Level 01 Small Power Layout Sheet 1 of 2 RDD Status A (13/4/18) WW-Z4-01-PL-531-002 Rev K Zone Z4 Level 01 Small Power Layout Sheet 2 of 2 RDD Status A (13/4/18) WW-Z4-03-PL-531-002 Rev I Zone Z4 Level 03 Small Power Layout Sheet 2 of 2 RDD Status A (13/4/18). Project Co to ensure (i) all rooms are correctly categorised and grouped as per SHTM 06-01 and BS 7671 Table 9.1 of Guidance Note 7; and (ii) all necessary associated works are completed.
10	**Drainage above IPS rooms / above IPS panels / Node Rooms** It is the Board's position that Project Co has installed drainage above exclusion zones, electrical equipment and other high risk locations except above MRI rooms where this has been completely removed.	The following rooms are where Project Co have installed drainage and water services above IPS rooms / IPS panel / electrical distribution services. The resolution for these examples have been identified and the resolution of the Dispute agreed by the Board and Project is outlined below: **Basement** 1 - Node room B-T1-001 Drainage will change to HDPE within the room and extend for at least a metre out with either wall.

Item	Dispute	Description of Agreed Resolution
	Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). For the avoidance of doubt this Dispute relates to the drainage in following areas only:- **Basement** 1 - Node room B-T1-001 2 - Node room B-T1-002 HDPE 3 - Switch cupboard B-S3-030 4 - UPS room **Ground floor** 5 - UPS room in basement to ground floor and connecting into CWST tank room stack. 6 -Drainage pipework through switch cupboard G-F1-095 7 - Drainage pipework in IPS room G-Q1-002 **Level 1** 8 - Drainage to HDPE in IPS room 1-B1-044 9 - Drainage to HDPE in Switch cupboard 1- L1-107 **Level 3** 10 - Vent pipe in switch cupboard 3-k2-083 Each party disagrees with the other party's position and therefore a dispute has arisen.	2 - Node room B-T1-002 HDPE drainage will be fusion welded and will extend into the office up until the first joint. 3 - Switch cupboard B-S3-030 will be installed in HDPE as shown within agreed sketches within MPX-GC-026626 as set out in Disputed Works Schedule Appendix 1 Item 10 4 - UPS Drainage will be routed once the walls are opened up where we have recesses to suit the best requirements. Drip trays will be installed under any drainage within the UPS room as noted on Drainage Changes.pdf as set out in Disputed Works Schedule Appendix 1 Item 10. **Ground floor** 5 - Drainage re-routed from UPS room in basement to ground floor and connecting into CWST tank room stack. 6 -Drainage pipework already running through switch cupboard G-F1-095 will be changed to HDPE 7 - Drainage pipework with no joints in IPS room G-Q1-002 can stay if joints are not directly next to wall either side of the cupboard (corridor and Nappy change) **Level 1** 8 - Drainage to change to HDPE in IPS room 1-B1-044 with the tundish moving into cylinder store and boxed in with access hatch. 9 - Drainage to change to HDPE in Switch cupboard 1- L1-107 only needs to extend 1 mtr into the disposal hold room and not as shown on the Drainage Changes.pdf. **Level 3** 10 - Vent pipe in switch cupboard 3-k2-083 (with no electrical equipment) can stay while drainage pipe will re-route as Drainage Changes.pdf. The above resolutions are noted within Aconex reference MPX-GC-026626 as set out in Disputed Works Schedule Appendix 1 Item 10 and Drainage Changes.pdf, and are deemed to have Reviewable Design Data status Level B.
11	**NOT USED**	-
12	**Lack of tamper proof flush fitted sockets in CAMHs** In the Board's opinion, sockets are not installed as per small power layout drawings and anti-ligature strategy drawing (HLM-SZ-00-PL-330-100. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the technical sub package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The resolution of the Dispute agreed by the Board and Project Co was for plastic faceplates to be replaced with metal flush fitted tamperproof sockets.
13	**Single Bedroom Ventilation air changes**	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute

Item	Dispute	Description of Agreed Resolution
	In relation to ventilation air change rates, the Board believes Project Co's design for the single bed ventilation is non-compliant with the Board's Construction Requirements ("**BCRs**"), Project Co Proposal's ("**PCPs**"), SHTM Guidance, and also non-compliant with comments made by the Board on the Environmental Matrix in the Reviewable Design Data schedule at Financial Close. 4ac/h supply provided to the bedrooms instead of the required 6ac/h. The ensuite extract rate proposed in excess of 10ac/h where requirements of SHTM 03-01 is 3ac/h. The Board also notes the Environmental Matrix was altered during Preferred Bidder to Financial Close period and was therefore not a direct copy of the reference design environmental matrix. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure) which included the environmental matrix which had been discussed and agreed pre Financial Close. The environmental matrix was a direct copy of the reference design environmental matrix developed during the preferred bidder period. Comments were received pre Financial Close and these were documented and the design amended to reflect the Board's comments. Each party disagrees with the other party's position and therefore a dispute has arisen.	is as set out in Disputed Works Schedule Appendix 1 Item 13.
14	**Smoke clearance in fire fighting stairwells** As per the Non Domestic Technical Handbook and project specific Fire Strategy, all fire fighting stairwells shall be provided with appropriate ventilation for heat and smoke control. Currently only a percentage of stairwells appear to have openings for high level ventilator. No details of electrical connections including fire rated cables for fire fighting plant as per BS 8519 have been provided. Project Co do not dispute the Board's position.	The remote activation and minimum free area opening is as noted in MPX-GC-026280: "In line with clause 2.14.6 (and table 2.16) of the NDTH, each of the stairs are designed with a mix of 'ventilators' achieving 1sqm ea. to the top of the stair (either smoke vents or windows). The strategy to each stair is noted below: • Stair 1 – Openable window to stair (1sqm window to top of stair) *CHSL* • Stair 2 – Openable window to stair (1sqm window to top of stair), mechanical ventilation to the bed evac lobby. Push buttons to topmost storey and access level as per 2.14.6 *CHSL* • Stair 3- Openable (mechanical) roof vent to stair, mechanical ventilation to the bed evac lobby. Push buttons to topmost storey and access level as per 2.14.6

Item	Dispute	Description of Agreed Resolution
		• Stair 4- Openable (mechanical) roof vent to stair. Push buttons to topmost storey and access level as per 2.14.6 • Stair 5 – Openable window to stair (window at each level, however topmost floor window to have local automated actuator allowing the window to open under actuation to achieve 1m2) *Velfac* • Stair 6 – Openable window to stair (window at each level, however topmost floor window to have local automated actuator allowing the window to open under actuation to achieve 1m2) *Velfac* • Stair 7- Openable (mechanical) vent to stair- exhausts via plant room area at L04. Push buttons to topmost storey and access level as per 2.14.6 In order to comply with section of 5.12 of the BCRs, all opening windows (including those to stairs 1, 2, 5 and 6) are lockable and fitted with restrictors. The CHSL Schuco Windows are provided with 'Custodian Handle Housings' with 'Custodian Keys' as per CHSL Technical Submittal no. 13 allowing the windows to the top of stairs 1 and 2 to open fully and achieve in excess of the min 1sqm requirement of the building regulations. The Velfac WT-022 windows to stairs 5 and 6 are provided with 'Espagnolette Handle with Lock' with 'Allen Key Lockable Restrictor'. The topmost window in each stair is to be fitted with localised actuation. This only allows opening by operatives as the locks and restrictors must be omitted. The actuators shall be activated locally by button control at 2m above floor level so as not easily accessible to public. This is in accordance with NDTH 2.14.6. The fire service carry the tool required to operate the CHSL windows and the key shall also be stored in a secure location near the windows i.e. break glass. All as noted within Aconex MPX-GC-026280, MM-GC-003950 and MPX-GC-026538 as set out in Disputed Works Schedule Appendix 1 Item 14 the above actions are agreed by the Board and Project Co to resolve this Dispute.
15	**Access hatches** It is the Board's position that a proliferation of Access hatches has been installed within theatre suites which is non-compliant with BCR clause 8.14 Service Routes and "Good Industry Practice". Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure).	Project Co agreed to the reduction of hatches in theatres, as noted within Aconex MPX-GC-027183 and as set out in Disputed Works Schedule Appendix 1 Item 15. This will be reflected in the as-built documentation. Updated versions of the following Reflected ceiling to be included in the As Built. HLM-Z3-01-PL-332-410;411;412;413.

Item	Dispute	Description of Agreed Resolution
	Each party disagrees with the other party's position and therefore a dispute has arisen.	
16	**Reductions to ceiling heights** In addition to the Project Co Change 016 (Basement Ceiling Heights), further Height reduction in Room Number 4-COR-007 and Room Number G-A1-062 appears to have been reduced without the agreement of the Board. Project Co do not dispute the Board's position.	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out in Disputed Works Schedule Appendix 1 Item 16.
17	**Duct Cleaning** The Board's position is that SHTM states all ducts must be cleaned unless they have been protected. The Contractor is not proposing to clean all ducts as believe they have sufficiently protected the ducts following installation. Independent Tester advised the Contractor will have to do a check to confirm ducts aren't dirty Project Co's position is that ducts were being protected, and will be sampled at commissioning stage - any failing the test will then being cleaned. Each party disagrees with the other party's position and therefore a dispute has arisen.	The extent of ductwork requiring to be cleaned has been captured within the following Aconex; Duct Cleaning – Aconex MM-GC-004106, MPX-GC-027187 as set out in Disputed Works Schedule Appendix 1 Item 17. It is agreed by the Board and Contactor that this Dispute item shall be resolved through witnessing and testing of the system, to demonstrate compliance with the BCR's / PCP's / Completion Criteria. For the avoidance of doubt, any other ducts that fail any checks or tests, shall be appropriately cleaned by Project Co.
18	**Bed Lift to Basement of Core 3** The Boards position is the Financial Close submission [IHSL-XX-XX-DC-4.15 Vertical Transportation] stated that the bed lift in core 3 would serve 5 floors. The Board notes the installed bed lift in core 3 only serves 4 floors. Project Co do not dispute the Board's position and has issued a Project Co Change for this item.	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out in Disputed Works Schedule Appendix 1 Item 18.

Item	Dispute	Description of Agreed Resolution
19	**Helipad fire fighting system (Water Pressure)** The Boards position is the Helipad fire fighting system does not comply with the guidance of HBN 15-03 Hospital Helipads clause 5.22. There does not appear to be a pressurised main supply, nor is there a system of inert gas to pressurise the system. Project Co's position is that a pressurised main supply and a system of inert gas to pressurise the system is not required. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co note the CAAi has certified the helipad is fit for purpose as installed. Reference is made to letter received by the Contractor from CAAi dated 07 March "it is with pleasure that we can issue this letter of completion which, subject to certain conditions outside of Multiplex's control being met before the heliport commences operations, confirms the rooftop heliport at RHSC & DCN is regarded as fit for purpose.". Documentation is noted within Aconex MPX-GC-027315 as set out in Disputed Works Schedule Appendix 1 Item 19. For the avoidance of doubt, whilst the CAAi has certified the helipad is fit for purpose, this item 19 relates to the Helipad fire fighting system (water pressure) only. All other elements of the Helipad compliance are as set out in the Project Agreement.
20	**Vegetation around air intakes in Neuroscience and Staff Courtyards** It is the Board's position that Landscape design around intake vents in Neuroscience Courtyard is potentially non-compliant with SHTM 03-01 which states: Air Intake 1.42 An uncontaminated air supply to the system is essential. In order to achieve this, the air intake will be positioned so that air discharged from extract systems or other dubious sources cannot be drawn in. Exhaust fumes from vehicles can present particular problems. The area surrounding the intake will need to be kept clean and free of vegetation and waste material in order to reduce the possibility of biohazards or fire. The intake itself will be protected by a louvre and mesh screen to prevent rainwater, vermin and insects etc. from entering the system. Project Co's position is that the design has been approved by the Board through RDD.	The Board / Project Co agree the Reviewable Design Data for this item has been given status Level A or B in accordance with Schedule Part 8 (Review Procedure). The following design measures proposed by Project Co and agreed with the Board to resolve the dispute, limit planting in the area surrounding the intake vents. This satisfies SHTM 03-01A Clause 1.42 in so far is it allows the area surrounding the vents to be clean and free of vegetation and waste material in order to reduce the possibility of biohazards or fire. Neuroscience Courtyard Project Co have replaced the planting around the air intake vents with artificial grass with the exception of one area which has been planted with sedum as per the Boards request. Staff Courtyard Project Co have incorporated a 600mm 'no plant zone' to the perimeter of the air intake vents." All as noted within Drawing HLM-Z0-03-PL-700-002 Rev E; Drawing HLM-Z0-00-PL-700-026 Rev E; and Aconex MM-GC-003873 as set out in Disputed Works Schedule Appendix 1 Item 20.
21	**"Do not use" labels removed from Medical Gas Outlets before commissioning.** It is the Board's position that Medical gas outlet "Do Not Use" labels removed before commissioning, non-compliance with SHTM02-01. Project Co's position is that there was no non-compliance relating to this issue. Project Co's position is that the installation was work in progress and would comply prior to the Actual Completion Date.	Through discussion it was agreed by Project Co and the Board that this Dispute will be resolved by the Medical gas outlet "Do Not Use" labels being put in place prior to commissioning, thus ensuring compliance with SHTM 02-01.

Item	Dispute	Description of Agreed Resolution
22	**Isolation Room supply ventilation relative to low building.** It is the Board's position that Isolation room ventilation is non-compliant for a 'low' building. Project Co's position is that the design and installation was based on isolation room ventilation report produced and tabled with the Board. This is compliant with the requirements of the Project Agreement. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out in Disputed Works Schedule Appendix 1 Item 22.
23	**Drainage joints in slabs** It is the Board's position that Drainage joints have been installed in the slab between floors with no access for maintenance or repair. This means there is no manufacturer warranty for the drainage connection. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Through discussion and site review with the Independent Tester, John Edwards (Arcadis) agreement has been reached on compliance and sign off. Reference is made to Aconex MPX-RFI-002569 and RBP-GC-002637 and the confirmation from the Independent Tester as set out in Disputed Works Schedule Appendix 1 Item 23.
24	**Fire Collar installation** Fire collars for drainage are not directly connected to the slab+C19. Project Co's position is that the installation was work in progress and would comply prior to the Actual Completion Date. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co agree this Dispute is closed and no further action is required. Confirmation has been received from the Project Co that the installation is ongoing and Project Co will procure compliance with BCRs prior to the Actual Completion Date.

Item	Dispute	Description of Agreed Resolution
25	**Level and position of smoke detectors** It is the Board's position that smoke detectors are installed at low levels above the ceiling i.e. not installed at the heights specified for void detectors Project Co's position is that the design and installation is in accordance with the requirements of the Project Agreement, was based on the package approved through Schedule Part 8 (Review Procedure) in compliance with the BCRs, and will be signed off by the installer as compliant. Each party disagrees with the other party's position and therefore a dispute has arisen.	Following discussion and site review, in relation to the level and position of the smoke detections, the Independent Tester has closed this item on basis of compliance. Summary of agreement contained with Aconex ECH-GC-000129 as set out in Schedule Disputed Works Schedule Appendix 1 Item 25.
26	**Ventilation in IPS** It is the Board's position that –Project Co have shown 3ac/h extract ventilation in the Environmental Matrix, but not all rooms have been provided with extract vent in the room - Potential heat gain issue. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Project Co confirm that all IPS rooms shall have extract ventilation of 3 ac/hr, and Project Co confirm that the environment and temperature within all IPS's room are within safe limits.
27	**Hot and Cold water supply pipe configuration** It is the Board's position that Hot and cold water supply pipes are crossed behind the sink in some rooms and in some instances the cold pipe is above the hot water pipe or touching the pipe meaning the will be heat transferred to the cold water supply. Not best practice and non-compliance with SHTM 04-01. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Through discussion and site review it was agreed between the Board and Project Co that Project Co shall modify the installation to maintain pipework separation and distance as per valve body so that the hot and cold water pipework doesn't touch or cross, in accordance with SHTM 04-01. Aconex MPX-GC-027580 as set out in Disputed Works Schedule Appendix 1 Item 27 specifies details of the changes made on Site. For the avoidance of doubt, Project Co to procure that the Agreed Resolution is applied in all requisite areas.

<table>
<tr><th>Item</th><th>Dispute</th><th>Description of Agreed Resolution</th></tr>
<tr><td>28</td><td>Windows/Partition in 1-B1-055

It is the Board's position that the GA and C sheet illustrates a 3 panel window however, in construction one panel appears to be 'false' with a partition behind it. From the inside it appears to be only 2 windows.

Project Co do not dispute the Board's position.</td><td>Agreement between the Board and Project Co was reached on this item at the Project Technical Review Meeting where it was agreed no further action was required (dated 31.01.18) as set out in Disputed Works Schedule Appendix 1 Item 28.

As built documentation shall reflect this.</td></tr>
<tr><td>29</td><td>Mounting heights for clinical lights (3-C1.4 -084, 3-C1.4 -061 and 3-D9-022)

It is the Board's position the Examination lights coded as LIG958 in 3-C1.4 -084, 3-C1.4 -061 and 3-D9-022 have been mounted in such a way as to cause obstruction.

Project Co's position is that the data sheets provided in accordance with Schedule Part 8(Review Procedure) should have caused the Board to pass comment during the review process, rather than wait until these had been constructed on Site.

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>Through discussion and agreement between the Board and Project Co, it was agreed to relocate the Examination lights coded as LIG958 in 3-C1.4 -084, 3-C1.4 -061 and 3-D9-022 to 2100mm. Reference is made to MM-RTRFI-000315 as set out in Disputed Works Schedule Appendix 1 Item 29.</td></tr>
<tr><td>30</td><td>Lightning Protection

It is the Board's position that Project Co have potentially deviated from design agreed with Consort.

Project Co's position is that the design and installation was based on the package approved through Schedule Part 8 (Review Procedure). Project Co does not agree with the comments raised.

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>The Board and Project Co agree the Reviewable Design Data for this item has been given status Level A in accordance with Schedule Part 8 (Review Procedure) and the Dispute has been resolved.

<table><tr><th>File Reference</th><th>Rev</th><th>Title</th><th>Status</th></tr><tr><td>ME-XX-XX-DC-579-002</td><td>01</td><td>Lightning Protection Interface between new RHSC & existing RIE</td><td>A</td></tr></table>

<tr><td>31</td><td>Gas supply to bedhead trunking

Supply has not been installed on Site as per Board comments during Schedule Part 8 (Review Procedure).

Project Co constructed position was that the design and installation was based on the package approved through Schedule Part 8 (Review Procedure).
Each party disagrees with the other party's position and</td><td>The Board and Project Co agree the Reviewable Design Data for this item has been given status Level A in accordance with Schedule Part 8 (Review Procedure) and the Dispute has been resolved.

<table><tr><th>File Reference</th><th>Rev</th><th>Title</th><th>Status</th></tr><tr><td>ME-XX-XX-DC-400-105</td><td>B</td><td>Bedhead Trunking Drawings</td><td>A</td></tr></table></td></tr>
</table>

Item	Dispute	Description of Agreed Resolution
	therefore a dispute has arisen.	
32	**Concealed ceiling grids** Ceiling Grids are not concealed and not constructed in line with drawings agreed in accordance with Schedule Part 8 (Review Procedure). Project Co do not dispute this position.	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out in Disputed Works Schedule Appendix 1 Item 32.
33	**Soft Landscaping planting specification** It is the Board's opinion that planting on Site was not as per planting schedule. i.e. clematis appears to be climbing but should be bush/ground variety. Project Co's position is that that this comment relates to unfinished works and is accordingly the Board's comment is premature.	These plants were left with the canes in them so that the Contractor could tend the bark mulch underneath before removing the canes. The canes will be removed so that the plant can lay on the ground.
34	**Wrong terminators fitted in warning lights** It is the Board's opinion in relation to Warning Lights that: - Terminal strip connector in theatres to be removed and correct terminations provided, all warning light boxes. - light box deformed where glanded Project Co's position is that the installation was still work in progress and will be compliant prior to the Actual Completion Date. The Board's comment is premature. Each party disagrees with the other party's position and therefore a dispute has arisen.	Due to quantity and size of cables not possible to terminate to manufacturers termination point, supplementary terminal block installed. The Board / Project Co agree this Dispute is closed, and no further action required.
35	**No evidence of IPS circuit bonding conductors** It is the Board's opinion that there is no evidence of IPS circuit bonding conductors at the IPS cabinets. The Main Bonding conductor between the IPS & the ERB is present. Project Co's position is that the installation is still a work in progress and will be compliant prior to the Actual Completion Date. The Board's comment is premature. Each party disagrees with the other party's position and therefore a dispute has arisen.	Project Co earthing philosophy was explained to the satisfaction of the Board and whilst differing from the guidance, it is deemed to be compliant. The Board / Project Co agree this Dispute is closed, and no further action required.

Item	Dispute	Description of Agreed Resolution
36	**Fire resistance of radiology door frame** Radiology: Door frame packed out in door opening, not in accordance within manufacturer's limits to maintain fire resistance of doorset. Project Co do not dispute this position.	As set out within Aconex MPX-GC-026747, MPX-GC-027156, NHSL-GC-003201 and MPX-GC-027646 as set out in Disputed Works Schedule Appendix 1 Item 36, the door frame has been rectified.
37	**UPS output switchboard with incorrect poles** It is the Board's position that the UPS output Switchboard 2 Switchboard is supposedly a Form 4 type 6 board. Schneider state that to achieve Form 4 type 2 or 6 that the incoming devices should be 4 poles. The incoming devices are three poles with un switched neutral. Project Co's position is that the design and installation is in accordance with the requirements of the Project Agreement and was based on the tech sub package approved through the approval process. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co agree that this switchboard can be fully isolated locally. The Board / Project Co agree this Dispute is closed and no further action required.
38	**Corridor service door handles** It is the Board's position that the Corridor service doors as installed include pull handles which are not acceptable as advised by the Board 30/01/17 (MM-GC-002483) during room review (corners of handles at children's head height). Project Co's position is that the design and installation complies with the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The solution agreed by the Board and the Contractor to resolve the Dispute was to remove the pull handles and replace them with standard flat escutcheon.
39	**NOT USED**	-
40	**NOT USED**	-

Item	Dispute	Description of Agreed Resolution
41	**As Built Energy Model / Seasonal Commissioning** It is the Board position that there is potential for some seasonal commissioning tests to be completed post hand over. Project Co's position is that seasonal commissioning would always be required to be carried out post the Actual Completion Date. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out in Disputed Works Schedule Appendix 1 Item 41.
42	**NOT USED**	-
43	**Routing of services. Corridor layouts against any non-compliance with standards to be tabled.** It is the Board's position that services are currently running through clinical areas that were not included within the original Project Co derogation. Project Co's position is that the design and installation meets the Project Agreement was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co acknowledge that Project Co have routed services through clinical area. This is not in compliance with the Board's Construction Requirements. The Board acknowledges that Project Co will not re-route these services. The areas impacted are as set out in Disputed Works Schedule Appendix 1 Item 43. Whilst the Board has agreed Project Co do not need to move the services, Project Co to procure that all other elements of the BCR's are fully complied with, for example if there are any acoustic issues associated with ventilation / drainage running through the rooms, Project Co shall at its own cost, resolve any compliance issues. Project Co confirm that any additional costs incurred to be borne by Project Co.
44	**Nurse call in WC** It is the Board's position that there is evidence from the Site (room C1.1-070) that nurse call pull cords have been installed in some visitor's WCs. However no nurse call should be installed in visitor's WCs. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The process agreed between the Board and Project Co to resolve the Dispute was for the Board to issue a Board Change. This has been received and Project Co is progressing the Board Change 142 as noted within NHSL-BCP-0142 as set out in Disputed Works Schedule Appendix 1 Item 44.
45	**Unidentified Circuits** Electrical circuits are not identified or labelled at terminal rail	The Board visited site with Multiplex and Mercury Engineering. Electrician confirmed spare circuits and these were identified accordingly.

Item	Dispute	Description of Agreed Resolution
	inside trunking. Consequently, there is no way to identify which cables enter and leave the circuit terminal strips. Project Co dispute this position and consider that the design and installation meets the requirements of the Project Agreement. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co agreed that no further action required.
46	**Fire alarm cable bands** It is the position that cable bands for fire alarms are plastic rather than metal. Metal ties are required by BS and are proposed by Project Co M&E specifications (4.23.3 of Section 4 of Schedule Part 6). Project Co' position is that the installation was still work in progress and would be compliant prior to the Actual Completion Date. Each party disagrees with the other party's position and therefore a dispute has arisen.	Project Co shall procure that installation is compliant with the BCRs, by installing metal cable bands as required.
47	**IPS units earthbar termination - 1-B1-044 – IPS Room** Project Co's position is that the installation was still work in progress and would be compliant prior to the Actual Completion Date.	Project Co earthing philosophy was explained to the satisfaction of the Board and whilst differing from the guidance, it is deemed to be compliant. Through discussion and site review it was agreed between the Board and Project Co that no further action required to resolve this Dispute.
48	**IPS sockets supplying non medical equipment** It is the Board's position that IPS sockets have been found on Site providing power for the television, scale of the issue still to be determined. Project Co's position that the installation was still a work in progress and will be compliant prior to the Actual Completion Date. The Board's position is premature. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board have observed on site that locations previously identified have been rectified and this item is now closed. It was agreed between the Board and Project Co that no further action is required to resolve this Dispute.

<table>
<tr><th>Item</th><th>Dispute</th><th>Description of Agreed Resolution</th></tr>
<tr><td>49</td><td>Interleaved circuits

It is the Board's opinion, as per SHTM 06-01 and note 7 on design drawings, that all sockets including pendants supplies, for Cat 3, 4 and 5 should be interleaved. However, the evidence from Site suggests this has not been installed.

Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure).

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>The Reviewable Design Data noted below for this item has been given status Level A or B in accordance with Schedule Part 8 (Review Procedure).

<table>
<tr><th>File Reference</th><th>Rev</th><th>Title</th><th>Status</th></tr>

<table>
<tr><th>Item</th><th>Dispute</th><th>Description of Agreed Resolution</th></tr>
<tr><td>50</td><td>Access and Maintenance Strategy

Access and Maintenance Strategy - lack of clear access and maintenance strategy submitted to date.

Project Co's position is that this is a work in progress and will be compliant prior to the Actual Completion Date. The Board's position is premature.

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>The Reviewable Design Data noted below for this item has been given status [Level B] in accordance with Schedule Part 8 (Review Procedure) in relation to revision 14. For the avoidance of doubt, Reviewable Design Data has not been submitted by Project Co (nor reviewed by NHSL) for the drainage resolution nor to take into account any impact on the Access and Maintenance Strategies for the drainage resolution. Accordingly neither the drainage resolution nor the Access and Maintenance Strategies have status [Level B approval] in respect of the drainage resolution or any impact of the drainage resolution. The design and specification of the drainage resolution and any impact on the Access and Maintenance Strategies to take account of the drainage resolution, will be submitted by Project Co as further Reviewable Design Data.

<table><tr><th>File Reference</th><th>Rev</th><th>Title</th><th>Status</th></tr><tr><td>HLM-XX-XX-DC-450-001</td><td>14</td><td>Access and Maintenance Strategies</td><td>Status B (except in relation to the drainage resolution or any impact on the Access and Maintenance Strategies for the drainage resolution, as detailed above)</td></tr></table></td></tr>
<tr><td>51</td><td>Lux levels in clean utilities

It is the Board's position that Lux levels in clean utilities rooms may not be sufficient for functionality of the space. Currently LG2 150 lux however due to the layout of the room / cupboards.

Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the environmental matrix approved through Schedule Part 8 (Review Procedure).

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>Project Co confirm that all clean utilities rooms shall have a minimum of 150 lux level at the work surface and additional light fittings will be provided if the levels are not achieved due to room layout / cupboards locations.</td></tr>
<tr><td>52</td><td>Breaches of Fire stopping

It is the Board's position that during the construction phase there were breaches of the fire stopping.

Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure).

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>The process agreed is for Project Co to issue the FIRAS Certificate to show compliance in accordance with the provisions of the Project Agreement.

For the avoidance of doubt, this does not release Project Co of their obligations to comply with the BCRs which relate to Fire Stopping.</td></tr>
</table>

Item	Dispute	Description of Agreed Resolution
53	**Egg crate Grilles in clinical areas** It is the Board's position that the Egg box grid is not suitable for cleaning. A technical submittal was issued and signed off by the Board, however a sample of the grid was not issued through the Review Procedure, hence the Board did not have a chance to view the type of product before it was installed. Project Co's position is that the design and installation was based on the package approved through Schedule Part 8 (Review Procedure) – photos of the products were provided which the Board should have used to raise comments at the appropriate time. Each party disagrees with the other party's position and therefore a dispute has arisen.	The process agreed between the Board and Project Co was for Project Co to procure Board preferred grills. This is set out within Aconex MPX-GC-025802 as set out in Disputed Works Schedule Appendix 1 Item 53.
54	**Curtain track and ceiling Hoist clashes** Hoists and curtain tracks clash and will need to be reviewed on a room by room basis. Project Co's position is that this is a work in progress and will be compliant prior to the Actual Completion Date. The Board's position is premature.	There has been a review of hoist and curtain tracks clashes by Project Co and Project Co to procure all clashes are resolved. As built documentation will record any alterations made.
55	**Wrong room configuration (G-Q1-074)** G-Q1-074 not constructed in line with C-Sheet (wrong sequence for data points and socket outlets) Project Co's position is that this is a work in progress and will be compliant prior to the Actual Completion Date. The Board's position is premature.	In relation to the orientation of the data points and socket outlets only, Project Co have amended on site the layout of the data points and sockets outlets, and it was agreed that no further action is required relating to this item.
56	**Helipad Ramp Lights** Helipad ramp now includes lighting however HBN 15-03 recommends that the luminaire should be lower than 25 cm and pointing down toward ramp. Calculations have not been submitted for lighting levels to ascertain if this complies with relevant standards. Project Co dispute the non-compliance alleged. Each party disagrees with the other party's position and therefore a dispute has arisen.	Through discussion between Project Co and the Board and site review it was agreed that no further action required relating to this item.

Item	Dispute	Description of Agreed Resolution
57	**Reduced access to electrical panels** It is the Board's position that Electrical panels should not be placed in reduced access areas. The Board understand this should have been designed in conjunction SHTM – Best Practice for Healthcare Engineering – Chapter 9 Engineering services. (For example 4-PLANT-001 – Central AHU Plant Room 01, 3 COR-008A - Switch cupboard) Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	As noted within Aconex MPX-GC-027300 as set out in Disputed Works Schedule Appendix 1 Item 57, Project CO reviewed on Site the 12 areas of concern with the Independent Tester, these were captured within the sketches contained within the Aconex, and this item has now been closed by the Independent Tester. Project Co confirm that any additional costs incurred to be borne by Project Co.
58	**Lighting in Service yard** It is the Board's position that lighting levels within service yard were initially designed at an average of 23 lux levels (i.e. the level required for a car park as per SLL Lighting Guide). This has now been corrected to 50 lux average however the uniformity is not in accordance with the requirements. Project Co's position was that the design and installation will comply with the Project Agreement, the BCRs, and design and calculations would be submitted through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	A process was agreed to capture the Board concern in relation to uniformity, update service yard with twin heads, and resubmit drawing, WW-EW-XX-DC-716-001 to the Board. This action is now complete. As noted within Aconex MPX-GC-027119 as set out in Disputed Works Schedule Appendix 1 Item 58. WW-EW-XX-DC-716-002 Service Yard Uniformity Calculation was submitted through the Review Procedure and given Level B by the Board, as noted in Aconex MPX-TRANSMIT-011188 as set out in Disputed Works Schedule Appendix 1 Item 58.
59	**Lighting in B-COR-014** It is the Board's position that L14 luminaries are missing in the corridor. Project Co's position is that the design and installation meets the requirements of the Employer's Requirements and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Project Co confirms lighting design has been amended to ensure the minimum height of 2.4m will not be impacted by the luminaires installed. This will be reflected within the as built information. Project Co confirms no luminaires are missing within corridor B-COR-014.
60	**3-T2-018: QP - Riser door missing**	The door has now been installed.

<table>
<tr><th>Item</th><th>Dispute</th><th>Description of Agreed Resolution</th></tr>
<tr><td></td><td>It is the Board's position that the riser wall should have a door to access pipework

Project Co's position is that the installation was still work in progress and would be compliant prior to the Actual Completion Date. The Board's comment was premature.</td><td></td></tr>
<tr><td>61</td><td>Provision of 360o CCTV Coverage

It is the Board's position that as illustrated in external CCTV drawing (ME-EW-XX-PL-571-001 Rev D) there are gaps within CCTV coverage on approach to the NW elevation of the Facility. Non-compliant with BCR Clause 7.6 (n) (Hard Landscaping).

The Board's position is not disputed by Project Co.</td><td>The Board and Project Co agreed that Project Co would update and resubmit drawing ME-EW-XX-PL-571-001.

This action is now complete. Project Co is to demonstrate compliance on Site when the system is commissioned.

Project Co confirms revision F of the aforementioned drawing was updated and issued for information.

<table><tr><th>File Reference</th><th>Rev</th><th>Title</th><th>Status</th></tr><tr><td>ME-EW-XX-PL-571-001</td><td>E</td><td>Site Plan. External CCTV Layout</td><td>B (23/05/18)</td></tr></table></td></tr>
<tr><td>62</td><td>Hazard classification and fire stopping in MRI suites

It is the Board's position that the MRI Suites are currently not operationally functional as hazard classification of the MRI equipment room prevents installation of waveguides between equipment and examination rooms which cannot be fire stopped.

Project Co's position is the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure).

Each party disagrees with the other party's position and therefore a dispute has arisen.</td><td>The Board and Project agree that the Revised Fire Strategy drawings for MRI suites indicate the altered compartmentation lines. These provide the necessary FR ratings and allow the Board to install their protection as required.

Drawing extract indicates change made on Aconex mail MPX-GC-027481 as set out in Schedule Disputed Works Schedule Appendix 1 Item 62.</td></tr>
<tr><td>63</td><td>Entrance to Service Yard for Large Vehicles

As witnessed at the trial on 17th Feb 2018, due to the location of the barrier, large vehicles extend into the blue light route (by Approximately 3ft) when waiting for access through the barrier.

The Board's position is not disputed by Project Co.</td><td>Project Co has submitted a revised service yard design drawing HLM-Z0-00-PL-711-007 Rev 5; NEW Z5 XXPL 720-001 Rev B and -002 Rev B reflecting the outcome of onsite testing. This has been reviewed through Schedule Part 8 (Review Procedure), agreed by the Board and given status Level B.

A bespoke swan neck access control pedestal was designed by Project Co to alleviate the potential for vehicle overhang.
Reference is made to Disputed Works Schedule Appendix 1 Item 63.</td></tr>
</table>

Item	Dispute	Description of Agreed Resolution
64	**Quench Pipe Route** Board's position is that Project Co has not left a clear route for the quench pipes to run. Project Co's position is that the route meets the requirements of the Project Agreement and was based around the design and installation package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Position resolving the Dispute as agreed by the Board and Project Co is recorded within Aconex MPX-GC-027186, as set out in Disputed Works Schedule Appendix 1 Item 64. Reference is also made to the quench pipe work scope Disputed Works Schedule Appendix 1 Item 64 and responsibility matrix for both parties Disputed Works Schedule Appendix 1 Item 64. For the avoidance of doubt, in relation to the quench pipe route, Project Co procure that the Facilities are fully compliant with the Project Agreement. Any costs associated with providing a clear route in the construction and operational phase are the responsibility of Project Co.
65	**CAMHS/PICU Glazing/DCN Acute** It is the Board's position that Project Co has not effectively designed glazing in PICU and CAMHS and DCN Acute to allow for adequate patient privacy from public spaces. As per Clinical Output Specifications and BCR Clauses 2.2/3.2.1/3.5.2/3.5.4/3.5.6/5.12/5.16.2. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). The privacy issue was discussed prior to any review under Schedule Part 8 (Review Procedure) and measures introduced to eliminate Board concerns during design stage. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board/Project Co agree to resolve the Dispute based on the email of "31 July 2018 RE: Privacy Glazing Final Position" and "Summary of Rooms requiring privacy screening 31072018 Vers 4" as set out in Disputed Works Schedule Appendix 1 Item 65. As built documentation will be issued by Project Co to record the agreed position.
66	**NOT USED**	-
67	**NOT USED**	-

Item	Dispute	Description of Agreed Resolution
68	**Security for CAMHS courtyards** The Board's position is that the height of fencing and hedge is currently not sufficient to prevent access to the CAHMS courtyards. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). The height of the fence was discussed extensively pre-FC and the Board specifically did not want a major boundary between public and private areas. Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board / Project Co agree to resolve the Dispute based on the following; Project Co proceeding with install of 2.4m high fence to match existing install at service yard, to the length of the existing installation. Hedge to be replaced with (as close to) 2.4m high hedge and including return up the back of the spine wall. Project Co has submitted updated design data as set out in Disputed Works Schedule Appendix 1 Item 68. This has been reviewed through Schedule Part 8 (Review Procedure), agreed by the Board and given status Level B.
69	**Service Yard Gate** The location of the induction loops for automatic gates / barriers will have to ensure there is safe and unobstructed egress from service yard. Project Co's position is that the installation was still a work in progress and will be compliant prior to handover the Actual Completion Date. The Board's comment is premature. Each party disagrees with the other party's position and therefore a dispute has arisen.	It is agreed by the Board and Project Co that Project Co will procure automated gates (both open on entry, but with capability for only the exit side gate to open on exit if size of vehicle does not require it. Service yard drawings to be updated by Project Co to reflect this position. This information is recorded on the following drawings contained in Disputed Works Schedule Appendix 1 Item 69; HLM-Z0-00-PL-711-007 Landscape GA - Service Yard Entrance Rev 5 NEW-Z5-XX-PL-720-001 Pedestrian Gate Layout Rev B NEW-Z5-XX-PL-720-002 LAYOUT AND FOUNDATIONS RAM GATES Rev B Project Co confirm that any additional costs incurred to be borne by Project Co.
70	**ED Drugs store ventilation** It is the Board's position that current ventilation provision for drugs store is not in line with Clinical Specific Requirements for the space and therefore is not compliant. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The Board and Project Co agree to proceed based on the following Board change NHSL-CCP-138 ED Drug Store Ventilation as set out Disputed Works Schedule Appendix 1 Item 70. Project Co to implement Board Change. Project Co confirm that any additional costs incurred to be borne by Project Co.
71	**Movement Joint outstanding action** Item 6.6 of the Boards Construction Requirements Schedule part 6; Section 3, states:	The Board / Project Co agree this item is closed, and the agreed technical solution approved through Schedule Part 8 (Review Procedure) and, agreed by the Board and Project Co as resolving the Dispute is as set out Disputed Works Schedule Appendix 1 Item 71.

Item	Dispute	Description of Agreed Resolution
	6.6 Movement Joints Structural movement joints shall not be located through a) Theatre rooms; b) Treatment and surgery rooms; c) X-ray and imaging rooms; d) Pharmacy manufacturing rooms; e) Kitchens and food preparation areas; f) Any room with (now or in the future) with ceiling mounted tracking hoists or other similar lifting equipment; and g) Any other room requiring a sterile environment; and h) Any rooms where there is a risk of biological or other hazard, or risk of penetration by water, grease/oil, or other hazardous or detrimental substance. Lateral stability bracing systems shall not obstruct or hinder clinical or non-clinical operations and shall not obscure the windows or doors. Project Co wishes to derogate from the requirements above for the following areas; a) Gamma Camera – G-Q1-044 (ceiling only) b) MRI room 2 – G-Q1-110 (ceiling only) c) Ward Kitchen – G-A2-041 (ceiling only) d) Utility room 1-1-P1-041 e) Corridor – 1-L1-105 f) Single bed – 1-L1-093 g) Corridor – 1-COR-007 h) Exit Bay – 1-P1-040 i) Hot toilet - 3-C1.4-078 J) Single Bedroom G-Q1-048	Project Co confirm that any additional costs incurred to be borne by Project Co.
72	**Heating pumps pressure** In the Board's opinion there is an issue with heating pumps pressure to distribute hot water around the Facility. Pumps may not be sized correctly. Project Co's position is that the installation was still a work in progress and will be compliant prior to the Actual Completion Date. The Board's comment was premature.	The Board and Project Agree that Project Co will capture the commissioning results and table these with the Board to confirm Contract compliance. All results are being uploaded to the Zutec as built document management system.

Item	Dispute	Description of Agreed Resolution
73	**Fridge Spaces** Spaces for fridges mid units are too small for the equipment. Project Co does not dispute this item.	The Board has agreed to reduce the sizes of some of the fridges. Project Co has agreed to provide adequate fridge space in line with the Board's requirement's, all as recorded on Aconex MPX-GC-027104 as set out in Disputed Works Schedule Appendix 1 Item 73.
74	**Incline in L2** The floor appears to be inclined in L2 department. Project Co disputes this position. Each party disagrees with the other party's position and therefore a dispute has arisen.	Through discussion between the Board and Project Co it was agreed no further action required.
75	**Row of work benches too close together - D6 first floor** It is the Board's position that the location of desks in therapies adjusted due to the location of power pole. This created the space between two rows of desks of around 1100cm which is not sufficient. Project Co does not dispute this item.	It was agreed by the Board and Project Co that Project Co should amend on Site the location of work benches at D6 first Floor. This work has been completed.
76	**Pot wash ceiling** Incorrect ceiling installed. Should be the same as the "high spec" ceiling in restaurant The ceiling tiles might be sufficient however the ceiling grid in non-compliant. Project Co does not dispute this item.	Through discussion and site review it was agreed between the Board and Project Co that Project Co would rectify this ceiling so that the specification is equal to the restaurant; Type H K40/115H and K40/250CR. This remedial work is to be captured by Project Co within the as built documentation.
77	**Socket outlets in Group 2 rooms** It is the Board's position, as per GN7, all socket outlets in group 2 rooms should be provided with metal plates. This however has not been provided by Project Co. Principle for plastic plates agreed in principle however Project Co Change is required. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	Through discussion and site review between the Board and Project Co it has been agreed that plastic switchplates are acceptable. Aconex MPX-CCP-063 as set out in Disputed Works Schedule Appendix 1 Item 77 documents the agreed change.

Item	Dispute	Description of Agreed Resolution
78	**Penetrations for services** It is the Board's position that desks fitted at touchdown bases have no penetrations for cabling that will need to be connected to sockets under the desks. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure). Each party disagrees with the other party's position and therefore a dispute has arisen.	The desk penetrations have now been fitted. This facilitates desk mounted IT equipment to below desk sockets.
79	**Pendants** It is the Board's position that there no evident fibre cabling has been provided and there is no cut out to terminate cables. Project Co's position is that the design and installation meets the requirements of the Project Agreement and was based on the package approved through Schedule Part 8 (Review Procedure).	Through discussion and agreement between the Board and Project Co, the Board is to procure final patching leads direct from the Board's preferred supplier (OUT 904). Aconex MPX-CCP-046 OUT904 Connections as set out in Disputed Works Schedule Appendix 1 Item 79 documents this position.

PART 2

TECHNICAL SCHEDULE DOCUMENTATION

Part 2 Technical Schedule Documentation is as set out on the USB memory stick in the Agreed Form identified and executed as Part 2 Technical Schedule Documentation of this SA1, referred to in and forming part of this SA1

PART 3

OTHER PROJECT AGREEMENT AMENDMENTS

PART A: DISPUTE RELATED AMENDMENTS

The following amendments shall be made to the Project Agreement with effect from the SA1 Effective Date (unless specified otherwise):

1. Access Rights

1.1 Clause 9.2 (Access following Construction) shall be amended as follows:

1.1.1 In line 3 of the opening paragraph, add "8" after "paragraphs 1" and before "and 10"; and

1.1.2 In Clause 9.2.2, add "and carrying out the Post Completion Works and Outstanding Works" after "Clause 23.15 (Board Maintenance Obligations)" and before ";".

1.2 In paragraph 8 (Site Compound/Car Park E) of Section 3 (Ancillary Rights) of Schedule Part 5 (Land Matters) "Project Co shall be entitled to occupy Car Park E" shall be deleted and replaced with:

"Project Co shall be entitled to occupy Car Park E and thereafter undertake reinstatement of Car Park E"

1.3 In paragraph 8 *(Site Compound/Car Park E)* of Section 3 *(Ancillary Rights)* of Schedule Part 5 *(Land Matters)*, the following shall be added on line one after "During the Construction Phase" and before "Project Co shall be entitled to occupy Car Park E and thereafter undertake reinstatement of Car Park E" as follows:

1.3.1 "and until 28 June 2019 ,".

1.4 In paragraph 1 of Section 3 *(Site Compound/Car Park E)* of Part 1 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of the Project Agreement, the following shall be added on line one after "During the Construction Phase" and before "Project Co shall be entitled to occupy Car Park E and thereafter undertake reinstatement of Car Park E" as follows:

1.4.1 "and until 28 June 2019 (such occupation rights terminating on the Expiry Date or (if earlier) the Termination Date),".

2. Clause 10

2.1 A new clause 10.4.1A shall be added as follows:

"until completion of the Post Completion Works where such matter arises solely as a result of the carrying out of the Post Completion Works, any such matter shall be deemed to be a Compensation Event for the purposes of this Agreement.".

2.2 In clause 10.4.2 and 10.4.3 the following shall be added after "Operational Term":

"(except where clause 10.4.1A applies)".

3. The words "(other than the Post Completion Works and the Outstanding Works)" shall be inserted after the word "Works" in the following provisions:

3.1 Clause 14.1 (Dates for Completion);

3.2 Clause 17.5 (Pre-Completion Commissioning and Completion);

3.3 Clause 17.10 (Pre-Completion inspection);

3.4 Clause 17.11 (Pre-Completion matters).

4. The words "(other than in respect of the Post Completion Works and the Outstanding Works)" shall be inserted after the words "are complete" in Clauses 17.12 and 17.13 (Completion Certificate);

5. After the words "Certificate of Practical Completion" as it appears in Clause 17.14, insert "and the certificate of completion of the Drainage Works; Void Detection Works; Heater Battery Works and Outstanding Works".

6. Clause 17.18 (As-built specification) shall be replaced as follows:

17.18.1 "Within ten (10) Business Days after the issue of the Certificate of Practical Completion, Project Co shall provide to the Board an electronic copy of the as-built building specification together with all drawings relating to the Works (other than the Post Completion Works and the Outstanding Works).

17.18.2 Within ten (10) Business Days after the certification by the Independent Tester of completion of the Drainage Works in accordance with the Drainage Completion Criteria, Project Co shall provide to the Board an electronic copy of the as-built building specification together with all drawings relating to the Drainage Works.

17.18.3 Within ten (10) Business Days after the certification by the Independent Tester of completion of the Void Detection Works in accordance with the Void Detection Completion Criteria, Project Co shall provide to the Board an electronic copy of the as-built building specification together with all drawings relating to the Void Detection Works.

17.18.4 Within ten (10) Business Days after the certification by the Independent Tester of completion of the Heater Battery Works in accordance with the Heater Battery Completion Criteria, Project Co shall provide to the Board an electronic copy of the as-built building specification together with all drawings relating to the Heater Battery Works.

17.18.5 Within ten (10) Business Days after the completion of the Outstanding Works in accordance with the Project Agreement (as amended by this Agreement), Project Co shall provide to the Board an electronic copy of the as-built building specification together with all drawings relating to the Outstanding Works.".

7. A new Clause 18.5.2A (Operational Manuals) shall be added as follows:

"Project Co shall make available on the Site to the Board's Representative:-

18.5.2A.1 on or before Milestone 2, Milestone 3 and / or Milestone 4 (as the case may be) two (2) electronic copies of a final draft operation and maintenance manual insofar as they relate to the Post Completion Works in sufficient detail to allow the Board to operate and use the Facilities safely and efficiently;

18.5.2A.2 within ten (10) Business Days following Milestone 2, Milestone 3 and / or Milestone 4 (as the case may be) three (3) electronic copies the principal operation and maintenance manual.

18.5.2A.3 on or before completion of the Outstanding Works two (2) electronic copies of a final draft operation and maintenance manual insofar as they relate to the Outstanding Works in sufficient detail to allow the Board to operate and use the Facilities safely and efficiently;

18.5.2A.4 within ten (10) Business Days following completion of the Outstanding Works three (3) electronic copies of the principal operation and maintenance manual.".

8. Clause 29 (Delay Events) shall be amended as follows:

8.1 In Clause 29.1, the words ", Post Completion Works Longstop Date, Milestone 2 Target Completion Date, Milestone 3 Target Completion Date and/ or Milestone 4 Target Completion Date as applicable" shall be inserted after the words "Completion Date" in the penultimate line.

8.2 In Clause 29.3, the words "or a delay in completion of the Drainage Works, Void Detection Works, Heater Battery Works or Outstanding Works" shall be inserted at the end of the first paragraph and at the end of Clause 29.3.1.

8.3 A new Clause 29.3.13 shall be inserted as follows:

"the suspension by Project Co of performance in accordance with Clause 4.3 of the SA1;".

8.4 A new Clause 29.3.14 shall be inserted as follows:

"the prevention or impediment of Project Co pursuant to Clause 6.18 of SA1 (Post Completion Works).".

8.5 In Clause 29.4, the words "or upon completion of the Drainage Works, Void Detection Works, Heater Battery Works or Outstanding Works" shall be inserted at the end of Clause 29.4.4.

8.6 In Clause 29.7, the words ", Outstanding Works Target Completion Date, Milestone 2 Target Completion Date, Milestone 3 Target Completion Date and/ or Milestone 4 Target Completion Date and/ or, in the case of the Post Completion Works only, the Post Completion Works Longstop Date" shall be inserted after the words "Completion Date" in the second line.

8.7 In Clause 29.10.1, the words "and 29.3.12" in the second line shall be replaced with ", 29.3.12, 29.3.13 and 29.3.14".

9. A new Clause 40.1.12 shall be inserted as follows:

"**Post Completion Works Longstop Date**

Project Co failing to complete the Post Completion Works by the Post Completion Works Longstop Date;".

10. In Clause 40.3.1 (Board's options) of the Project Agreement, the words "or 40.1.10 (Payment)" shall be replaced with the following:

", 40.1.10 (Payment) or 40.1.12 (Post Completion Works Longstop Date)".

11. The definition of "Completion Criteria" in Schedule Part 1 (Definitions and Interpretation) shall be replaced with the following:

""Completion Criteria" means, where the context permits, the Completion Tests as defined in Appendix B of Schedule Part 10 (*Outline Commissioning Programme*) or the Agreed Resolution, provided that in the event of conflict or inconsistency between the Agreed Resolution and the Completion Tests, the Agreed Resolution shall prevail;".

12. New definitions shall be inserted in Schedule Part 1 (Definitions and Interpretation) as follows:

"**Agreement**" or "**Project Agreement**" means this project agreement between the Board and Project Co dated 12th and 13th February 2015 as amended or supplemented from time to time in accordance with the terms of this Agreement;";

""**Drainage Completion Criteria**" means the drainage completion criteria as set out in Part C of Part 5 of the Schedule (Post Completion Works) to SA1;";

""**Drainage Works**" means the drainage works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works) to SA1;";

""**Failed Instalment**" has the meaning given in Clause 4.1 (Payment) of SA1;";

""**Heater Battery Completion Criteria**" means the heater battery completion criteria as described in Part C of Part 5 of the Schedule (Post Completion Works) to SA1;";

""**Heater Battery Works**" means the heater battery works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works) to SA1;";

""**Outstanding Works**" means the works set out in Part 6 of the Schedule (Outstanding Works) to SA1 which the Parties have agreed will be completed after the Actual Completion Date;";

""**Post Completion Works**" means the Drainage Works, Void Detection Works and Heater Battery Works all as described in Parts A and B of Part 5 of the Schedule (Post Completion Works) to the SA1;";

""**Post Completion Works Longstop Date**" means 26th July 2019 or such revised date as may be specified by the Board's Representative pursuant to Clause 29 (Delay Events) or such other date as may be agreed by the Parties;";

""**SA1**" means the supplemental agreement to this Agreement entered into between the Parties on 22 February 2019;";

""**Void Detection Completion Criteria**" means the void detection completion criteria as set out in Part C of Part 5 of the Schedule (Post Completion Works) to the SA1;";

""**Void Detection Works**" means the void detection works as described in Parts A and B of Part 5 of the Schedule (Post Completion Works) to the SA1;".

13. The words "(including for the avoidance of doubt the carrying out of the Post Completion Works and the Outstanding Works)" shall be inserted after the word "Works" in the definition of "Project Operations" in Schedule Part 1 (Definitions and Interpretation).

14. **Schedule Part 10**

Appendix B (Completion Criteria) of Schedule Part 10 (Outline Commissioning Programme) of the Project Agreement shall be amended as follows:-

14.1.1 The opening paragraph of section 3 (Handover Clean) shall be deleted and replaced with the following:-

"On completion of the Works (excluding the Post Completion Works and the Outstanding Works), Project Co shall have carried out and completed the Handover Clean (as defined in this paragraph 3 (Handover Clean) of Appendix B (Completion Criteria) of Schedule Part 10 (Outline Commissioning Programme)) in all areas of the Facilities, except those areas where the Post Completion Works and/or Outstanding Works will be undertaken by Project Co following the Actual Completion Date.

On completion of Milestone 2, Milestone 3, Milestone 4 and the Outstanding Works respectively, Project Co shall have carried out and completed the Handover Clean (as defined in this paragraph 3 (Handover Clean) of Appendix B (Completion Criteria) of Schedule Part 10 (Outline Commissioning Programme)) in each of the areas where the Drainage Works, Heater Battery Works, Void Detection Works and Outstanding Works have been undertaken.";

14.1.2 Paragraph 4.1.1 shall be deleted and replaced with the following:-

4.1.1 "Temporary Occupation Certificate;

4.1.1A Project Co shall procure that a Building Warrant Completion Certificate shall be produced by 31 March 2019;".

15. **Schedule Part 14**

15.1 The following new paragraphs 4.1A and 4.1B shall be added to Section 3 (Deductions for Availability Failures) of Schedule Part 14 (Payment Mechanism) as follows:-

15.2 A new Paragraph 4.1A shall be inserted as follows:

"4.1A Where a Service Event occurs which results in a failure by Project Co to provide that one of the three basement sump pumps is operational (which, for the avoidance of doubt, means a simultaneous and consecutive failure of the in situ duty pump, in-situ standby pump and third emergency pump) ("Total Basement Pump Failure") and:-

(i) the Total Basement Pump Failure is not Rectified within the Rectification Period; and

(ii) the Board in its absolute discretion has vacated the Functional Areas which are those areas highlighted in blue and/or referred to as "Basement Pump Additional Functional Areas" as set out in Appendix 3 *(Clinical Assessment Basement GSU)* of Schedule Part 14 *(Payment Mechanism)* ("**Basement Pump Additional Functional Areas**");

subject to paragraph 4.1A3, the Basement Pump Additional Functional Areas shall be deemed to be Unavailable from the commencement of the Service Failure Time until such time as the Total Basement Pump Failure is Rectified.

4.1A2 If a Total Basement Pump Failure occurs and

(i) the Total Basement Pump Failure is not Rectified within the Rectification Period; and

(ii) the Board, in its absolute discretion has vacated the Functional Areas which are those areas highlighted in green and/or referred to as "Basement Pump Functional Areas" as set out in Appendix 3 *(Clinical Assessment Basement GSU)* of Schedule Part 14 *(Payment Mechanism*] ("**Basement Pump Functional Areas**")

subject to paragraph 4.1A3 the Basement Pump Functional Areas shall be deemed to be Unavailable from the Service Failure Time until such time as the Total Basement Pump Failure is Rectified.

4.1A3 If the Board in its absolute discretion does not vacate both the Basement Pump Functional Areas and the Basement Pump Additional Functional Areas then no Unavailability or Service Event will have occurred in respect of the Basement Pump Additional Functional Areas and Deductions will not apply to the Basement Pump Additional Functional Areas."

15.3 A new Paragraph 4.1B shall be inserted as follows:

4.1B Where a Service Event occurs which results in a failure by Project Co to ensure that the external sump pump is operational (which, for the avoidance of doubt, means a failure of the in situ pumps and spare pump) ("**Total External Pump Failure**") and:

(i) the Total External Pump Failure is not Rectified within the Rectification Period; and

(ii) the Board in its absolute discretion has vacated the Functional Areas which are those areas highlighted in blue and/or referred to as "External Pump Additional Functional Areas" as set out in Appendix 4 *(Clinical Assessment PARU GSU)* of Schedule Part 14 *(Payment Mechanism)* ("**External Pump Additional Functional Areas**");

subject to paragraph 4.1A3, the External Pump Additional Functional Areas shall be deemed to be Unavailable from the commencement of the Service Failure Time until such time as the Total External Pump Failure is Rectified.

4.1B2 If a Total External Pump Failure occurs and:

(i) the Total External Pump Failure is not Rectified within the Rectification Period; and

(ii) the Board, in its absolute discretion has vacated the Functional Areas which are those areas highlighted in green and/or referred to as "External Pump Functional Areas" as set out in Appendix 4 *(Clinical Assessment PARU GSU)* of Schedule Part 14 *(Payment Mechanism)* ("**External Pump Functional Areas**")

subject to paragraph 4.1A3 the External Pump Functional Areas shall be deemed to be Unavailable from the Service Failure Time until such time as the Total External Pump Failure is Rectified.

4.1B3 If the Board in its absolute discretion does not vacate both the External Pump Functional Areas and the External Pump Additional Functional Areas then no Unavailability or Service Event will have occurred in respect of the External Pump Additional Functional Areas and Deductions will not apply to the External Pump Additional Functional Areas.

16. A new Appendix 3 (Clinical Assessment Basement GSU) as set out in Part E of Part 3 of the Schedule to SA1 shall be added to Schedule Part 14 (Payment Mechanism.

17. A new Appendix 4 (Clinical Assessment Paru GSU) as set out in Part F of Part 3 of the Schedule to SA1 shall be added to Schedule Part 14 (Payment Mechanism).

18. The definition of "Deemed New Agreement" in Section 6 (Definitions) of Schedule Part 17 (Compensation on Termination) shall be replaced with the following:

"means an agreement on the same terms and conditions as this Agreement (including, for the avoidance of doubt SA1), as at the Termination Date, but with the following amendments

(a) if this Agreement is terminated prior to:

(i) the Actual Completion Date, then the Longstop Date shall be extended by a period to allow a New Project Co (had one been appointed) to achieve the Actual Completion Date prior to the Longstop Date;

(ii) completion of the Post Completion Works, then the Post Completion Works Longstop Date shall be extended by a period to allow a New Project Co (had one been appointed) to complete the Post Completion Works prior to the Post Completion Works Longstop Date;

(b) any accrued Deductions and / or Warning Notices shall, for the purposes of termination only, and without prejudice to the rights of the Board to make financial deductions, be cancelled; and

(c) the term of such agreement shall be for a period equal to the term from the Termination Date to the Expiry Date;

19. The definition of " New Agreement" in Section 6 (Definitions) of Schedule Part 17 (Compensation on Termination) shall be replaced with the following:

"means an agreement on the same terms and conditions as this Agreement (including, for the avoidance of doubt SA1), at the Termination Date, but with the following amendments

(a) if this Agreement is terminated prior to:

(i) the Actual Completion Date, then the Longstop Date shall be extended by a period to allow a New Project Co to achieve the Actual Completion Date prior to the Longstop Date;

(ii) completion of the Post Completion Works, then the Post Completion Works Longstop Date shall be extended by a period to allow a New Project Co to complete the Post Completion Works prior to the Post Completion Works Longstop Date;

(b) any accrued Deductions and / or Warning Notices shall, for the purposes of termination only, and without prejudice to the rights of the Board to make financial deductions, be cancelled;

(c) the term of such agreement shall be for a period equal to the term from the Termination Date to the Expiry Date; and

(d) any other amendments which do not adversely affect the Project Co;".

16. Paragraph 4.3.3 (c) of Section 2 of Schedule Part 17 (Compensation on Termination) of the Project Agreement shall be amended as follows:-

After the word "Works)" in line 3 the following will be added:- "(including for the avoidance of doubt, any rectification costs associated with SA1 which rectification costs shall be valued at the level of the outstanding Element of the Settlement Sum attributable to Milestone 2 and / or Milestone 3 and / or Milestone 4 (as applicable) set out in Schedule Part 7 (Payment and Milestones) of SA1)"

PART B – CCTV RELATED AMENDMENTS

With effect from SA1 Effective Date, the provisions of the Project Agreement shall be amended as set out in this Part B of Schedule Part 3 (Other Project Agreement Amendments) and construed accordingly.

1. Schedule Part 1 of the Project Agreement *(Definitions and Interpretations)*

The following definitions shall be inserted and/or deleted and restated, as applicable, in Schedule Part 1 *(Definitions and Interpretations)* as follows:

""**CCTV Infrastructure"** means the infrastructure resulting from the CCTV Works;"

""**CCTV Infrastructure Sites"** means the Sites of the CCTV Infrastructure shown indicatively as a "P○" on drawing number ME-EW-XX-PL-571-001 version E, which forms part of the CCTV Works Proposal or such other sites as are otherwise agreed between the Parties;"

""**CCTV Works"** means the design (including preparation of all Design Data), construction, testing, commissioning and completion of the CCTV Infrastructure and thereafter maintaining, repairing and renewing the CCTV Infrastructure at the CCTV Infrastructure Sites in the Yellow Area, as described in the CCTV Works Proposal;"

""**CCTV Works Proposal"** means the information for the design and construction of the CCTV Works detailed in Part B of Schedule Part 3 (Other Project Agreement Amendments) of SA1 as amended from time to time in accordance with the Project Agreement;"

""**Interface Proposals**" means any of the Access Strategy, Connection Proposal, Construction Access Proposal, Oversail Strategy, Service Proposal, Supplemental Drainage Proposal, Traffic Management Strategy, CCTV Works Proposal and any strategy or proposal agreed or determined pursuant to the terms of Part 2 *(Interface Proposals Procedure)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, which Interface Proposals form part of Project Co's Proposals and Method Statements;"

""**Off-Site Works**" means the RIE Works, Hospital Square Works, Cycle Paths Works, Substation Works, Petrol Station Site Works, Surface Water Drainage Works and/ or CCTV Works;".

2. Schedule Part 5 of the Project Agreement *(Land Matters)*

2.1 In paragraph 4 *(Access Areas)* of Section 3 *(Ancillary Rights)* of Schedule Part 5 *(Land Matters),* delete "and" at end of paragraph 4.4, insert "and" at end of paragraph 4.5 and insert a new paragraph 4.6 after paragraph 4.5 as follows:

"4.6 carry out the CCTV Works including the rights to construct and lay service media to and from the Site as necessary to serve the CCTV Works within the Yellow Area;".

2.2 In the last paragraph of paragraph 4 *(Access Areas)* of Section 3 *(Ancillary Rights)* of Schedule Part 5 *(Land Matters)* at the end of the paragraph insert after "Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*," the following:

2.3 ", and without limiting the foregoing, further in relation to the matters in the foregoing paragraph 4.6, complying with the CCTV Works Proposals".

2.4 After paragraph 10.5 of paragraph 10 *(Operational Access)* of Section 3 *(Ancillary Rights)* of Schedule Part 5 *(Land Matters)* insert a NEW paragraph 10.6 as follows:

"During the Operational Term Project Co shall have a right of access to the Yellow Area to maintain, repair and renew the CCTV Infrastructure and service media serving such CCTV Infrastructure within the Yellow Area subject to Project Co complying with the terms of Section 2 *(Operational Construction Issues)* and Section 5 *(Access Areas and Drainage)* of Part 1 *(Interface*

Construction Issues and Interface Proposals) of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* and the CCTV Works Proposal.".

3. Schedule Part 14 of the Project Agreement (Payment Mechanism)

The disc in the Agreed Form which sets out Appendix 2 (Functional Areas and GSUs) of Schedule Part 14 of the Project Agreement (Payment Mechanism) and which was initialled on or around the date of the Project Agreement, shall be replaced with the updated Appendix 2 (Functional Areas and GSUs) of Schedule Part 14 of the Project Agreement (Payment Mechanism) set out in in Part D of this Schedule Part 3 (Other Project Agreement Amendments).

4. Schedule Part 31 (*Consort Interface with Campus Site and/or Campus Facilities*) of the Project Agreement

4.1 In Annex 5 (Access to RIE Site and RIE Facilities during the Operational Term – Foul Service Strip) and Annex 6 (Access to RIE Site and RIE Facilities during the Operational Term – Service Strip) of Appendix 7 of Schedule Part 31, delete the heading reference "Part B" and replace this reference with "Part C".

4.2 In Section 2 *(Operational Construction Issues)* of Part 1 *(Interface Construction Issues and Interface Proposals)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* delete the words "Not Used" in paragraph 4 and replace with the following:

"4. CCTV Works

Without limiting the terms of paragraph 1 *(Access to RIE Site and RIE Facilities)*, during the Operational Term Project Co shall maintain, repair and renew the CCTV Infrastructure and service media serving such CCTV Infrastructure installed within the Yellow Area pursuant to the Board's Construction Requirements and/or the CCTV Works Proposal."

4.3 In Section 5 (*Access Areas and Drainage*) of Part 1 *(Interface Construction Issues and Interface Proposals)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, add a new paragraph 1.1.7 as follows:

"1.1.7 carry out the CCTV Works within the Yellow Area, in the form of notice set out in Annex 3 of Part B of Appendix 4 of this Schedule Part 31."

4.4 In Section 5 *(Access Areas and Drainage)* of Part 1 *(Interface Construction Issues and Interface Proposals)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, at paragraph 4 delete "Not Used" and insert a new paragraph 4 *(CCTV Works)* as follows:

"4. CCTV Works

4.1 In addition to the requirements of paragraph 1 of this Section 5 (*Access Areas and Drainage*) of Part 1 (*Interface Construction Issues and Interface Proposals*) of this Schedule Part 31, in regard to the CCTV Works within the Yellow Area under paragraph 1.1.7 of this Section 5 the following additional requirements shall apply:-

4.1.1 Project Co shall comply with and procure compliance by Project Co Parties with the CCTV Works Proposal;

4.1.2 the information for the CCTV Works Proposal shall contain full details of the design, construction, programme and method statements sufficient to enable a full assessment of the proposed works and shall provide that the works will:-

(a) be safe to any personnel or equipment or any part of the Campus Site and/or Campus Facilities; and

(b) comply with Good Industry Practice and Law; and

(c) have the effect that the operational and/or structural performance of the Campus Site and/or Campus Facilities will be of an equivalent standard of performance compared with the standard of performance if the CCTV Works Proposal were not implemented and/or that the functionality or design life of the Campus Site and/or Campus Facilities or any material part thereof and/or the Board's, Consort's and/or the University's and/or any other operations at the Campus Site and Campus Facilities are not materially adversely affected, and the Board and/or any Board Party and/or Consort and/or any Consort Party or any party on behalf of any of them shall be entitled to observe the works for the protection of existing service media serving the Campus Site and/or Campus Facilities within the relevant part of the Access Areas;

4.1.3 as at the SA1 Effective Date, the CCTV Works Proposal set out in Part C of Part 3 of the Schedule to SA1 (CCTV Works Proposal) shall be deemed to be agreed by all relevant parties as satisfying the requirements of this Agreement."

4.5 In Section 5 *(Access Areas and Drainage)* of Part 1 *(Interface Construction Issues and Interface Proposals)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, after NEW paragraph 4 *(CCTV Works)* insert a NEW Paragraph 4A *(Maintenance, Repair and Renewal)* as follows:

"4A Maintenance, Repair and Renewal of CCTV Works

4A.1 Where the works to be carried out by Project Co pursuant to paragraph 1.1.7 of this Section 5 involve the maintenance, repair or renewal of CCTV Infrastructure the following provisions shall apply:

4A.1.1 except in the case of emergency works (which for the purposes of this paragraph shall include any circumstances which give or may give rise to the occurrence of a Service Event) of maintenance, repair or renewal, the condition of the relevant part of the Yellow Area will be recorded in a Schedule of Condition to be prepared pursuant to paragraph 2 (Schedules of Condition) of Part 3 (General Matters) of this Schedule Part 31;

4A.1.2 the works shall be carried out in such a manner as shall cause the minimum practicable disruption to the use and occupation of the relevant area and shall be completed as soon as reasonably practicable;

4A.1.3 on completion of the works Project Co shall and shall procure that Project Co Parties shall reinstate the relevant area and any buildings, structures and others erected thereon and any plant, machinery and equipment to no worse condition than that which existed prior to Project Co taking occupation of the relevant area to carry out the works evidenced by the Schedule of Condition referred to at paragraph 4A.1.1 and that as soon as practicable, and in the event Project Co fails or fails to procure any such reinstatement is effected as soon as reasonably practicable then the Board and/or any Board Party and/or Consort and/or any Consort Party and/or or any party on behalf of any of them shall be entitled to effect such reinstatement at Project Co's cost;

4A.1.4 Project Co shall be obliged to give the Board notice of completion of the works in the form of notice set out in Annex 10 of Part B of Appendix 10 of this Schedule Part 31 as applicable and the reinstatement works forthwith on the works being completed and the relevant area being vacated by Project Co;

4A.1.5 Project Co shall be liable and the provisions of Clause 49.*1 (Project Co Indemnities to Board)* of this Agreement shall apply for the consequences of failing to comply with and/or any breach of and/or any negligent act in complying with the requirements in this paragraph 4A of this Section 5

(Access and Drainage) of Part 1 *(Interface Construction Issues and Interface Proposals)* of this Schedule Part 31 and/or the losses which may be suffered or incurred by any Campus Party as a result of any act or omission of Project Co and/or a Project Co Party exercising any of the rights and/or performing any of its obligations and/or failing to do so including without limitation costs of repair, replacement, renewal and/or reinstatement of the Yellow Area and/or the existing service media within any of them."

4.6 In Part 2 (Interface Proposals Procedure) of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, insert a new Section 4 after Section 3 *(Amended Service Proposal (Service Strip and Foul Service Strip))* as follows:

"Section 4

CCTV Works Proposal Amendments

1. In the event that the route, depth, size or condition of any existing service media within the Yellow Area is found to be different from that which was anticipated in the CCTV Works Proposal, with the result that the CCTV Works Proposal cannot be implemented and requires to be amended then:

1.1 Project Co shall provide written notice to the Board in the form of notice set out in Annex 7 of Part B of Appendix 7 of this Schedule Part 31 of how the CCTV Works Proposal cannot be implemented and the changes required together with details outlining the issue with the existing service media and providing an amended CCTV Works Proposal with such additional detail, information and drawings as are available. The Board shall deliver a copy of the amended CCTV Works Proposal to Consort not later than two (2) Business Days after receipt of the amended CCTV Works Proposal from Project Co;

1.2 Not later than seven (7) Business Days following the date upon which notice has been given to the Board pursuant to paragraph 1.1 Project Co and the Board shall and the Board shall use reasonable endeavours to procure that Consort (or the respective representatives thereof) shall meet on site to review the amended CCTV Works Proposal and inspect the existing service media, and the Board and Project Co shall use all reasonable endeavours, and the Board shall use reasonable endeavours to procure that Consort use all reasonable endeavours (acting in good faith) to provisionally agree the amended CCTV Works Proposal and any variations thereto which will allow the service media installation(s) to proceed;

1.3 Not later than five (5) Business Days following the meeting held pursuant to paragraph 1.2 Project Co and the Board shall, and the Board shall use reasonable endeavours to procure that Consort shall further review the detail of the amended CCTV Works Proposal proposed at the meeting, with a view to reaching agreement on a final amended CCTV Works Proposal including updated plans and/or specifications for the applicable service media installations;

1.4 Dispute

1.4.1 In the event that the Board has not intimated to Project Co that the amended CCTV Works Proposal has been agreed by the Board and Consort by the date ten (10) Business Days after the date of the meeting held pursuant to paragraph 1.2 then the Board shall, where the amended CCTV Works Proposal is not agreed by Consort and if requested to do so by Project Co, refer the determination of the amended CCTV Works Proposal to the Independent Expert (who in this case, in the event of a failure by the Board and Consort to agree on the proposed expert, shall be nominated by the Institution of Engineering and Technology, Institution of Mechanical Engineers or the Chartered Institution of Building Services Engineers, as appropriate);

1.4.2 The Independent Expert shall act as an expert and will accept as a condition of his appointment that he shall give a decision within five (5) Business Days of his

appointment. The Independent Expert shall require to determine the amendments that should be made to the CCTV Works Proposal to enable the applicable service media installations to proceed within the Yellow Area while taking into account the need to protect the existing service media within the Yellow Area serving the Campus Site and/or Campus Facilities and the requirement for the Board and/or any Board Party and/or Consort and/or any Consort Party to access such service media in order to comply with its maintenance obligations;

1.4.3 Before nominating a person to act as Independent Expert or agreeing to the nomination by Consort, the Board shall take account of any reasonable representations made by Project Co with regard to the identity of the proposed Independent Expert provided that Project Co shall have regard to the requirement that the Independent Expert should be suitably qualified and have not less than seven (7) years' experience in groundworks/infrastructure. In referring matters to the Independent Expert the Board shall give due regard to any written representations received from Project Co which the Board acting reasonably consider are proper and reasonable and shall keep Project Co advised as to all communications to and from the Independent Expert;

1.4.4 The decision of the Independent Expert shall be final and binding on the Board, Project Co and Consort. In the event that the Independent Expert decides wholly or partly in favour of Consort, Project Co shall meet any award as to the costs of and associated with the referral proceedings including without limitation the costs of the Independent Expert, Consort, the Board and any other party involved in the referral;

1.5 Project Co shall and shall procure that Project Co Parties shall comply with and the provisions of paragraphs 1, 3, 4, 4A and 5 of Section 5 *(Access Areas and Drainage)* of Part 1 *(Interface Construction Issues and Interface Proposals)* of this Schedule Part 31 shall apply in respect of any matters carried out pursuant to the CCTV Works Proposal agreed or determined pursuant to this Section 4.

4.7 In Paragraph 1.4 of Part 3 *(General Matters) of* Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* delete paragraph 1.4.4 and substitute the following:

"paragraphs 1.1, 1.3.1 and/or 4A.1.4 of Section 5 *(Access Areas and Drainage)* of Part 1;"

4.8 In paragraph 1.4.of Part 3 *(General Matters)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* insert a NEW paragraph 1.4.8 after paragraph 1.4.7 as follows:

"1.4.8 paragraph 1.1 of Section 4 *(CCTV Works Proposal Amendments)* of Part 2;"

4.9 In paragraph 4.1.2 of Part 3 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* after "Section 3 *(Amended Service Proposal)*" in the penultimate line insert the following:

"and Section 4 *(CCTV Works Proposal Amendments)* of Part 2 *(Interface Proposals Procedure)"*

4.10 In paragraph 4.2 of Part 3 *(General Matters)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* insert at the end of the paragraph the following:

"provided however that where the alleged failure and/or Defect is in the CCTV Infrastructure Project Co shall or shall ensure that immediate action to remedy the alleged failure and/or Defect is taken and Project Co shall be provided with an opportunity to do so."

4.11 Amend Annex 3 of Part B of Appendix 4 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* as follows:

4.11.1 delete Annex 3 title and insert "Cycle Path Works and CCTV Works in the Yellow Area";

4.11.2 in "Notice Period" add "and/or CCTV Works" after "Cycle Path Works" and before "in the Yellow Area" and add the following comment;

"**[NB: THE NOTICE PERIOD DOES NOT APPLY IN AN EMERGENCY WHERE AS MUCH NOTICE AS PRACTICABLE IN THE CIRCUMSTANCES IS TO BE GIVEN]**";

4.11.3 in "Notice Order Provision" add "and/or paragraph 1.1.7" after "1.1.6";

4.11.4 in "Description of Requirements" insert "[/CCTV Works]]" after "Cycle Path" on line 1;

4.11.5 in the "Schedule of Condition" section after "Form of Notice]" insert

"**[NB THIS IS NOT REQUIRED WHERE THERE ARE EMERGENCY WORKS TO MAINTAIN, REPAIR OR RENEW SERVICE MEDIA]**";

4.12 Amend Annex 5 of Part C of Appendix 4 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* in the "Other Requirements" section by adding "and paragraph 4 *(CCTV Works)*" after "paragraph 1 *(Access to RIE and RIE Facilities)*" on line 2.

4.13 Insert a new Annex 7 in Part B of Appendix 7 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* as follows:

"APPENDIX 7

PART B – FORM OF NOTICES FOR CONSTRUCTION PHASE

ANNEX 7 - CCTV WORKS PROPOSAL

Notice Period:	**Notice Order Provisions:**	
Not applicable.	Paragraph 1.1 of Section 4 *(Amended Proposal – CCTV Works)* of Part 2 of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities).*	
Date of Notice:	**Reference:**	
[ ]	**Board: [ ]**	**Project Co: [ ]**
Description of requirements:		
The [route, depth, size or condition – insert exact details of the problem of the existing service media in the Yellow Area differs from what has been provided for in the CCTV Works Proposal with the result the CCTV Works Proposal cannot be implemented [insert how the Proposal cannot be implemented] and requires to be amended.		
Amended CCTV Works **Proposal:**		
The amended CCTV Works Proposal is attached and includes: • existing service media; • additional details of works; • information and drawings.		
Meeting and inspection:		
Project Co agrees to meet the Board (and if required Consort) at site not later than seven (7) Business Days after this notice has been given to the Board to review the amended CCTV Works Proposal and inspect the existing service media and to attend any further meetings within five (5) Business Days of the meeting at site (as required) to endeavour to agree the Amended Proposal.		
Approvals (if applicable):		

Schedule of Condition:
A Schedule of Condition of the Access Area being occupied has been prepared in accordance with paragraph 2 of Part 3 of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* [and a copy is attached to this Form of Notice]
Construction Access Strategy:
Project Co shall comply at all times with the Construction Access Strategy.
Traffic management arrangements:
Project Co's traffic arrangements (e.g. one way and contra flow) shall be managed by [identity of contractor] and supervised by [identity of supervisors, their duties and responsibilities, contact details (telephone numbers, bleep numbers, etc).]
Journeys:
Project Co anticipates the following number of journeys shall be [ ].
Timing of access:
Project requests that the time of day when access is required shall be [ ].
Construction traffic:
Project Co's construction traffic will comprise the following [vehicle size/type, access requirements].
Activities of construction traffic:
Project Co's construction traffic will be doing the following activities [off-loading, etc].
Compliance with [paragraph 1.2 of Section 5] OR [paragraph 1.1 of Section 2 of Part 2] of Part 1 of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities):*
As per [paragraph 1.2 of Section 5 of Part 1] OR [paragraph 1.1 of Section 2 of Part 2] of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, Project Co shall also implement and comply with any with any other measures and operations reasonably requested by the Board for the proper implementation of the Access Strategy, including measures which should be taken to reduce any health and safety risks to all visitors, staff and patients at the Campus Site and/or Campus Facilities. For the avoidance of doubt, Project Co shall: 1 not used; 2 ensure the imposition, where appropriate, of a suitable Permit to Work System and any other reasonable requirement of the Board, appropriate to the nature of the CCTV Works; 3 ensure restrictions on the periods during which construction access may be taken; 4 not used; 5 re-sequencing (and/or temporary cessation) the performance of elements of the CCTV Works/ activities; and 6 implement other reasonable measures which should be taken to (1) ensure sufficient and appropriate continued pedestrian and vehicular access to the Campus Site and/or Campus Facilities and part of the Retained Site and/or Retained Estate during the period of occupation, and (2) to reduce any health and safety risks to all visitors, staff and patients at the Campus

Site and/or Campus Facilities.
Hoarding off Access Area:
The affected part of the [Access Areas] shall be securely hoarded off by Project Co
Other requirements of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*:
Project Co acknowledges and shall comply with the other requirements set out in: • paragraphs 1, 3, 4 and 4A and on completion in the relevant area, paragraph 5 of Section 5 *(Access Areas and Drainage)* of Part 1; • [paragraph 1 and 4 of Section 2 *(Operational Construction Issues)* of Part 1; and] • the applicable requirements in Part 3 *(General Matters);* of this Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)*, in respect of any matters carried out pursuant to the agreed or determined amended CCTV Works Proposal.
Issued by: [ ] for Project Co
Signed..... **Print name**..... **Title**.....

4.14 Amend Annex 4 of Part A of Appendix 10 of Schedule Part 31 (*Consort Interface with Campus Site and/or Campus Facilities*) as follows:

4.14.1 in Annex 4 title insert "and/or CCTV Works" after "Cycle Path Works" but before "in the Yellow Area";

4.14.2 in Annex 4 "Notice Order Provisions" add "or paragraph 1.1.7)" after "paragraph 1.1.6" on line 1;

4.14.3 in Annex 4 "Description of completion of construction and date of completion" add "[form the CCTV Works]" after "[form the Cycle Path Works]" on line 1.

4.15 Insert a new Annex 10 of Part B of Appendix 10 of Schedule Part 31 (*Consort Interface with Campus Site and/or Campus Facilities*) of the Project Agreement as follows:

"**APPENDIX 10**

FORM OF NOTICES FOR COMPLETION AND VACATION

PART B – FORM OF NOTICES FOR OPERATIONAL TERM

ANNEX 10 - COMPLETION OF MAINTENANCE, REPAIR OR RENEWAL OF CCTV INFRASTRUCTURE IN AND VACATION OF THE YELLOW AREA (WHICH IS NOT SERVICE STRIP OR FOUL STRIP)

Notice Period:	Notice Order Provisions:
Not applicable.	Paragraph 4A of Section 5 (*Access Areas and Drainage*) of Part 1 (Interface Construction Issues and Interface Proposals) of Schedule Part 31

	(Consort Interface with Campus Site and/or Campus Facilities)	
Date of Notice:	**Reference:**	
[ ]	**Board: [ ]**	**Project Co: [ ]**
Description of completion of construction and date of completion:		
Project Co hereby gives notice that it has completed the works to [repair maintain, renew] service media for the CCTV Infrastructure within the Yellow Area shown on plan [ ] attached which were notified in Project Co's notice to the Board dated [ ] and Project Co has reinstated the area to its prior condition as evidenced by the Schedule of Condition and has vacated the area. Completion of these works occurred on [ ]. Reinstatement of the area occurred on [ ]. Vacation of the area occurred on [ ].		
Further Schedule of Condition:		
A further Schedule of Condition of the Access Area which is no longer being used should now be prepared in accordance with paragraph 2 *(Schedules of Condition)* of Part 3 *(General Matters)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement.		
Issued by: [ ] for Project Co		
Signed..... **Print name**..... **Title**....."		

PART C - CCTV WORKS PROPOSAL

Part C of Schedule Part 3 CCTV Works Proposal is in the Agreed Form identified and executed as Part C of Schedule Part 3CCTV Works Proposal of this SA1, referred to in and forming part of this SA1

APPENDIX 4

Part B – Form of Notices for Construction Phase

ANNEX 3 – Cycle Path Works in the Yellow Area

Notice Period:	**Notice Order Provisions:**	
Notwithstanding the period of Notice required from the date upon which Project Co intends to carry out works to form Cycle Path Works in the Yellow Area the parties agree access was granted on 9th November 2017.	Paragraph 1.1 (relative to paragraph 1.1.6) of Section 5 (Access Areas and Drainage) of Part 1) of Schedule 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement.	
Date of Notice:	**Reference:**	
17th July 2018	**Board:**	**Project Co: 039**
Description of requirements:		
As part of the Works to form the Cycle Path Works (cycle path & reconfigure landscaped areas) within the Yellow Area, CCTV works are required. Information listed below refers: • Plan 2 • 091-MS-CRUM-058-00-CCTV Ducting • 1545 BAS cat v4.1 • ME-EW-XX-PL-571-001_E • RAMS Method Statement Temp CCTV Fibre Works • WW-EW-XX-PL-716-001		
Area or areas of the Retained Site where access will be required:		
The Yellow Area shown on plan 2 attached.		
Date or dates on which access will be required:		
Notwithstanding the Notice periods within Schedule Part 31 to the PA it has been agreed between the parties (MPX/IHSL/Board/Consort) at Interface meetings that access is granted from 9th November 2017 for the period up to Actual Completion as defined in the Project Agreement.		

Schedule of Condition:
A Schedule of Condition of the Access Area being occupied has been prepared in accordance with paragraph 2 of Part 3 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement and a copy is in the possession of both the Board and Consort.
Access Strategy:
Project Co shall ensure pedestrian and vehicular access to the Campus Site and Campus Facilities must be maintained at all times and shall comply with the Access Strategy, which in turn shall comply with the requirements of paragraph 1.2 of Section 5 of Part 1 of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement, when taking any access over the Orange Area.
Responsibility for traffic management:
Project Co shall will be responsible for management of traffic across the Orange Area adjacent to the Yellow Area and primary responsibility for health and safety of all users of the Orange Area and road traffic signage and pedestrian crossings within the Orange Area
Arrangements for traffic management:
Project Co's traffic arrangements shall be managed by Multiplex Construction Europe Ltd (MPX) and supervised by Stuart Jackson (Project Manager) 07912 575 611 who may delegate authority to a competent and suitably qualified employee of MPX, contact details of whom will be communicated timeously.
Journeys:
Project Co is unable to quantify the expected number of journeys. All deliveries and unloading will be subject to Method Statement '091-MS-CRUM-058-00-CCTV Ducting' (2 pages) & 'RAMS Method Statement Temp CCTV Fibre Works' (3 pages) attached.
Timing of access:
Project Co requests that the time of day when access is required shall generally be 0700hrs to 1800hrs.
Construction traffic:
Project Co's construction traffic will be directed in accordance with Method Statement '091-MS-CRUM-058-00-CCTV Ducting' (2 pages) & 'RAMS Method Statement Temp CCTV Fibre Works' (3

pages) attached.

Activities of construction traffic:

Project Co's construction traffic will be carrying out the activities as defined Method Statement'091-MS-CRUM-058-00-CCTV Ducting' (2 pages) & 'RAMS Method Statement Temp CCTV Fibre Works' (3 pages) attached.

Compliance with paragraph 1.2 of Section 5 of Part 1 of Schedule 31*(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement:

As per paragraph 1.2 of Section 5 of Part 1 of Schedule 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement, Project Co shall also implement and comply with any with any other measures and operations reasonably requested by the Board for the proper implementation of the Access Strategy, including measures which should be taken to reduce any health and safety risks to all visitors, staff and patients at the Campus Site and/or Campus Facilities. For the avoidance of doubt, Project Co shall:

1 ensure the he imposition, where appropriate, of a suitable Permit to Work System and any other reasonable requirement of the Board, appropriate to the nature of the Works;

2 ensure restrictions on the periods during which construction access may be taken;

3 re-sequencing (and/or temporary cessation) the performance of elements of the Works/activities; and

4 implement other reasonable measures which should be taken (1) to ensure sufficient and appropriate continued pedestrian and vehicular access to the Campus Site and/or Campus Facilities and part of the Retained Site and/or Retained Estate during the period of occupation, and (2) to reduce any health and safety risks to all visitors, staff and patients at the Campus Site and/or Campus Facilities;

Hoarding off Access Area:

The affected part of the Access Areas shall be securely hoarded off by Project Co.

Other requirements of Schedule Part 31*(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement:

Project Co acknowledges and shall comply and/or shall procure compliance with the other requirements set out in paragraph 1 *(Access Areas)*, and on completion of the works, paragraph 5 *(Other General Matters)* of Section 5 *(Access Areas and Drainage)* of Part 1, and the applicable completion and vacation requirements of Part 3 *(General Matters)* of Schedule Part 31 *(Consort Interface with Campus Site and/or Campus Facilities)* of this Agreement.

Issued by: Multiplex Construction Europe Ltd for IHS Lothian Ltd (Project Co)
Signed.. [redacted] **Print name: G Coupé** **Title: Commercial Manager**

Statement of Proposed Method

Contract: RHSC **Contract No: J2045**

Client: Multiplex **Method Statement Ref: MS058-00**

Operation: Construction of CCTV Bases and installation of associated ducting.

Location: Cycle Path

Description of Method and Sequence of Operations:

This document will be briefed to the operatives on site by the site Supervisor prior to starting the works and will be signed by them to say they have received and understand it.
Works Manager will manage and monitor the assessment and Project Manager will check, review and update the assessment.

1. Ensuring Multiplex staff are advised in advance of planned excavations to ensure co-ordination with all relevant parties, works will only begin once relevant permits are in place
2. Multiplex will offer daily permit cover all excavations. The work area will be barriered off to ensure no access by the general public.
3. Trial digs shall then be carried out at the locations of known services by means of Hand excavation (this may be assisted by a small excavator **in strict accordance with HSG47** - Avoiding danger from underground services).
4. Prior to any excavations taking place all service records shall be checked and a CAT scan carried out for the section of trench excavation to be undertaken. Hand excavations shall be employed in areas of known or suspected services as per HSG47.
5. The depth of the excavation works is expected to be no greater than 1m. Stepped excavation will be used if necessary.
6. Should any obstructions be found, the works are to stop and MPX notified.
7. CCTV BASES: Once excavated, the levels will be checked and the joiners will hang the supplied bolts ready for concrete to be installed. Concrete will be installed by hand directly from a dumper. On completion the bolts will be checked for line and Level.
8. DUCTING: Once excavated the 100mm ducting will be installed with a sand surround, with warning tape placed above the sand. Trench shall be backfilled in layers with as dug material (or otherwise approved backfill material) and suitably compacted.
9. On completion of the work the work are will be made safe and permit signed off.

Delivery:	Direct to Location
Access:	Guided by Banksman
P.P.E.:	Safety glasses, overalls and gloves to be worn at all times with Steel-toed anti-static lacing boots, Hard Hat, Hi-Vis vest. Dust Mask/goggles

Do's	Don'ts
1. Ensure all Permits are in place prior to commencing 2. Wear appropriate PPE during this operation 3. Have qualified banksman with delivery vehicles at all times 4. Fence off excavations at all times 5. Follow Method of excavation **in strict accordance with HSG47** - Avoiding danger from underground services 6. Exercise caution when excavating near existing services	1. Carry out tasks until inducted/trained or briefed. 2. Walk on the blind side of the delivery vehicle or any road user. 3. Reverse vehicles unless absolutely necessary. 4. Ignore approaching Emergency Vehicles
Labour 1. Banksman 2. Operatives and Plant Operatives 3. Site Engineer 4. Site Supervisor	**Plant** Delivery Vehicles Small Excavator Forward/Reverse Compaction Plate Floor Saw Road Plates Small Dumper

AW2075

AW1545/BAS

AW1545/UP

Altron AW1545 cabinet based camera poles were originally introduced in 1994 as the first CCTV cabinet based pole product. They have been used and specified extensively since then and are now a common feature in urban areas throughout the UK. Ideal for mounting camera equipment within, they provide a cost effective installation and reduce street furniture and clutter. The tilt-down range enables camera equipment to be serviced easily at ground level, without the need for a man lift. Recent developments have been aimed at producing a clean and aesthetic outline, whilst enhancing security, so close fitting flush doors and our heavy duty secure locks are now common across the range.

The AW2075 Cylindrical cabinet based version, with parallel or tapered shafts are popular for installations with an architectural theme.

Altron's numerous security design features ensure a good level of protection against vandal attacks.

→ AW1545/BAS Cabinet Based Pole

AW1545/8/BAS

Fixed height range 4m - 12m
Tilt Down height range 4m -12m

The 'basic' AW1545 BAS cabinet based pole range offers a cost effective means of mounting CCTV equipment within the one pole structure. More commonly used for industrial and commercial type installations, it does not have venting and high security locks, that come as standard on the UP range, but does offer the other security features common to our cabinet based poles and also the clean, aesthetic appearance, common to the AW1545 ranges and is backed up with a full range of accessories.

Typically used for the following types of installation

- Public area CCTV
- Industrial and commercial premises
- Schools and universities
- Prisons and detention facilities
- Utilities sites
- Railway platforms & car parks
- Car parks
- Retail Parks
- Sports stadia

Security Features

- Internal cabling
- Close fitting flush doors
- Solid secure heavy duty door locks
- Internal padlock facility on tilt down poles to protect against un-authorised lowering

General Features

- Stable structures for all camera types
- Available in 6 standard cabinet sizes, 300, 350, 400, 450, 500 and 600 square (350mm square as standard if not specified)
- Flush fitting door, level with cabinet surface, no external frame combined with flush fitting Altron secure locks giving enhanced security and a clean aesthetic appearance
- Treated wooden backboard within cabinet
- 4 point security door locking option
- Demountable winches allow for a secure installation whilst also reducing costs on multiple installations
- A wide range of standard Altron Accessories and Brackets available
- Pole adaptations available to suit customers/project specific requirements
- Constructed in high tensile steel and hot dip galvanised after fabrication for durability
- Option of painting over the galvanised finish in colours available from BS and RAL colour charts
- For design, manufacturing and finishing standards, see details on page 107

Table dimensions in mm

Base plate and bolt sizes are for the standard cabinet sizes shown. For other cabinet sizes please contact our technical department for confirmation of sizes

Foundation sizes in table are W x W x D
Dimensions in metres

*D= 1000 on PM and buried flange/embedded base models

- For area D locations and exposed locations over 100m above sea level for areas A, B and 150m above sea level for area C, we recommend increased foundation sizes. Please refer to the table on page 101 for conformation of these.
- A minimum soil bearing capacity of 75 kN/m² is assumed.
- Foundation base dimensions are typical and may vary depending on site conditions.
- Please refer to the foundations & windloading section on pages 101-103 for further guidance.

Designer Identification of Hazard Risk

- Indicates a Residual Risk requiring a Compulsory Action
- Indicates a Residual Risk for Information
- Indicates a Residual Risk requiring a Prohibitive Action
- Indicates a Residual Risk as a Warning

EXTERNAL SERVICES NOTES

1. ALL DUCTS TO BE C/W HEAVY DUTY DRAW CORD & HAVE ENDS SEALED ON COMPLETION OF INSTALLATION TO PREVENT INGRESS OF MOISTURE & VERMIN.
2. ALL DUCTS TO HAVE SLOW RADIUS BENDS (MINIMUM OF 8 TIMES DUCT OD.
3. ALL DUCTS TO HAVE MINIMUM 600mm COVER TO TOP OF DUCT UNLESS DETAILED OTHERWISE.
4. CIVIL ENGINEER TO DETAIL BUILDING/FOUNDATION PENETRATION DETAILS.
5. LANDSCAPE ARCHITECT TO DETAIL MANHOLE COVERS.
6. DUCTS INSTALLED IN TRAFFIC AREAS/ROAD CROSSING AREAS SHALL HAVE ADDITIONAL PROTECTION TO MEET REQUIREMENTS FOR ROAD CROSSINGS i.e.- THEY SHALL BE LOWERED & HAUNCHED IN CONCRETE AS PER THE MANUFACTURERS & UTILITY PROVIDERS RECOMMENDATIONS. MINIMUM DEPTH 750mm TO TOP OF DUCT.
7. CCTV BASES TO BE DETAILED BY STRUCTURAL ENGINEER IN ACCORDANCE WITH MANUFACTURERS DETAILS. BASES TO INCORPORATE CAST-IN ANCHORS & DUCT ACCESS. MANHOLES ARE REQUIRED ADJACENT TO CCTV BASES FOR CABLING ACCESS. (NOT SHOWN FOR CLARITY)
8. ALL DUCTS & SERVICE ROUTES TO BE IDENTIFIED WITH TAPE & MARKERS.
9. THE CONTRACTOR SHALL PRODUCE FULLY CO-ORDINATED DRAWINGS SHOWING ALL EXISTING & PROPOSED SERVICES BEFORE WORKS COMMENCE.
10. WHERE EXISTING SERVICES WILL BE EXPOSED OR POTENTIALLY DAMAGED DURING THE WORKS THE CONTRACTOR SHALL SEEK APPROVAL FROM THE RELEVANT UTILITY PROVIDER AND ALLOW FOR ADDITIONAL PROTECTION MEASURES TO ENSURE THE INTEGRITY OF THE SERVICE IS NOT COMPROMISED IN ANY WAY. WHERE DIVERSIONS ARE REQUIRED THE CONTRACTOR SHALL TAKE FULL RESPONSIBILITY TO ENSURE THAT THIS IS CARRIED OUT WITH THE RELEVANT UTILITY PROVIDERS WRITTEN CONSENT. THE CONTRACTOR SHALL MANAGE ALL WORKS ASSOCIATED WITH THE DIVERSIONARY WORKS.
11. MANHOLES / ACCESS CHAMBERS SHALL BE PROVIDED AT EVERY CHANGE IN DIRECTION. NOT SHOWN FOR CLARITY. MANHOLES SHOWN ARE INDICATIVE ONLY. IT IS THE CONTRACTORS RESPONSIBILITY TO ENSURE THAT A SUITABLE AMOUNT OF MANHOLES / ACCESS CHAMBERS SHALL BE PROVIDED BY THE SPECIALIST CONTRACTOR.
12. IT WILL BE THE CONTRACTORS RESPONSIBILITY TO ENSURE DUCTS AND SERVICES ARE INSTALLED AT THE CORRECT LEVELS. CONTRACTOR MUST CONFIRM FINISHED GROUND LEVEL TO ENABLE DUCTS TO HAVE SUFFICIENT COVER.
13. THE CONTRACTOR SHALL ALLOW FOR ALL EXTERNAL MANHOLES / ACCESS CHAMBERS TO BE LOCKABLE OUTSIDE OF THE SECURE PERIMETER FENCE.
14. DUCTING ENTERING THE LIGHTING COLUMN BASE SHALL BE 35/100mm INSIDE DIAMETER PURPLE DUCT. REFER TO DUCTING DETAILS.
15. THE CONTRACTOR SHALL ALLOW FOR DUCTS TO BE INSPECTED BEFORE ANY BACKFILLING COMMENCES.
16. FINAL ROUTING OF ALL UTILITY SERVICES TO BE CO-ORDINATED FULLY WITH THE NOMINATED UTILITY SUPPLIER.
17. LIGHTING SUPPLIES TO CANOPY TO BE FED VIA CANOPY LEG. DETAILS TO BE AGREED WITH CANOPY SUPPLIER.
18. FEEDER PILLAR TO BE TEMPORARILY FED FROM SITE SERVICES SUPPLY WITH CHANGE OVER TO BUILDING SUPPLY WHEN AVAILABLE.
19. LIGHTING TO BE CONTROLLED FROM DAY LIGHT SENSOR WITH MANUAL OVERIDE

Scale 1:100

Status Given	Comments on Rev 3	Mercury Response
C	Please confirm how / If secured by design achieved	Secure by Design is a strategy to build safer building, we meet these criteria's by being a MSI Gold approved company and working with the operational requirements within the design specification this being the case the current CCTV design covers car parking with general surveillance, all entrances to the car parks and entrances to the hospital are covered by CCTV, internally cameras cover entrances to wards and critical areas like pharmacy areas and concourse areas.
	Please confirm how / If park safe is achieved	HLM to confirm.
	Please confirm how areas highlighted on the drawings are covered by CCTV including Helipad	The Helipad will be covered by two cameras on opposing sides of the deck installed no more than 250mm from the deck surface to maintain the safety of the Heli-Deck, to maintain the image quality camera will have the capability to invert the image to overcome the camera being installed as close to the deck surface.
	Please confirm how glare on the south facing cameras being addressed	Sun Glare – all cameras being proposed are dome based and are designed to work externally and have built in auto iris lens, the camera are building mounted and will be installed at a height where sun glare should not be a mitigating factor. Some building factors that need to be checked will be no reflective surfaces that can cause glare into the cameras and maintenance regimes as poor maintenance can cause glare from dirt on the surface of the cameras.
	Cameras required at car park barriers	Car Park Barriers are Covered with Building mounted CCTV.
	Service yard security office has to be able to view footage of service yard	The security office PC will be given access to the CCTV system
	No CCTV indicated	Static mounted CCTV now facing Main and DCN entrance
	No fixed camera for ED	Area covered with building mounted CCTV Camera.

Status Given	Comments on Rev B	Mercury Response
B	HLM Comments to be incorporated reviewed as per HLM-GC-004520	HLM comments have been reviewed, refer to updated layout.

Status Given	Comments on Rev D - 30/01/18	Mercury Response
C	How are these gaps being covered?	CCTV coverage now highlighted on drawing.
	Area not covered by CCTV	180 CCTV covers this area now.
	Entrance not covered by CCTV	Additional external added to cover door.
	This camera to be coordinated with bin washer & tipper for maximum view.	Due to bin location CCTV moved to be building mounted covering entrance.
	Sufficient cable to be rolled to allow for potential relocation.	Additional service loop of cabled coiled.
	1. Review comments noted.	All comments have been reviewed/noted.
	2. Confirm which / any comments taken on board from previous review	All comments have been reviewed and actioned as required.
	3 Review CAMHS coverage BCR 9 17.7 - All external cameras to be shown on one drawing.	All courtyard CCTV now shown on drawing.
